Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • ABS/VSA function not in operation With the Driving Pattern: • Start the engine. • Wait 20 seconds or more.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 20 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop brake assist function • Stop hydraulic boost failure compensation function • Stop hill start assist function • Stop automatic brake hold function • Stop automatic operating function (Drive away assist) • Stop ignition OFF apply function • Stop ACC function* • Stop CMBS function*
Possible Cause	• VSA modulator-control unit internal failure

DTC C0011-49

DTC C0011-49 : Outlet Solenoid (Left Front) Circuit Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • ABS/VSA function not in operation With the Driving Pattern: • Start the engine. • Wait 20 seconds or more.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 20 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop brake assist function • Stop hydraulic boost failure compensation function • Stop hill start assist function • Stop automatic brake hold function • Stop automatic operating function (Drive away assist) • Stop ignition OFF apply function

	- Stop ACC function* - Stop CMBS function*
Possible Cause	- VSA modulator-control unit internal failure

DTC Type	1 drive cycle Brake system indicator (red) on (If multiple wheel failures are detected) Brake system indicator (amber) on ABS indicator on VSA indicator on
Fail Safe Action	Stop EBD function (If multiple wheel failures are detected) Stop ABS function Stop engine drag torque control function Stop TCS function Stop VSA function Stop agile handling assist function Stop brake assist function Stop hydraulic boost failure compensation function Stop hill start assist function Stop automatic brake hold function Stop automatic operating function (Drive away assist) Stop automatic operating function (Request from other system) (Dependant upon the conditions) Stop ignition OFF apply function Stop ACC function* Stop CMBS function*
Possible Cause	Open, Short to ground, Short to power, or Short to another line between the VSA modulator-control unit and the left-rear wheel speed sensor (RR L ABS SNSR+, RR L ABS SNSR- lines) Left-rear wheel speed sensor failure VSA modulator-control unit internal failure

*: With ACC

DTC C0037-3A

DTC C0037-3A : Wheel Speed Sensor (Left Rear) Signal Failure (Signal Frequency is Too High)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: - Start the engine. - Test-drive the vehicle for 80 seconds or more. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 80 seconds
DTC Type	- 1 drive cycle - Brake system indicator (red) on (If multiple wheel failures are detected) - Brake system indicator (amber) on - ABS indicator on - VSA indicator on
Fail Safe Action	- Stop EBD function (If multiple wheel failures are detected) - Stop ABS function - Stop engine drag torque control function - Stop TCS function - Stop VSA function - Stop agile handling assist function - Stop brake assist function - Stop hydraulic boost failure compensation function - Stop hill start assist function - Stop automatic brake hold function - Stop automatic operating function (Drive away assist) - Stop automatic operating function (Request from other system) (Dependant upon the conditions) - Stop ignition OFF apply function - Stop ACC function* - Stop CMBS function*
Possible Cause	- Electrical noise in the left-rear wheel speed sensor signal - Left-rear wheel speed sensor incorrect installation - Debris on the left-rear encoder surface - Left-rear wheel speed sensor failure - VSA modulator-control unit internal failure

*: With ACC

DTC C0037-62 (VSA CONTROL UNIT)

DTC C0037-62 : Left Rear Wheel Speed Sensor Signal Compare Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition • No other DTCs detected • Brake TCS function not in operation • ABS function not in operation (Not applied under operating only for slowest wheel) With the Driving Pattern: • Start the engine. • Test-drive the vehicle at 31 mph (50 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on (If multiple wheel failures are detected) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (If multiple wheel failures are detected) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop brake assist function • Stop hydraulic boost failure compensation function • Stop hill start assist function • Stop automatic brake hold function • Stop automatic operating function (Drive away assist)

	- Stop automatic operating function (Request from other system) (Dependant upon the conditions) - Stop ignition OFF apply function - Stop ACC function* - Stop CMBS function*

*: With ACC

Possible Cause	- Left-rear wheel speed sensor incorrect installation - Debris on the left-rear encoder surface - Left-rear wheel speed sensor failure - VSA modulator-control unit internal failure

*: With ACC

Duration	About 20 seconds
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • ABS indicator on *1 • VSA indicator on
Fail Safe Action	• Stop ABS function *1 • Stop engine drag torque control function • Stop TCS function *1 • Stop VSA function *1 • Stop agile handling assist function *1 • Stop brake assist function *1 • Stop hydraulic boost failure compensation function *1 • Stop hill start assist function • Stop automatic brake hold function • Stop automatic operating function (Drive away assist) • Stop ignition OFF apply function • Stop ACC function *2 • Stop CMBS function *2

Possible Cause	- SRS unit internal failure

*1: AWD

*2: With ACC

DTC C0063-49

DTC C0063-49 : Yaw Rate Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Start the engine.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (amber) on - ABS indicator on (Dependant upon the conditions) *1 - VSA indicator on
Fail Safe Action	- Degrade ABS performance *2 - Stop ABS function or degrade ABS performance (Dependant upon the conditions) *1 - Stop engine drag torque control function - Stop TCS function - Stop VSA function - Stop agile handling assist function - Stop brake assist function (Dependant upon the conditions) *1 - Stop hydraulic boost failure compensation function (Dependant upon the conditions) *1 - Stop hill start assist function - Stop automatic brake hold function

	• Stop automatic operating function (Drive away assist) (Dependant upon the conditions) • Stop ignition OFF apply function (Dependant upon the conditions) • Stop ACC function *3 • Stop CMBS function *3
Possible Cause	• SRS unit internal failure • VSA modulator-control unit internal failure

*1: AWD

*2: 2WD

*3: With ACC

DTC C0063-54

DTC C0063-54 : Yaw Rate Sensor Calibration Incomplete

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • No other DTCs detected With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function

	• Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hill start assist function • Stop automatic brake hold function • Stop ACC function* • Stop CMBS function*
Possible Cause	• VSA sensor neutral position memorization not completed • SRS unit internal failure • VSA modulator-control unit internal failure

*: With ACC

DTC C0063-62

DTC C0063-62 : Yaw Rate Sensor Failure (Signal Compare Failure)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:
	• No other DTCs detected
	• ABS/VSA function not in operation
	With the Driving Pattern:
	• Start the engine.
	• Test-drive the vehicle under these conditions:
	(Be careful of the surrounding traffic conditions.)
	•
	  • Vehicle speed at 31 mph (50 km/h) or more for at least 20 seconds
	  • Brake pedal released
	  • Change lanes for a few times

Execution	Regular Diagnosis
Duration	About 5 seconds
DTC Type	1 drive cycle Brake system indicator (amber) on VSA indicator on
Fail Safe Action	Degrade ABS performance Stop engine drag torque control function Stop TCS function Stop VSA function Stop agile handling assist function Stop hill start assist function Stop automatic brake hold function Stop ACC function* Stop CMBS function*
Possible Cause	SRS unit internal failure

DTC C1000-94

DTC C1000-94 : ABS/VSA Activation Time Too Long

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 6.9 V or more With the Driving Pattern: • Start the engine. • Test-drive the vehicle under these conditions: (Be careful of the surrounding traffic conditions.)

	• • Vehicle speed at 31 mph (50 km/h) or more for at least 60 seconds • Brake pedal released
Execution	Regular Diagnosis
Duration	About 60 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on (Dependant upon the conditions) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (Dependant upon the conditions) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop brake assist function • Stop hydraulic boost failure compensation function • Stop hill start assist function • Stop automatic brake hold function • Stop automatic operating function (Drive away assist) • Stop ignition OFF apply function • Stop ACC function* • Stop CMBS function*
Possible Cause	• Low air pressure in tires • Different diameter tires • Wheel speed sensor failure • Debris on the encoder surface • VSA modulator-control unit internal failure

DTC C1021-49

DTC C1021-49 : VSA Suction Valve Failure (Unexpected Operation)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Start the engine. • Wait 20 seconds or more. • Test-drive the vehicle at 9 mph (15 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 20 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop brake assist function • Stop hydraulic boost failure compensation function • Stop hill start assist function • Stop automatic brake hold function • Stop automatic operating function (Drive away assist) • Stop ignition OFF apply function • Stop ACC function* • Stop CMBS function*

Possible Cause	- VSA modulator-control unit internal failure

*: With ACC

DTC C1022-14

DTC C1022-14 : Power Source Failure for Pump Motor

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine. • Test-drive the vehicle at 6 mph (10 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Degrade EBD performance • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop brake assist function • Stop hydraulic boost failure compensation function • Stop hill start assist function • Stop automatic brake hold function • Stop automatic operating function (Drive away assist)

	- Stop ignition OFF apply function - Stop ACC function* - Stop CMBS function*
Possible Cause	- Open or Short to ground between the VSA modulator-control unit and the under-hood fuse/relay box (+B ABS/VSA MTR line) - Fuse failure (Under-hood fuse/relay box No. A3-3 (40 A)) - VSA modulator-control unit internal failure

DTC C1110-94

DTC C1110-94 : Left Side Electric Parking Brake Actuator Unexpected Operation

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode. • Apply and release the parking brake several times.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) blink • Brake system indicator (amber) on
Fail Safe Action	• Stop automatic brake hold function • Stop automatic operating function (Drive away assist) • Stop automatic operating function (Request from other system) • Stop ignition OFF apply function • Stop ACC function* • Stop CMBS function*
Possible Cause	• Left electric parking brake actuator • VSA modulator-control unit internal failure

*: With ACC

DTC C1110-96

DTC C1110-96 : Left Side Electric Parking Brake Actuator Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode. • Apply and release the parking brake several times.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) blink (Dependant upon the conditions) • Brake system indicator (amber) on
Fail Safe Action	• Stop automatic brake hold function • Stop manual operating function (Dependant upon the conditions) • Stop automatic operating function (Drive away assist) (Dependant upon the conditions) • Stop automatic operating function (Request from other system) • Stop ignition OFF apply function • Stop ACC function* • Stop CMBS function*
Possible Cause	• Rear brake component parts installation incorrect • Left electric parking brake actuator • VSA modulator-control unit internal failure

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 9.6 - 16.5 V

	With the Driving Pattern: • Start the engine.
Execution	Regular Diagnosis
Duration	About 5 seconds
DTC Type	• 1 drive cycle • Brake system indicator (amber) on (Dependant upon the conditions) • VSA indicator on (Dependant upon the conditions)
Fail Safe Action	• Degrade ABS performance (Dependant upon the conditions) • Stop engine drag torque control function (Dependant upon the conditions) • Stop TCS function (Dependant upon the conditions) • Stop VSA function (Dependant upon the conditions) • Stop agile handling assist function (Dependant upon the conditions) • Stop brake assist function (Dependant upon the conditions) • Stop hydraulic boost failure compensation function (Dependant upon the conditions) • Stop hill start assist function (Dependant upon the conditions) • Stop automatic brake hold function (Dependant upon the conditions) • Stop ACC function (Dependant upon the conditions)* • Stop CMBS function (Dependant upon the conditions)*
Possible Cause	• Open or Poor connection between the VSA modulator-control unit and the gauge control module (F-CAN lines) • Gauge control module internal failure • VSA modulator-control unit internal failure

*: With ACC

DTC U0401-68 (VSA CONTROL UNIT)

DTC U0401-68 : ECM Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Start the engine.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) blink • Brake system indicator (amber) on • VSA indicator on
Fail Safe Action	• Degrade ABS performance (Dependant upon the conditions) • Stop engine drag torque control function (Dependant upon the conditions) • Stop TCS function (Dependant upon the conditions) • Stop VSA function (Dependant upon the conditions) • Stop agile handling assist function (Dependant upon the conditions) • Stop hill start assist function • Stop automatic brake hold function • Stop automatic operating function (Drive away assist) • Stop ignition OFF apply function • Stop ACC function (Dependant upon the conditions)* • Stop CMBS function (Dependant upon the conditions)*
Possible Cause	• PGM-FI system failure • PCM internal failure

DTC U0402-68 (VSA CONTROL UNIT)

DTC U0402-68 : TCM Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Start the engine.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • VSA indicator on (Dependant upon the conditions)
Fail Safe Action	• Stop hill start assist function (Dependant upon the conditions) • Stop automatic brake hold function • Stop automatic operating function (Drive away assist) • Stop ignition OFF apply function
Possible Cause	• CVT system failure • PCM internal failure *1 • TCM internal failure *2

*1: K24W9/K24V9 engine

*2: L15BE engine

DTC U0418-68 (VSA CONTROL UNIT)

DTC U0418-68 : ESB/EBB Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	• 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Start the engine.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • VSA indicator on (Dependant upon the conditions)
Fail Safe Action	• Degrade ABS performance (Dependant upon the conditions) • Stop engine drag torque control function (Dependant upon the conditions) • Stop TCS function (Dependant upon the conditions) • Stop VSA function (Dependant upon the conditions) • Stop agile handling assist function (Dependant upon the conditions) • Stop brake assist function (Dependant upon the conditions) • Stop hill start assist function (Dependant upon the conditions) • Stop automatic brake hold function • Stop ACC function* • Stop CMBS function*
Possible Cause	• Electric brake booster system failure • Electric brake booster internal failure

DTC U0418-F8 (VSA CONTROL UNIT) (2020 2021)

DTC U0418-F8 : Plausibility Brake Pedal Signal (EBB) vs. Pressure Sensor

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	- 12 volt battery voltage 9.6 - 16.5 V - No other DTCs detected With the Driving Pattern: - Start the engine. - Wait 1 second or more without pressing the brake pedal. - Press the brake pedal hard for 1 second or more.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (amber) on - VSA indicator on
Fail Safe Action	- Degrade ABS performance - Stop engine drag torque control function - Stop TCS function - Stop VSA function - Stop agile handling assist function - Stop brake assist function - Stop hill start assist function - Stop starting assist brake function* 1 - Stop automatic brake hold function - Stop ACC function* 2 - Stop CMBS function* 2
Possible Cause	- Electric brake booster system failure - Electric brake booster internal failure

*1: With auto idle stop system

*2: With ACC

DTC U3000-49 (VSA CONTROL UNIT)

DTC U3000-49 : ECU Internal Circuit Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • ABS/VSA function not in operation With the Driving Pattern: • Start the engine. • Test-drive the vehicle at 25 mph (40 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on or blink (Dependant upon the conditions) • Brake system indicator (amber) on (Dependant upon the conditions) • ABS indicator on (Dependant upon the conditions) • VSA indicator on (Dependant upon the conditions)

*1: 2WD

*2: AWD

*3: With ACC

Fail Safe Action	• Stop CAN function (Dependant upon the conditions) • Stop EBD function or Degrade EBD performance (Dependant upon the conditions) • Stop ABS function or Degrade ABS performance (Dependant upon the conditions) *1 • Stop ABS function (Dependant upon the conditions) *2 • Stop engine drag torque control function (Dependant upon the conditions) • Stop TCS function (Dependant upon the conditions) • Stop VSA function (Dependant upon the conditions) • Stop agile handling assist control function (Dependant upon the conditions) • Stop brake assist function (Dependant upon the conditions) • Stop hydraulic boost failure compensation function (Dependant upon the conditions) • Stop hill start assist function (Dependant upon the conditions) • Stop automatic brake hold function (Dependant upon the conditions) • Stop manual operating function (Dependant upon the conditions) • Stop automatic operating function (Drive away assist) (Dependant upon the conditions)

	• Stop automatic operating function (Request from other system) (Dependant upon the conditions) • Stop ignition OFF apply function (Dependant upon the conditions) • Stop emergency brake function (Dependant upon the conditions) • Stop ACC function (Dependant upon the conditions) *3 • Stop CMBS function (Dependant upon the conditions) *3
Possible Cause	• VSA modulator-control unit internal failure

DTC U3000-51 (VSA CONTROL UNIT)

DTC U3000-51 : ECU Software Update Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on (Dependant upon the conditions) • Brake system indicator (amber) on (Dependant upon the conditions) • ABS indicator on (Dependant upon the conditions) • VSA indicator on (Dependant upon the conditions)
Fail Safe Action	• Stop CAN function • Stop EBD function • Stop ABS function • Stop engine drag torque control function

	• Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop brake assist function • Stop hydraulic boost failure compensation function • Stop hill start assist function • Stop automatic brake hold function • Stop manual operating function • Stop automatic operating function (Drive away assist) • Stop automatic operating function (Request from other system) • Stop ignition OFF apply function • Stop emergency brake function • Stop ACC function* • Stop CMBS function*
Possible Cause	• VSA modulator-control unit program not the latest • VSA modulator-control unit internal failure

*: With ACC

DTC U3003-16 (VSA CONTROL UNIT)

DTC U3003-16 : Electric Parking Brake Control Unit Power Source Circuit (+B) Low Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine. • Wait 15 seconds or more.
Execution	Regular Diagnosis
Duration	About 15 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) blink (Dependant upon the conditions)

	- Brake system indicator (amber) on
Fail Safe Action	- Stop automatic brake hold function (Dependant upon the conditions) - Stop manual operating function - Stop automatic operating function (Drive away assist) (Dependant upon the conditions) - Stop automatic operating function (Request from other system) (Dependant upon the conditions) - Stop ignition OFF apply function (Dependant upon the conditions) - Stop emergency brake function (Dependant upon the conditions) - Stop ACC function (Dependant upon the conditions)* - Stop CMBS function (Dependant upon the conditions)*
Possible Cause	- Poor connection between the VSA modulator-control unit and the under-hood fuse/relay box (+B ABS/VSA FSR line) - PGM-FI system failure - Abnormal 12 volt battery - VSA modulator-control unit internal failure

*: With ACC

DTC U3003-17 (VSA CONTROL UNIT)

DTC U3003-17 : Electric Parking Brake Control Unit Power Source Circuit (+B) High Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Start the engine.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (amber) on

Fail Safe Action	- Stop automatic brake hold function - Stop manual operating function - Stop automatic operating function (Drive away assist) - Stop automatic operating function (Request from other system) - Stop ignition OFF apply function - Stop ACC function* - Stop CMBS function*
Possible Cause	- PGM-FI system failure - Abnormal 12 volt battery - VSA modulator-control unit internal failure

*: With ACC

DTC U3006-16 (VSA CONTROL UNIT)

DTC U3006-16 : Power Source Failure for ECU (Low Voltage)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Start the engine. - Test-drive the vehicle at 6 mph (10 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (red) on or blink (Dependant upon the conditions) - Brake system indicator (amber) on - ABS indicator on (Dependant upon the conditions) - VSA indicator on
Fail Safe Action	- Stop CAN function (Dependant upon the conditions)

	- Stop EBD function or Degrade EBD performance (Dependant upon the conditions) - Stop ABS function or Degrade ABS performance (Dependant upon the conditions) *1 - Stop ABS function *2 - Stop engine drag torque control function - Stop TCS function - Stop VSA function - Stop agile handling assist control function - Stop brake assist function - Stop hydraulic boost failure compensation function - Stop hill start assist function - Stop automatic brake hold function - Stop automatic operating function (Drive away assist) - Stop ignition OFF apply function - Stop ACC function *3 - Stop CMBS function *3
Possible Cause	- Poor connection between the VSA modulator-control unit and the under-hood fuse/relay box (+B ABS/VSA FSR line) - PGM-FI system failure - Abnormal 12 volt battery - VSA modulator-control unit internal failure

*1: 2WD

*2: AWD

*3: With ACC

DTC U3006-17 (VSA CONTROL UNIT)

DTC U3006-17 : Power Source Failure for ECU (High Voltage)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on or blink (Dependant upon the conditions) • Brake system indicator (amber) on • ABS indicator on (Dependant upon the conditions) • VSA indicator on
Fail Safe Action	• Stop CAN function (Dependant upon the conditions) • Degrade EBD performance (Dependant upon the conditions) • Stop ABS function or Degrade ABS performance (Dependant upon the conditions) • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist control function • Stop brake assist function • Stop hydraulic boost failure compensation function • Stop hill start assist function • Stop automatic brake hold function • Stop automatic operating function (Drive away assist) • Stop ignition OFF apply function • Stop ACC function* • Stop CMBS function*
Possible Cause	• PGM-FI system failure • Abnormal 12 volt battery • VSA modulator-control unit internal failure

DTC TROUBLESHOOTING

DTC B0050-F0 (VSA CONTROL UNIT)

DTC B0050-F0 : Driver's Seat Belt Buckle Switch Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
B0050-F0 Driver's Seat Belt Buckle Switch Malfunction	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for a few seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B0050-F0 Driver's Seat Belt Buckle Switch Malfunction	B	B

   Is DTC B0050-F0 indicated?

   YES

   The failure is duplicated. Go to SRS troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0010-49, C0011-49, C0014-49, C0015-49, C0018-49, C0019-49, C001C-49, C001D-49

DTC C0010-49 : Inlet Solenoid (Left Front) Circuit Failure **DTC C0011-49** : Outlet Solenoid (Left Front) Circuit Failure **DTC C0014-49** : Inlet Solenoid (Right Front) Circuit Failure **DTC C0015-49** : Outlet Solenoid (Right Front) Circuit Failure **DTC C0018-49** : Inlet Solenoid (Left Rear) Circuit Failure **DTC C0019-49** : Outlet Solenoid (Left Rear) Circuit Failure **DTC C001C-49** : Inlet Solenoid (Right Rear) Circuit Failure **DTC C001D-49** : Outlet Solenoid (Right Rear) Circuit Failure

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
C0010-49 Inlet Solenoid (Left Front) Circuit Failure	B	B
C0011-49 Outlet Solenoid (Left Front) Circuit Failure	B	B
C0014-49 Inlet Solenoid (Right Front) Circuit Failure	B	B

DTC Description	DTC	Freeze Frame
C0015-49 Outlet Solenoid (Right Front) Circuit Failure	B	B
C0018-49 Inlet Solenoid (Left Rear) Circuit Failure	B	B
C0019-49 Outlet Solenoid (Left Rear) Circuit Failure	B	B
C001C-49 Inlet Solenoid (Right Rear) Circuit Failure	B	B
C001D-49 Outlet Solenoid (Right Rear) Circuit Failure	B	B

DTC (VSA)

1. Problem verification

 -1. Turn the vehicle to the ON mode.

 -2. Clear the DTC with the HDS.

 -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

 -4. Wait 20 seconds or more.

 -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0010-49 Inlet Solenoid (Left Front) Circuit Failure	B	B
C0011-49 Outlet Solenoid (Left Front) Circuit Failure	B	B
C0014-49 Inlet Solenoid (Right Front) Circuit Failure	B	B
C0015-49 Outlet Solenoid (Right Front) Circuit Failure	B	B
C0018-49 Inlet Solenoid (Left Rear) Circuit Failure	B	B
C0019-49 Outlet Solenoid (Left Rear) Circuit Failure	B	B
C001C-49 Inlet Solenoid (Right Rear) Circuit Failure	B	B
C001D-49 Outlet Solenoid (Right Rear) Circuit Failure	B	B

Is DTC C0010-49, C0011-49, C0014-49, C0015-49, C0018-49, C0019-49, C001C-49, or C001D-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0020-12

DTC C0020-12 : Pump Motor Circuit Failure (Stuck ON)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C0020-12 Pump Motor Circuit Failure (Stuck ON)	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0020-12 Pump Motor Circuit Failure (Stuck ON)	B	B

Is DTC C0020-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (GND line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

VSA modulator-control unit 46P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 4**
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open or poor connection in the wire between the VSA modulator-control unit and body ground (G201).

DTC C0020-14, C1022-14

DTC C0020-14 : Pump Motor Circuit Failure (Stuck OFF)**DTC C1022-14** : Power Source Failure for Pump Motor

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C0020-14 Pump Motor Circuit Failure (Stuck OFF)	B	B
C1022-14 Power Source Failure for Pump Motor	B	B

DTC (VSA)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Wait 20 seconds or more.

   -5. Test-drive the vehicle at 6 mph (10 km/h) or more.

   -6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0020-12 Pump Motor Circuit Failure (Stuck ON)	B	B
C0020-14 Pump Motor Circuit Failure (Stuck OFF)	B	B

DTC Description	DTC	Freeze Frame
C1022-14 Power Source Failure for Pump Motor	B	B

Is DTC C0020-14 or C1022-14 indicated?

YES

If only DTC C0020-14 or C1022-14 are indicated, go to step 2.

YES

If DTC C0020-12 is also indicated, **go to DTC C0020-12**.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. A3-3 (40 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A3-3 (40 A) fuse circuit.

3. Open wire check (+B ABS/VSA MTR line)

-1. Disconnect the following connector.

VSA modulator-control unit 46P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

The +B ABS/VSA MTR wire is OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the No. A3-3 (40 A) fuse in the under-hood fuse/relay box and the VSA modulator-control unit.

DTC C0023-12

DTC C0023-12 : Brake Diag Circuit ON Failure

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C0023-12 Brake Diag Circuit ON Failure	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Wait 2 seconds or more without pressing the brake pedal.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0023-12 Brake Diag Circuit ON Failure	B	B

Is DTC C0023-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Relay circuit board check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES

Replace the relay circuit board .

NO

Go to step 3.

3. Shorted wire check (BRK LAMP line) 1

-1. Turn the vehicle to the ON mode.

-2. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES

Go to step 4.

NO

Go to step 5.

4. Shorted wire check (BRK LAMP line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VSA modulator-control unit 46P connector

-3. Turn the vehicle to the ON mode.

-4. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES

Repair a short to ground in the wire between the relay circuit board and the VSA modulator-control unit.

NO

The BRK LAMP wire is OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

5. Open wire check (STOP SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

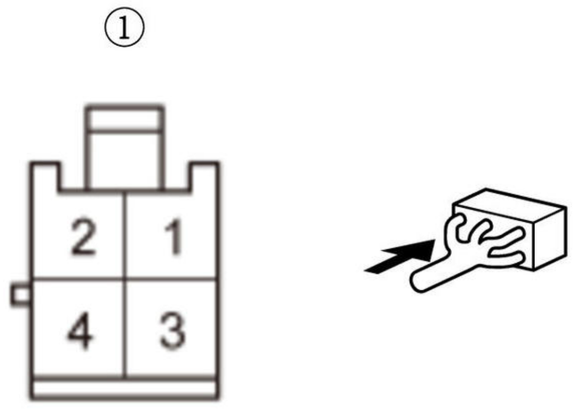
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (50P) (L15BE engine)
PCM connector A (51P) (K24W9/K24V9 engine)
Brake pedal position switch 4P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P) (L15BE engine): disconnected
B	PCM connector A (51P) (K24W9/K24V9 engine): disconnected
B	Brake pedal position switch 4P connector: disconnected
Test point 1	**PCM connector A (50P) (L15BE engine) No. 26**
B	**PCM connector A (51P) (K24W9/K24V9 engine) No. 37**
Test point 2	Brake pedal position switch 4P connector (female terminals) No. 1: ①



Is there continuity?

YES

The STOP SW wire is OK. Go to step 6.

NO

Repair an open in the wire between the PCM and the brake pedal position switch.

6. PCM check

   -1. Reconnect the following connectors.

PCM connector A (50P) (L15BE engine)
PCM connector A (51P) (K24W9/K24V9 engine)
Brake pedal position switch 4P connector

   -2. **Substitute a known-good PCM** .

   -3. Clear the DTC with the HDS.

   -4. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -5. Wait 2 seconds or more without pressing the brake pedal.

   -6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0023-12 Brake Diag Circuit ON Failure	B	B

   Is DTC C0023-12 indicated?

   YES

   Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

   NO

   Replace the original PCM .

DTC C0023-14

DTC C0023-14 : Brake Diag Circuit OFF Failure

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C0023-14 Brake Diag Circuit OFF Failure	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Select the BRAKE LIGHT RELAY TEST in the VSA FUNCTION TEST with the HDS.

   BRAKE LIGHT RELAY TEST

   Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0023-14 Brake Diag Circuit OFF Failure	B	B

Is DTC C0023-14 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Relay circuit board check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good relay circuit board** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Select the BRAKE LIGHT RELAY TEST in the VSA FUNCTION TEST with the HDS.

BRAKE LIGHT RELAY TEST

Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0023-14 Brake Diag Circuit OFF Failure	B	B

Is DTC C0023-14 indicated?

YES

Go to step 3.

NO

Replace the original relay circuit board .

3. Open wire check (BRK LAMP line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VSA modulator-control unit 46P connector

-3. Connect terminals 1 and 2 with a jumper wire.

Terminal 1	**VSA modulator-control unit 46P connector No. 11**
Terminal 2	Body ground

-4. Turn the vehicle to the ON mode.

-5. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES

Go to step 7.

NO

Go to step 4.

4. Open wire check (BRK LAMP line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

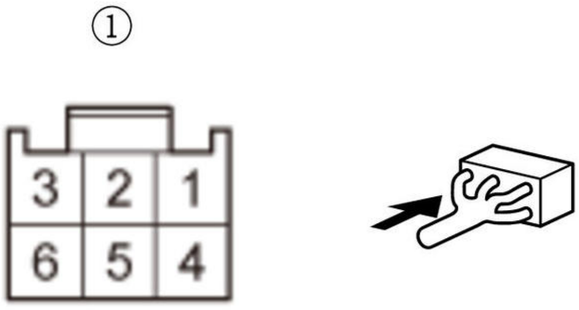
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Relay circuit board connector B (6P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Relay circuit board connector B (6P): disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 11**
Test point 2	Relay circuit board connector B (6P) (female terminals) No. 1: ①



Is there continuity?

YES

The BRK LAMP wire is OK. Go to step 5.

NO

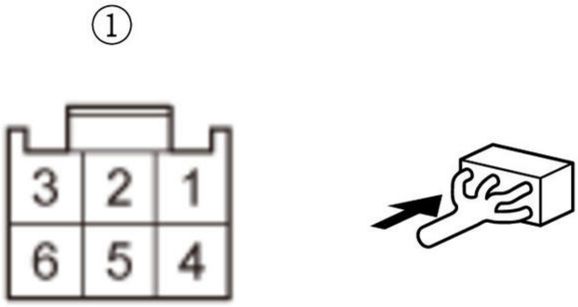
Repair an open in the wire between the VSA modulator-control unit and the relay circuit board.

5. Open wire check (IG1 OPTION line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	VSA modulator-control unit 46P connector: disconnected
B	Relay circuit board connector B (6P): disconnected
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 OPTION wire is OK. Go to step 6.

NO

Repair an open in the wire between the under-dash fuse/relay box and the relay circuit board.

6. Open wire check (+B STOP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

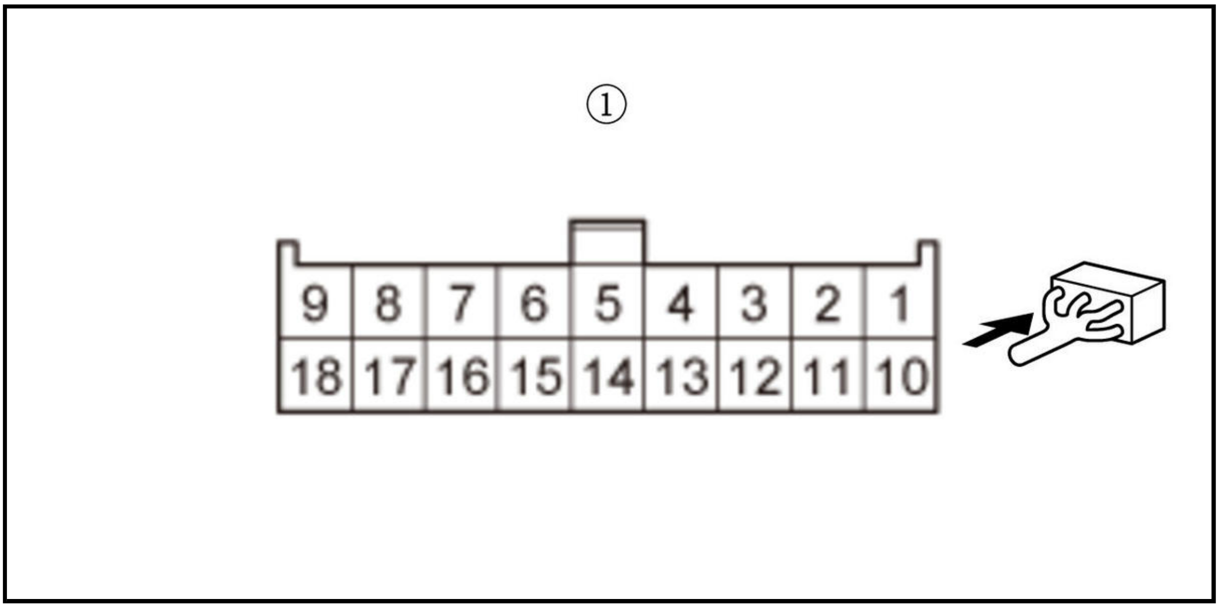
-2. Disconnect the following connector.

Relay circuit board connector C (18P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Relay circuit board connector B (6P): disconnected
B	Relay circuit board connector C (18P): disconnected

Test point 1	Relay circuit board connector C (18P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B STOP wire is OK. Go to step 7.

NO

Repair an open in the wire between the under-hood fuse/relay box and the relay circuit board.

7. Open wire check (BRK DIAG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

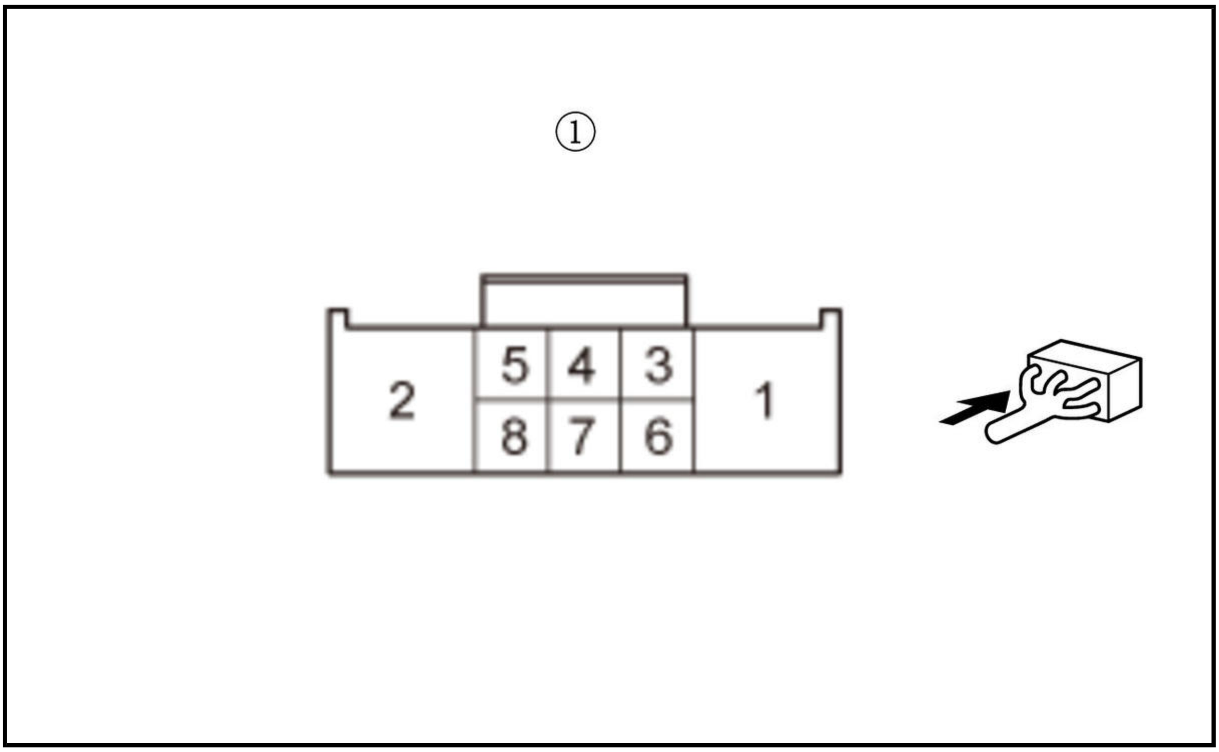
-2. Disconnect the jumper wire. (if connected)

-3. Disconnect the following connector.

Relay circuit board connector A (8P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board connector A (8P): disconnected
B	Relay circuit board connector B (6P): disconnected (if disconnected)
B	Relay circuit board connector C (18P): disconnected (if disconnected)
B	VSA modulator-control unit 46P connector: disconnected
Test point 1	VSA modulator-control unit 46P connector No. 44
Test point 2	Relay circuit board connector A (8P) (female terminals) No. 6: ①



Is there continuity?

YES

The BRK DIAG wire is OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Repair an open in the wire between the relay circuit board and the VSA modulator-control unit.

DTC C0031-14, C0034-14, C0037-14, C003A-14

DTC C0031-14 : Left Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)**DTC C0034-14** : Right-Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)**DTC C0037-14** : Left Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)**DTC C003A-14** : Right Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
C0031-14 Left Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B	B
C0034-14 Right-Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B	B
C0037-14 Left Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B	B
C003A-14 Right Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0031-14 Left Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B	B
C0034-14 Right-Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B	B
C0037-14 Left Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B	B
C003A-14 Right Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B	B

Is DTC C0031-14, C0034-14, C0037-14, or C003A-14 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (Wheel speed sensor lines to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VSA modulator-control unit 46P connector

-3. Check for continuity between body ground and the appropriate wheel speed sensor +B and GND terminals of the VSA modulator-control unit 46P connector individually (see table).

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected

Connector	DTC	Test point 1	Test point 2
VSA modulator-control unit 46P connector	C0031-14Left-front	No. 33	Body ground
		No. 42	
	C0034-14Right-front	No. 30	
		No. 35	
	C0037-14Left-rear	No. 17	
		No. 32	
	C003A-14Right-rear	No. 31	
		No. 15	

Is there continuity?

YES

Wheel speed sensor wires are shorted to ground. Go to step 3.

NO

Wheel speed sensor wires are not shorted to ground. Go to step 4.

3. Wheel speed sensor (s) check 1

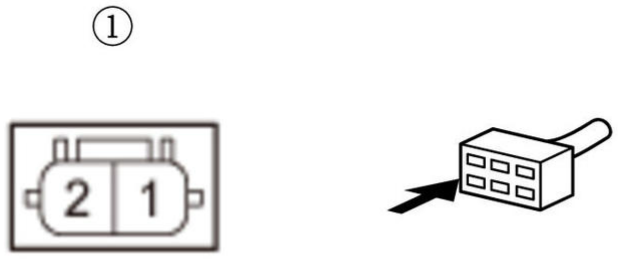
-1. Disconnect the following connectors.

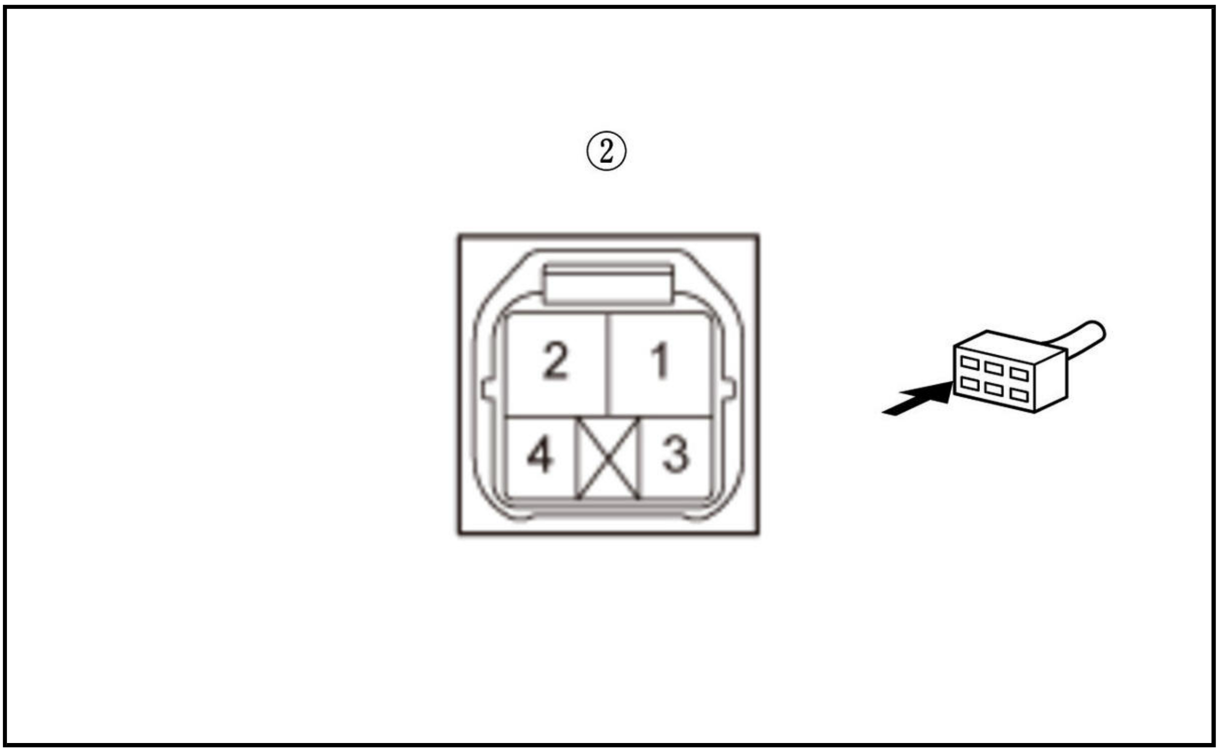
Appropriate wheel speed sensor 2P connector (front)
Appropriate wheel speed sensor 4P connector (rear)

-2. On the sensor side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate wheel speed sensor 2P connector (front): disconnected
B	Appropriate wheel speed sensor 4P connector (rear): disconnected
Test circuit 1	B
Test point 1	Appropriate wheel speed sensor 2P connector (male terminals) No. 1: ①
B	Appropriate wheel speed sensor 4P connector (male terminals) No. 3: ②
Test point 2	Body ground

Test circuit 2	B
Test point 1	Appropriate wheel speed sensor 2P connector (male terminals) No. 2: ①
B	Appropriate wheel speed sensor 4P connector (male terminals) No. 4: ②
Test point 2	Body ground





Is there continuity?

YES

Replace the appropriate wheel speed sensor .

NO

Repair a short to ground in the wire between the VSA modulator-control unit and the wheel speed sensor.

4. Shorted wire check (Wheel speed sensor lines to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between body ground and the appropriate wheel speed sensor +B and GND terminals of the VSA modulator-control unit 46P connector individually (see table).

Test condition	Vehicle ON mode
B	VSA modulator-control unit 46P connector: disconnected

Connector	DTC	Test point 1	Test point 2
VSA modulator-control unit 46P connector	C0031-14Left-front	No. 33	Body ground
		No. 42	
	C0034-14Right-front	No. 30	
		No. 35	
	C0037-14Left-rear	No. 17	
		No. 32	
	C003A-14Right-rear	No. 31	
		No. 15	

Is there 1 V or more?

YES

The wheel speed sensor wires are shorted to power. Go to step 5.

NO

The wheel speed sensor wires are not shorted to power. Go to step 6.

5. Wheel speed sensor (s) check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

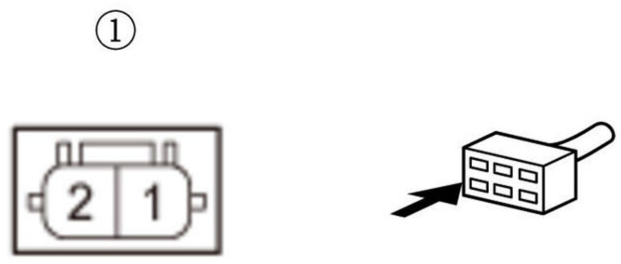
Appropriate wheel speed sensor 2P connector (front)
Appropriate wheel speed sensor 4P connector (rear)

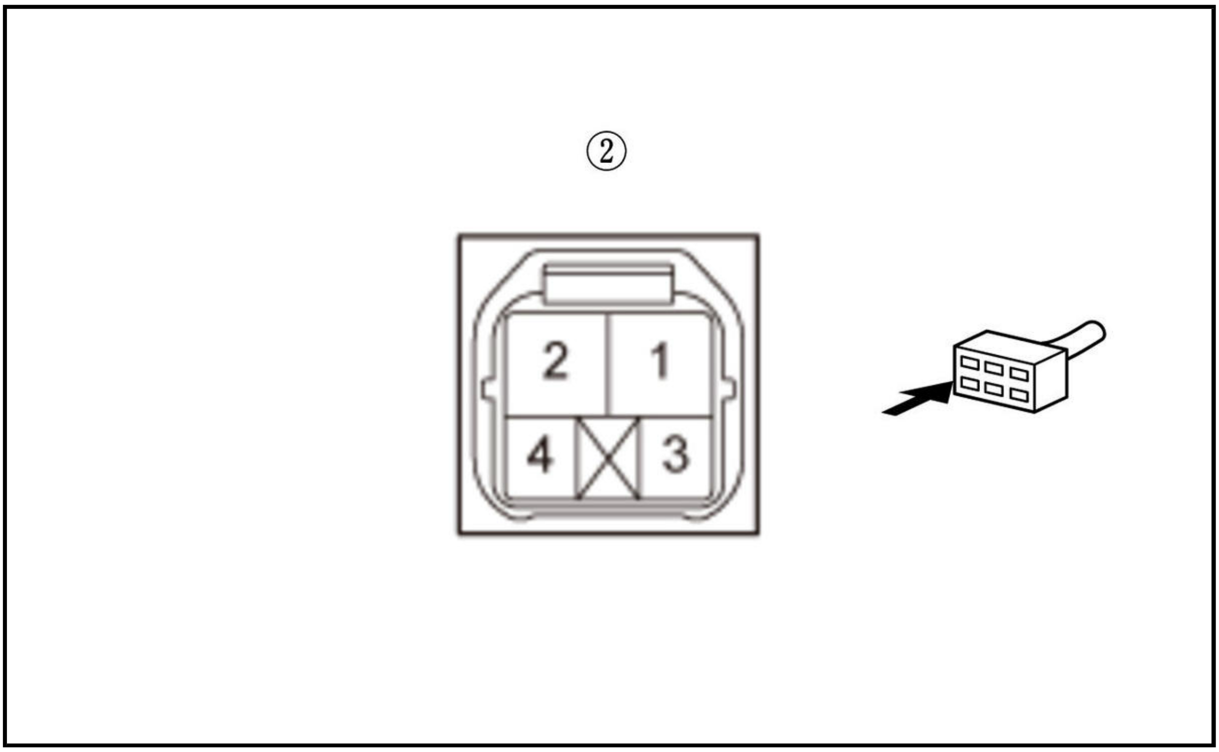
-3. Turn the vehicle to the ON mode.

-4. On the sensor side, measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate wheel speed sensor 2P connector (front): disconnected
B	Appropriate wheel speed sensor 4P connector (rear): disconnected
Test circuit 1	B
Test point 1	Appropriate wheel speed sensor 2P connector (male terminals) No. 1: ①
B	Appropriate wheel speed sensor 4P connector (male terminals) No. 3: ②
Test point 2	Body ground

Test circuit 2	B
Test point 1	Appropriate wheel speed sensor 2P connector (male terminals) No. 2: ①
B	Appropriate wheel speed sensor 4P connector (male terminals) No. 4: ②
Test point 2	Body ground





Is there 1 V or more?

YES

Replace the appropriate wheel speed sensor .

NO

Repair a short to power in the wire between the VSA modulator-control unit and the appropriate wheel speed sensor.

6. Shorted wire check (Wheel speed sensor lines wire to wire)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Appropriate wheel speed sensor 2P connector (front)
Appropriate wheel speed sensor 4P connector (rear)

-3. Check for continuity between the appropriate VSA modulator-control unit 46P connector wheel speed sensor +B and GND terminals (see table).

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate wheel speed sensor 2P connector (front): disconnected
B	Appropriate wheel speed sensor 4P connector (rear): disconnected

Connector	DTC	Test point 1	Test point 2
VSA modulator-control unit 46P connector	C0031-14Left-front	No. 33	No. 42
	C0034-14Right-front	No. 30	No. 35
	C0037-14Left-rear	No. 17	No. 32
	C003A-14Right-rear	No. 31	No. 15

Is there continuity?

YES

Repair a short in the wires between the VSA modulator-control unit and the appropriate wheel speed sensor.

NO

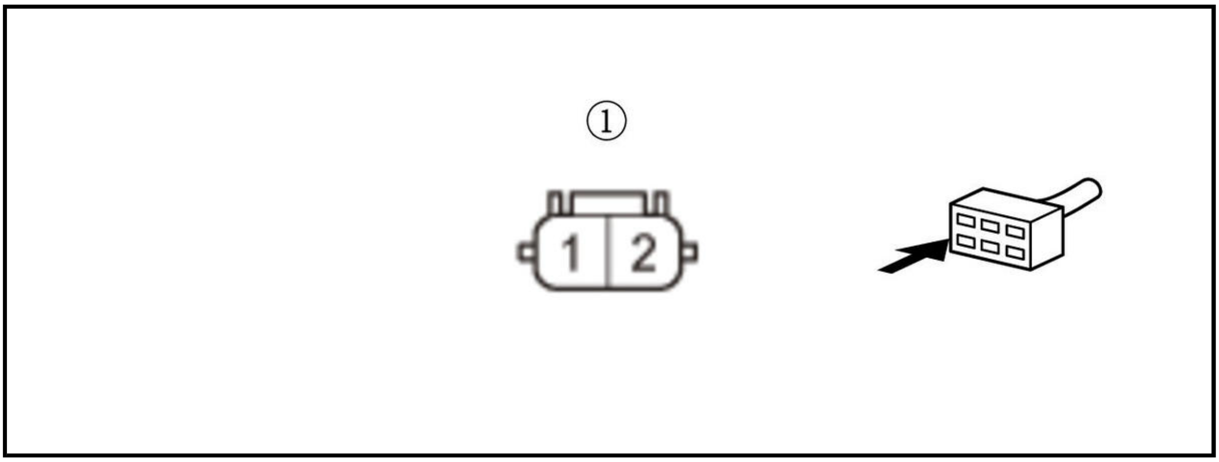
The wheel speed sensor wires are not shorted in the wires. Go to step 7.

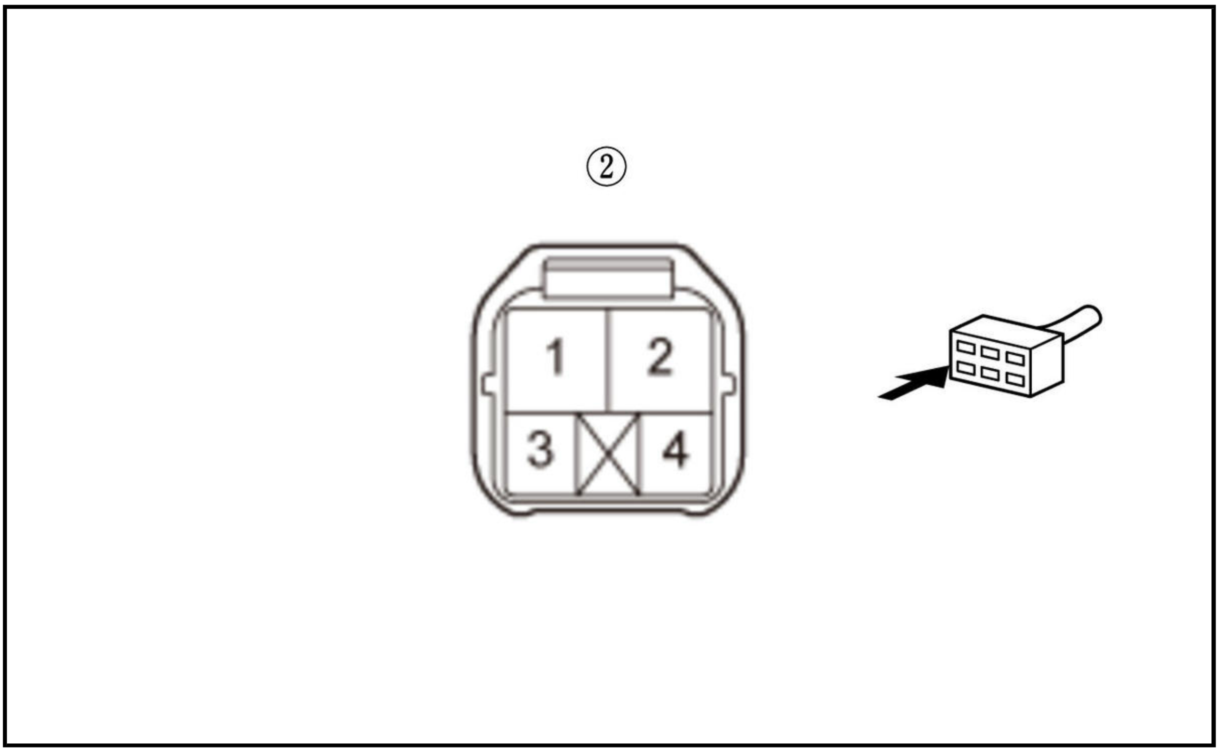
7. Open wire check (Wheel speed sensor lines) 1

-1. Check for continuity between the appropriate VSA modulator-control unit 46P connector terminal and the appropriate wheel speed sensor connector terminal (see table).

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate wheel speed sensor 2P connector (front): disconnected
B	Appropriate wheel speed sensor 4P connector (rear): disconnected

DTC	**VSA modulator-control unit 46P connector**	**Appropriate Wheel Speed Sensor Connector Terminal**
C0031-14Left-front	No. 33	Left-front wheel speed sensor 2P connector (female terminals) No. 1: ①
C0034-14Right-front	No. 30	Right-front wheel speed sensor 2P connector (female terminals) No. 1: ①
C0037-14Left-rear	No. 17	Left-rear wheel speed sensor 4P connector (female terminals) No. 3: ②
C003A-14Right-rear	No. 31	Right-rear wheel speed sensor 4P connector (female terminals) No. 3: ②





Is there continuity?

YES

Go to step 8.

NO

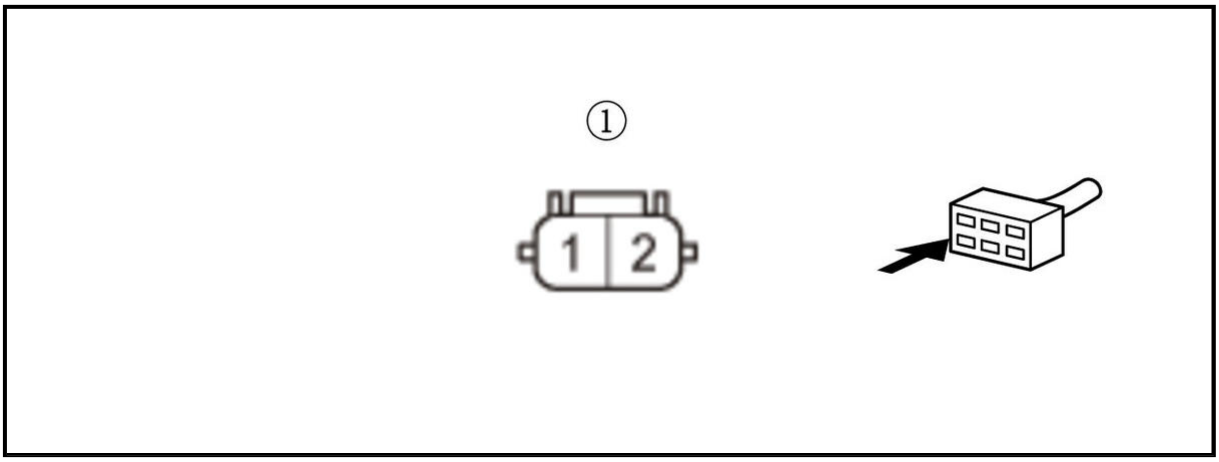
Repair an open in the wire between the VSA modulator-control unit and the appropriate wheel speed sensor.

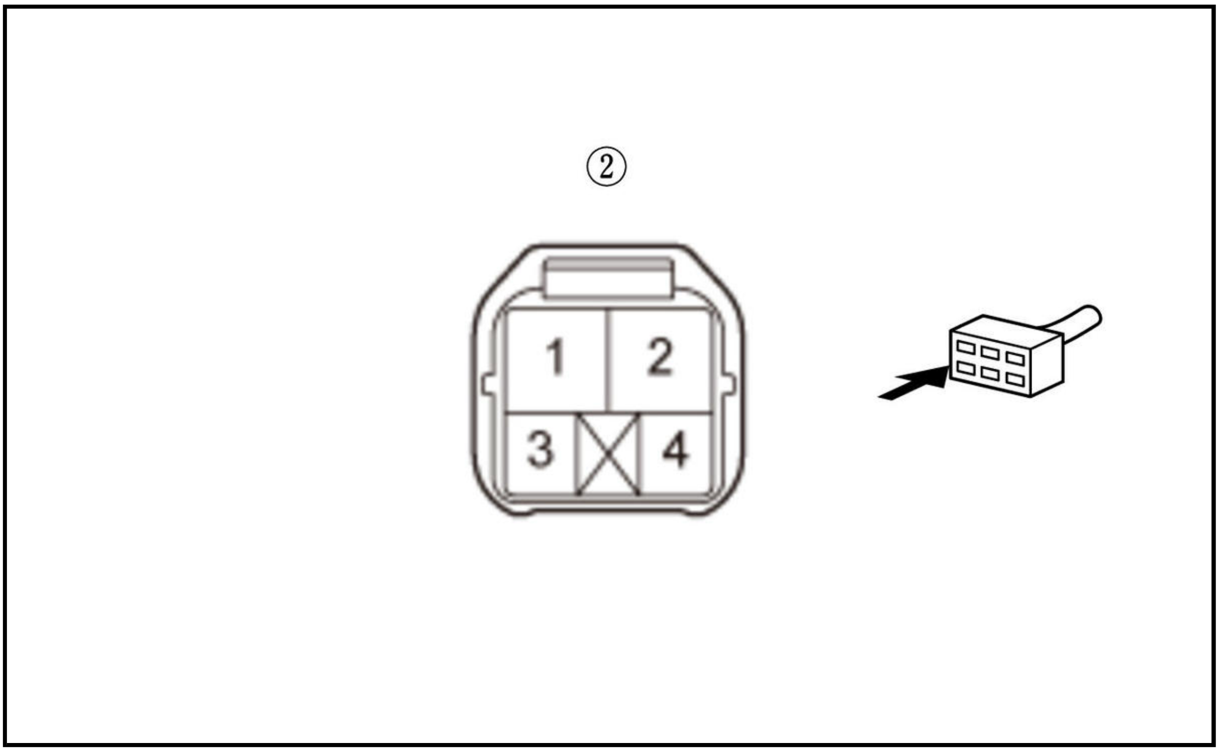
8. Open wire check (Wheel speed sensor lines) 2

-1. Check for continuity between the appropriate VSA modulator-control unit 46P connector terminal and the appropriate wheel speed sensor connector terminal (see table).

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate wheel speed sensor 2P connector (front): disconnected
B	Appropriate wheel speed sensor 4P connector (rear): disconnected

DTC	**VSA modulator-control unit 46P connector**	**Appropriate Wheel Speed Sensor Connector Terminal**
C0031-14Left-front	No. 42	Left-front wheel speed sensor 2P connector (female terminals) No. 2: ①
C0034-14Right-front	No. 35	Right-front wheel speed sensor 2P connector (female terminals) No. 2: ①
C0037-14Left-rear	No. 32	Left-rear wheel speed sensor 4P connector (female terminals) No. 4: ②
C003A-14Right-rear	No. 15	Right-rear wheel speed sensor 4P connector (female terminals) No. 4: ②





Is there continuity?

YES

The wheel speed sensor wires are OK. Go to step 9.

NO

Repair an open in the wire between the VSA modulator-control unit and the appropriate wheel speed sensor.

9. Wheel speed sensor (s) check

-1. **Substitute a known-good wheel speed sensor** .

DTC	Appropriate Wheel Speed Sensor
C0031-14	Left-front
C0034-14	Right-front
C0037-14	Left-rear
C003A-14	Right-rear

-2. Reconnect the following connectors.

VSA modulator-control unit 46P connector
Appropriate wheel speed sensor 2P connector (front)
Appropriate wheel speed sensor 4P connector (rear)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Is DTC C0031-14, C0034-14, C0037-14, or C003A-14 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original wheel speed sensor .

DTC C0031-3A, C0034-3A, C0037-3A, C003A-3A

DTC C0031-3A : Wheel Speed Sensor (Left Front) Signal Failure (Signal Frequency is Too High)**DTC C0034-3A** : Wheel Speed Sensor (Right Front) Signal Failure (Signal Frequency is Too High)**DTC C0037-3A** : Wheel Speed Sensor (Left Rear) Signal Failure (Signal Frequency is Too High)**DTC C003A-3A** : Wheel Speed Sensor (Right Rear) Signal Failure (Signal Frequency is Too High)

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- If the ABS and other indicators come on because of electrical noise, the indicators will go off when you test-drive the vehicle speed at 9 mph (15 km/h) or more and the noise is gone.

DTC Description	DTC	Freeze Frame
C0031-3A Wheel Speed Sensor (Left Front) Signal Failure (Signal Frequency is Too High)	B	B
C0034-3A Wheel Speed Sensor (Right Front) Signal Failure (Signal Frequency is Too High)	B	B
C0037-3A Wheel Speed Sensor (Left Rear) Signal Failure (Signal Frequency is Too High)	B	B
C003A-3A Wheel Speed Sensor (Right Rear) Signal Failure (Signal Frequency is Too High)	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Test-drive the vehicle for 80 seconds or more.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0031-3A Wheel Speed Sensor (Left Front) Signal Failure (Signal Frequency is Too High)	B	B
C0034-3A Wheel Speed Sensor (Right Front) Signal Failure (Signal Frequency is Too High)	B	B
C0037-3A Wheel Speed Sensor (Left Rear) Signal Failure (Signal Frequency is Too High)	B	B
C003A-3A Wheel Speed Sensor (Right Rear) Signal Failure (Signal Frequency is Too High)	B	B

Is DTC C0031-3A, C0034-3A, C0037-3A, or C003A-3A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Wheel speed sensor installation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check that the appropriate wheel speed sensor is properly mounted** .

DTC	Appropriate Wheel Speed Sensor
C0031-3A	Left-front
C0034-3A	Right-front
C0037-3A	Left-rear
C003A-3A	Right-rear

Is the wheel speed sensor installation OK?

YES

Go to step 3.

NO

Reinstall the wheel speed sensor , and recheck its mounting position, then go to step 1.

3. Wheel speed sensor check

-1. **Substitute a known-good wheel speed sensor** .

DTC	Appropriate Wheel Speed Sensor
C0031-3A	Left-front

DTC	Appropriate Wheel Speed Sensor
C0034-3A	Right-front
C0037-3A	Left-rear
C003A-3A	Right-rear

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-5. Test-drive the vehicle for 80 seconds or more.

NOTE: Drive the vehicle on the road, not on a lift.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0031-3A Wheel Speed Sensor (Left Front) Signal Failure (Signal Frequency is Too High)	B	B
C0034-3A Wheel Speed Sensor (Right Front) Signal Failure (Signal Frequency is Too High)	B	B
C0037-3A Wheel Speed Sensor (Left Rear) Signal Failure (Signal Frequency is Too High)	B	B
C003A-3A Wheel Speed Sensor (Right Rear) Signal Failure (Signal Frequency is Too High)	B	B

Is DTC C0031-3A, C0034-3A, C0037-3A, or C003A-3A indicated?

YES

Go to step 4.

NO

Replace the original wheel speed sensor .

4. Magnetic encoder check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the appropriate magnetic encoder for damage, debris, and correct installation.

DTC	Appropriate Magnetic Encoder	Note
C0031-3A	Left-front	**Remove the driveshaft outboard joint from the appropriate wheel hub** .
C0034-3A	Right-front	
C0037-3A	Left-rear	**Remove the hub bearing unit** .
C003A-3A	Right-rear	

Is the magnetic encoder surface OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Clean the debris from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit. If the debris cannot be removed or the encoder is damaged, replace the appropriate wheel bearing or the hub bearing unit .

DTC C0031-62, C0034-62, C0037-62, C003A-62 (VSA CONTROL UNIT)

DTC C0031-62 : Left Front Wheel Speed Sensor Signal Compare Failure **DTC C0034-62** : Right Front Wheel Speed Sensor Signal Compare Failure **DTC C0037-62** : Left Rear Wheel Speed Sensor Signal Compare Failure **DTC C003A-62** : Right Rear Wheel Speed Sensor Signal Compare Failure

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
C0031-62 Left Front Wheel Speed Sensor Signal Compare Failure	B	B
C0034-62 Right Front Wheel Speed Sensor Signal Compare Failure	B	B
C0037-62 Left Rear Wheel Speed Sensor Signal Compare Failure	B	B
C003A-62 Right Rear Wheel Speed Sensor Signal Compare Failure	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Test-drive the vehicle at 31 mph (50 km/h) or more.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0031-62 Left Front Wheel Speed Sensor Signal Compare Failure	B	B
C0034-62 Right Front Wheel Speed Sensor Signal Compare Failure	B	B
C0037-62 Left Rear Wheel Speed Sensor Signal Compare Failure	B	B
C003A-62 Right Rear Wheel Speed Sensor Signal Compare Failure	B	B

Is DTC C0031-62, C0034-62, C0037-62, or C003A-62 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same

conditions with the freeze data/on-board snapshot.

2. Wheel speed sensor installation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check that the appropriate wheel speed sensor is properly mounted** .

DTC	Appropriate Wheel Speed Sensor
C0031-62	Left-front
C0034-62	Right-front
C0037-62	Left-rear
C003A-62	Right-rear

Is the wheel speed sensor installation OK?

YES

Go to step 3.

NO

Reinstall the wheel speed sensor , and recheck the mounting position, then go to step 1.

3. Wheel speed sensor check

-1. **Substitute a known-good wheel speed sensor** .

DTC	Appropriate Wheel Speed Sensor
C0031-62	Left-front
C0034-62	Right-front
C0037-62	Left-rear
C003A-62	Right-rear

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-5. Test-drive the vehicle at 31 mph (50 km/h) or more.

NOTE: Drive the vehicle on the road, not on a lift.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0031-62 Left Front Wheel Speed Sensor Signal Compare Failure	B	B
C0034-62 Right Front Wheel Speed Sensor Signal Compare Failure	B	B
C0037-62 Left Rear Wheel Speed Sensor Signal Compare Failure	B	B
C003A-62 Right Rear Wheel Speed Sensor Signal Compare Failure	B	B

Is DTC C0031-62, C0034-62, C0037-62, or C003A-62 indicated?

YES

Go to step 4.

NO

Replace the original wheel speed sensor .

4. Magnetic encoder check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the appropriate magnetic encoder for damage, debris, and correct installation.

DTC	Appropriate Magnetic Encoder	Note
C0031-62	Left-front	**Remove the driveshaft outboard joint from the appropriate wheel hub** .
C0034-62	Right-front	
C0037-62	Left-rear	**Remove the hub bearing unit** .
C003A-62	Right-rear	

Is the magnetic encoder surface OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Clean the debris from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit. If the debris cannot be removed or the encoder is damaged, replace the appropriate **wheel bearing** or the **hub bearing unit** .

DTC C0040-12 (2017 2018 2019)

DTC C0040-12 : Brake Light Switch Failure (Stuck ON)/Brake Pedal Stroke Sensor Stuck (EBB)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C0040-12 Brake Light Switch Failure (Stuck ON)/Brake Pedal Stroke Sensor Stuck (EBB)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Test-drive the vehicle under these conditions:

- Vehicle speed at 9 mph (15 km/h) or more for at least 60 seconds
- Accelerator pedal pressed
- Brake pedal released

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0040-12 Brake Light Switch Failure (Stuck ON)/Brake Pedal Stroke Sensor Stuck (EBB)	B

Is DTC C0040-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric brake booster system DTC check

-1. Check for electric brake booster system DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C01-96 Brake Pedal Stroke Sensor Component Internal Failure	B	B
C1C02-12 Brake Pedal Stroke Sensor Signal Circuit 1 Short To Battery	B	B
C1C02-14 Brake Pedal Stroke Sensor Signal Circuit 1 Short To Ground or Open	B	B
C1C03-11 Brake Pedal Stroke Sensor Signal Circuit 2 Short To Ground	B	B
C1C03-15 Brake Pedal Stroke Sensor Signal Circuit 2 Short To Battery or Open	B	B
C1C04-11 Brake Pedal Stroke Sensor Power Circuit Short To Ground or Battery	B	B

Is DTC indicated?

YES

Go to indicated DTCs troubleshooting.

NO

Go to step 3.

3. Brake pedal/brake pedal position switch and electric brake booster check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Inspect the brake pedal and brake pedal position switch** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-6. Test-drive the vehicle under these conditions:

- Vehicle speed at 9 mph (15 km/h) or more for at least 60 seconds
- Accelerator pedal pressed
- Brake pedal released

NOTE: Drive the vehicle on the road, not on a lift.

-7. Check for DTCs with the HDS.

DTC Description	DTC
C0040-12 Brake Light Switch Failure (Stuck ON)/Brake Pedal Stroke Sensor Stuck (EBB)	B

Is DTC C0040-12 indicated?

YES

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Troubleshooting is complete.

DTC C0040-16 (2017 2018 2019)

DTC C0040-16 : Plausibility BLS vs. Pressure Sensor

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C0040-16 Plausibility BLS vs. Pressure Sensor	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Wait 1 second or more without pressing the brake pedal.

-5. Press the brake pedal hard for 1 second or more.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0040-16 Plausibility BLS vs. Pressure Sensor	B	B

Is DTC C0040-16 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric brake booster system DTC check

-1. Check for electric brake booster system DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C01-96 Brake Pedal Stroke Sensor Component Internal Failure	B	B
C1C02-12 Brake Pedal Stroke Sensor Signal Circuit 1 Short To Battery	B	B
C1C02-14 Brake Pedal Stroke Sensor Signal Circuit 1 Short To Ground or Open	B	B
C1C03-11 Brake Pedal Stroke Sensor Signal Circuit 2 Short To Ground	B	B
C1C03-15 Brake Pedal Stroke Sensor Signal Circuit 2 Short To Battery or Open	B	B
C1C04-11 Brake Pedal Stroke Sensor Power Circuit Short To Ground or Battery	B	B

Is DTC indicated?

YES

Go to indicated DTCs troubleshooting.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0044-49

DTC C0044-49 : Master Cylinder Pressure Sensor Failure (Internal Circuit Failure)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C0044-49 Master Cylinder Pressure Sensor Failure (Internal Circuit Failure)	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0044-49 Master Cylinder Pressure Sensor Failure (Internal Circuit Failure)	B	B

Is DTC C0044-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0044-62

DTC C0044-62 : Master Cylinder Pressure Sensor Failure (Signal Stuck)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C0044-62 Master Cylinder Pressure Sensor Failure (Signal Stuck)	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

Test-drive the vehicle under these conditions:

- Vehicle speed at less than 9 mph (14 km/h) for at least 30 seconds
- Brake pedal released

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0044-62 Master Cylinder Pressure Sensor Failure (Signal Stuck)	B	B

Is DTC C0044-62 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0049-7B

DTC C0049-7B : Brake Fluid Level Too Low

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- Bleeding the brake system while turn the vehicle to the ON mode can cause this DTC.

DTC Description	DTC	Freeze Frame
C0049-7B Brake Fluid Level Too Low	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait 60 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0049-7B Brake Fluid Level Too Low	B	B

   Is DTC C0049-7B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Brake fluid level check

   -1. Check the brake fluid level in the master cylinder reservoir.

   Is the brake fluid level OK?

   YES

   Go to step 3.

   NO

Check for worn brake pads or brake fluid leaks.

- **Inspect the brake lines and hoses for leaks** , and repair as needed.
- **Inspect the front brake pads** and replace worn out brake pads.
- **Inspect the rear brake pads** and replace worn out brake pads.
- Add brake fluid and recheck.

3. Gauge control module check 1

-1. Release the parking brake.

-2. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-3. Check the brake system indicator (red) in the gauge control module.

Does the indicator come on, then go off?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Go to step 4.

4. Gauge control module check 2

-1. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
BRAKE FLUID LEVEL	B	B

Does the HDS indicate ENOUGH?

YES

Replace the gauge control module .

NO

Go to step 5.

5. Brake fluid level switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Brake fluid level switch 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
BRAKE FLUID LEVEL	B	B

Does the HDS indicate ENOUGH?

YES

Replace the brake fluid reservoir (brake fluid level switch is included) .

NO

Go to step 6.

6. Shorted wire check (BRAKE LEVEL SW line)

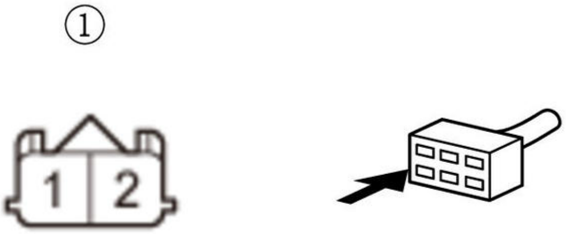
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake fluid level switch 2P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	Brake fluid level switch 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to body ground in the wire between the gauge control module and the brake fluid level switch.

NO

The BRAKE LEVEL SW wire is OK. **Replace the gauge control module** .

DTC C0051-54 (VSA CONTROL UNIT)

DTC C0051-54 : Steering Angle Neutral Position Learning Incomplete

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C0051-54 Steering Angle Neutral Position Learning Incomplete	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0051-54 Steering Angle Neutral Position Learning Incomplete	B	B

   Is DTC C0051-54 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (EPS control unit)

   -1. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Is DTC indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Go to step 3.

3. VSA modulator-control unit check (VSA sensor neutral position memorization)

-1. **Do the VSA sensor neutral position memorization** .

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0051-54 Steering Angle Neutral Position Learning Incomplete	B	B

Is DTC C0051-54 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Troubleshooting is complete.

DTC C0051-62, C0051-96

DTC C0051-62 : Steering Angle Sensor Failure (Signal Compare Failure)**DTC C0051-96** : Steering Angle Sensor Failure (Sensor Detects Internal Failure)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C0051-62 Steering Angle Sensor Failure (Signal Compare Failure)	B	B
C0051-96 Steering Angle Sensor Failure (Sensor Detects Internal Failure)	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Test-drive the vehicle under these conditions:

- Vehicle speed at 45 mph (72 km/h) or more
- Change lanes for a few times

NOTE:

- Drive the vehicle on the road, not on a lift.
- Be careful of the surrounding traffic conditions.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0051-62 Steering Angle Sensor Failure (Signal Compare Failure)	B	B
C0051-96 Steering Angle Sensor Failure (Sensor Detects Internal Failure)	B	B

Is DTC C0051-62 or C0051-96 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (EPS control unit)

-1. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Is DTC indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

DTC C0061-49, C0062-49, C0063-49

DTC C0061-49 : Acceleration Sensor Malfunction **DTC C0062-49** : Longitudinal Acceleration Sensor Malfunction **DTC C0063-49** : Yaw Rate Sensor Malfunction

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- The yaw rate-acceleration sensor is built into the SRS unit.
- Before troubleshooting, check the SRS unit for proper mounting. If not properly installed the VSA modulator-control unit may set these codes.

DTC Description	DTC	Freeze Frame
C0061-49 Acceleration Sensor Malfunction	B	B
C0062-49 Longitudinal Acceleration Sensor Malfunction	B	B
C0063-49 Yaw Rate Sensor Malfunction	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0061-49 Acceleration Sensor Malfunction	B	B
C0062-49 Longitudinal Acceleration Sensor Malfunction	B	B
C0063-49 Yaw Rate Sensor Malfunction	B	B

Is DTC C0061-49, C0062-49, or C0063-49 indicated?

YES

The failure is duplicated. **Replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0061-54, C0062-54, C0063-54

DTC C0061-54 : Lateral Acceleration Sensor Calibration Incomplete **DTC C0062-54** : Longitudinal Acceleration Sensor Calibration Incomplete **DTC C0063-54** : Yaw Rate Sensor Calibration Incomplete

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C0061-54 Lateral Acceleration Sensor Calibration Incomplete	B	B
C0062-54 Longitudinal Acceleration Sensor Calibration Incomplete	B	B
C0063-54 Yaw Rate Sensor Calibration Incomplete	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0061-54 Lateral Acceleration Sensor Calibration Incomplete	B	B
C0062-54 Longitudinal Acceleration Sensor Calibration	B	B

DTC Description	DTC	Freeze Frame
Incomplete		

DTC Description	DTC	Freeze Frame
C0063-54 Yaw Rate Sensor Calibration Incomplete	B	B

Is DTC C0061-54, C0062-54, or C0063-54 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (SRS unit)

-1. Check for DTCs with the HDS.

DTC Description	DTC
B	B

Is DTC indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. VSA modulator-control unit check (VSA sensor neutral position memorization)

-1. **Do the VSA sensor neutral position memorization** .

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0061-54 Lateral Acceleration Sensor Calibration Incomplete	B	B
C0062-54 Longitudinal Acceleration Sensor Calibration Incomplete	B	B
C0063-54 Yaw Rate Sensor Calibration Incomplete	B	B

Is DTC C0061-54, C0062-54, or C0063-54 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Troubleshooting is complete.

DTC C0061-62, C0062-62, C0063-62

DTC C0061-62 : Lateral Acceleration Sensor Failure (Signal Compare Failure)**DTC C0062-62** : Longitudinal Acceleration Sensor Failure (Signal Compare Failure)**DTC C0063-62** : Yaw Rate Sensor Failure (Signal Compare Failure)

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- The yaw rate-acceleration sensor is built into the SRS unit.
- Before troubleshooting, check the SRS unit for proper mounting. If not properly installed the VSA modulator-control unit may set these codes.

DTC Description	DTC	Freeze Frame
C0061-62 Lateral Acceleration Sensor Failure (Signal Compare Failure)	B	B
C0062-62 Longitudinal Acceleration Sensor Failure (Signal Compare Failure)	B	B
C0063-62 Yaw Rate Sensor Failure (Signal Compare Failure)	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Test-drive the vehicle under these conditions:

- Vehicle speed at 31 mph (50 km/h) or more for at least 20 seconds
- Brake pedal released
- Change lanes for a few times

NOTE:

- Drive the vehicle on the road, not on a lift.
- Be careful of the surrounding traffic conditions.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0061-62 Lateral Acceleration Sensor Failure (Signal Compare Failure)	B	B
C0062-62 Longitudinal Acceleration Sensor Failure (Signal Compare Failure)	B	B
C0063-62 Yaw Rate Sensor Failure (Signal Compare Failure)	B	B

Is DTC C0061-62, C0062-62, or C0063-62 indicated?

YES

The failure is duplicated. Replace the SRS unit .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1000-94

DTC C1000-94 : ABS/VSA Activation Time Too Long

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- A wheel bearing that is installed backwards can cause this DTC.

DTC Description	DTC	Freeze Frame
C1000-94 ABS/VSA Activation Time Too Long	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Test-drive the vehicle under these conditions:

   - Vehicle speed at 31 mph (50 km/h) or more for at least 60 seconds
   - Brake pedal released

   NOTE: Drive the vehicle on the road, not on a lift.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1000-94 ABS/VSA Activation Time Too Long	B	B

   Is DTC C1000-94 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Tire check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check all four tires for size, inflation, and wear .

Are all four tires the correct size, properly inflated, and worn evenly?

YES

Go to step 3.

NO

Swap the wheels and tires with a known-good set (the correct size, type, and properly inflated), then retest-drive the vehicle.

3. Wheel speed sensor performance check

-1. Test-drive the vehicle at 31 mph (50 km/h) or more in a straight line.

NOTE: Drive the vehicle on the road, not on a lift.

-2. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
RIGHT FRONT WHEEL SPEED	B	B
LEFT FRONT WHEEL SPEED	B	B
RIGHT REAR WHEEL SPEED	B	B
LEFT REAR WHEEL SPEED	B	B

Is any one of the four values different?

YES

Go to step 4.

NO

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

4. Wheel speed sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good wheel speed sensor** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-6. Test-drive the vehicle under these conditions:

- Vehicle speed at 31 mph (50 km/h) or more for at least 60 seconds
- Brake pedal released

NOTE: Drive the vehicle on the road, not on a lift.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1000-94 ABS/VSA Activation Time Too Long	B	B

Is DTC C1000-94 indicated?

YES

Go to step 5.

NO

Replace the original wheel speed sensor .

5. Magnetic encoder check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the magnetic encoder for damage, debris, and correct installation.

Appropriate Magnetic Encoder	Note
Left-front	**Remove the driveshaft outboard joint from the appropriate wheel hub** .
Right-front	
Left-rear	**Remove the hub bearing unit** .
Right-rear	

Is the magnetic encoder surface OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Clean the debris from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit. If the debris cannot be removed or the encoder is damaged, replace the appropriate **wheel bearing** or the **hub bearing unit** .

DTC C1020-49, C1021-49

DTC C1020-49 : VSA Master Cut Valve Failure (Unexpected Operation)**DTC C1021-49** : VSA Suction Valve Failure (Unexpected Operation)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1020-49 VSA Master Cut Valve Failure (Unexpected Operation)	B	B
C1021-49 VSA Suction Valve Failure (Unexpected Operation)	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Wait 20 seconds or more.

-5. Test-drive the vehicle at 9 mph (15 km/h) or more.

NOTE: Drive the vehicle on the road, not on a lift.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1020-49 VSA Master Cut Valve Failure (Unexpected Operation)	B	B
C1021-49 VSA Suction Valve Failure (Unexpected Operation)	B	B

Is DTC C1020-49 or C1021-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1040-00 (VSA CONTROL UNIT)

DTC C1040-00 : Different Diameter Tire is Detected

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1040-00 Different Diameter Tire is Detected	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1040-00 Different Diameter Tire is Detected	B	B

Is DTC C1040-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Tire check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check all four tires for size, inflation, and wear** .

Are all four tires the correct size, properly inflated, and worn evenly?

YES

Go to step 3.

NO

Swap the wheels and tires with a known-good set (the correct size, type, and properly inflated), then retest-drive the vehicle.

3. Wheel speed sensor performance check

-1. Test-drive the vehicle at 12 mph (20 km/h) or more in a straight line.

NOTE: Drive the vehicle on the road, not on a lift.

-2. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	Unit
RIGHT FRONT WHEEL SPEED	B	B
LEFT FRONT WHEEL SPEED	B	B
RIGHT REAR WHEEL SPEED	B	B
LEFT REAR WHEEL SPEED	B	B

Is any one of the four values different?

YES

Go to step 4.

NO

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

4. Wheel speed sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good wheel speed sensor** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-6. Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds.

NOTE: Drive the vehicle on the road, not on a lift.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1040-00 Different Diameter Tire is Detected	B	B

Is DTC C1040-00 indicated?

YES

Go to step 5.

NO

Replace the original wheel speed sensor .

5. Magnetic encoder check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the magnetic encoder for damage, debris, and correct installation.

Appropriate Magnetic Encoder	Note
Left-front	**Remove the driveshaft outboard joint from the appropriate wheel hub** .
Right-front	
Left-rear	**Remove the hub bearing unit** .
Right-rear	

Is the magnetic encoder surface OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Clean the debris from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit. If the debris cannot be removed or the encoder is damaged, replace the appropriate **wheel bearing** or the **hub bearing unit** .

DTC C1041-00, C1042-00, C1043-00, C1044-00

DTC C1041-00 : Right Front Wheel Abnormal Slip Detection **DTC C1042-00** : Left Front Wheel Abnormal Slip Detection **DTC C1043-00** : Right Rear Wheel Abnormal Slip Detection **DTC C1044-00** : Left Rear Wheel Abnormal Slip Detection

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1041-00 Right Front Wheel Abnormal Slip Detection	B	B
C1042-00 Left Front Wheel Abnormal Slip Detection	B	B
C1043-00 Right Rear Wheel Abnormal Slip Detection	B	B
C1044-00 Left Rear Wheel Abnormal Slip Detection	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds.

   NOTE: Drive the vehicle on the road, not on a lift.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1041-00 Right Front Wheel Abnormal Slip Detection	B	B
C1042-00 Left Front Wheel Abnormal Slip Detection	B	B
C1043-00 Right Rear Wheel Abnormal Slip Detection	B	B
C1044-00 Left Rear Wheel Abnormal Slip Detection	B	B

   Is DTC C1041-00, C1042-00, C1043-00, or C1044-00 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Tire check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Check all four tires for size, inflation, and wear** .

   Are all four tires the correct size, properly inflated, and worn evenly?

   YES

   Go to step 3.

   NO

   Swap the wheels and tires with a known-good set (the correct size, type, and properly inflated), then retest-drive the vehicle.

3. Wheel speed sensor performance check

-1. Test-drive the vehicle at 12 mph (20 km/h) or more in a straight line.

NOTE: Drive the vehicle on the road, not on a lift.

-2. Check the parameter (s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
RIGHT FRONT WHEEL SPEED	B	B
LEFT FRONT WHEEL SPEED	B	B
RIGHT REAR WHEEL SPEED	B	B
LEFT REAR WHEEL SPEED	B	B

Is any one of the four values different?

YES

Go to step 4.

NO

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

4. Wheel speed sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good wheel speed sensor** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-6. Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds.

NOTE: Drive the vehicle on the road, not on a lift.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1041-00 Right Front Wheel Abnormal Slip Detection	B	B
C1042-00 Left Front Wheel Abnormal Slip Detection	B	B
C1043-00 Right Rear Wheel Abnormal Slip Detection	B	B
C1044-00 Left Rear Wheel Abnormal Slip Detection	B	B

Is DTC C1041-00, C1042-00, C1043-00, or C1044-00 indicated?

YES

Go to step 5.

NO

Replace the original wheel speed sensor .

5. Magnetic encoder check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Inspect the magnetic encoder for damage, debris, and correct installation.

Appropriate Magnetic Encoder	Note
Left-front	**Remove the driveshaft outboard joint from the appropriate wheel hub** .
Right-front	
Left-rear	**Remove the hub bearing unit** .
Right-rear	

Is the magnetic encoder surface OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Clean the debris from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit. If the debris cannot be removed or the encoder is damaged, replace the appropriate **wheel bearing** or the **hub bearing unit** .

DTC C1100-48

DTC C1100-48 : Electric Parking Brake Abnormal Operation Monitoring

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1100-48 Electric Parking Brake Abnormal Operation Monitoring	B	B

DTC (VSA)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait 30 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Is DTC C1100-48 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Go to indicated DTC's troubleshooting.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1100-54

DTC C1100-54 : Piston Position Not Learned

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
C1100-54 Piston Position Not Learned	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1100-54 Piston Position Not Learned	B	B

   Is DTC C1100-54 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Piston position learn operation check

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -3. Apply and release the parking brake several times.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1100-54 Piston Position Not Learned	B	B

Is DTC C1100-54 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Troubleshooting is complete.

DTC C1100-94

DTC C1100-94 : Electric Parking Brake Actuator Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
C1100-94 Electric Parking Brake Actuator Malfunction	B	B

DTC (VSA)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Apply and release the parking brake several times.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Is DTC C1100-94 indicated?

   YES

   The failure is duplicated. Go to step 2.

   YES

   If DTC C1110-11, C1110-13, C1110-79, C1110-94, C1110-96, C1111-11, C1111-13, C1111-79, C1111-94, or C1111-96 is also indicated, go to indicated DTCs troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric parking brake actuator check (Left side)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good left electric parking brake actuator** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Apply and release the parking brake several times.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1100-94 Electric Parking Brake Actuator Malfunction	B	B

Is DTC C1100-94 indicated?

YES

Go to step 3.

NO

Replace the original left electric parking brake actuator .

3. Electric parking brake actuator check (Right side)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Reinstall the original left electric parking brake actuator** .

-3. **Substitute a known-good right electric parking brake actuator** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-7. Apply and release the parking brake several times.

-8. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1100-94 Electric Parking Brake Actuator Malfunction	B	B

Is DTC C1100-94 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original right electric parking brake actuator .

DTC C1100-98

DTC C1100-98 : Electric Parking Brake Continuous Operations Detected

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- This DTC is set when repeated use of the electric parking brake function causes electric parking brake actuator overheating. The code can be cleared with the HDS once the electric parking brake actuator has cooled.

DTC Description	DTC	Freeze Frame
C1100-98 Electric Parking Brake Continuous Operations Detected	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then wait for 5 minutes or more.

   -4. Turn the vehicle to the ON mode.

   -5. Apply and release the parking brake several times.

   -6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1100-98 Electric Parking Brake Continuous Operations Detected	B	B

   Is DTC C1100-98 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric parking brake actuator check (Left side)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Substitute a known-good left electric parking brake actuator** .

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode, then wait for 5 minutes or more.

-6. Turn the vehicle to the ON mode.

-7. Apply and release the parking brake several times.

-8. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1100-98 Electric Parking Brake Continuous Operations Detected	B	B

Is DTC C1100-98 indicated?

YES

Go to step 3.

NO

Replace the original left electric parking brake actuator .

3. Electric parking brake actuator check (Right side)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Reinstall the original left electric parking brake actuator** .

-3. **Substitute a known-good right electric parking brake actuator** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode, then wait for 5 minutes or more.

-7. Turn the vehicle to the ON mode.

-8. Apply and release the parking brake several times.

-9. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1100-98 Electric Parking Brake Continuous Operations Detected	B	B

Is DTC C1100-98 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original right electric parking brake actuator .

DTC C1110-11, C1111-11

DTC C1110-11 : Left Rear Electric Parking Brake Actuator Circuit Short to Ground **DTC C1111-11** : Right Rear Electric Parking Brake Actuator Circuit Short to Ground

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1110-11 Left Rear Electric Parking Brake Actuator Circuit Short to Ground	B	B
C1111-11 Right Rear Electric Parking Brake Actuator Circuit Short to Ground	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Apply and release the parking brake several times.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1110-11 Left Rear Electric Parking Brake Actuator Circuit Short to Ground	B	B
C1111-11 Right Rear Electric Parking Brake Actuator Circuit Short to Ground	B	B

   Is DTC C1110-11 or C1111-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (EPB L ACT+, EPB R ACT+ lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
Appropriate electric parking brake actuator 4P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate electric parking brake actuator 4P connector: disconnected

DTC	Test point 1	Test point 2
C1110-11	**VSA modulator-control unit 46P connector No. 8**	Body ground

DTC	Test point 1	Test point 2
C1111-11	**VSA modulator-control unit 46P connector No. 5**	Body ground

Is there continuity?

YES

Repair a short to body ground in the wires between the VSA modulator-control unit and the appropriate electric parking brake actuator.

NO

The EPB L ACT+ and EPB R ACT+ wires are OK. Go to step 3.

3. Shorted wire check (EPB L ACT-, EPB R ACT- lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate electric parking brake actuator 4P connector: disconnected

DTC	Test point 1	Test point 2
C1110-11	**VSA modulator-control unit 46P connector No. 7**	Body ground
C1111-11	**VSA modulator-control unit 46P connector No. 6**	Body ground

Is there continuity?

YES

Repair a short to body ground in the wires between the VSA modulator-control unit and the appropriate electric parking brake actuator.

NO

Go to step 4.

4. Electric parking brake actuator check

-1. **Substitute a known-good electric parking brake actuator** .

-2. Reconnect the following connectors.

VSA modulator-control unit 46P connector
Appropriate electric parking brake actuator 4P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Apply and release the parking brake several times.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1110-11 Left Rear Electric Parking Brake Actuator Circuit Short to Ground	B	B
C1111-11 Right Rear Electric Parking Brake Actuator Circuit Short to Ground	B	B

Is DTC C1110-11 or C1111-11 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the appropriate electric parking brake actuator .

DTC C1110-13, C1111-13

DTC C1110-13 : Left Rear Electric Parking Brake Actuator Circuit Open **DTC C1111-13** : Right Rear Electric Parking Brake Actuator Circuit Open

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1110-13 Left Rear Electric Parking Brake Actuator Circuit Open	B	B
C1111-13 Right Rear Electric Parking Brake Actuator Circuit Open	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Apply and release the parking brake several times.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1110-13 Left Rear Electric Parking Brake Actuator Circuit Open	B	B
C1111-13 Right Rear Electric Parking Brake Actuator Circuit Open	B	B

Is DTC C1110-13 or C1111-13 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (EPB L ACT+, EPB L ACT-, EPB R ACT+, EPB R ACT- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

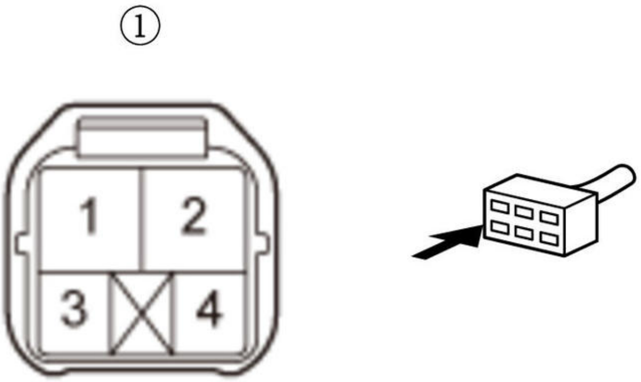
-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
Appropriate electric parking brake actuator 4P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate electric parking brake actuator 4P connector: disconnected

DTC	Test point 1	Test point 2
C1110-13	**VSA modulator-control unit 46P connector No. 8**	Left electric parking brake actuator 4P connector (female terminals) No. 1: ①
	VSA modulator-control unit 46P connector No. 7	Left electric parking brake actuator 4P connector (female terminals) No. 2: ①
C1111-13	**VSA modulator-control unit 46P connector No. 5**	Right electric parking brake actuator 4P connector (female terminals) No. 1: ①
	VSA modulator-control unit 46P connector No. 6	Right electric parking brake actuator 4P connector (female terminals) No. 2: ①



Is there continuity?

YES

Go to step 3.

NO

Repair an open in the wire between the VSA modulator-control unit and the appropriate electric parking brake actuator.

3. Electric parking brake actuator check

-1. **Substitute a known-good electric parking brake actuator** .

-2. Reconnect the following connectors.

VSA modulator-control unit 46P connector
Appropriate electric parking brake actuator 4P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Apply and release the parking brake several times.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1110-13 Left Rear Electric Parking Brake Actuator Circuit Open	B	B
C1111-13 Right Rear Electric Parking Brake Actuator Circuit Open	B	B

Is DTC C1110-13 or C1111-13 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original electric parking brake actuator .

DTC C1110-79, C1111-79

DTC C1110-79 : Left Side Electric Parking Brake Doesn't Work Correctly **DTC C1111-79** : Right Side Electric Parking Brake Doesn't Work Correctly

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1110-79 Left Side Electric Parking Brake Doesn't Work Correctly	B	B
C1111-79 Right Side Electric Parking Brake Doesn't Work Correctly	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Apply and release the parking brake several times.

   -5. Wait 35 seconds or more.

   -6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1110-79 Left Side Electric Parking Brake Doesn't Work Correctly	B	B

DTC Description	DTC	Freeze Frame
C1111-79 Right Side Electric Parking Brake Doesn't Work Correctly	B	B

   Is DTC C1110-79 or C1111-79 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Rear brake component parts check (brake caliper, brake pad, brake disc, and electric parking brake actuator)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check that the appropriate rear brake component parts are properly mounted.

   Is the rear brake component parts installation OK?

   YES

   Go to step 3.

   NO

   Reinstall the rear brake component parts, then recheck.

3. Electric parking brake actuator check

   -1. **Substitute a known-good electric parking brake actuator** .

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-5. Apply and release the parking brake several times.

-6. Wait 35 seconds or more.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1110-79 Left Side Electric Parking Brake Doesn't Work Correctly	B	B
C1111-79 Right Side Electric Parking Brake Doesn't Work Correctly	B	B

Is DTC C1110-79 or C1111-79 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original electric parking brake actuator .

DTC C1110-94

DTC C1110-94 : Left Side Electric Parking Brake Actuator Unexpected Operation

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1110-94 Left Side Electric Parking Brake Actuator Unexpected Operation	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Apply and release the parking brake several times.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1110-94 Left Side Electric Parking Brake Actuator Unexpected Operation	B	B

Is DTC C1110-94 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric parking brake actuator check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Substitute a known-good left electric parking brake actuator .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Apply and release the parking brake several times.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1110-94 Left Side Electric Parking Brake Actuator Unexpected Operation	B	B

Is DTC C1110-94 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Replace the original left electric parking brake actuator .

DTC C1110-96, C1111-96

DTC C1110-96 : Left Side Electric Parking Brake Actuator Malfunction **DTC C1111-96** : Right Side Electric Parking Brake Actuator Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
C1110-96 Left Side Electric Parking Brake Actuator Malfunction	B	B
C1111-96 Right Side Electric Parking Brake Actuator Malfunction	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Apply and release the parking brake several times.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1110-96 Left Side Electric Parking Brake Actuator Malfunction	B	B
C1111-96 Right Side Electric Parking Brake Actuator Malfunction	B	B

Is DTC C1110-96 or C1111-96 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Rear brake component parts installation check (brake caliper, brake pad, brake disc, and electric parking brake actuator)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check that the appropriate rear brake component parts are properly mounted.

   Is the rear brake component parts installation OK?

   YES

   Go to step 3.

   NO

   Reinstall the rear brake component parts, then recheck.

3. Electric parking brake actuator check

   -1. **Substitute a known-good electric parking brake actuator** .

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

   -4. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -5. Apply and release the parking brake several times.

   -6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1110-96 Left Side Electric Parking Brake Actuator Malfunction	B	B
C1111-96 Right Side Electric Parking Brake Actuator Malfunction	B	B

Is DTC C1110-96 or C1111-96 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the appropriate electric parking brake actuator .

DTC C1111-94

DTC C1111-94 : Right Side Electric Parking Brake Actuator Unexpected Operation

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1111-94 Right Side Electric Parking Brake Actuator Unexpected Operation	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Apply and release the parking brake several times.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1111-94 Right Side Electric Parking Brake Actuator Unexpected Operation	B	B

   Is DTC C1111-94 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric parking brake actuator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Substitute a known-good right electric parking brake actuator** .

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Apply and release the parking brake several times.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1111-94 Right Side Electric Parking Brake Actuator Unexpected Operation	B	B

Is DTC C1111-94 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original right electric parking brake actuator .

DTC C1120-14

DTC C1120-14 : Electric Parking Brake Switch Circuit Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1120-14 Electric Parking Brake Switch Circuit Malfunction	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1120-14 Electric Parking Brake Switch Circuit Malfunction	B	B

Is DTC C1120-14 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric parking brake switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check the electric parking brake switch** .

Is the electric parking brake switch OK?

YES

Go to step 3.

NO

Replace the electric parking brake/automatic brake hold switch .

3. Shorted wire check (SW lines)

-1. Disconnect the following connectors.

VSA modulator-control unit 46P connector
Electric parking brake/automatic brake hold switch 12P connector

-2. Check for continuity between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected

Connector	Test circuit	Test point 1	Test point 2
VSA modulator-control unit 46P connector	SW1	No. 9	Body ground
	SW3	No. 24	
	SW4	No. 10	
	SW6	No. 25	

Is there continuity?

YES

Repair a short to body ground in the wires between the VSA modulator-control unit and the electric parking brake/automatic brake hold switch.

NO

The SW wires are not shorted. Go to step 4.

4. Open wire check (SW lines)

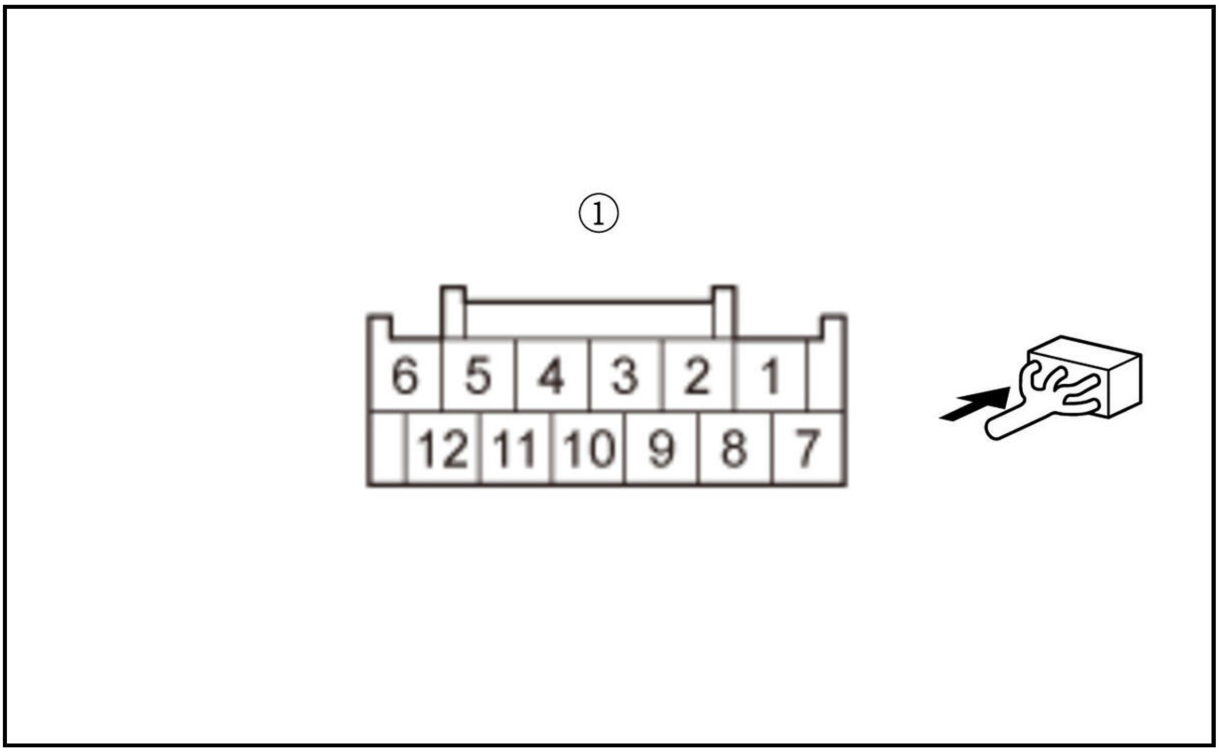
-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 9**
Test point 2	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 4: ①

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 24**
Test point 2	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 1: ①

Test circuit 3	B
Test point 1	**VSA modulator-control unit 46P connector No. 10**
Test point 2	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 2: ①

Test circuit 4	B
Test point 1	**VSA modulator-control unit 46P connector No. 25**
Test point 2	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 3: ①



Is there continuity?

YES

The SW wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wires between the VSA modulator-control unit and the electric parking brake/automatic brake hold switch.

DTC C1120-96

DTC C1120-96 : Electric Parking Brake Switch Malfunction

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- This DTC is detected when operating the electric parking brake switch continuously for more than 20 seconds.
- Check that electric parking brake/automatic brake hold switch is free of dirt and other foreign particles.

DTC Description	DTC	Freeze Frame
C1120-96 Electric Parking Brake Switch Malfunction	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait 5 minutes or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1120-96 Electric Parking Brake Switch Malfunction	B	B

   Is DTC C1120-96 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric parking brake switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the electric parking brake switch .

   Is the electric parking brake switch OK?

   YES

   Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

   NO

   Replace the electric parking brake/automatic brake hold switch.

DTC C1270-11

DTC C1270-11 : Automatic Brake Hold Switch Signal Circuit Short

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1270-11 Automatic Brake Hold Switch Signal Circuit Short	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1270-11 Automatic Brake Hold Switch Signal Circuit Short	B	B

   Is DTC C1270-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Automatic brake hold switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Check the automatic brake hold switch** .

   Is the automatic brake hold switch OK?

   YES

   Go to step 3.

   NO

   Replace the electric parking brake/automatic brake hold switch .

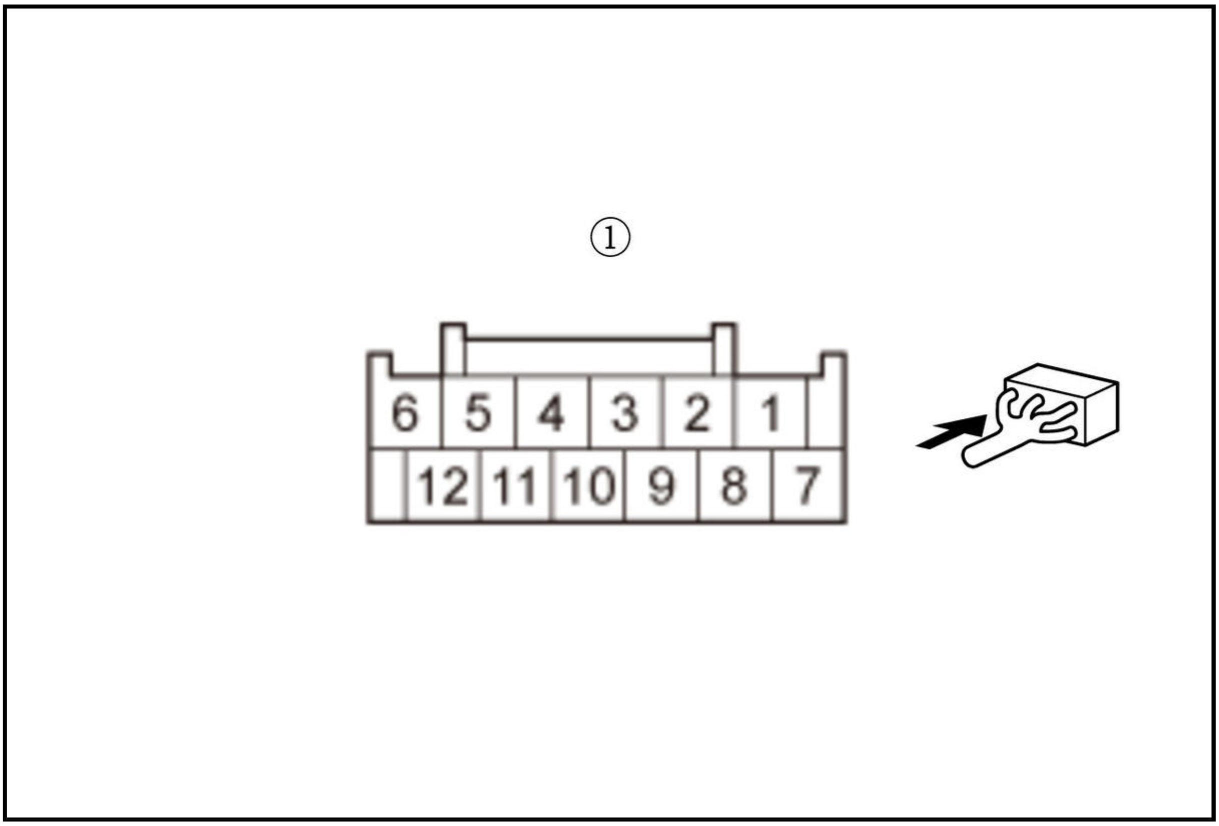
3. Shorted wire check (BRAKE HOLD line)

   -1. Disconnect the following connectors.

Electric parking brake/automatic brake hold switch 12P connector
Gauge control module connector A (32P)

   -2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to body ground in the wire between the electric parking brake/automatic brake hold switch and the gauge control module.

NO

The BRAKE HOLD wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

DTC C1270-15

DTC C1270-15 : Automatic Brake Hold Switch Signal Circuit Open

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1270-15 Automatic Brake Hold Switch Signal Circuit Open	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1270-15 Automatic Brake Hold Switch Signal Circuit Open	B	B

Is DTC C1270-15 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Automatic brake hold switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check the automatic brake hold switch** .

Is the automatic brake hold switch OK?

YES

Go to step 3.

NO

Replace the electric parking brake/automatic brake hold switch .

3. Open wire check (BRAKE HOLD line) 1

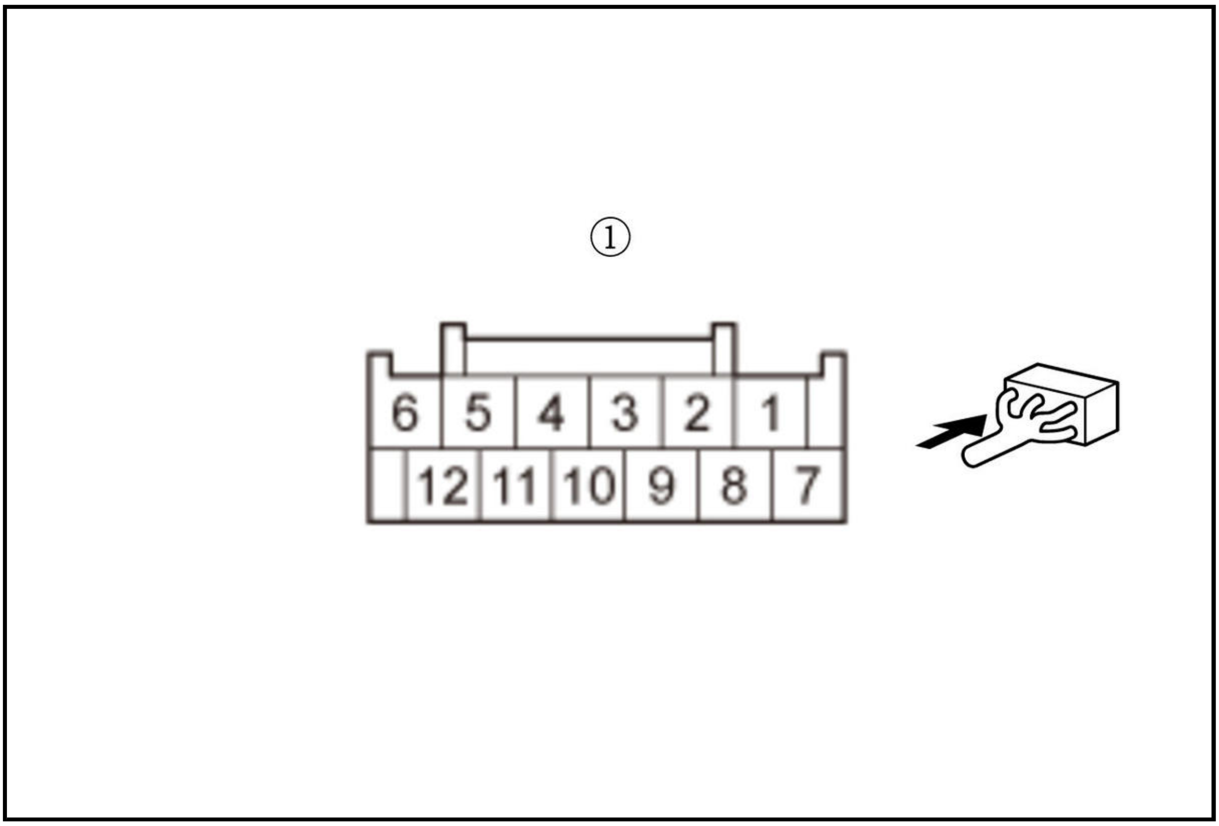
-1. Disconnect the following connector.

Electric parking brake/automatic brake hold switch 12P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
Test point 1	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there about 5 V?

YES

The BRAKE HOLD wire is OK. Go to step 4.

NO

Go to step 5.

NO

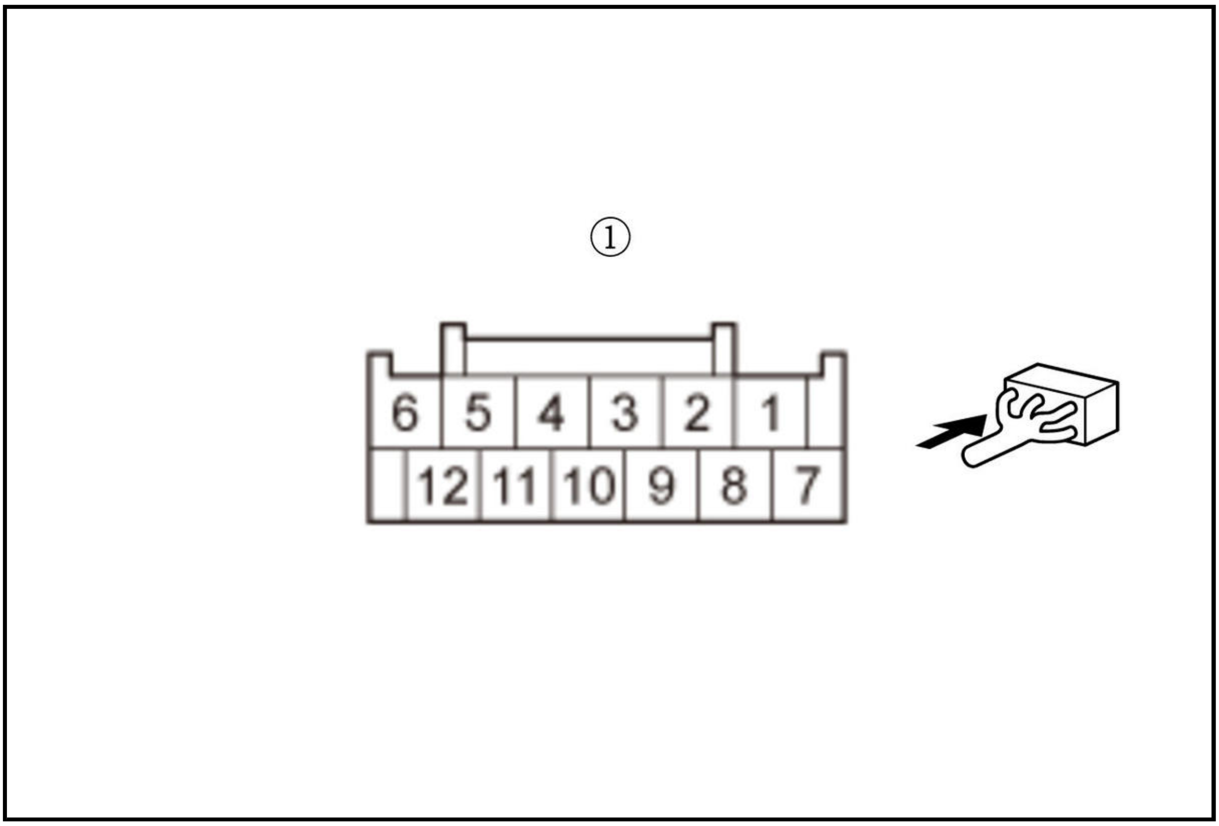
Go to step 6.

4. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
Test point 1	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 8: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

NO

Repair an open in the wire between the electric parking brake/automatic brake hold switch and body ground (G402).

5. Shorted wire check (BRAKE HOLD line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

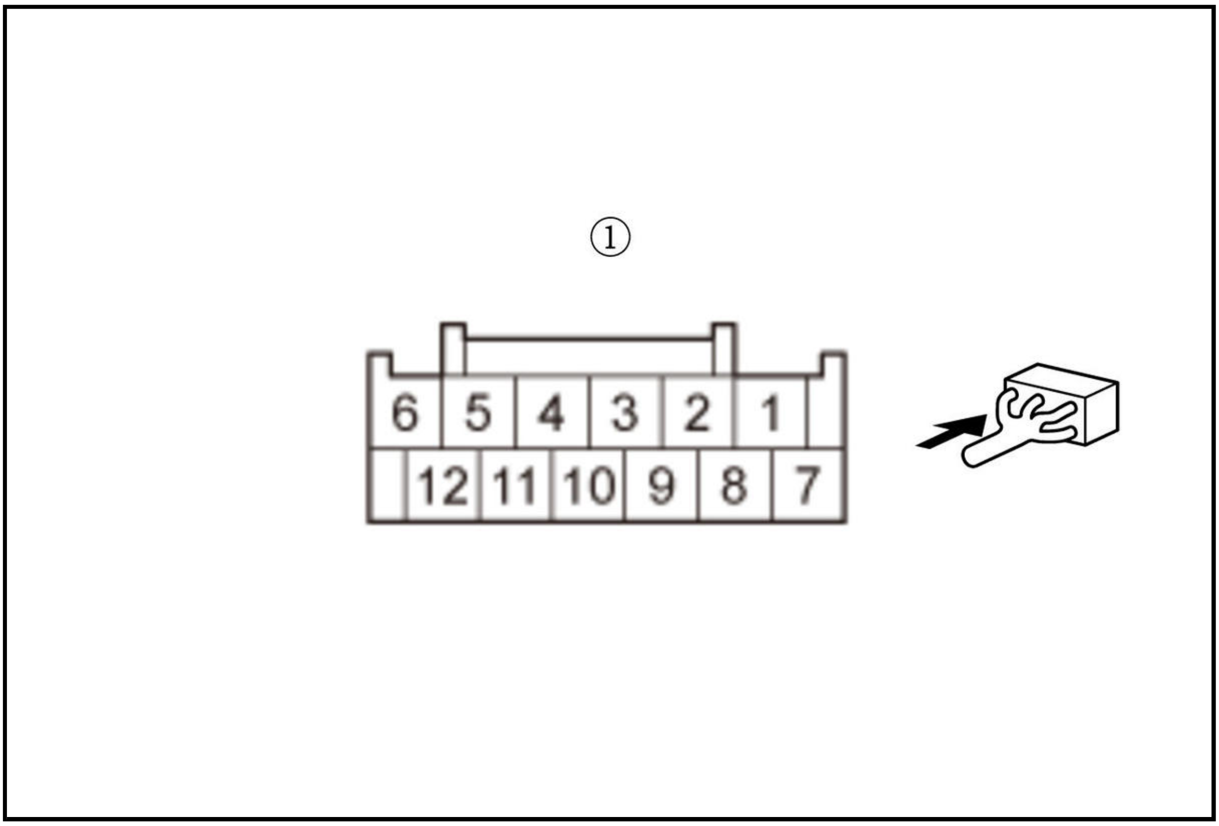
Gauge control module connector A (32P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 7: ①

Test point 2	Body ground



Is there 0.1 V or more?

YES

Repair a short to power in the wire between the electric parking brake/automatic brake hold switch and the gauge control module.

NO

The BRAKE HOLD wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

6. Open wire check (BRAKE HOLD line) 2

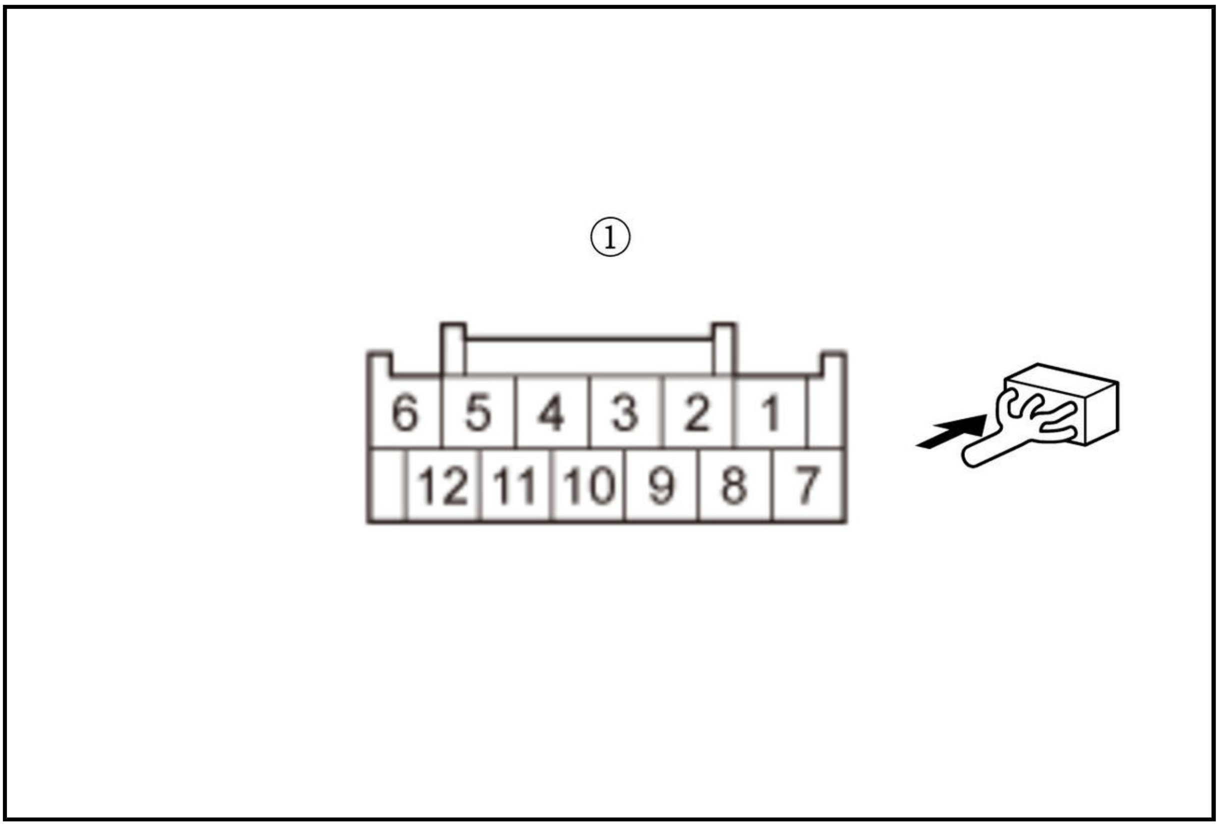
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 7: ①
Test point 2	**Gauge control module connector A (32P) No. 12**



Is there continuity?

YES

The BRAKE HOLD wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

NO

Repair an open in the wire between the electric parking brake/automatic brake hold switch and the gauge control module.

DTC U0029-00 (VSA CONTROL UNIT (WITHOUT CAN GATEWAY)) (2017 2018 2019)

DTC U0029-00 : CAN Communication Failure (Bus OFF Ch 1)

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- This DTC is stored by communication failure between the F-CAN line and the VSA modulator-control unit. When DTC U0029-00 is indicated, the F-CAN line has already returned to normal. Check for loose terminals and poor connections in the connectors. If the connectors are OK, clear the DTC and following this troubleshooting.

DTC Description	DTC	Freeze Frame
U0029-00 CAN Communication Failure (Bus OFF Ch 1)	B	B

DTC (VSA)

1. VSA modulator-control unit communication check

   -1. Start the engine.

-2. Check for communication between the VSA modulator-control unit and the HDS.

Is there communication between the VSA modulator-control unit and the HDS?

YES

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

Go to step 2.

2. Open wire check (F-CAN H, F-CAN L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

VSA modulator-control unit 46P connector
PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	PCM connector A (51P): disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 40**
Test point 2	**PCM connector A (51P) No. 2**

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 28**
Test point 2	**PCM connector A (51P) No. 1**

Is there continuity?

YES

The F-CAN H and F-CAN L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the PCM.

DTC U0029-00, U0047-00 (VSA CONTROL UNIT (WITH CAN GATEWAY))

DTC U0029-00 : CAN Communication Failure (Bus OFF Ch 1)**DTC U0047-00** : CAN Communication Failure (Bus OFF Ch 2)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

*1: CAN gateway 12P connector type

*2: CAN gateway 16P connector type

DTC Description	DTC
U0029-00 CAN Communication Failure (Bus OFF Ch 1)	B
U0047-00 CAN Communication Failure (Bus OFF Ch 2)	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Communication Failure (Bus OFF Ch 1)	B
U0047-00 CAN Communication Failure (Bus OFF Ch 2)	B

   Is DTC U0029-00 or U0047-00 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. DTC check (CAN gateway system)

   -1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Are DTC (s) indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Go to step 3.

3. F-CAN circuit communication check

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Which result is indicated?

   VSA modulator-control unit (Bus A) is Not Available

Go to step 4.

VSA modulator-control unit (Bus B) is Not Available

Go to step 5.

VSA modulator-control unit (Bus A and B) is Available

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

4. Open wire check (F-CAN A H, F-CAN A L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

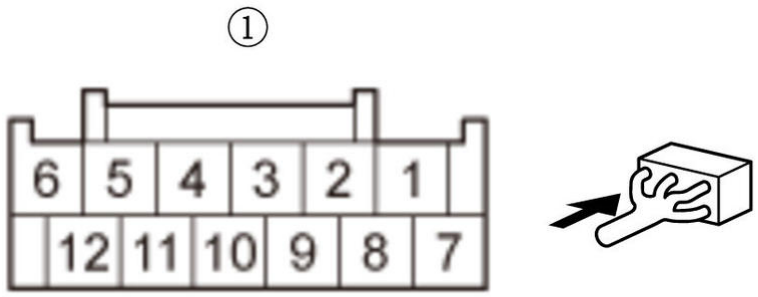
-2. Disconnect the following connectors.

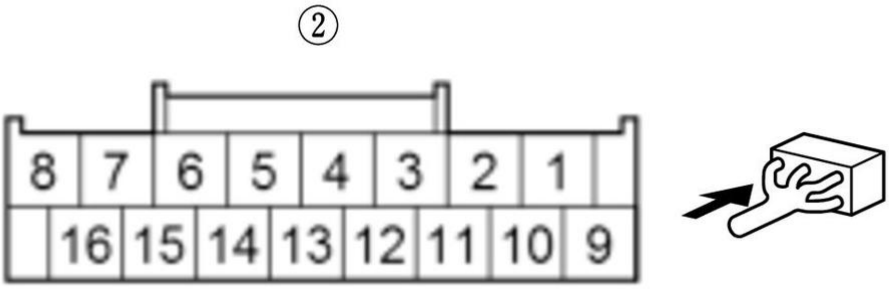
VSA modulator-control unit 46P connector
CAN gateway 12P connector *1
CAN gateway 16P connector *2

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	CAN gateway 12P connector *1: disconnected
B	CAN gateway 16P connector *2: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 40**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 3: ①
B	CAN gateway 16P connector *2 (female terminals) No. 3: ②

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 28**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 9: ①
B	CAN gateway 16P connector *2 (female terminals) No. 11: ②





Is there 1.0 Ω or less?

YES

The F-CAN A H and F-CAN A L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

5. Open wire check (F-CAN B H, F-CAN B L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

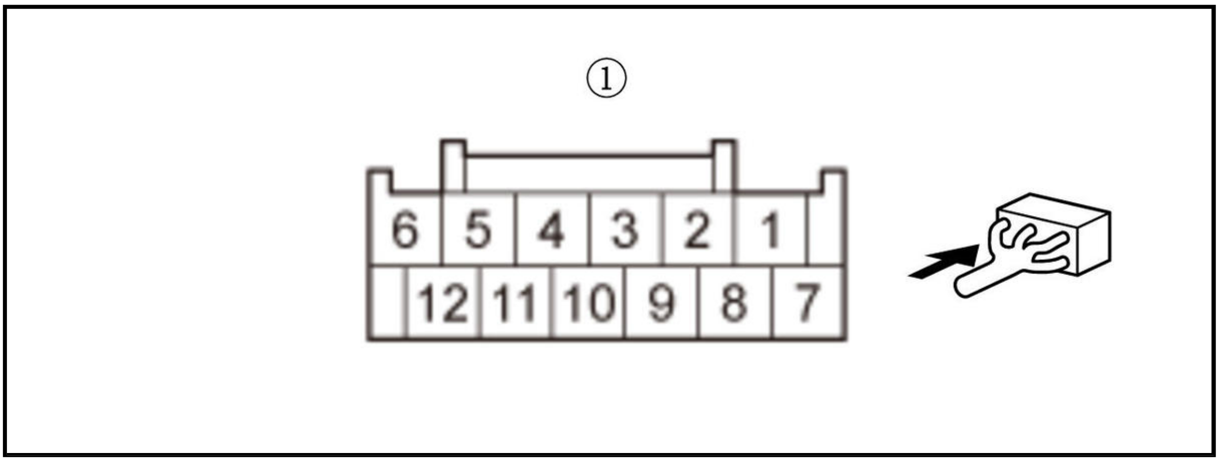
-2. Disconnect the following connectors.

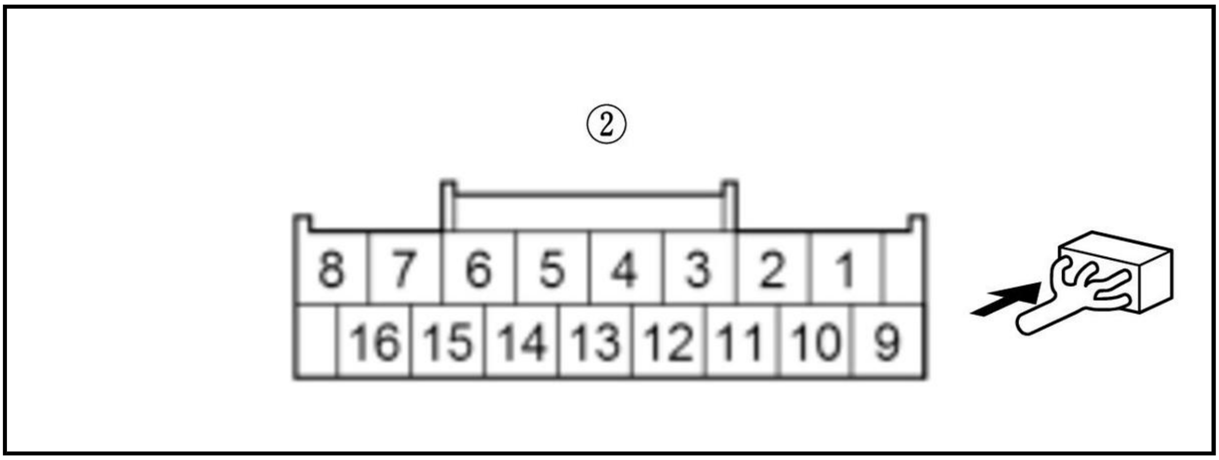
VSA modulator-control unit 46P connector
CAN gateway 12P connector *1
CAN gateway 16P connector *2

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	CAN gateway 12P connector *1: disconnected
B	CAN gateway 16P connector *2: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 46**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 12: ①
B	CAN gateway 16P connector *2 (female terminals) No. 6: ②

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 34**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 5: ①
B	CAN gateway 16P connector *2 (female terminals) No. 14: ②





Is there 1.0 Ω or less?

YES

The F-CAN B H and F-CAN B L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

DTC U0047-00 (VSA CONTROL UNIT (WITHOUT CAN GATEWAY)) (2017 2018 2019)

DTC U0047-00 : CAN Communication Failure (Bus OFF Ch 2)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
U0047-00 CAN Communication Failure (Bus OFF Ch 2)	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0047-00 CAN Communication Failure (Bus OFF Ch 2)	B	B

Is DTC U0047-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. EBB CAN circuit resistance check

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Disconnect the following connector.

VSA modulator-control unit 46P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 46**
Test point 2	**VSA modulator-control unit 46P connector No. 34**

Is there about 108-132 Ω ?

YES

Go to step 5.

NO

Go to step 3.

3. Shorted wire check (EBB CAN H line to EBB CAN L line)

-1. Disconnect the following connector.

Electric brake booster 26P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	VSA modulator-control unit 46P connector: disconnected
	Electric brake booster 26P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 46**
Test point 2	**VSA modulator-control unit 46P connector No. 34**

Is there continuity?

YES

Repair a short in the wires between the VSA modulator-control unit terminals 46 and 34.

NO

Go to step 4.

4. Open wire check (EBB CAN H, EBB CAN L lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	VSA modulator-control unit 46P connector: disconnected
B	Electric brake booster 26P connector: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 46**
Test point 2	**Electric brake booster 26P connector No. 19**

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 34**
Test point 2	**Electric brake booster 26P connector No. 12**

Is there continuity?

YES

The EBB CAN H, EBB CAN L wires are OK. Check for loose terminals and poor connections in the electric brake booster 26P connector. If they are OK, **replace the electric brake booster** .

NO

Repair an open in the wire between the VSA modulator-control unit and the electric brake booster.

5. Shorted wire check (EBB CAN H, EBB CAN L lines)

-1. Disconnect the following connector.

Electric brake booster 26P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Electric brake booster 26P connector: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 46**
Test point 2	Body ground

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 34**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire between the VSA modulator-control unit and the electric brake booster.

NO

The EBB CAN H, EBB CAN L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

DTC U0100-00, U0101-00, U0104-00, U0126-00, U0129-00, U0151-00, U0155-00 (VSA CONTROL UNIT (WITH CAN GATEWAY))

DTC U0100-00 : CAN Communication Failure with ECM/ISU **DTC U0101-00** : CAN Communication Failure with PCM/TCM **DTC U0104-00** : CAN Communication Failure with Driving Support System Control Unit **DTC U0126-00** : CAN Communication Failure with Absolute Steering Wheel Angle Sensor **DTC U0129-00** : CAN Communication Failure with AHB/ESB/EBB **DTC U0151-00** : CAN Communication Failure with SRS **DTC U0155-00** : CAN Communication Failure with Meter

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- According to the detected DTC (s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the VSA modulator-control unit.

*1: CAN gateway 12P connector type

*2: CAN gateway 16P connector type

DTC Description	DTC
U0100-00 CAN Communication Failure with ECM/ISU	B
U0101-00 CAN Communication Failure with PCM/TCM	B
U0104-00 CAN Communication Failure with Driving Support System Control Unit	B
U0126-00 CAN Communication Failure with Absolute Steering Wheel Angle Sensor	B
U0129-00 CAN Communication Failure with AHB/ESB/EBB	B
U0151-00 CAN Communication Failure with SRS	B
U0155-00 CAN Communication Failure with Meter	B

DTC (VSA)

1. DTC check (VSA modulator-control unit)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Test-drive the vehicle at 6 mph (10 km/h) or more.

   NOTE: Drive the vehicle on the road, not on a lift.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U0100-00 CAN Communication Failure with ECM/ISU	B
U0101-00 CAN Communication Failure with PCM/TCM	B
U0104-00 CAN Communication Failure with Driving Support System Control Unit	B

DTC Description	DTC
U0126-00 CAN Communication Failure with Absolute Steering Wheel Angle Sensor	B
U0129-00 CAN Communication Failure with AHB/ESB/EBB	B
U0151-00 CAN Communication Failure with SRS	B
U0155-00 CAN Communication Failure with Meter	B

Is DTC indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. DTC check (CAN gateway system)

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Are DTC (s) indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

VSA modulator-control unit (Bus A) is Not Available

Go to step 4.

VSA modulator-control unit (Bus B) is Not Available

Go to step 5.

VSA modulator-control unit (Bus A and B) is Available

Go to step 6.

4. Open wire check (F-CAN A H, F-CAN A L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

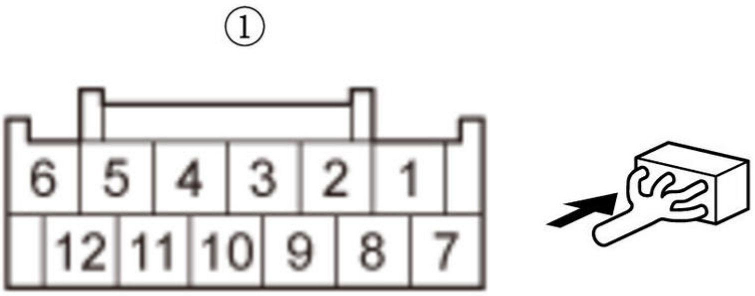
VSA modulator-control unit 46P connector
CAN gateway 12P connector *1
CAN gateway 16P connector *2

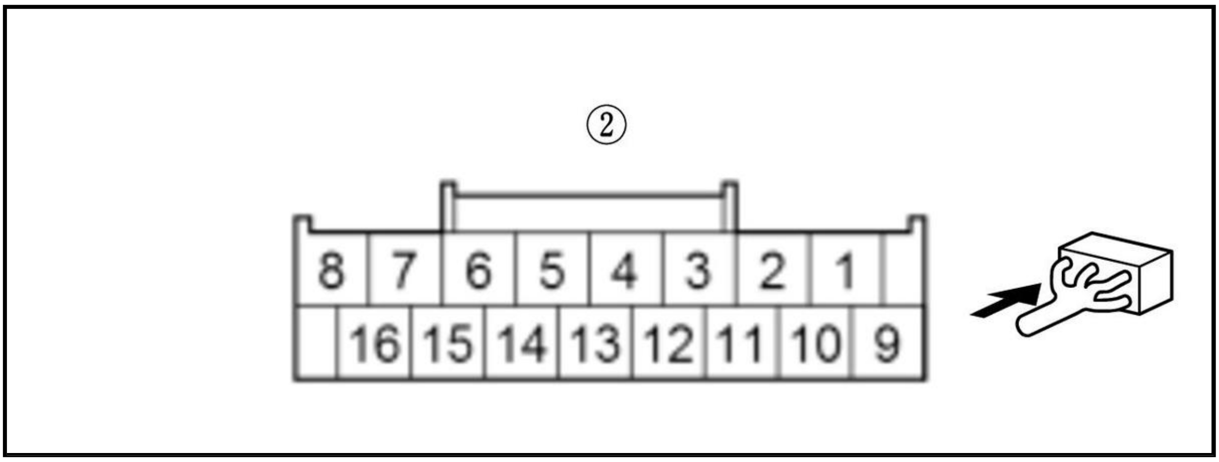
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	CAN gateway 12P connector *1: disconnected
B	CAN gateway 16P connector *2: disconnected

Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 40**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 3: ①
B	CAN gateway 16P connector *2 (female terminals) No. 3: ②

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 28**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 9: ①
B	CAN gateway 16P connector *2 (female terminals) No. 11: ②





Is there 1.0 Ω or less?

YES

The F-CAN A H and F-CAN A L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

5. Open wire check (F-CAN B H, F-CAN B L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

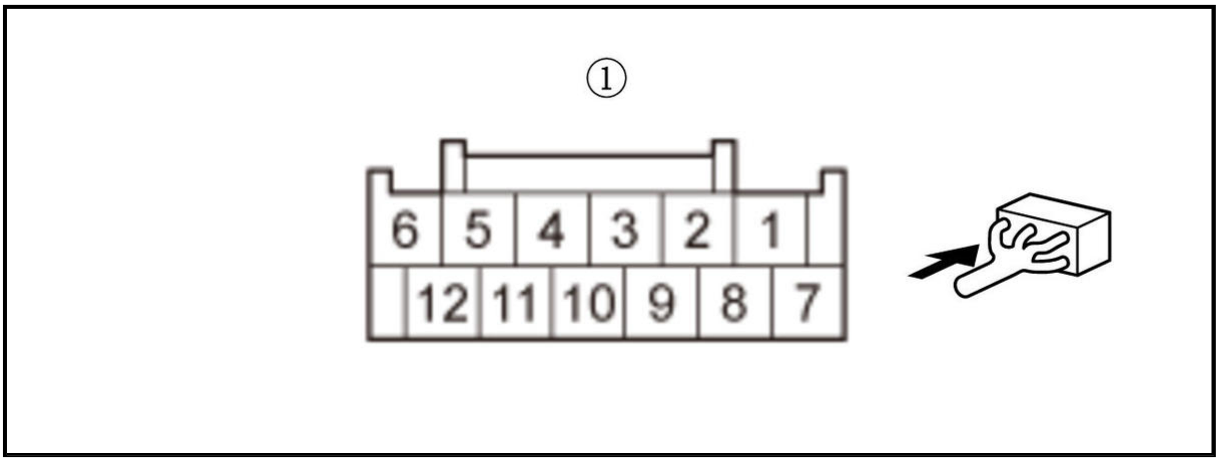
VSA modulator-control unit 46P connector
CAN gateway 12P connector *1
CAN gateway 16P connector *2

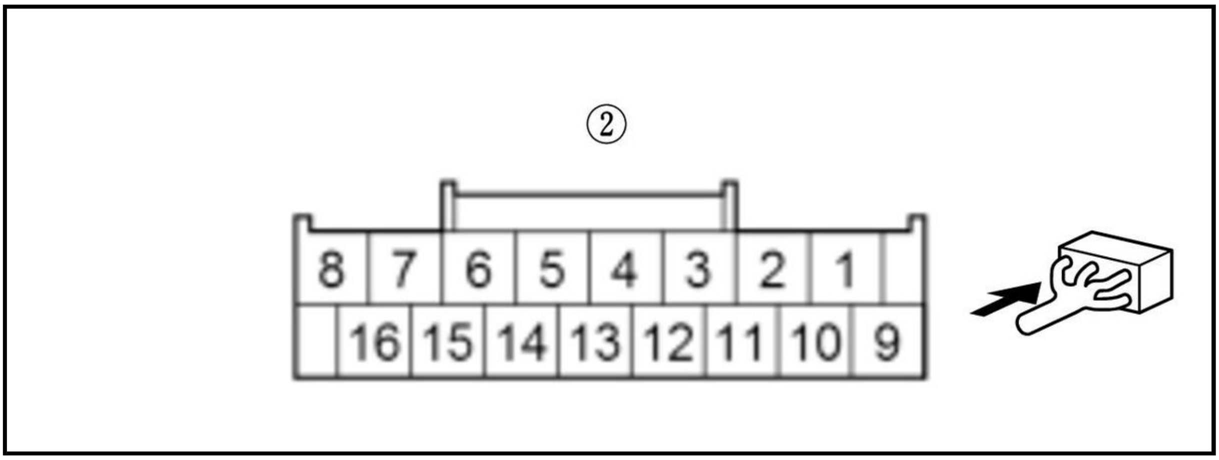
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	CAN gateway 12P connector *1: disconnected
B	CAN gateway 16P connector *2: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 46**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 12: ①
B	CAN gateway 16P connector *2 (female terminals) No. 6: ②

Test circuit 2	B

Test point 1	**VSA modulator-control unit 46P connector No. 34**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 5: ①
B	CAN gateway 16P connector *2 (female terminals) No. 14: ②





Is there 1.0 Ω or less?

YES

The F-CAN B H and F-CAN B L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

6. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel (s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel (s) at normal
U0100-00	PCM	A, B
U0101-00	TCM	A
U0104-00	Millimeter wave radar	B
U0126-00	EPS control unit	B
U0129-00	Electric brake booster	A, B
U0151-00	SRS unit	B
U0155-00	Gauge control module	A

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

U0100-00: PCM (Bus A) is Not Available

Go to step 7.

U0100-00: PCM (Bus B) is Not Available

Go to step 8.

U0101-00: TCM (Bus A) is Not Available

Go to step 7.

U0104-00: Millimeter wave radar (Bus B) is Not Available

Go to step 8.

U0126-00: EPS control unit (Bus B) is Not Available

Go to step 8.

U0129-00: Electric brake booster (Bus A) is Not Available

Go to step 7.

U0129-00: Electric brake booster (Bus B) is Not Available

Go to step 8.

U0151-00: SRS unit (Bus B) is Not Available

Go to step 8.

U0155-00: Gauge control module (Bus A) is Not Available

Go to step 7.

7. Open wire check (F-CAN A H, F-CAN A L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors according to the detected DTC.

DTC	Connector
B	CAN gateway 12P connector *1 CAN gateway 16P connector *2
U0100-00	PCM connector A (50P)
U0101-00	TCM 50P connector
U0129-00	Electric brake booster 26P connector
U0155-00	Gauge control module connector A (32P)

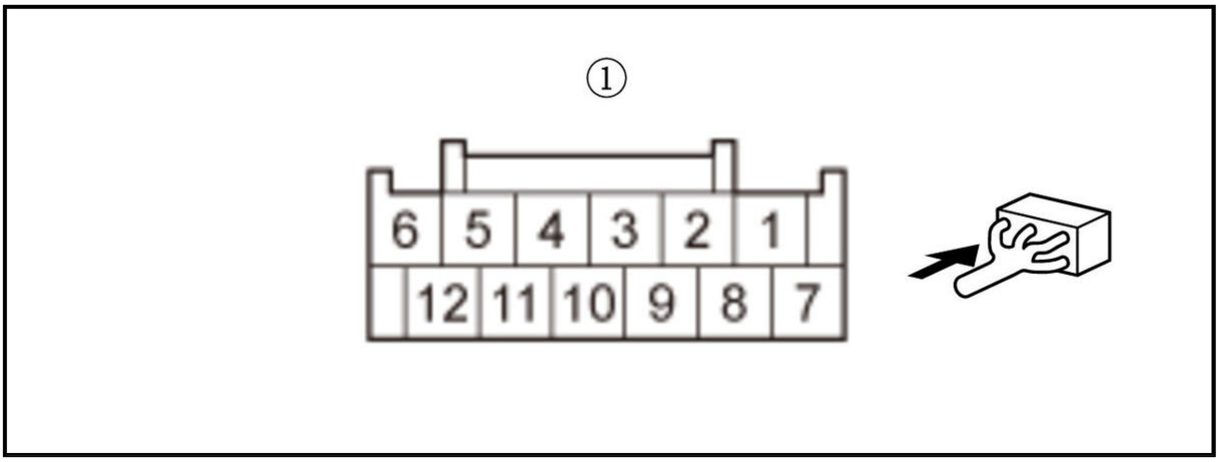
NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector.

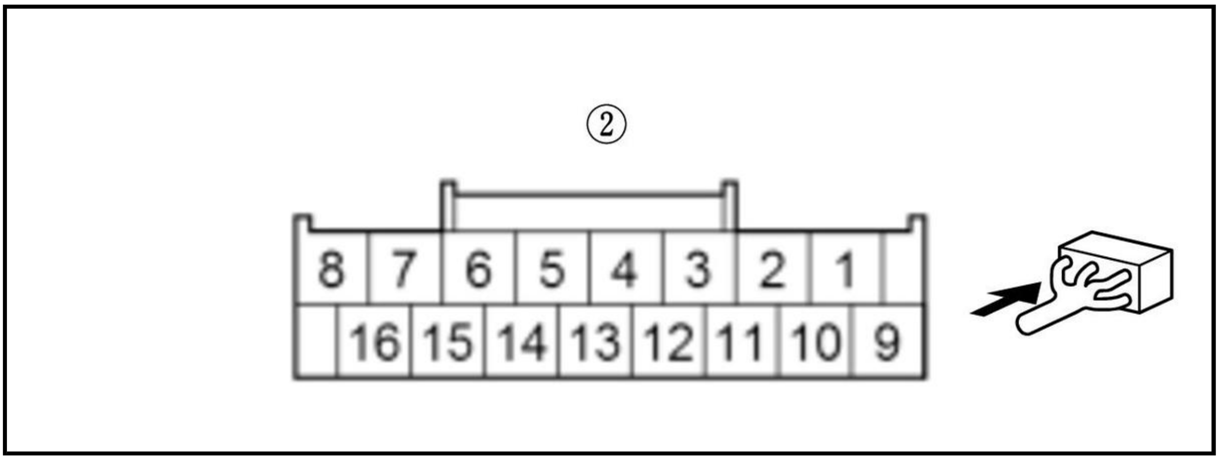
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmitting control unit connector (s) for indicated DTCs: disconnected
B	CAN gateway 12P connector *1: disconnected
B	CAN gateway 16P connector *2: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN A H	CAN gateway 12P connector *1 (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A L		No. 9		No. 36
	F-CAN A H	CAN gateway 16P connector *2 (female terminals): ②	No. 3		No. 37
	F-CAN A L		No. 11		No. 36

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0101-00	F-CAN A H	CAN gateway 12P connector *1 (female terminals): ①	No. 3	TCM 50P connector	No. 3
	F-CAN A L		No. 9		No. 11
	F-CAN A H	CAN gateway 16P connector *2 (female terminals): ②	No. 3		No. 3
	F-CAN A L		No. 11		No. 11
U0129-00	F-CAN A H	CAN gateway 12P connector *1 (female terminals): ①	No. 3	Electric brake booster 26P connector	No. 26
	F-CAN A L		No. 9		No. 18
	F-CAN A H	CAN gateway 16P connector *2 (female terminals): ②	No. 3		No. 26
	F-CAN A L		No. 11		No. 18
U0155-00	F-CAN A H	CAN gateway 12P connector *1 (female terminals): ①	No. 3	Gauge control module connector A (32P)	No. 19
	F-CAN A L		No. 9		No. 20
	F-CAN A H	CAN gateway 16P connector *2 (female terminals): ②	No. 3		No. 19
	F-CAN A L		No. 11		No. 20





Is there 1.0 Ω or less?

YES

The F-CAN A H and F-CAN A L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0100-00	PCM
U0101-00	TCM
U0129-00	Electric brake booster
U0155-00	Gauge control module

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

8. Open wire check (F-CAN B H, F-CAN B L lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors according to the detected DTC.

DTC	Connector
B	CAN gateway 12P connector *1 CAN gateway 16P connector *2
U0100-00	PCM connector A (50P)
U0104-00	Millimeter wave radar 8P connector
U0126-00	EPS control unit connector B (6P)

DTC	Connector
U0129-00	Electric brake booster 26P connector
U0151-00	SRS unit connector A (39P)

NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmitting control unit connector (s) for indicated DTCs: disconnected
B	CAN gateway 12P connector *1: disconnected
B	CAN gateway 16P connector *2: disconnected

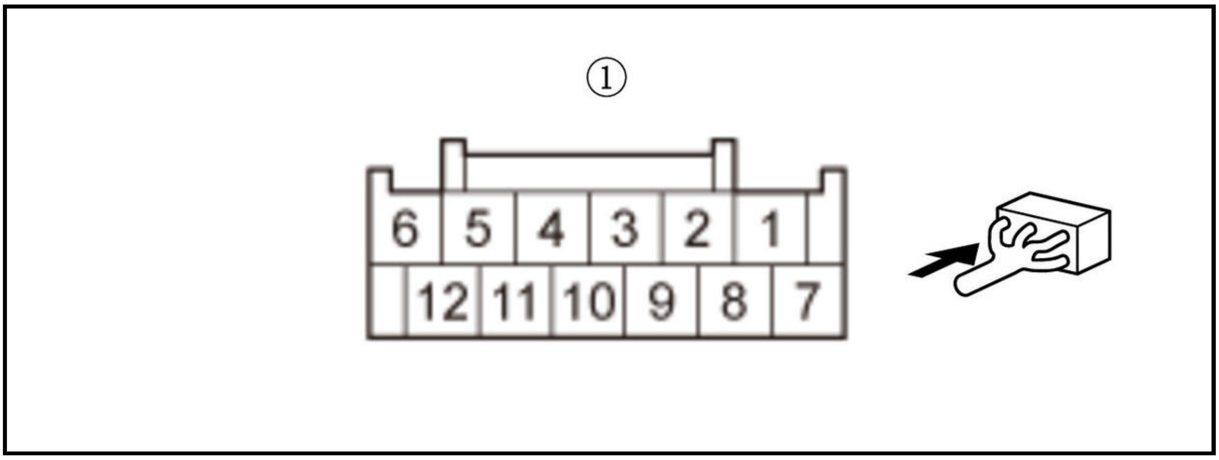
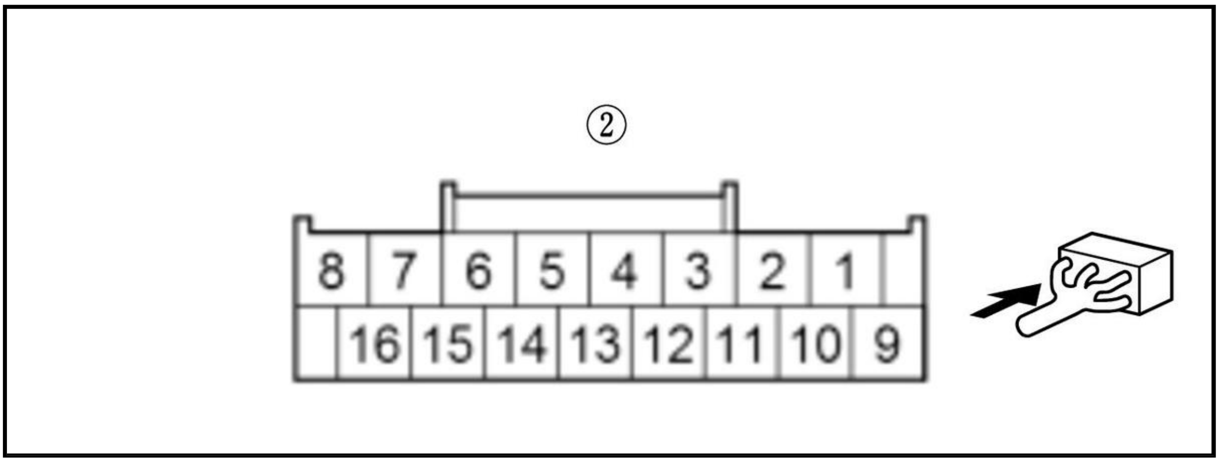
		Connector	Terminal	Connector	Terminal
	F-CAN B L	terminals): ②	No. 14		No. 35





Is there 1.0 Ω or less?

YES

The F-CAN B H and F-CAN B L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0100-00	PCM
U0104-00	Millimeter wave radar
U0126-00	EPS motor/control unit
U0129-00	Electric brake booster
U0151-00	SRS unit

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

DTC U0100-00, U0101-00, U0126-00, U0129-00, U0151-00, U0155-00 (VSA CONTROL UNIT (WITHOUT CAN GATEWAY)) (2017 2018 2019)

DTC U0100-00 : CAN Communication Failure with ECM/ISU **DTC U0101-00** : CAN Communication Failure with PCM/TCM **DTC U0126-00** : CAN Communication Failure with Absolute Steering Wheel Angle Sensor

DTC U0129-00 : CAN Communication Failure with AHB/ESB/EBB **DTC U0151-00** : CAN Communication Failure with SRS **DTC U0155-00** : CAN Communication Failure with Meter

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- According to the detected DTC (s), check the voltage supply and ground circuit of the control unit which cannot communicate with the VSA modulator-control unit.

DTC Description	DTC	Freeze Frame
U0100-00 CAN Communication Failure with ECM/ISU	B	B
U0101-00 CAN Communication Failure with PCM/TCM	B	B
U0126-00 CAN Communication Failure with Absolute Steering Wheel Angle Sensor	B	B
U0129-00 CAN Communication Failure with AHB/ESB/EBB	B	B
U0151-00 CAN Communication Failure with SRS	B	B
U0155-00 CAN Communication Failure with Meter	B	B

DTC (VSA)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Test-drive the vehicle at 6 mph (10 km/h) or more.

   NOTE: Drive the vehicle on the road, not on a lift.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0100-00 CAN Communication Failure with ECM/ISU	B	B
U0101-00 CAN Communication Failure with PCM/TCM	B	B
U0126-00 CAN Communication Failure with Absolute Steering Wheel Angle Sensor	B	B
U0129-00 CAN Communication Failure with AHB/ESB/EBB	B	B
U0151-00 CAN Communication Failure with SRS	B	B
U0155-00 CAN Communication Failure with Meter	B	B

   Is DTC indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (F-CAN H, F-CAN L lines)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Disconnect the following connector.

VSA modulator-control unit 46P connector

-4. Disconnect the following connectors according to the detected DTC.

DTC	Connector
U0100-00	PCM connector A (51P)
U0101-00	PCM connector A (51P)
U0126-00	EPS control unit connector B (6P)
U0129-00	Electric brake booster 26P connector
U0151-00	SRS unit connector A (39P)
U0155-00	Gauge control module connector A (32P)

NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector.

-5. Check for continuity between the receiving control unit and the transmitting control unit according to the detected DTC.

Test condition	Vehicle OFF (LOCK) mode

B	VSA modulator-control unit 46P connector: disconnected
B	Transmitting control unit connector (s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	**Terminal**	**Connector**	**Terminal**
U0100-00	F-CAN H	VSA modulator-control unit 46P connector	No. 40	PCM connector A (51P)	No. 2
	F-CAN L		No. 28		No. 1
U0101-00	F-CAN H	VSA modulator-control unit 46P connector	No. 40	PCM connector A (51P)	No. 2
	F-CAN L		No. 28		No. 1
U0126-00	F-CAN H	VSA modulator-control unit 46P connector	No. 40	EPS control unit connector B (6P)	No. 3
	F-CAN L		No. 28		No. 1
U0129-00	F-CAN H	VSA modulator-control unit 46P connector	No. 40	Electric brake booster 26P connector	No. 26
	F-CAN L		No. 28		No. 18
U0151-00	F-CAN H	VSA modulator-control unit 46P connector	No. 40	SRS unit connector A (39P)	No. 34
	F-CAN L		No. 28		No. 35
U0155-00	F-CAN H	VSA modulator-control unit 46P connector	No. 40	Gauge control module connector A (32P)	No. 19
	F-CAN L		No. 28		No. 20

Is there continuity?

YES

The F-CAN H and F-CAN L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0100-00	PCM
U0101-00	PCM
U0126-00	EPS motor/control unit
U0129-00	Electric brake booster
U0151-00	SRS unit
U0155-00	Gauge control module

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

DTC U0401-68 (VSA CONTROL UNIT)

DTC U0401-68 : ECM Failure

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
U0401-68 ECM Failure	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0401-68 ECM Failure	B	B

Is DTC U0401-68 indicated?

YES

The failure is duplicated. Go to PGM-FI system troubleshooting .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U0402-68 (VSA CONTROL UNIT)

DTC U0402-68 : TCM Failure

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
U0402-68 TCM Failure	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0402-68 TCM Failure	B	B

   Is DTC U0402-68 indicated?

   YES

   The failure is duplicated. Go to CVT system troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U0418-68 (VSA CONTROL UNIT)

DTC U0418-68 : ESB/EBB Failure

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
U0418-68 ESB/EBB Failure	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0418-68 ESB/EBB Failure	B	B

   Is DTC U0418-68 indicated?

   YES

The failure is duplicated. Go to electric brake booster system troubleshooting .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U0418-F8 (VSA CONTROL UNIT) (2020 2021)

DTC U0418-F8 : Plausibility Brake Pedal Signal (EBB) vs. Pressure Sensor

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
U0418-F8 Plausibility Brake Pedal Signal (EBB) vs. Pressure Sensor	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Wait 1 second or more without pressing the brake pedal.

-5. Press the brake pedal hard for 1 second or more.

-6. Check for DTCs with the HDS.

DTC Description	DTC
U0418-F8 Plausibility Brake Pedal Signal (EBB) vs. Pressure Sensor	B

Is DTC U0418-F8 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

2. Electric brake booster system DTC check

-1. Check for electric brake booster system DTCs with the HDS.

DTC Description	DTC
C1C01-96 Brake Pedal Stroke Sensor Component Internal Failure	B
C1C02-11 Brake Pedal Stroke Sensor Signal Circuit1 Short To Ground	B

DTC Description	DTC
C1C02-15 Brake Pedal Stroke Sensor Signal Circuit1 Short To Battery or Open	B
C1C03-11 Brake Pedal Stroke Sensor Signal Circuit 2 Short To Ground	B

DTC Description	DTC
C1C03-15 Brake Pedal Stroke Sensor Signal Circuit 2 Short To Battery or Open	B
C1C04-11 Brake Pedal Stroke Sensor Power Circuit Short To Ground or Battery	B

Is DTC indicated?

YES

Go to indicated DTCs troubleshooting.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

DTC U3000-49 (VSA CONTROL UNIT)

DTC U3000-49 : ECU Internal Circuit Failure

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
U3000-49 ECU Internal Circuit Failure	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Test-drive the vehicle at 25 mph (40 km/h) or more.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-49 ECU Internal Circuit Failure	B	B

Is DTC U3000-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U3000-51 (VSA CONTROL UNIT)

DTC U3000-51 : ECU Software Update Failure

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- Do not turn the vehicle to the OFF (LOCK) mode while updating the VSA modulator-control unit. If you turn the vehicle to the OFF (LOCK) mode before completion, the VSA modulator-control unit will be damaged.

DTC Description	DTC	Freeze Frame
U3000-51 ECU Software Update Failure	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-51 ECU Software Update Failure	B	B

   Is DTC U3000-51 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. VSA modulator-control unit check (update)

   -1. **Update the VSA modulator-control unit** .

   -2. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Is DTC U3000-51 indicated?

   YES

   The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Troubleshooting is complete. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC U3003-16 (VSA CONTROL UNIT)

DTC U3003-16 : Electric Parking Brake Control Unit Power Source Circuit (+B) Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
U3003-16 Electric Parking Brake Control Unit Power Source Circuit (+B) Low Voltage	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Wait 15 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3003-16 Electric Parking Brake Control Unit Power Source Circuit (+B) Low Voltage	B	B

   Is DTC U3003-16 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (PGM-FI system)

   -1. Check for PGM-FI system DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Is DTC indicated?

   YES

   Go to indicated DTCs troubleshooting.

   NO

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

DTC U3003-17 (VSA CONTROL UNIT)

DTC U3003-17 : Electric Parking Brake Control Unit Power Source Circuit (+B) High Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
U3003-17 Electric Parking Brake Control Unit Power Source Circuit (+B) High Voltage	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3003-17 Electric Parking Brake Control Unit Power Source Circuit (+B) High Voltage	B	B

   Is DTC U3003-17 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. VSA modulator-control unit check

   -1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BATTERY VOLTAGE	More than 16.5	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Check the 12 volt battery , and check the PGM-FI system DTCs .

   NO

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

DTC U3006-16 (VSA CONTROL UNIT)

DTC U3006-16 : Power Source Failure for ECU (Low Voltage)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
U3006-16 Power Source Failure for ECU (Low Voltage)	B	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Test-drive the vehicle at 6 mph (10 km/h) or more.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3006-16 Power Source Failure for ECU (Low Voltage)	B	B

Is DTC U3006-16 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (PGM-FI system)

-1. Check for PGM-FI system DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

Is DTC indicated?

YES

Go to indicated DTCs troubleshooting.

NO

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

DTC U3006-17 (VSA CONTROL UNIT)

DTC U3006-17 : Power Source Failure for ECU (High Voltage)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
U3006-17 Power Source Failure for ECU (High Voltage)	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3006-17 Power Source Failure for ECU (High Voltage)	B	B

   Is DTC U3006-17 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. VSA modulator-control unit check

   -1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BATTERY VOLTAGE	More than 16.5	V	B	B

   Do the current condition (s) match the threshold?

   YES

   Check the 12 volt battery , and check the PGM-FI system DTCs .

   NO

   Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

DTC TROUBLESHOOTING

DTC B0050-F0 (VSA CONTROL UNIT)

DTC B0050-F0 : (Driver's Seat Belt Buckle Switch Malfunction)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
B0050-F0 (Driver's Seat Belt Buckle Switch Malfunction)	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for a few seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B0050-F0 (Driver's Seat Belt Buckle Switch Malfunction)	B

   Is DTC B0050-F0 indicated?

   YES

   The failure is duplicated. **Go to SRS troubleshooting** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

DTC C0010-49, C0011-49, C0014-49, C0015-49, C0018-49, C0019-49, C001C-49, C001D-49

DTC C0010-49 : Inlet Solenoid (Left Front) Circuit Failure

DTC C0011-49 : Outlet Solenoid (Left Front) Circuit Failure

DTC C0014-49 : Inlet Solenoid (Right Front) Circuit Failure

DTC C0015-49 : Outlet Solenoid (Right Front) Circuit Failure

DTC C0018-49 : Inlet Solenoid (Left Rear) Circuit Failure

DTC C0019-49 : Outlet Solenoid (Left Rear) Circuit Failure

DTC C001C-49 : Inlet Solenoid (Right Rear) Circuit Failure

DTC C001D-49 : Outlet Solenoid (Right Rear) Circuit Failure

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C0010-49 Inlet Solenoid (Left Front) Circuit Failure	B
C0011-49 Outlet Solenoid (Left Front) Circuit Failure	B
C0014-49 Inlet Solenoid (Right Front) Circuit Failure	B
C0015-49 Outlet Solenoid (Right Front) Circuit Failure	B
C0018-49 Inlet Solenoid (Left Rear) Circuit Failure	B
C0019-49 Outlet Solenoid (Left Rear) Circuit Failure	B
C001C-49 Inlet Solenoid (Right Rear) Circuit Failure	B
C001D-49 Outlet Solenoid (Right Rear) Circuit Failure	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Wait 20 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
C0010-49 Inlet Solenoid (Left Front) Circuit Failure	B
C0011-49 Outlet Solenoid (Left Front) Circuit Failure	B
C0014-49 Inlet Solenoid (Right Front) Circuit Failure	B
C0015-49 Outlet Solenoid (Right Front) Circuit Failure	B
C0018-49 Inlet Solenoid (Left Rear) Circuit Failure	B
C0019-49 Outlet Solenoid (Left Rear) Circuit Failure	B
C001C-49 Inlet Solenoid (Right Rear) Circuit Failure	B
C001D-49 Outlet Solenoid (Right Rear) Circuit Failure	B

Is DTC C0010-49, C0011-49, C0014-49, C0015-49, C0018-49, C0019-49, C001C-49, or C001D-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

DTC C0020-12

DTC C0020-12 : Pump Motor Circuit Failure (Stuck ON)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C0020-12 Pump Motor Circuit Failure (Stuck ON)	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
C0020-12 Pump Motor Circuit Failure (Stuck ON)	B

   Is DTC C0020-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Open wire check (GND line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

VSA modulator-control unit 46P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 4**

Test point 2	Body ground

   Is there 1.0 Ω or less?

   YES

   The GND wire is OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

   NO

   Repair an open or poor connection in the wire between the VSA modulator-control unit and body ground (G202).

DTC C0020-14, C1022-14

DTC C0020-14 : Pump Motor Circuit Failure (Stuck OFF)

DTC C1022-14 : Power Source Failure for Pump Motor

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C0020-14 Pump Motor Circuit Failure (Stuck OFF)	B
C1022-14 Power Source Failure for Pump Motor	B

DTC (VSA)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Wait 20 seconds or more.

   -5. Test-drive the vehicle at 6 mph (10 km/h) or more.

   -6. Check for DTCs with the HDS.

DTC Description	DTC
C0020-12 Pump Motor Circuit Failure (Stuck ON)	B
C0020-14 Pump Motor Circuit Failure (Stuck OFF)	B

DTC Description	DTC
C1022-14 Power Source Failure for Pump Motor	B

   Is DTC C0020-14 or C1022-14 indicated?

   YES

   If only DTC C0020-14 or C1022-14 are indicated, go to step 2.

   YES

   If DTC C0020-12 is also indicated, **go to DTC C0020-12**.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. A3-3**

   Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A3-3 fuse circuit.

3. Open wire check (+B_ABS/VSA_MTR line)

-1. Disconnect the following connector.

VSA modulator-control unit 46P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_ABS/VSA_MTR wire is OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the **No. A3-3** fuse and the VSA modulator-control unit.

DTC C0031-14, C0034-14, C0037-14, C003A-14

DTC C0031-14 : Left Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)

DTC C0034-14 : Right Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)

DTC C0037-14 : Left Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)

DTC C003A-14 : Right Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C0031-14 Left Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B
C0034-14 Right Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B
C0037-14 Left Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B
C003A-14 Right Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC
C0031-14 Left Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B
C0034-14 Right Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B
C0037-14 Left Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B
C003A-14 Right Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)	B

Is DTC C0031-14, C0034-14, C0037-14, or C003A-14 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Shorted wire check (Wheel speed sensor lines to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VSA modulator-control unit 46P connector

-3. Measure the resistance between body ground and the appropriate wheel speed sensor +B and GND terminals of the VSA modulator-control unit 46P connector individually (see table).

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected

Connector	DTC	Test point 1	Test point 2
VSA modulator-control unit 46P connector	C0031-14 Left-front	No. 33	Body ground
		No. 42	
	C0034-14 Right-front	No. 30	
		No. 35	
	C0037-14 Left-rear	No. 17	
		No. 32	
	C003A-14 Right-rear	No. 31	
		No. 15	

Is there 1 MΩ or more?

YES

Wheel speed sensor wires are not shorted to ground. Go to step 4.

NO

Wheel speed sensor wires are shorted to ground. Go to step 3.

3. Wheel speed sensor(s) check 1

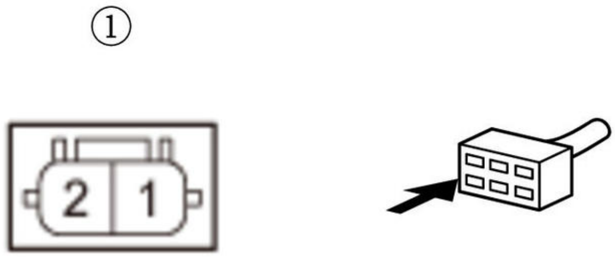
-1. Disconnect the following connectors.

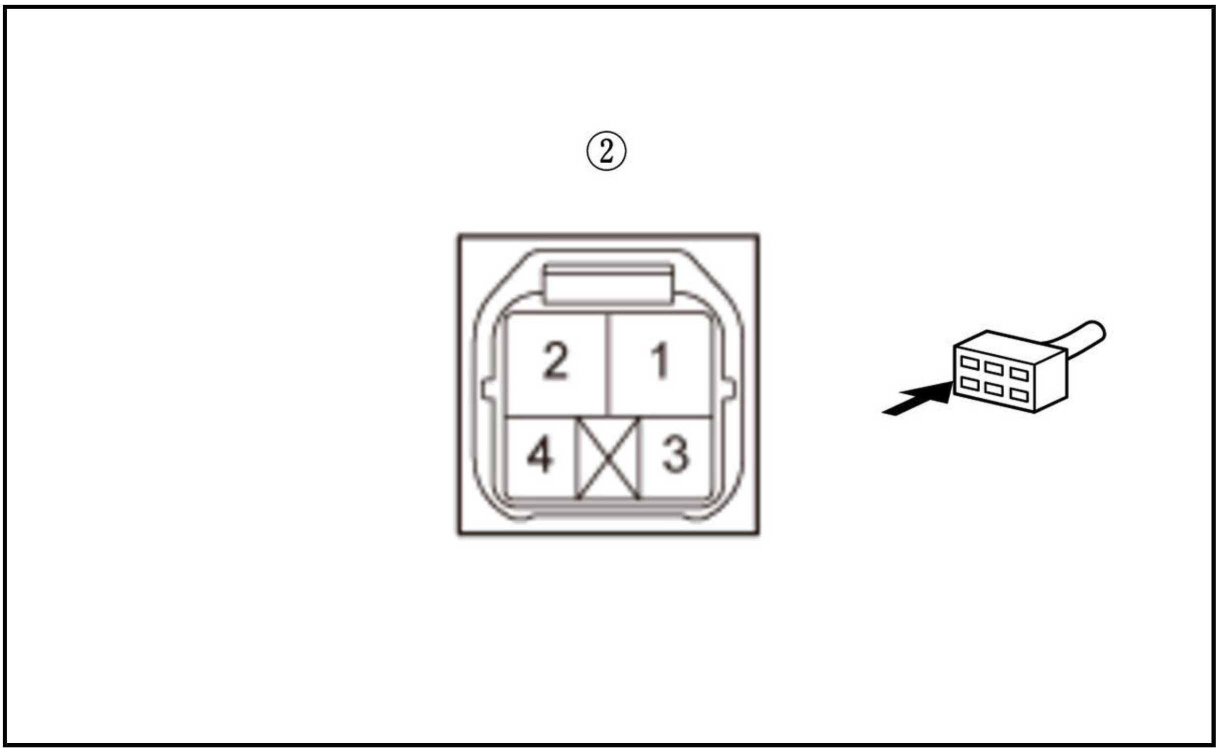
Appropriate wheel speed sensor 2P connector (front)
Appropriate wheel speed sensor 4P connector (rear)

-2. On the sensor side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate wheel speed sensor 2P connector (front): disconnected
B	Appropriate wheel speed sensor 4P connector (rear): disconnected
Test circuit 1	B
Test point 1	Appropriate wheel speed sensor 2P connector (male terminals) No. 1: ①
B	Appropriate wheel speed sensor 4P connector (male terminals) No. 3: ②
Test point 2	Body ground

Test circuit 2	B
Test point 1	Appropriate wheel speed sensor 2P connector (male terminals) No. 2: ①
B	Appropriate wheel speed sensor 4P connector (male terminals) No. 4: ②
Test point 2	Body ground





Is there 1 MΩ or more?

YES

Repair a short to ground in the wire between the VSA modulator-control unit and the wheel speed sensor.

NO

Replace the appropriate wheel speed sensor .

4. Shorted wire check (Wheel speed sensor lines to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between body ground and the appropriate wheel speed sensor +B and GND terminals of the VSA modulator-control unit 46P connector individually (see table).

Test condition	Vehicle ON mode
B	VSA modulator-control unit 46P connector: disconnected

Connector	DTC	Test point 1	Test point 2
VSA modulator-control unit 46P connector	C0031-14 Left-front	No. 33	Body ground
		No. 42	
	C0034-14 Right-front	No. 30	
		No. 35	
	C0037-14 Left-rear	No. 17	
		No. 32	
	C003A-14 Right-rear	No. 31	
		No. 15	

Is there 1 V or more?

YES

The wheel speed sensor wires are shorted to power. Go to step 5.

NO

The wheel speed sensor wires are not shorted to power. Go to step 6.

5. Wheel speed sensor(s) check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

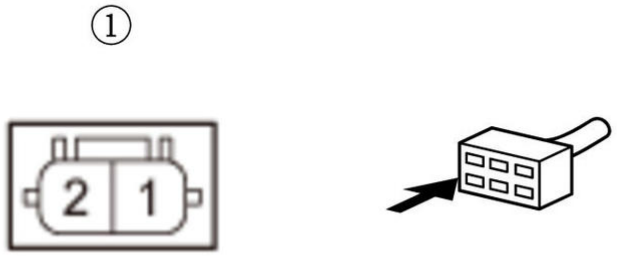
Appropriate wheel speed sensor 2P connector (front)
Appropriate wheel speed sensor 4P connector (rear)

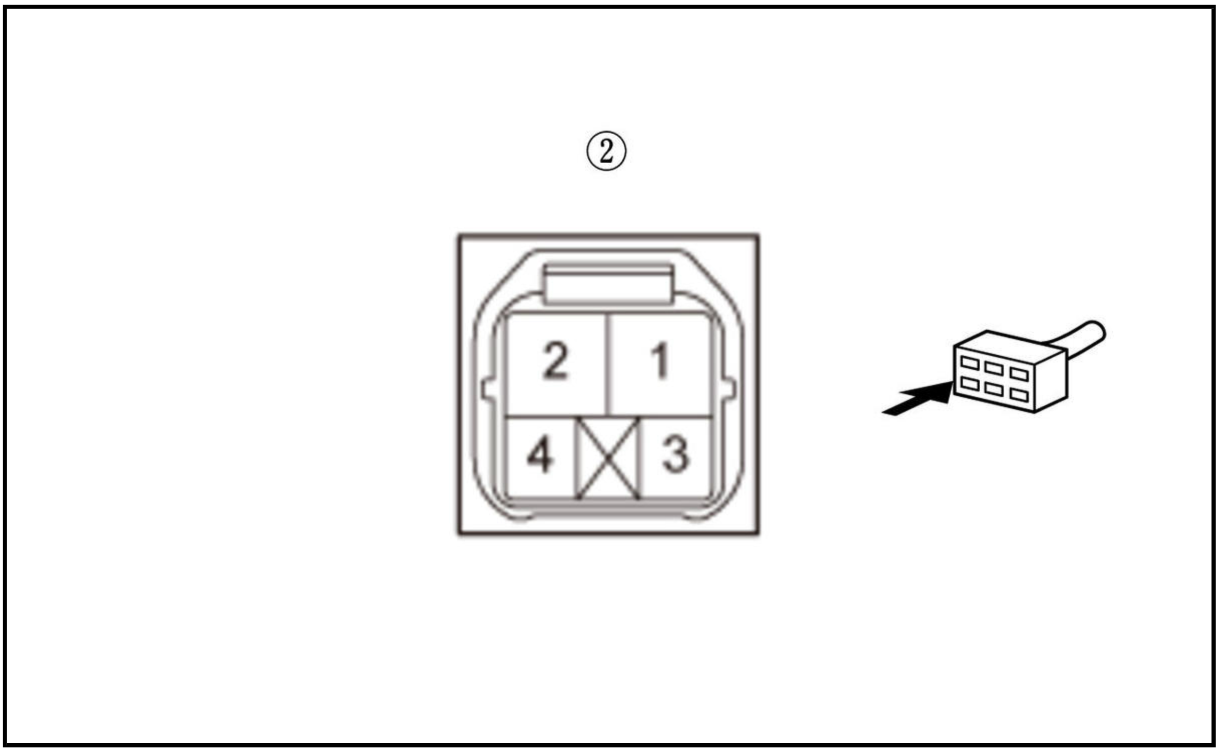
-3. Turn the vehicle to the ON mode.

-4. On the sensor side, measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate wheel speed sensor 2P connector (front): disconnected
B	Appropriate wheel speed sensor 4P connector (rear): disconnected
Test circuit 1	B
Test point 1	Appropriate wheel speed sensor 2P connector (male terminals) No. 1: ①
B	Appropriate wheel speed sensor 4P connector (male terminals) No. 3: ②
Test point 2	Body ground

Test circuit 2	B
Test point 1	Appropriate wheel speed sensor 2P connector (male terminals) No. 2: ①
B	Appropriate wheel speed sensor 4P connector (male terminals) No. 4: ②
Test point 2	Body ground





Is there 1 V or more?

YES

Replace the appropriate wheel speed sensor .

NO

Repair a short to power in the wire between the VSA modulator-control unit and the appropriate wheel speed sensor.

6. Shorted wire check (Wheel speed sensor lines wire to wire)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Appropriate wheel speed sensor 2P connector (front)
Appropriate wheel speed sensor 4P connector (rear)

   -3. Measure the resistance between the appropriate VSA modulator-control unit 46P connector wheel speed sensor +B and GND terminals (see table).

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate wheel speed sensor 2P connector (front): disconnected
B	Appropriate wheel speed sensor 4P connector (rear): disconnected

Connector	DTC	Test point 1	Test point 2
VSA modulator-control unit 46P connector	C0031-14 Left-front	No. 33	No. 42
	C0034-14 Right-front	No. 30	No. 35
	C0037-14 Left-rear	No. 17	No. 32
	C003A-14 Right-rear	No. 31	No. 15

Is there 1 MΩ or more?

YES

The wheel speed sensor wires are not shorted in the wires. Go to step 7.

NO

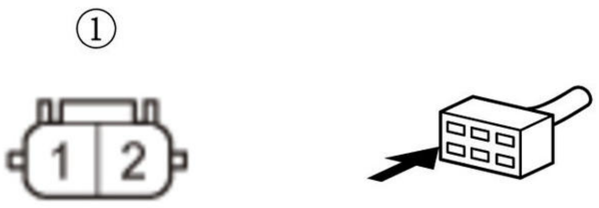
Repair a short in the wires between the VSA modulator-control unit and the appropriate wheel speed sensor.

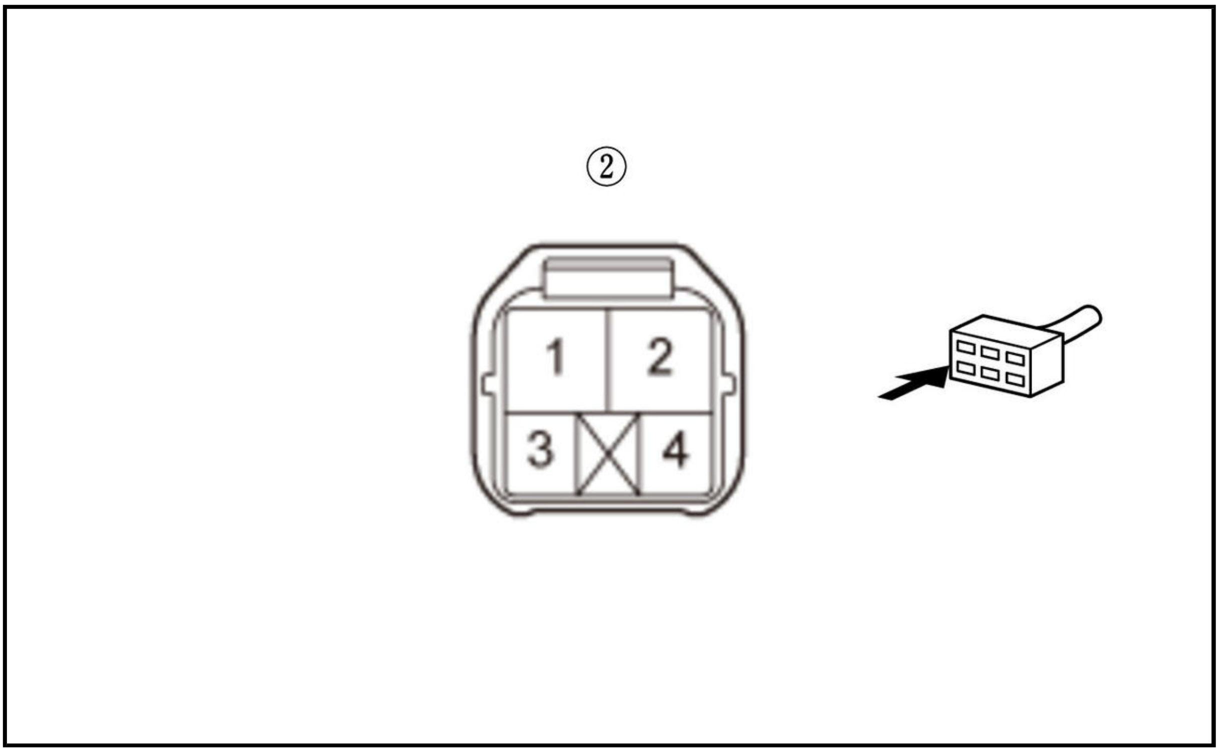
7. Open wire check (Wheel speed sensor lines) 1

-1. Measure the resistance between the appropriate VSA modulator-control unit 46P connector terminal and the appropriate wheel speed sensor connector terminal (see table).

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate wheel speed sensor 2P connector (front): disconnected
B	Appropriate wheel speed sensor 4P connector (rear): disconnected

DTC	**VSA modulator-control unit 46P connector**	**Appropriate Wheel Speed Sensor Connector Terminal**
C0031-14 Left-front	No. 33	Left-front wheel speed sensor 2P connector (female terminals) No. 1: ①
C0034-14 Right-front	No. 30	Right-front wheel speed sensor 2P connector (female terminals) No. 1: ①
C0037-14 Left-rear	No. 17	Left-rear wheel speed sensor 4P connector (female terminals) No. 3: ②
C003A-14 Right-rear	No. 31	Right-rear wheel speed sensor 4P connector (female terminals) No. 3: ②





Is there 1.0 Ω or less?

YES

Go to step 8.

NO

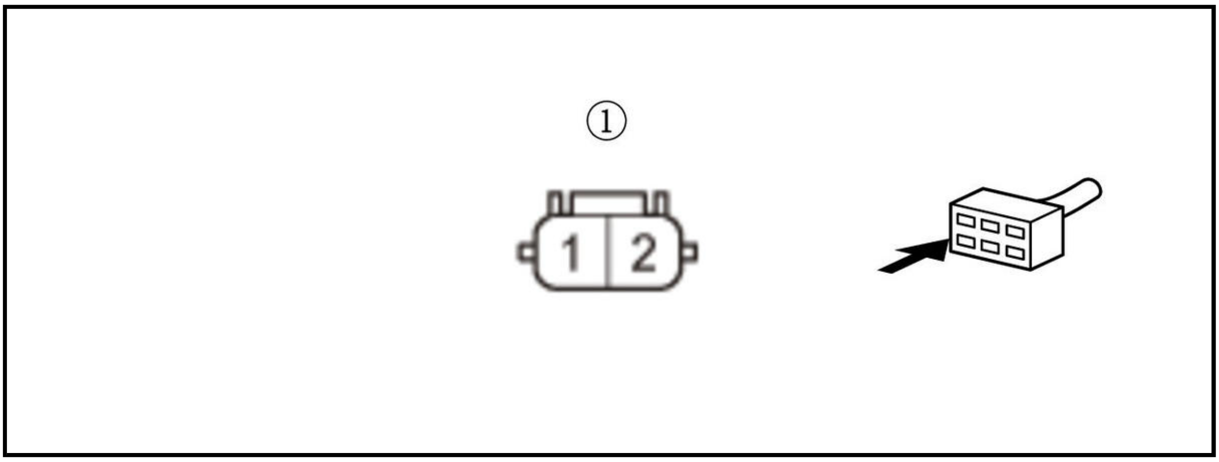
Repair an open in the wire between the VSA modulator-control unit and the appropriate wheel speed sensor.

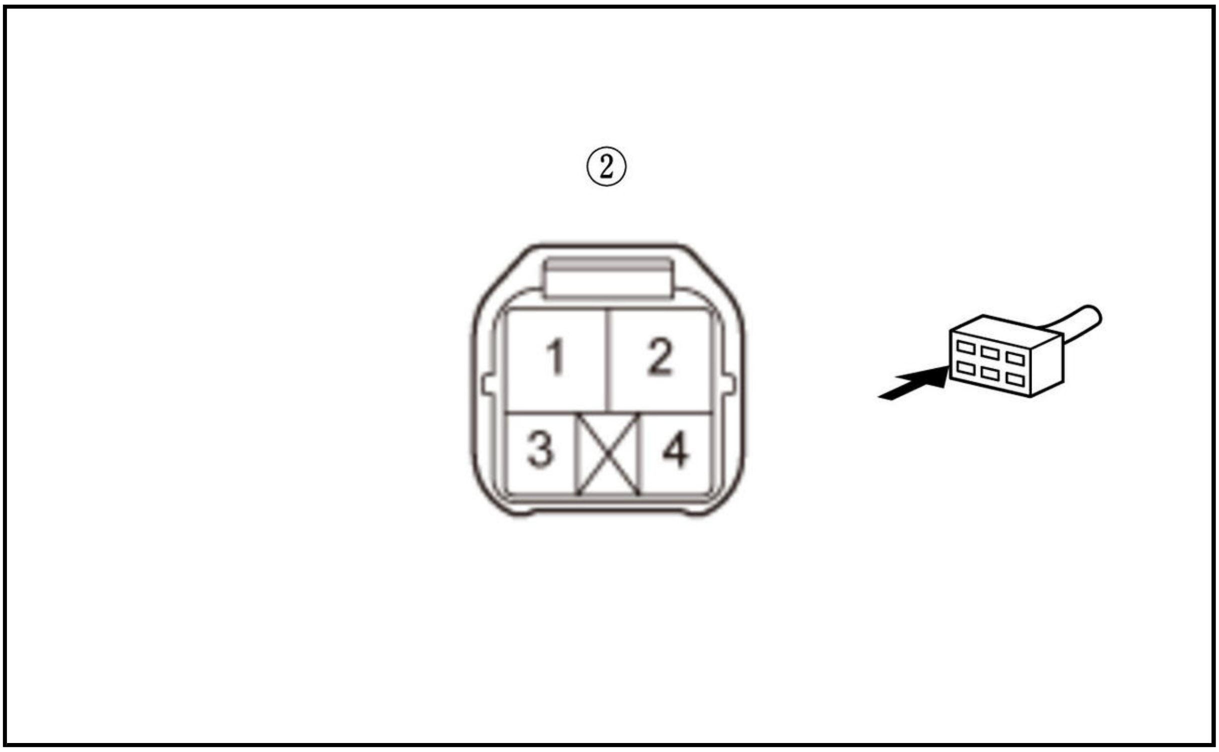
8. Open wire check (Wheel speed sensor lines) 2

-1. Measure the resistance between the appropriate VSA modulator-control unit 46P connector terminal and the appropriate wheel speed sensor connector terminal (see table).

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate wheel speed sensor 2P connector (front): disconnected
B	Appropriate wheel speed sensor 4P connector (rear): disconnected

DTC	**VSA modulator-control unit 46P connector**	**Appropriate Wheel Speed Sensor Connector Terminal**
C0031-14 Left-front	No. 42	Left-front wheel speed sensor 2P connector (female terminals) No. 2: ①
C0034-14 Right-front	No. 35	Right-front wheel speed sensor 2P connector (female terminals) No. 2: ①
C0037-14 Left-rear	No. 32	Left-rear wheel speed sensor 4P connector (female terminals) No. 4: ②
C003A-14 Right-rear	No. 15	Right-rear wheel speed sensor 4P connector (female terminals) No. 4: ②





Is there 1.0 Ω or less?

YES

The wheel speed sensor wires are OK. Go to step 9.

NO

Repair an open in the wire between the VSA modulator-control unit and the appropriate wheel speed sensor.

9. Wheel speed sensor(s) check

-1. **Substitute a known-good wheel speed sensor** .

DTC	Appropriate Wheel Speed Sensor
C0031-14	Left-front
C0034-14	Right-front
C0037-14	Left-rear
C003A-14	Right-rear

-2. Reconnect the following connectors.

VSA modulator-control unit 46P connector
Appropriate wheel speed sensor 2P connector (front)
Appropriate wheel speed sensor 4P connector (rear)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B	B

Is DTC C0031-14, C0034-14, C0037-14, or C003A-14 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Replace the original wheel speed sensor .

DTC C0031-3A, C0034-3A, C0037-3A, C003A-3A

DTC C0031-3A : Wheel Speed Sensor (Left Front) Signal Failure (Signal Frequency is Too High)

DTC C0034-3A : Wheel Speed Sensor (Right Front) Signal Failure (Signal Frequency is Too High)

DTC C0037-3A : Wheel Speed Sensor (Left Rear) Signal Failure (Signal Frequency is Too High)

DTC C003A-3A : Wheel Speed Sensor (Right Rear) Signal Failure (Signal Frequency is Too High)

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If the ABS and other indicators come on because of electrical noise, the indicators will go off when you test-drive the vehicle speed at 9 mph (15 km/h) or more and the noise is gone.

DTC Description	DTC
C0031-3A Wheel Speed Sensor (Left Front) Signal Failure (Signal Frequency is Too High)	B
C0034-3A Wheel Speed Sensor (Right Front) Signal Failure (Signal Frequency is Too High)	B
C0037-3A Wheel Speed Sensor (Left Rear) Signal Failure (Signal Frequency is Too High)	B
C003A-3A Wheel Speed Sensor (Right Rear) Signal Failure (Signal Frequency is Too High)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Test-drive the vehicle for 80 seconds or more.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0031-3A Wheel Speed Sensor (Left Front) Signal Failure (Signal Frequency is Too High)	B
C0034-3A Wheel Speed Sensor (Right Front) Signal Failure (Signal Frequency is Too High)	B
C0037-3A Wheel Speed Sensor (Left Rear) Signal Failure (Signal Frequency is Too High)	B
C003A-3A Wheel Speed Sensor (Right Rear) Signal Failure (Signal Frequency is Too High)	B

Is DTC C0031-3A, C0034-3A, C0037-3A, or C003A-3A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Wheel speed sensor installation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check that the appropriate wheel speed sensor is properly mounted** .

DTC	Appropriate Wheel Speed Sensor
C0031-3A	Left-front
C0034-3A	Right-front
C0037-3A	Left-rear
C003A-3A	Right-rear

Is the wheel speed sensor installation OK?

YES

Go to step 3.

NO

Reinstall the wheel speed sensor , and recheck its mounting position, then go to step 1.

3. Wheel speed sensor check

-1. **Substitute a known-good wheel speed sensor** .

DTC	Appropriate Wheel Speed Sensor
C0031-3A	Left-front

DTC	Appropriate Wheel Speed Sensor
C0034-3A	Right-front
C0037-3A	Left-rear
C003A-3A	Right-rear

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-5. Test-drive the vehicle for 80 seconds or more.

NOTE: Drive the vehicle on the road, not on a lift.

-6. Check for DTCs with the HDS.

DTC Description	DTC
C0031-3A Wheel Speed Sensor (Left Front) Signal Failure (Signal Frequency is Too High)	B
C0034-3A Wheel Speed Sensor (Right Front) Signal Failure (Signal Frequency is Too High)	B
C0037-3A Wheel Speed Sensor (Left Rear) Signal Failure (Signal Frequency is Too High)	B
C003A-3A Wheel Speed Sensor (Right Rear) Signal Failure (Signal Frequency is Too High)	B

Is DTC C0031-3A, C0034-3A, C0037-3A, or C003A-3A indicated?

YES

Go to step 4.

NO

Replace the original wheel speed sensor .

4. Magnetic encoder check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the appropriate magnetic encoder for damage, debris, and correct installation.

DTC	Appropriate Magnetic Encoder	Note
C0031-3A	Left-front	**Remove the driveshaft outboard joint from the appropriate wheel hub** .
C0034-3A	Right-front	
C0037-3A	Left-rear	**Remove the hub bearing unit** .
C003A-3A	Right-rear	

Is the magnetic encoder surface OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Clean the debris from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit. If the debris cannot be removed or the encoder is damaged, replace the appropriate **wheel bearing** or the **hub bearing unit** .

DTC C0031-62, C0034-62, C0037-62, C003A-62 (VSA CONTROL UNIT)

DTC C0031-62 : Left Front Wheel Speed Sensor Signal Compare Failure

DTC C0034-62 : Right Front Wheel Speed Sensor Signal Compare Failure

DTC C0037-62 : Left Rear Wheel Speed Sensor Signal Compare Failure

DTC C003A-62 : Right Rear Wheel Speed Sensor Signal Compare Failure

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C0031-62 Left Front Wheel Speed Sensor Signal Compare Failure	B
C0034-62 Right Front Wheel Speed Sensor Signal Compare Failure	B
C0037-62 Left Rear Wheel Speed Sensor Signal Compare Failure	B
C003A-62 Right Rear Wheel Speed Sensor Signal Compare Failure	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Test-drive the vehicle at 31 mph (50 km/h) or more.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0031-62 Left Front Wheel Speed Sensor Signal Compare Failure	B
C0034-62 Right Front Wheel Speed Sensor Signal Compare Failure	B
C0037-62 Left Rear Wheel Speed Sensor Signal Compare Failure	B
C003A-62 Right Rear Wheel Speed Sensor Signal Compare Failure	B

Is DTC C0031-62, C0034-62, C0037-62, or C003A-62 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Wheel speed sensor installation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check that the appropriate wheel speed sensor is properly mounted .

DTC	Appropriate Wheel Speed Sensor
C0031-62	Left-front
C0034-62	Right-front
C0037-62	Left-rear
C003A-62	Right-rear

Is the wheel speed sensor installation OK?

YES

Go to step 3.

NO

Reinstall the wheel speed sensor , and recheck the mounting position, then go to step 1.

3. Wheel speed sensor check

-1. Substitute a known-good wheel speed sensor .

DTC	Appropriate Wheel Speed Sensor
C0031-62	Left-front
C0034-62	Right-front
C0037-62	Left-rear
C003A-62	Right-rear

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-5. Test-drive the vehicle at 31 mph (50 km/h) or more.

NOTE: Drive the vehicle on the road, not on a lift.

-6. Check for DTCs with the HDS.

DTC Description	DTC
C0031-62 Left Front Wheel Speed Sensor Signal Compare Failure	B
C0034-62 Right Front Wheel Speed Sensor Signal Compare Failure	B
C0037-62 Left Rear Wheel Speed Sensor Signal Compare Failure	B
C003A-62 Right Rear Wheel Speed Sensor Signal Compare Failure	B

Is DTC C0031-62, C0034-62, C0037-62, or C003A-62 indicated?

YES

Go to step 4.

NO

Replace the original wheel speed sensor .

4. Magnetic encoder check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the appropriate magnetic encoder for damage, debris, and correct installation.

DTC	Appropriate Magnetic Encoder	Note
C0031-62	Left-front	Remove the driveshaft outboard joint from the appropriate wheel hub .
C0034-62	Right-front	
C0037-62	Left-rear	Remove the hub bearing unit .
C003A-62	Right-rear	

Is the magnetic encoder surface OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Clean the debris from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit. If the debris cannot be removed or the encoder is damaged, replace the appropriate wheel bearing or the hub bearing unit .

DTC C0040-12

DTC C0040-12 : Brake Light Switch Failure (Stuck ON)/Brake Pedal Stroke Sensor Stuck (EBB)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
C0040-12 Brake Light Switch Failure (Stuck ON)/Brake Pedal Stroke Sensor Stuck (EBB)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Test-drive the vehicle under these conditions:

- Vehicle speed at 9 mph (15 km/h) or more for at least 60 seconds
- Accelerator pedal pressed
- Brake pedal released

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0040-12 Brake Light Switch Failure (Stuck ON)/Brake Pedal Stroke Sensor Stuck (EBB)	B

Is DTC C0040-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

2. Brake pedal height check

-1. Check the brake pedal height .

Is the brake pedal height OK?

YES

Go to step 3.

NO

Adjust brake pedal height .

3. Brake pedal position switch performance check 1

-1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
BRAKE SWITCH	B	B

Does the signal change ON and OFF when the brake pedal is pressed and released?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Go to step 4.

4. Brake pedal position switch performance check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Brake pedal position switch 4P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
BRAKE SWITCH	B	B

Does the indicator change from ON to OFF?

YES

Replace the brake pedal position switch .

NO

Go to step 5.

5. Shorted wire check (STOP_SW line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Brake pedal position switch 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 26**
Test point 2	Body ground

Is there 0.1 V or more?

YES

Repair a short to power in the wire between the brake pedal position switch and the PCM.

NO

The STOP_SW wire is OK. Go to step 6.

6. PCM check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good PCM** .

-3. Reconnect the following connectors.

Brake pedal position switch 4P connector
PCM connector A (50P)

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-7. Test-drive the vehicle under these conditions:

- Vehicle speed at 9 mph (15 km/h) or more for at least 60 seconds
- Accelerator pedal pressed

- Brake pedal released

NOTE: Drive the vehicle on the road, not on a lift.

-8. Check for DTCs with the HDS.

DTC Description	DTC
C0040-12 Brake Light Switch Failure (Stuck ON)/Brake Pedal Stroke Sensor Stuck (EBB)	B

Is DTC C0040-12 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original PCM .

DTC C0040-16

DTC C0040-16 : Plausibility BLS vs. Pressure Sensor

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- **Troubleshoot any PGM-FI DTCs first** .

DTC Description	DTC
C0040-16 Plausibility BLS vs. Pressure Sensor	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Wait for 1 second or more without pressing the brake pedal.

-5. Press the brake pedal hard for 1 second or more.

-6. Check for DTCs with the HDS.

DTC Description	DTC
C0040-16 Plausibility BLS vs. Pressure Sensor	B

Is DTC C0040-16 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. VSA modulator-control unit performance check

-1. Check the parameter(s) below with the HDS.

NOTE: Do not press the brake pedal.

Signal	Current conditions	
	Values	Unit
BRAKE PRESSURE	B	B

Is there 10 MPa or less?

YES

Go to step 5.

NO

Go to step 3.

3. Brake pedal height check

-1. **Check the brake pedal height** .

Is the brake pedal height OK?

YES

Go to step 4.

NO

Adjust brake pedal height .

4. Brake drag check

-1. **Check for brake drag** .

Is the brake drag OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair a brake drag .

5. Brake pedal position switch performance check 1

-1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
BRAKE SWITCH	B	B

Does the signal change ON and OFF when the brake pedal is pressed and released?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Go to step 6.

6. Brake pedal position switch performance check 2

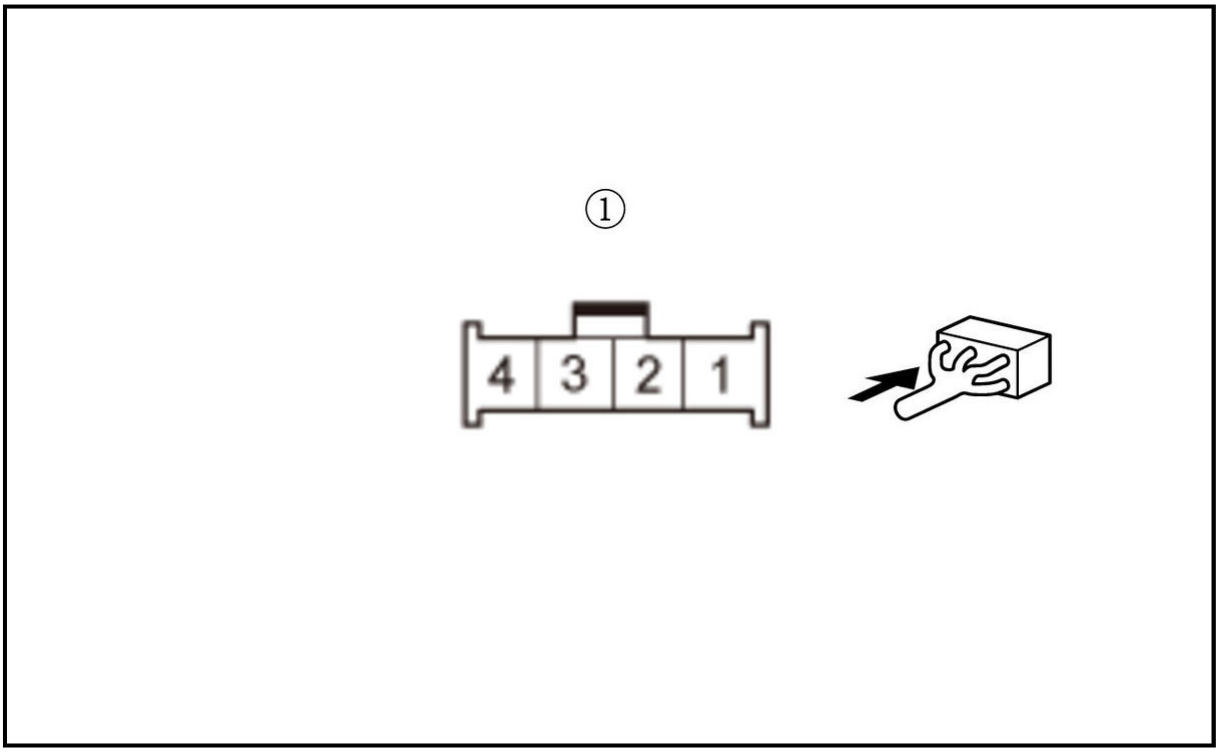
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Brake pedal position switch 4P connector

-3. Connect terminals 1 and 2 with a jumper wire.

Terminal 1	Brake pedal position switch 4P connector (female terminals) No. 1: ①
Terminal 2	Brake pedal position switch 4P connector (female terminals) No. 4: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
BRAKE SWITCH	B	B

Does it indicate ON?

YES

Replace the brake pedal position switch .

NO

Go to step 7.

7. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Check the following fuse.

Fuse	**No. A9**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 8.

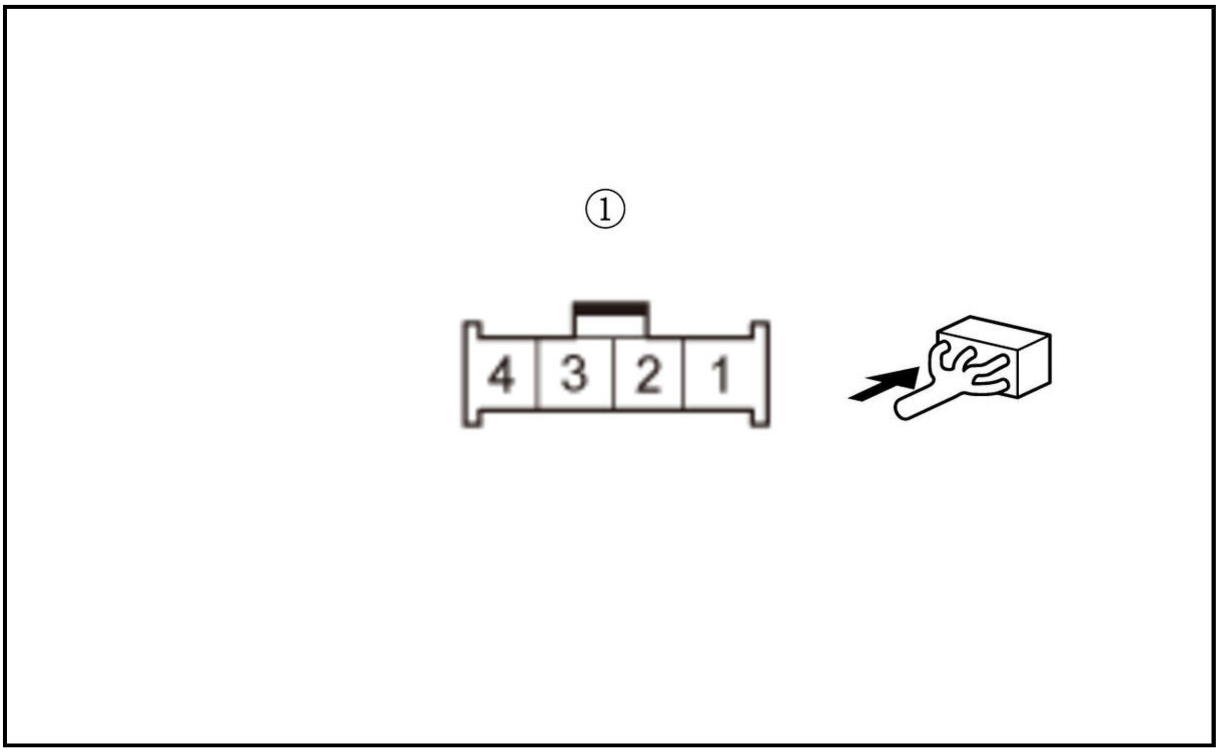
NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A9 fuse circuit.

8. Open wire check (+B_STOP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake pedal position switch 4P connector: disconnected
Test point 1	Brake pedal position switch 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B_STOP wire is OK. Go to step 9.

NO

Repair an open in the wire between the under-hood fuse/relay box and the brake pedal position switch.

9. Open wire check (STOP_SW line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

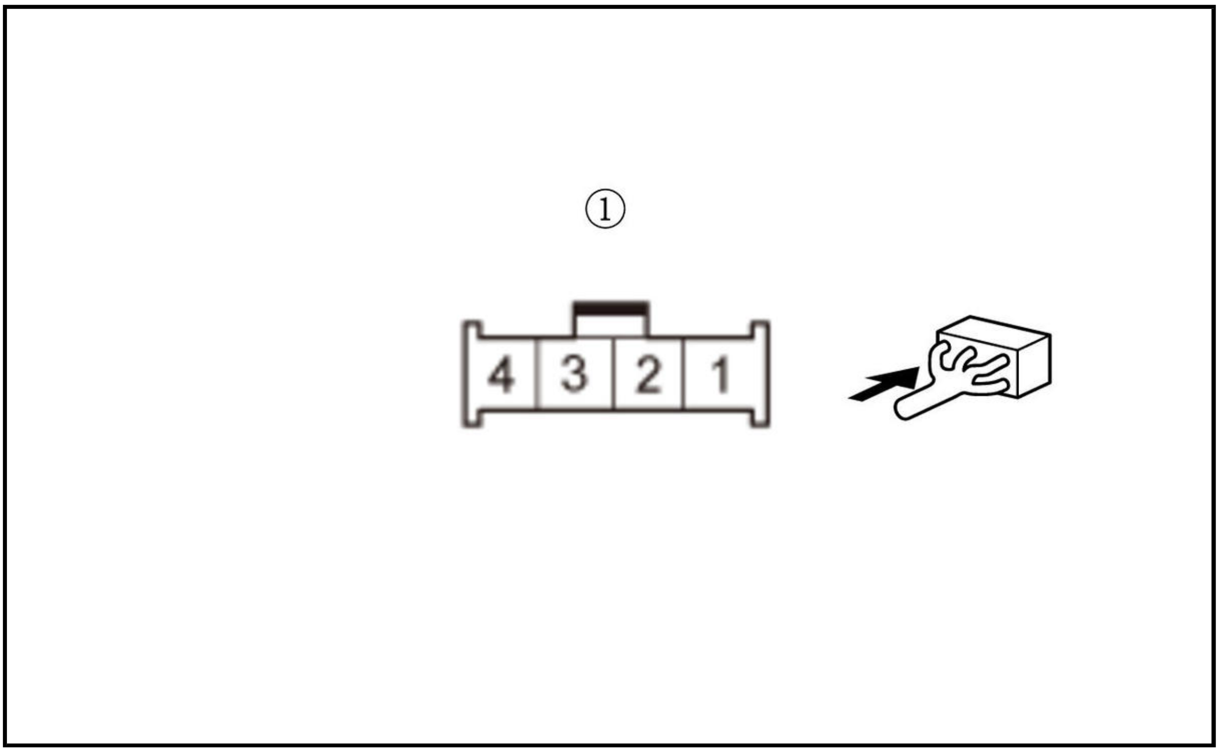
-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake pedal position switch 4P connector: disconnected
B	PCM connector A (50P): disconnected

Test point 1	**PCM connector A (50P) No. 26**
Test point 2	Brake pedal position switch 4P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The STOP_SW wire is OK. Go to step 10.

NO

Repair an open in the wire between the brake pedal position switch and the PCM.

10. PCM check

-1. **Substitute a known-good PCM** .

-2. Reconnect the following connectors.

Brake pedal position switch 4P connector
PCM connector A (50P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-6. Wait for 1 second or more without pressing the brake pedal.

-7. Press the brake pedal hard for 1 second or more.

-8. Check for DTCs with the HDS.

DTC Description	DTC
C0040-16 Plausibility BLS vs. Pressure Sensor	B

Is DTC C0040-16 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Replace the original PCM .

DTC C0044-49

DTC C0044-49 : Master Cylinder Pressure Sensor Failure (Internal Circuit Failure)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
C0044-49 Master Cylinder Pressure Sensor Failure (Internal Circuit Failure)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC
C0044-49 Master Cylinder Pressure Sensor Failure (Internal Circuit Failure)	B

Is DTC C0044-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

DTC C0044-62

DTC C0044-62 : Master Cylinder Pressure Sensor Failure (Signal Stuck)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
C0044-62 Master Cylinder Pressure Sensor Failure (Signal Stuck)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Test-drive the vehicle under these conditions:

- Vehicle speed at less than 9 mph (14 km/h) for at least 30 seconds
- Brake pedal released

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0044-62 Master Cylinder Pressure Sensor Failure (Signal Stuck)	B

Is DTC C0044-62 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

DTC C0049-7B

DTC C0049-7B : Brake Fluid Level Too Low

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- Bleeding the brake system while turn the vehicle to the ON mode can cause this DTC.

DTC Description	DTC
C0049-7B Brake Fluid Level Too Low	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Wait 60 seconds or more.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0049-7B Brake Fluid Level Too Low	B

Is DTC C0049-7B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Brake fluid level check

-1. Check the brake fluid level in the master cylinder reservoir.

Is the brake fluid level OK?

YES

Go to step 3.

NO

Check for worn brake pads or brake fluid leaks.

- **Inspect the brake lines and hoses for leaks** , and repair as needed.
- **Inspect the front brake pads** and replace worn out brake pads.
- **Inspect the rear brake pads** and replace worn out brake pads.
- Add brake fluid and recheck.

3. Gauge control module check 1

-1. Release the parking brake.

-2. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-3. Check the brake system indicator (red) in the gauge control module.

Does the indicator come on, then go off?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Go to step 4.

4. Gauge control module check 2

-1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
BRAKE FLUID LEVEL	B	B

Does the HDS indicate ENOUGH?

YES

Replace the gauge control module .

NO

Go to step 5.

5. Brake fluid level switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Brake fluid level switch 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
BRAKE FLUID LEVEL	B	B

Does the HDS indicate ENOUGH?

YES

Replace the brake fluid reservoir (brake fluid level switch is included) .

NO

Go to step 6.

6. Shorted wire check (BRAKE_LEVEL_SW line)

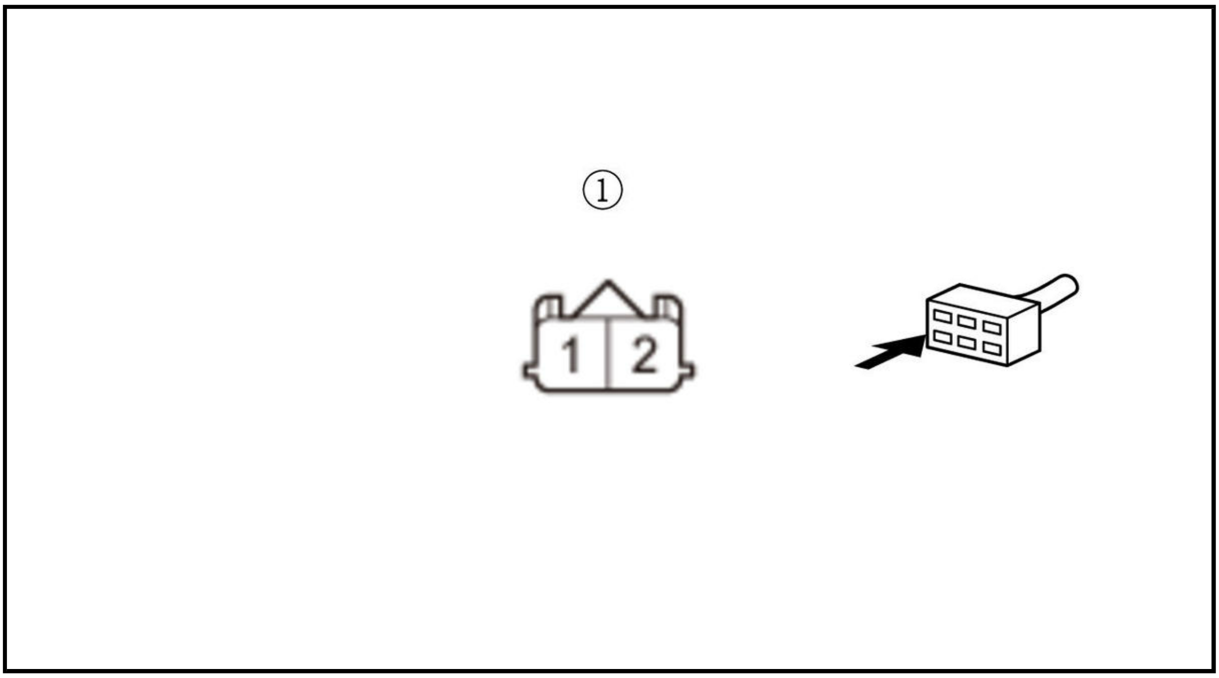
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake fluid level switch 2P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	Brake fluid level switch 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The BRAKE_LEVEL_SW wire is OK. **Replace the gauge control module** .

NO

Repair a short to body ground in the wire between the gauge control module and the brake fluid level switch.

DTC C0051-54 (VSA CONTROL UNIT)

DTC C0051-54 : Steering Angle Neutral Position Learning Incomplete

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C0051-54 Steering Angle Neutral Position Learning Incomplete	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
C0051-54 Steering Angle Neutral Position Learning Incomplete	B

Is DTC C0051-54 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. DTC check (EPS control unit)

-1. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Is DTC indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. VSA modulator-control unit check (VSA sensor neutral position memorization)

-1. **Do the VSA sensor neutral position memorization** .

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC
C0051-54 Steering Angle Neutral Position Learning Incomplete	B

Is DTC C0051-54 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Troubleshooting is complete.

DTC C0051-62, C0051-96

DTC C0051-62 : Steering Angle Sensor Failure (Signal Compare Failure)

DTC C0051-96 : Steering Angle Sensor Failure (Sensor Detects Internal Failure)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C0051-62 Steering Angle Sensor Failure (Signal Compare Failure)	B
C0051-96 Steering Angle Sensor Failure (Sensor Detects Internal Failure)	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Test-drive the vehicle under these conditions:

   - Vehicle speed at 45 mph (72 km/h) or more
   - Change lanes for a few times

   NOTE:

   - Drive the vehicle on the road, not on a lift.
   - Be careful of the surrounding traffic conditions.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
C0051-62 Steering Angle Sensor Failure (Signal Compare Failure)	B
C0051-96 Steering Angle Sensor Failure (Sensor Detects Internal Failure)	B

   Is DTC C0051-62 or C0051-96 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. DTC check (EPS control unit)

   -1. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Is DTC indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

DTC C0061-49, C0062-49, C0063-49

DTC C0061-49 : Acceleration Sensor Malfunction

DTC C0062-49 : Longitudinal Acceleration Sensor Malfunction

DTC C0063-49 : Yaw Rate Sensor Malfunction

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- The yaw rate-acceleration sensor is built into the SRS unit.
- Before troubleshooting, check the SRS unit for proper mounting. If not properly installed the VSA modulator-control unit may set these codes.

DTC Description	DTC
C0061-49 Acceleration Sensor Malfunction	B
C0062-49 Longitudinal Acceleration Sensor Malfunction	B
C0063-49 Yaw Rate Sensor Malfunction	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
C0061-49 Acceleration Sensor Malfunction	B
C0062-49 Longitudinal Acceleration Sensor Malfunction	B
C0063-49 Yaw Rate Sensor Malfunction	B

   Is DTC C0061-49, C0062-49, or C0063-49 indicated?

   YES

   The failure is duplicated. **Replace the SRS unit** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

DTC C0061-54, C0062-54, C0063-54

DTC C0061-54 : Lateral Acceleration Sensor Calibration Incomplete

DTC C0062-54 : Longitudinal Acceleration Sensor Neutral Position Not Learned/Calibration Incomplete

DTC C0063-54 : Yaw Rate Sensor Calibration Incomplete

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C0061-54 Lateral Acceleration Sensor Calibration Incomplete	B
C0062-54 Longitudinal Acceleration Sensor Neutral Position Not Learned/Calibration Incomplete	B

DTC Description	DTC
C0063-54 Yaw Rate Sensor Calibration Incomplete	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
C0061-54 Lateral Acceleration Sensor Calibration Incomplete	B
C0062-54 Longitudinal Acceleration Sensor Neutral Position Not Learned/Calibration Incomplete	B
C0063-54 Yaw Rate Sensor Calibration Incomplete	B

   Is DTC C0061-54, C0062-54, or C0063-54 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. SRS unit check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Substitute a known-good SRS unit** .

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -6. Check for DTCs with the HDS.

DTC Description	DTC
C0061-54 Lateral Acceleration Sensor Calibration Incomplete	B
C0062-54 Longitudinal Acceleration Sensor Neutral Position Not Learned/Calibration Incomplete	B
C0063-54 Yaw Rate Sensor Calibration Incomplete	B

   Is DTC C0061-54, C0062-54, or C0063-54 indicated?

   YES

   Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original SRS unit .

DTC C0061-62, C0062-62, C0063-62

DTC C0061-62 : Lateral Acceleration Sensor Failure (Signal Compare Failure)

DTC C0062-62 : Longitudinal Acceleration Sensor Failure (Signal Compare Failure)

DTC C0063-62 : Yaw Rate Sensor Failure (Signal Compare Failure)

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- The yaw rate-acceleration sensor is built into the SRS unit.
- Before troubleshooting, check the SRS unit for proper mounting. If not properly installed the VSA modulator-control unit may set these codes.

DTC Description	DTC
C0061-62 Lateral Acceleration Sensor Failure (Signal Compare Failure)	B
C0062-62 Longitudinal Acceleration Sensor Failure (Signal Compare Failure)	B
C0063-62 Yaw Rate Sensor Failure (Signal Compare Failure)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Test-drive the vehicle under these conditions:

- Vehicle speed at 31 mph (50 km/h) or more for at least 20 seconds
- Brake pedal released
- Change lanes for a few times

NOTE:

- Drive the vehicle on the road, not on a lift.
- Be careful of the surrounding traffic conditions.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0061-62 Lateral Acceleration Sensor Failure (Signal Compare Failure)	B

DTC Description	DTC
C0062-62 Longitudinal Acceleration Sensor Failure (Signal Compare Failure)	B
C0063-62 Yaw Rate Sensor Failure (Signal Compare Failure)	B

Is DTC C0061-62, C0062-62, or C0063-62 indicated?

YES

The failure is duplicated. Replace the SRS unit .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

DTC C1000-94

DTC C1000-94 : ABS/VSA Activation Time Too Long

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- A wheel bearing that is installed backwards can cause this DTC.

DTC Description	DTC
C1000-94 ABS/VSA Activation Time Too Long	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Test-drive the vehicle under these conditions:

- Vehicle speed at 31 mph (50 km/h) or more for at least 60 seconds
- Brake pedal released

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1000-94 ABS/VSA Activation Time Too Long	B

Is DTC C1000-94 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

2. Tire check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check all four tires for size, inflation, and wear .

Are all four tires the correct size, properly inflated, and worn evenly?

YES

Go to step 3.

NO

Swap the wheels and tires with a known-good set (the correct size, type, and properly inflated), then retest-drive the vehicle.

3. Wheel speed sensor performance check

-1. Test-drive the vehicle at 31 mph (50 km/h) or more in a straight line.

NOTE: Drive the vehicle on the road, not on a lift.

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
RIGHT FRONT WHEEL SPEED	B	B
LEFT FRONT WHEEL SPEED	B	B
RIGHT REAR WHEEL SPEED	B	B
LEFT REAR WHEEL SPEED	B	B

Is any one of the four values different?

YES

Go to step 4.

NO

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

4. Wheel speed sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good wheel speed sensor** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-6. Test-drive the vehicle under these conditions:

- Vehicle speed at 31 mph (50 km/h) or more for at least 60 seconds
- Brake pedal released

NOTE: Drive the vehicle on the road, not on a lift.

-7. Check for DTCs with the HDS.

DTC Description	DTC
C1000-94 ABS/VSA Activation Time Too Long	B

Is DTC C1000-94 indicated?

YES

Go to step 5.

NO

Replace the original wheel speed sensor .

5. Magnetic encoder check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the magnetic encoder for damage, debris, and correct installation.

Appropriate Magnetic Encoder	Note
Left-front	**Remove the driveshaft outboard joint from the appropriate wheel hub** .
Right-front	
Left-rear	**Remove the hub bearing unit** .
Right-rear	

Is the magnetic encoder surface OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Clean the debris from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit. If the debris cannot be removed or the encoder is damaged, replace the appropriate **wheel bearing** or the **hub bearing unit** .

DTC C1020-49, C1021-49

DTC C1020-49 : VSA Master Cut Valve Failure (Unexpected Operation)

DTC C1021-49 : VSA Suction Valve Failure (Unexpected Operation)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1020-49 VSA Master Cut Valve Failure (Unexpected Operation)	B
C1021-49 VSA Suction Valve Failure (Unexpected Operation)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Wait 20 seconds or more.

-5. Test-drive the vehicle at 9 mph (15 km/h) or more.

NOTE: Drive the vehicle on the road, not on a lift.

-6. Check for DTCs with the HDS.

DTC Description	DTC
C1020-49 VSA Master Cut Valve Failure (Unexpected Operation)	B
C1021-49 VSA Suction Valve Failure (Unexpected Operation)	B

Is DTC C1020-49 or C1021-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

DTC C1040-00 (VSA CONTROL UNIT)

DTC C1040-00 : Different Diameter Tire is Detected

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1040-00 Different Diameter Tire is Detected	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1040-00 Different Diameter Tire is Detected	B

Is DTC C1040-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Tire check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check all four tires for size, inflation, and wear .

Are all four tires the correct size, properly inflated, and worn evenly?

YES

Go to step 3.

NO

Swap the wheels and tires with a known-good set (the correct size, type, and properly inflated), then retest-drive the vehicle.

3. Wheel speed sensor performance check

-1. Test-drive the vehicle at 12 mph (20 km/h) or more in a straight line.

NOTE: Drive the vehicle on the road, not on a lift.

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
RIGHT FRONT WHEEL SPEED	B	B
LEFT FRONT WHEEL SPEED	B	B
RIGHT REAR WHEEL SPEED	B	B
LEFT REAR WHEEL SPEED	B	B

Is any one of the four values different?

YES

Go to step 4.

NO

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

4. Wheel speed sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Substitute a known-good wheel speed sensor .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-6. Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds.

NOTE: Drive the vehicle on the road, not on a lift.

-7. Check for DTCs with the HDS.

DTC Description	DTC
C1040-00 Different Diameter Tire is Detected	B

Is DTC C1040-00 indicated?

YES

Go to step 5.

NO

Replace the original wheel speed sensor .

5. Magnetic encoder check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the magnetic encoder for damage, debris, and correct installation.

Appropriate Magnetic Encoder	Note
Left-front	**Remove the driveshaft outboard joint from the appropriate wheel hub** .
Right-front	
Left-rear	**Remove the hub bearing unit** .
Right-rear	

Is the magnetic encoder surface OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Clean the debris from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit. If the debris cannot be removed or the encoder is damaged, replace the appropriate **wheel bearing** or the **hub bearing unit** .

DTC C1041-00, C1042-00, C1043-00, C1044-00

DTC C1041-00 : Right Front Wheel Abnormal Slip Detection

DTC C1042-00 : Left Front Wheel Abnormal Slip Detection

DTC C1043-00 : Right Rear Wheel Abnormal Slip Detection

DTC C1044-00 : Left Rear Wheel Abnormal Slip Detection

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1041-00 Right Front Wheel Abnormal Slip Detection	B
C1042-00 Left Front Wheel Abnormal Slip Detection	B
C1043-00 Right Rear Wheel Abnormal Slip Detection	B
C1044-00 Left Rear Wheel Abnormal Slip Detection	B

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1041-00 Right Front Wheel Abnormal Slip Detection	B
C1042-00 Left Front Wheel Abnormal Slip Detection	B
C1043-00 Right Rear Wheel Abnormal Slip Detection	B
C1044-00 Left Rear Wheel Abnormal Slip Detection	B

Is DTC C1041-00, C1042-00, C1043-00, or C1044-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Tire check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check all four tires for size, inflation, and wear** .

Are all four tires the correct size, properly inflated, and worn evenly?

YES

Go to step 3.

NO

Swap the wheels and tires with a known-good set (the correct size, type, and properly inflated), then retest-drive the vehicle.

3. Wheel speed sensor performance check

-1. Test-drive the vehicle at 12 mph (20 km/h) or more in a straight line.

NOTE: Drive the vehicle on the road, not on a lift.

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
RIGHT FRONT WHEEL SPEED	B	B

Signal	Current conditions	
	Values	Unit
LEFT FRONT WHEEL SPEED	B	B
RIGHT REAR WHEEL SPEED	B	B
LEFT REAR WHEEL SPEED	B	B

Is any one of the four values different?

YES

Go to step 4.

NO

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

4. Wheel speed sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good wheel speed sensor** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-6. Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds.

NOTE: Drive the vehicle on the road, not on a lift.

-7. Check for DTCs with the HDS.

DTC Description	DTC
C1041-00 Right Front Wheel Abnormal Slip Detection	B
C1042-00 Left Front Wheel Abnormal Slip Detection	B
C1043-00 Right Rear Wheel Abnormal Slip Detection	B
C1044-00 Left Rear Wheel Abnormal Slip Detection	B

Is DTC C1041-00, C1042-00, C1043-00, or C1044-00 indicated?

YES

Go to step 5.

NO

Replace the original wheel speed sensor .

5. Magnetic encoder check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Inspect the magnetic encoder for damage, debris, and correct installation.

Appropriate Magnetic Encoder	Note
Left-front	**Remove the driveshaft outboard joint from the appropriate wheel hub** .
Right-front	
Left-rear	**Remove the hub bearing unit** .
Right-rear	

Is the magnetic encoder surface OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Clean the debris from the appropriate magnetic encoder surface on the wheel bearing or the hub bearing unit. If the debris cannot be removed or the encoder is damaged, replace the appropriate **wheel bearing** or the **hub bearing unit** .

DTC C1100-48

DTC C1100-48 : Electric Parking Brake Abnormal Operation Monitoring

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1100-48 Electric Parking Brake Abnormal Operation Monitoring	B

DTC (VSA)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Wait 30 seconds or more.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B	B

Is DTC C1100-48 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Go to indicated DTC's troubleshooting.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

DTC C1100-54

DTC C1100-54 : Piston Position Not Learned

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1100-54 Piston Position Not Learned	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC
C1100-54 Piston Position Not Learned	B

Is DTC C1100-54 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Piston position learn operation check

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-3. Apply and release the parking brake several times.

-4. Check for DTCs with the HDS.

DTC Description	DTC
C1100-54 Piston Position Not Learned	B

Is DTC C1100-54 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Troubleshooting is complete.

DTC C1100-94

DTC C1100-94 : Electric Parking Brake Actuator Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1100-94 Electric Parking Brake Actuator Malfunction	B

DTC (VSA)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Apply and release the parking brake several times.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   Is DTC C1100-94 indicated?

   YES

   The failure is duplicated. Go to step 2.

   YES

   If DTC C1110-11, C1110-13, C1110-79, C1110-94, C1110-96, C1111-11, C1111-13, C1111-79, C1111-94, or C1111-96 is also indicated, **go to indicated DTCs troubleshooting** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Electric parking brake actuator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Substitute a known-good electric parking brake actuator** .

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -6. Apply and release the parking brake several times.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
C1100-94 Electric Parking Brake Actuator Malfunction	B

Is DTC C1100-94 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the appropriate electric parking brake actuator .

DTC C1100-98

DTC C1100-98 : Electric Parking Brake Continuous Operations Detected

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- This DTC is set when repeated use of the electric parking brake function causes electric parking brake actuator overheating. The code can be cleared with the HDS once the electric parking brake actuator has cooled.

DTC Description	DTC
C1100-98 Electric Parking Brake Continuous Operations Detected	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then wait for 5 minutes or more.

   -4. Turn the vehicle to the ON mode.

   -5. Apply and release the parking brake several times.

   -6. Check for DTCs with the HDS.

DTC Description	DTC
C1100-98 Electric Parking Brake Continuous Operations Detected	B

Is DTC C1100-98 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Electric parking brake actuator check (Left side)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good left-rear electric parking brake actuator** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then wait for 5 minutes or more.

-6. Turn the vehicle to the ON mode.

-7. Apply and release the parking brake several times.

-8. Check for DTCs with the HDS.

DTC Description	DTC
C1100-98 Electric Parking Brake Continuous Operations Detected	B

Is DTC C1100-98 indicated?

YES

Go to step 3.

NO

Replace the original left-rear electric parking brake actuator .

3. Electric parking brake actuator check (Right side)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Reinstall the original left-rear electric parking brake actuator** .

-3. **Substitute a known-good right-rear electric parking brake actuator** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode, then wait for 5 minutes or more.

-7. Turn the vehicle to the ON mode.

-8. Apply and release the parking brake several times.

-9. Check for DTCs with the HDS.

DTC Description	DTC
C1100-98 Electric Parking Brake Continuous Operations Detected	B

Is DTC C1100-98 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original right-rear electric parking brake actuator .

DTC C1110-11, C1111-11

DTC C1110-11 : Left Rear Electric Parking Brake Actuator Circuit Short to Ground

DTC C1111-11 : Right Rear Electric Parking Brake Actuator Circuit Short to Ground

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
C1110-11 Left Rear Electric Parking Brake Actuator Circuit Short to Ground	B
C1111-11 Right Rear Electric Parking Brake Actuator Circuit Short to Ground	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Apply and release the parking brake several times.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1110-11 Left Rear Electric Parking Brake Actuator Circuit Short to Ground	B

DTC Description	DTC
C1111-11 Right Rear Electric Parking Brake Actuator Circuit Short to Ground	B

Is DTC C1110-11 or C1111-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

2. Shorted wire check (EPB_L_ACT+, EPB_R_ACT+ lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
Appropriate electric parking brake actuator 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate electric parking brake actuator 4P connector: disconnected

DTC	Test point 1	Test point 2
C1110-11	**VSA modulator-control unit 46P connector No. 8**	Body ground
C1111-11	**VSA modulator-control unit 46P connector No. 5**	Body ground

Is there 1 MΩ or more?

YES

The EPB_L_ACT+ and EPB_R_ACT+ wires are OK. Go to step 3.

NO

Repair a short to body ground in the wires between the VSA modulator-control unit and the appropriate electric parking brake actuator.

3. Shorted wire check (EPB_L_ACT-, EPB_R_ACT- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate electric parking brake actuator 4P connector: disconnected

DTC	Test point 1	Test point 2
C1110-11	**VSA modulator-control unit 46P connector No. 7**	Body ground
C1111-11	**VSA modulator-control unit 46P connector No. 6**	Body ground

Is there 1 MΩ or more?

YES

Go to step 4.

NO

Repair a short to body ground in the wires between the VSA modulator-control unit and the appropriate electric parking brake actuator.

4. Electric parking brake actuator check

-1. **Substitute a known-good electric parking brake actuator** .

-2. Reconnect the following connectors.

VSA modulator-control unit 46P connector
Appropriate electric parking brake actuator 4P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Apply and release the parking brake several times.

-7. Check for DTCs with the HDS.

DTC Description	DTC
C1110-11 Left Rear Electric Parking Brake Actuator Circuit Short to Ground	B
C1111-11 Right Rear Electric Parking Brake Actuator Circuit Short to Ground	B

Is DTC C1110-11 or C1111-11 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the appropriate electric parking brake actuator .

DTC C1110-13, C1111-13

DTC C1110-13 : Left Rear Electric Parking Brake Actuator Circuit Open

DTC C1111-13 : Right Rear Electric Parking Brake Actuator Circuit Open

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1110-13 Left Rear Electric Parking Brake Actuator Circuit Open	B
C1111-13 Right Rear Electric Parking Brake Actuator Circuit Open	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Apply and release the parking brake several times.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1110-13 Left Rear Electric Parking Brake Actuator Circuit Open	B
C1111-13 Right Rear Electric Parking Brake Actuator Circuit Open	B

Is DTC C1110-13 or C1111-13 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Open wire check (EPB_L_ACT+, EPB_L_ACT-, EPB_R_ACT+, EPB_R_ACT- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

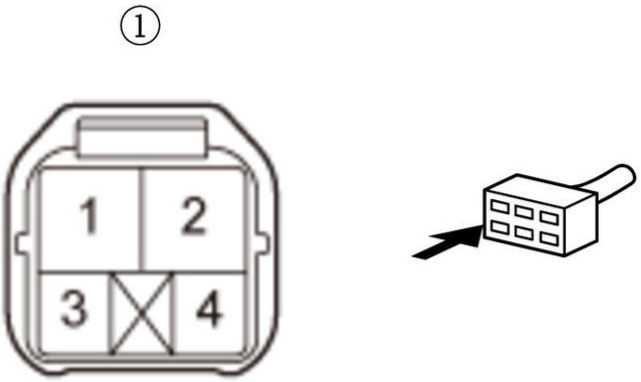
-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
Appropriate electric parking brake actuator 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Appropriate electric parking brake actuator 4P connector: disconnected

DTC	Test point 1	Test point 2
C1110-13	**VSA modulator-control unit 46P connector No. 8**	Left-rear electric parking brake actuator 4P connector (female terminals) No. 1: ①
	VSA modulator-control unit 46P connector No. 7	Left-rear electric parking brake actuator 4P connector (female terminals) No. 2: ①
C1111-13	**VSA modulator-control unit 46P connector No. 5**	Right-rear electric parking brake actuator 4P connector (female terminals) No. 1: ①
	VSA modulator-control unit 46P connector No. 6	Right-rear electric parking brake actuator 4P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Go to step 3.

NO

Repair an open in the wire between the VSA modulator-control unit and the appropriate electric parking brake actuator.

3. Electric parking brake actuator check

-1. **Substitute a known-good electric parking brake actuator** .

-2. Reconnect the following connectors.

VSA modulator-control unit 46P connector
Appropriate electric parking brake actuator 4P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Apply and release the parking brake several times.

-7. Check for DTCs with the HDS.

DTC Description	DTC
C1110-13 Left Rear Electric Parking Brake Actuator Circuit Open	B
C1111-13 Right Rear Electric Parking Brake Actuator Circuit Open	B

Is DTC C1110-13 or C1111-13 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the appropriate electric parking brake actuator .

DTC C1110-79, C1111-79

DTC C1110-79 : Left Side Electric Parking Brake Doesn't Work Correctly

DTC C1111-79 : Right Side Electric Parking Brake Doesn't Work Correctly

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1110-79 Left Side Electric Parking Brake Doesn't Work Correctly	B
C1111-79 Right Side Electric Parking Brake Doesn't Work Correctly	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Apply and release the parking brake several times.

-5. Wait 35 seconds or more.

-6. Check for DTCs with the HDS.

DTC Description	DTC
C1110-79 Left Side Electric Parking Brake Doesn't Work Correctly	B
C1111-79 Right Side Electric Parking Brake Doesn't Work Correctly	B

Is DTC C1110-79 or C1111-79 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Rear brake component parts check (brake caliper, brake pad, brake disc, and electric parking brake actuator)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check that the appropriate rear brake component parts are properly mounted.

Is the rear brake component parts installation OK?

YES

Go to step 3.

NO

Reinstall the rear brake component parts, then recheck.

3. Electric parking brake actuator check

-1. **Substitute a known-good electric parking brake actuator** .

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-5. Apply and release the parking brake several times.

-6. Wait 35 seconds or more.

-7. Check for DTCs with the HDS.

DTC Description	DTC
C1110-79 Left Side Electric Parking Brake Doesn't Work Correctly	B
C1111-79 Right Side Electric Parking Brake Doesn't Work Correctly	B

Is DTC C1110-79 or C1111-79 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original electric parking brake actuator .

DTC C1110-94

DTC C1110-94 : Left Side Electric Parking Brake Actuator Unexpected Operation

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1110-94 Left Side Electric Parking Brake Actuator Unexpected Operation	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Apply and release the parking brake several times.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
C1110-94 Left Side Electric Parking Brake Actuator Unexpected Operation	B

   Is DTC C1110-94 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Electric parking brake actuator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Substitute a known-good left-rear electric parking brake actuator** .

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Apply and release the parking brake several times.

-7. Check for DTCs with the HDS.

DTC Description	DTC
C1110-94 Left Side Electric Parking Brake Actuator Unexpected Operation	B

Is DTC C1110-94 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original left-rear electric parking brake actuator .

DTC C1110-96, C1111-96

DTC C1110-96 : Left Side Electric Parking Brake Actuator Malfunction

DTC C1111-96 : Right Side Electric Parking Brake Actuator Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1110-96 Left Side Electric Parking Brake Actuator Malfunction	B
C1111-96 Right Side Electric Parking Brake Actuator Malfunction	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Apply and release the parking brake several times.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1110-96 Left Side Electric Parking Brake Actuator Malfunction	B
C1111-96 Right Side Electric Parking Brake Actuator Malfunction	B

Is DTC C1110-96 or C1111-96 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Rear brake component parts installation check (brake caliper, brake pad, brake disc, and electric parking brake actuator)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check that the appropriate rear brake component parts are properly mounted.

   Is the rear brake component parts installation OK?

   YES

   Go to step 3.

   NO

   Reinstall the rear brake component parts, then recheck.

3. Electric parking brake actuator check

   -1. **Substitute a known-good electric parking brake actuator** .

   -2. Turn the vehicle to the ON mode.

   -3. Clear the DTC with the HDS.

   -4. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -5. Apply and release the parking brake several times.

   -6. Check for DTCs with the HDS.

DTC Description	DTC
C1110-96 Left Side Electric Parking Brake Actuator Malfunction	B
C1111-96 Right Side Electric Parking Brake Actuator Malfunction	B

   Is DTC C1110-96 or C1111-96 indicated?

   YES

   Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

   NO

   Replace the appropriate electric parking brake actuator .

DTC C1111-94

DTC C1111-94 : Right Side Electric Parking Brake Actuator Unexpected Operation

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1111-94 Right Side Electric Parking Brake Actuator Unexpected Operation	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Apply and release the parking brake several times.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1111-94 Right Side Electric Parking Brake Actuator Unexpected Operation	B

Is DTC C1111-94 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Electric parking brake actuator check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good right-rear electric parking brake actuator** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Apply and release the parking brake several times.

-7. Check for DTCs with the HDS.

DTC Description	DTC
C1111-94 Right Side Electric Parking Brake Actuator Unexpected Operation	B

Is DTC C1111-94 indicated?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the original right-rear electric parking brake actuator .

DTC C1120-14

DTC C1120-14 : Electric Parking Brake Switch Circuit Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
C1120-14 Electric Parking Brake Switch Circuit Malfunction	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC
C1120-14 Electric Parking Brake Switch Circuit Malfunction	B

Is DTC C1120-14 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Electric parking brake switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check the electric parking brake switch** .

Is the electric parking brake switch OK?

YES

Go to step 3.

NO

Replace the electric parking brake/automatic brake hold switch .

3. Shorted wire check (SW lines)

-1. Disconnect the following connectors.

VSA modulator-control unit 46P connector
Electric parking brake/automatic brake hold switch 12P connector

-2. Measure the resistance between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected

Connector	Test circuit	Test point 1	Test point 2
VSA modulator-control unit 46P connector	SW1	No. 9	Body ground
	SW3	No. 24	
	SW4	No. 10	
	SW6	No. 25	

Is there 1 MΩ or more?

YES

The SW wires are not shorted. Go to step 4.

NO

Repair a short to body ground in the wires between the VSA modulator-control unit and the electric parking brake/automatic brake hold switch.

4. Open wire check (SW lines)

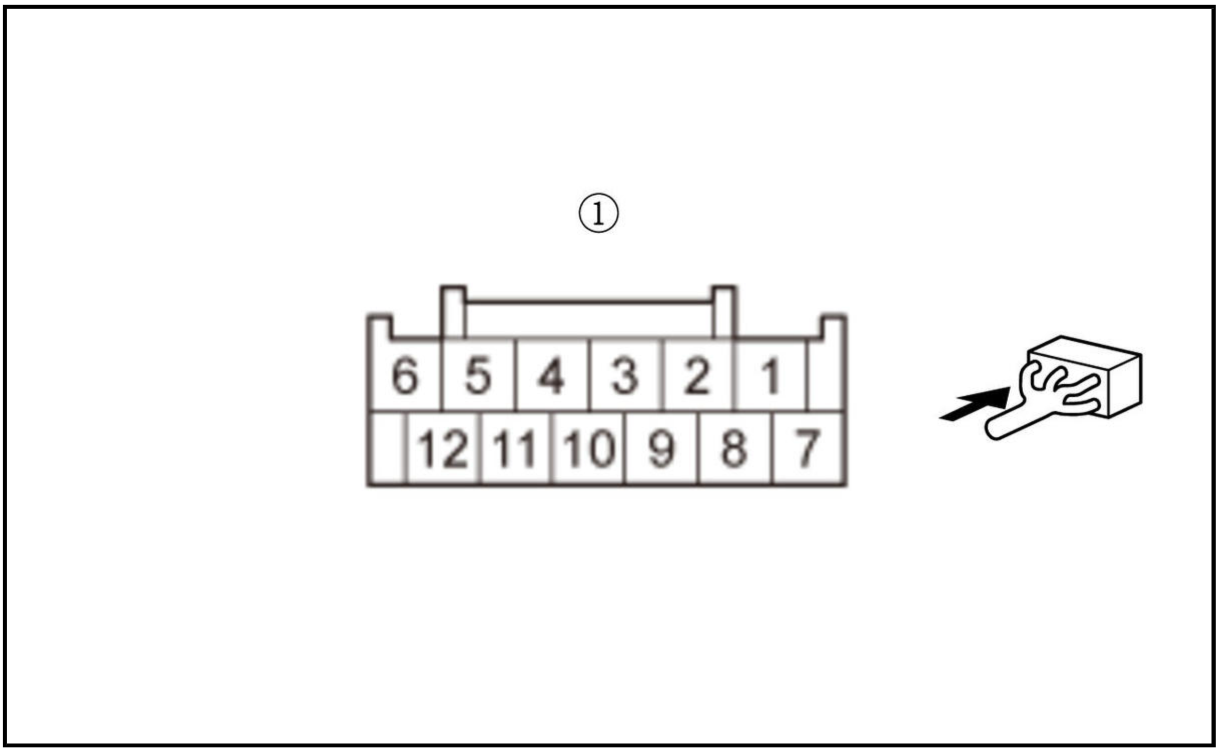
-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 9**
Test point 2	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 4: ①

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 24**
Test point 2	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 1: ①

Test circuit 3	B
Test point 1	**VSA modulator-control unit 46P connector No. 10**
Test point 2	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 2: ①

Test circuit 4	B
Test point 1	**VSA modulator-control unit 46P connector No. 25**
Test point 2	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

The SW wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wires between the VSA modulator-control unit and the electric parking brake/automatic brake hold switch.

DTC C1120-96

DTC C1120-96 : Electric Parking Brake Switch Malfunction

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- This DTC is detected when operating the electric parking brake switch continuously for more than 20 seconds.
- Check that electric parking brake/automatic brake hold switch is free of dirt and other foreign particles.

DTC Description	DTC
C1120-96 Electric Parking Brake Switch Malfunction	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Wait 5 minutes or more.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1120-96 Electric Parking Brake Switch Malfunction	B

Is DTC C1120-96 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Electric parking brake switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check the electric parking brake switch** .

Is the electric parking brake switch OK?

YES

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace the electric parking brake/automatic brake hold switch .

DTC P0562 (94) (TRACTION MOTOR CONTROL MODULE)

DTC P0562 : Traction Motor Control Module System Voltage Low

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0562 troubleshoot those DTCs first, then recheck for P0562
-
    - P0AE1, P0DA8, P1D65

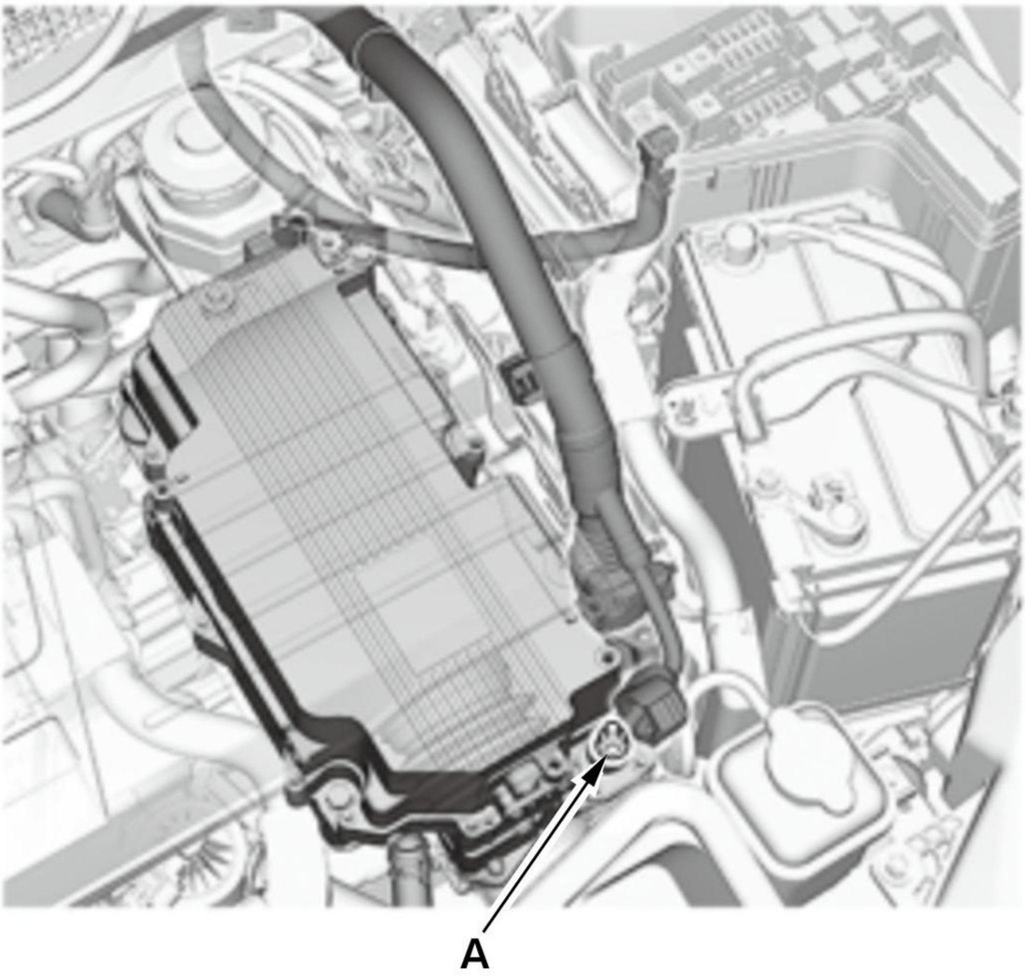
DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0562 Traction Motor Control Module System Voltage Low	B	B	B

DTC (Electric Powertrain)

1. Battery power cable check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the +B terminal (A) at the PCU.



Is there battery voltage?

YES

Go to step 2.

NO

Replace the battery power cable .

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0562 Traction Motor Control Module System Voltage Low	B	B	B

Is DTC P0562 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0602 (310) (GENERATOR MOTOR CONTROL MODULE)

DTC P0602 : Generator Motor Control Module Programming Error

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0602 Generator Motor Control Module Programming Error	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Do the motor control module update procedure .

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0602 Generator Motor Control Module Programming Error	B	B	B

Is DTC P0602 indicated?

YES

Replace the PCU .

NO

The update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0602 (91) (TRACTION MOTOR CONTROL MODULE)

DTC P0602 : Traction Motor Control Module Programming Error

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0602 Traction Motor Control Module Programming Error	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. **Do the motor control module update procedure** .

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0602 Traction Motor Control Module Programming Error	B	B	B

   Is DTC P0602 indicated?

   YES

   Replace the PCU .

   NO

   The update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P061B (MOTOR CONTROL MODULE)

DTC P061B : Traction Motor Control Module Torque Calculation Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P061B, troubleshoot those DTCs first, then recheck for P061B.
-
  - P1A54, P1A55

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P061B Traction Motor Control Module Torque Calculation Performance	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are DTC P061B and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Update the motor control module if it does not have the latest software .

DTC P062F (308) (GENERATOR MOTOR CONTROL MODULE)

DTC P062F : Generator Motor Control Module EEPROM Error

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P062F Generator Motor Control Module EEPROM Error	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P062F Generator Motor Control Module EEPROM Error	B	B	B

Is DTC P062F indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P062F (60) (TRACTION MOTOR CONTROL MODULE)

DTC P062F : Traction Motor Control Module EEPROM Error

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P062F Traction Motor Control Module EEPROM Error	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P062F Traction Motor Control Module EEPROM Error	B	B	B

   Is DTC P062F indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0634 (425)

DTC P0634 : PCU Internal Temperature Too High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0634 PCU Internal Temperature Too High	B	B	B

DTC (Electric Powertrain)

1. Cooling system check

   -1. **Do the PCU coolant circuit inspection** .

   Is it OK?

   YES

   Go to step 2.

   NO

   Repair or replace parts as needed.

2. Problem verification

-1. Test-drive the vehicle in the range of the recorded freeze data parameters.

Freeze Data

-2. Monitor the OBD STATUS for DTC P0634 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0634 PCU Internal Temperature Too High	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until the status changes. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P06B1 (353), P06B1 (356), P06B4 (354), P06B4 (357), P06E7 (355), P06E7 (358) (GENERATOR MOTOR CONTROL MODULE)

DTC P06B1 : Traction Motor Phase Current Sensor Power Supply Circuit Low (Phase U)

DTC P06B1 : Generator Motor Phase Current Sensor Power Supply Circuit Low (Phase U)

DTC P06B4 : Traction Motor Phase Current Sensor Power Supply Circuit Low (Phase V)

DTC P06B4 : Generator Motor Phase Current Sensor Power Supply Circuit Low (Phase V)

DTC P06E7 : Traction Motor Phase Current Sensor Power Supply Circuit Low (Phase W)

DTC P06E7 : Generator Motor Phase Current Sensor Power Supply Circuit Low (Phase W)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P06B1 Traction Motor Phase Current Sensor Power Supply Circuit Low (Phase U)	B	B	B
P06B1 Generator Motor Phase Current Sensor Power Supply Circuit Low (Phase U)	B	B	B
P06B4 Traction Motor Phase Current Sensor Power Supply Circuit Low (Phase V)	B	B	B
P06B4 Generator Motor Phase Current Sensor Power Supply Circuit Low (Phase V)	B	B	B
P06E7 Traction Motor Phase Current Sensor Power Supply Circuit Low (Phase W)	B	B	B
P06E7 Generator Motor Phase Current Sensor Power Supply Circuit Low (Phase W)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P06B1 Traction Motor Phase Current Sensor Power Supply Circuit Low (Phase U)	B	B	B
P06B1 Generator Motor Phase Current Sensor Power Supply Circuit Low (Phase U)	B	B	B
P06B4 Traction Motor Phase Current Sensor Power Supply Circuit Low (Phase V)	B	B	B
P06B4 Generator Motor Phase Current Sensor Power Supply Circuit Low (Phase V)	B	B	B
P06E7 Traction Motor Phase Current Sensor Power Supply Circuit Low (Phase W)	B	B	B
P06E7 Generator Motor Phase Current Sensor Power Supply Circuit Low (Phase W)	B	B	B

Is DTC P06B1, P06B4, and/or P06E7 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0710 (327)

DTC P0710 : Transmission Fluid Temperature Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0710 Transmission Fluid Temperature Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, and wait for about 6 hours.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0710 Transmission Fluid Temperature Sensor Circuit Range/Performance	B	B	B

Is DTC P0710 indicated?

YES

The failure is duplicated. Go to step 2.

NO

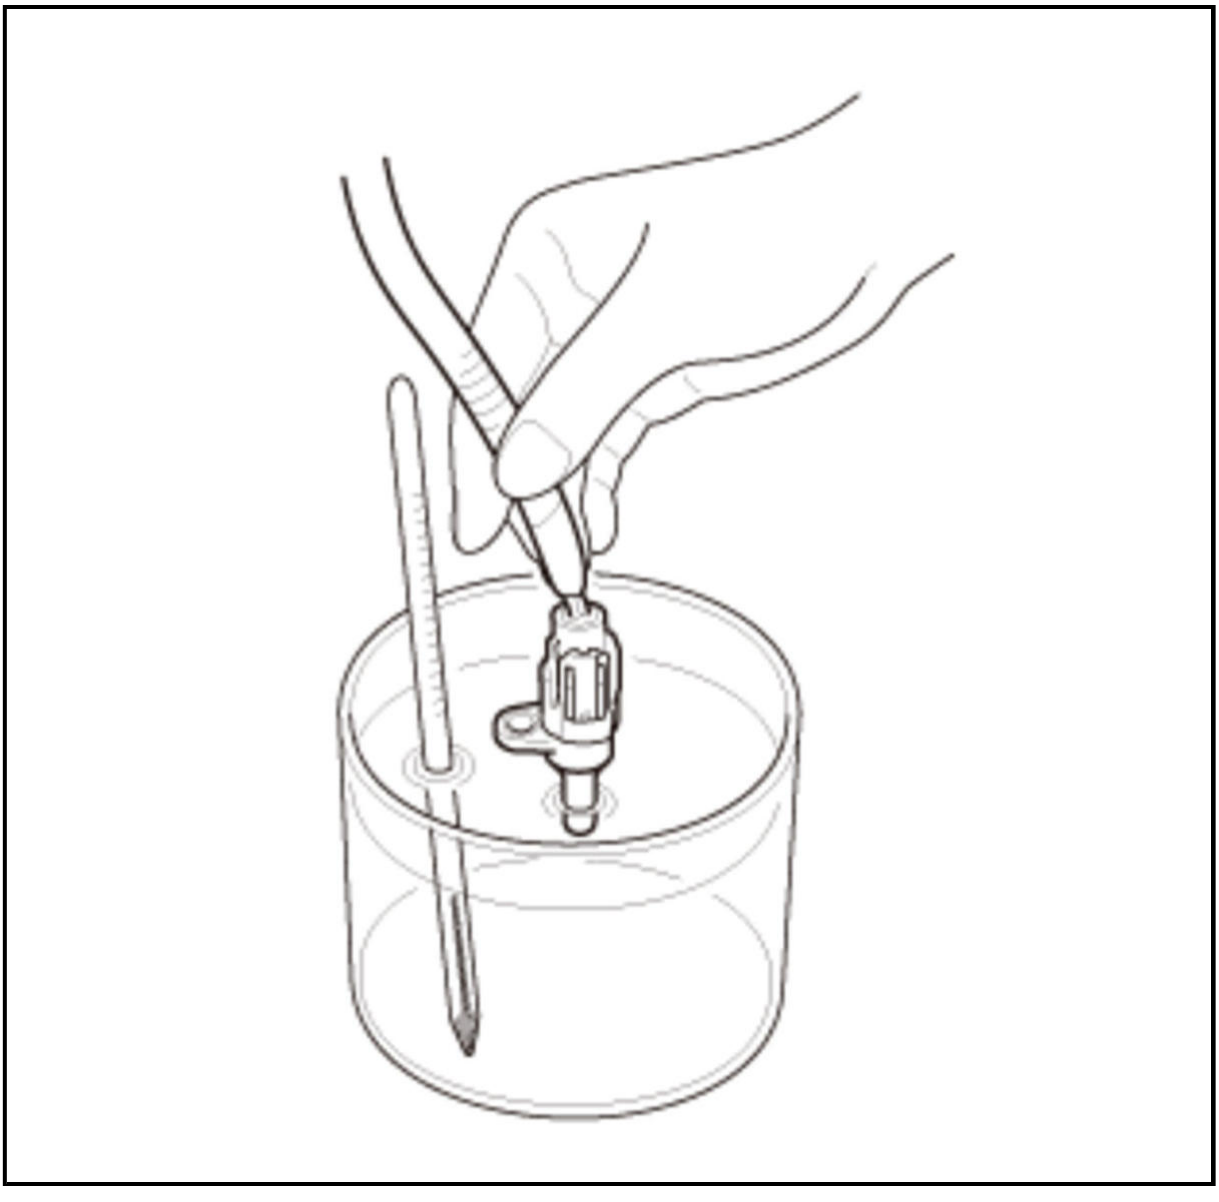
Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Transmission fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the transmission fluid temperature sensor** , but leave it connected.

-3. Submerge the sensor and a thermometer in a container of water.



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
ATF Temperature (TRC)	B	B

Does the live data for the transmission fluid temperature sensor match the temperature reading from the thermometer?

YES

Replace the transmission (e-CVT) assembly .

NO

Replace the transmission fluid temperature sensor .

DTC P0711 (363)

DTC P0711 : Transmission Fluid Temperature Sensor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0711 Transmission Fluid Temperature Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0711 Transmission Fluid Temperature Sensor Circuit	B	B	B

Is DTC P0711 indicated?

YES

The failure is duplicated. Go to step 2.

NO

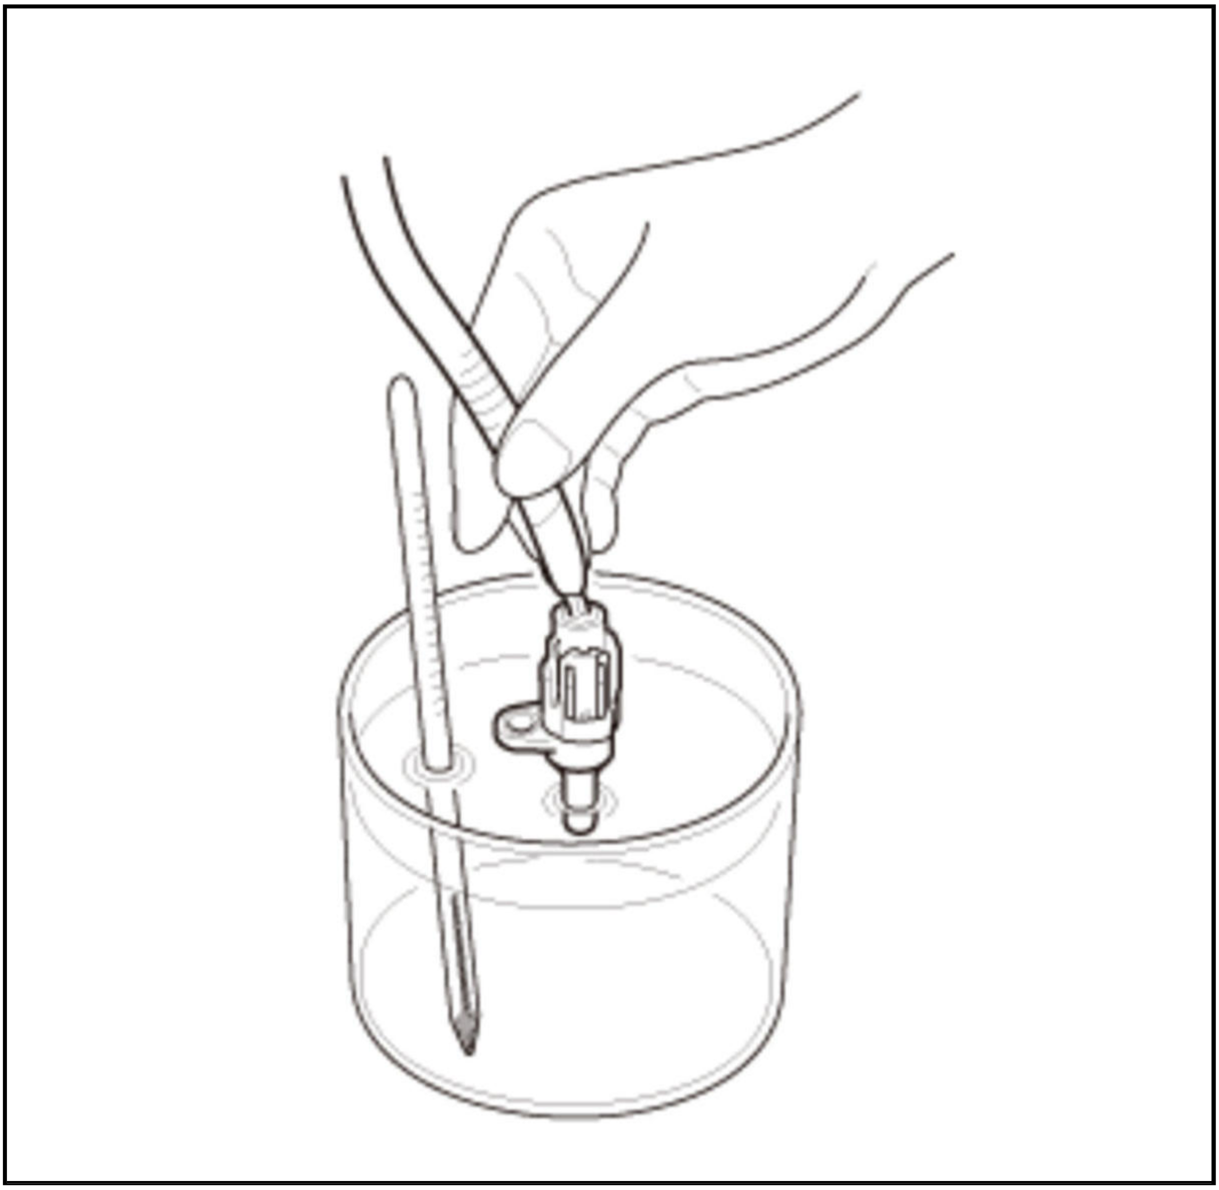
Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Transmission fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the transmission fluid temperature sensor , but leave it connected.

-3. Submerge the sensor and a thermometer in a container of water.



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
ATF Temperature (TRC)	B	B

Does the live data for the transmission fluid temperature sensor match the temperature reading from the thermometer?

YES

Replace the transmission (e-CVT) assembly .

NO

Replace the transmission fluid temperature sensor .

DTC P0712 (326)

DTC P0712 : Transmission Fluid Temperature Sensor Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0712 Transmission Fluid Temperature Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ATF Temperature Sensor Voltage (TRC)	Less than 0.1	V	B	B

   Does the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TATF line, transmission fluid temperature sensor)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Transmission fluid temperature sensor 2P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ATF Temperature Sensor Voltage (TRC)	Less than 0.1	V	B	B

   Does the current condition(s) match the threshold?

   YES

Go to step 3.

NO

Replace the transmission fluid temperature sensor .

3. Shorted wire check (TATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Do the 12 volt battery terminal disconnection procedure .

-3. Disconnect the following connector.

PCU 33P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Transmission fluid temperature sensor 2P connector: disconnected
Test point 1	PCU 33P connector No. 23
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the PCU .

NO

Repair a short in the TATF wire between the transmission fluid temperature sensor and the PCU.

DTC P0713 (325)

DTC P0713 : Transmission Fluid Temperature Sensor Circuit High

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0713 Transmission Fluid Temperature Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ATF Temperature Sensor Voltage (TRC)	More than 4.9	V	B	B

Does the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TATF line, SGTEMP/SGTATF line)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0713 Transmission Fluid Temperature Sensor Circuit High	B	B	B
P0A2D Traction Motor Temperature Sensor Circuit High	B	B	B
P0CF1 PCU Coolant Temperature Sensor Circuit High	B	B	B

Are DTC P0713, P0A2D, and P0CF1 indicated at the same time?

YES

Go to step 5.

NO

Go to step 3.

3. Open wire check (TATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

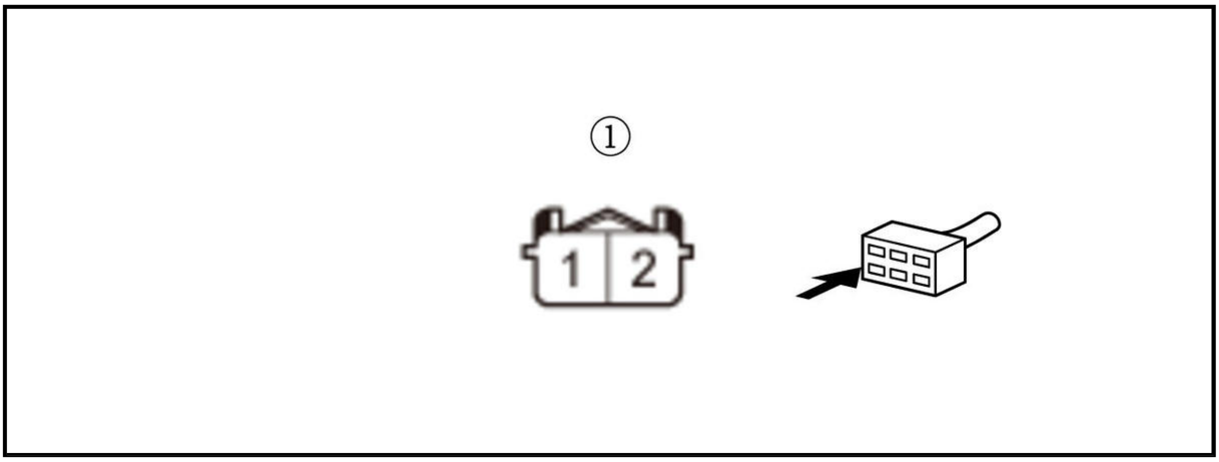
-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connectors.

PCU 33P connector
Transmission fluid temperature sensor 2P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Transmission fluid temperature sensor 2P connector: disconnected
Test point 1	**PCU 33P connector No. 23**
Test point 2	Transmission fluid temperature sensor 2P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Go to step 4.

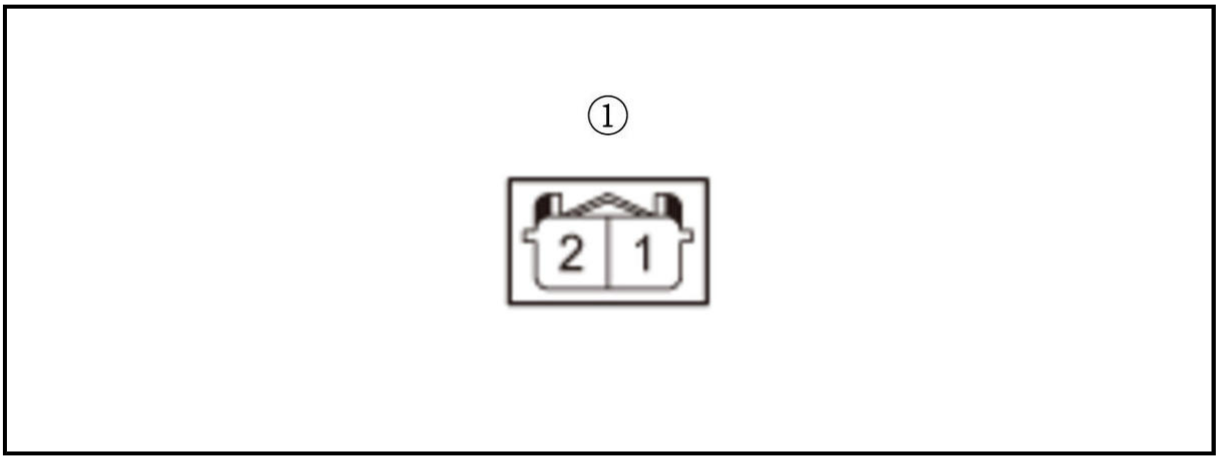
NO

Repair an open in the TATF wire between the transmission fluid temperature sensor and the PCU.

4. Transmission fluid temperature sensor check

-1. At the sensor side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Transmission fluid temperature sensor 2P connector: disconnected
Test point 1	Transmission fluid temperature sensor 2P connector (male terminals) No. 1: ①
Test point 2	Transmission fluid temperature sensor 2P connector (male terminals) No. 2: ①



Is there continuity?

YES

Replace the PCU .

NO

Replace the transmission fluid temperature sensor .

5. Open wire check (SGTEMP/SGTATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

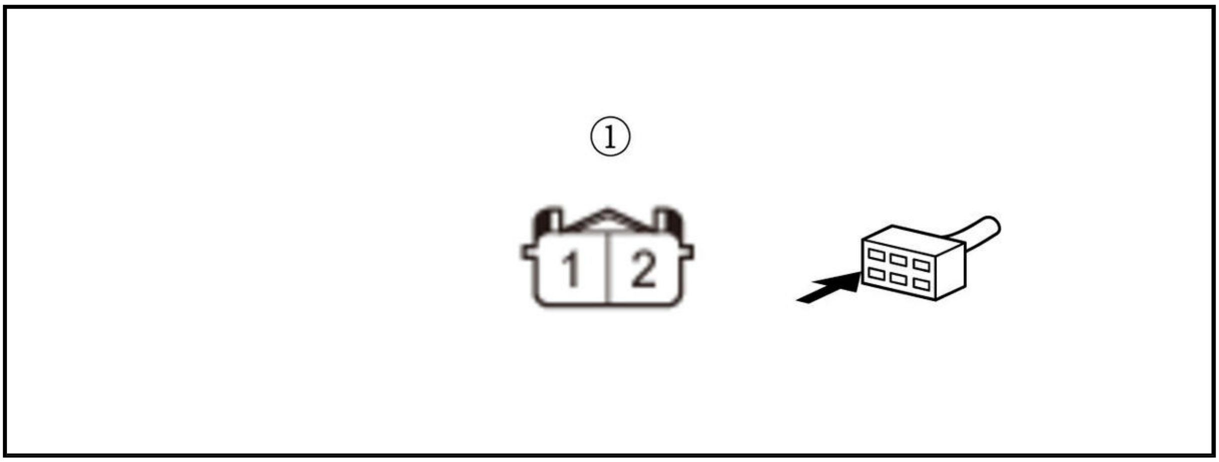
-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connectors.

PCU 33P connector
Transmission fluid temperature sensor 2P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Transmission fluid temperature sensor 2P connector: disconnected
Test point 1	**PCU 33P connector No. 17**
Test point 2	Transmission fluid temperature sensor 2P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

Replace the PCU .

NO

Repair an open in the SGTEMP/SGTATF wire between the transmission fluid temperature sensor and the PCU.

DTC P0A1A (296)

DTC P0A1A : Generator Motor Control Module (Traction Motor Control Module Detected)

DTC P0A1A : Generator Motor Control Module

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A1A Generator Motor Control Module (Traction Motor Control Module Detected)	B	B	B
P0A1A Generator Motor Control Module	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A1A Generator Motor Control Module (Traction Motor Control Module Detected)	B	B	B
P0A1A Generator Motor Control Module	B	B	B

Is DTC P0A1A indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0A1B (256)

DTC P0A1B : Traction Motor Control Module

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A1B Traction Motor Control Module	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A1B Traction Motor Control Module	B	B	B

Is DTC P0A1B indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0A2A

DTC P0A2A : Traction Motor Temperature Sensor Circuit

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0A2A, troubleshoot those DTCs first, then recheck for P0A2A.
-
    - P1D6E, P1D72

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A2A Traction Motor Temperature Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are DTC P0A2A and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Update the motor control module if it does not have the latest software .

DTC P0A2B (359)

DTC P0A2B : Traction Motor Temperature Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A2B Traction Motor Temperature Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A2B Traction Motor Temperature Sensor Circuit Range/Performance	B	B	B

   Is DTC P0A2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (traction motor temperature sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Motor temperature sensor 6P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Motor Temperature Sensor Voltage (TRC)	More than 4.83	V	B	B

   Does the current condition(s) match the threshold?

   YES

   Faulty traction motor temperature sensor. **Replace the transmission (e-CVT) assembly** .

   NO

   Replace the PCU .

DTC P0A2C (238)

DTC P0A2C : Traction Motor Temperature Sensor Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A2C Traction Motor Temperature Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Motor Temperature Sensor Voltage (TRC)	Less than 0.3	V	B	B

Does the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TMOT line, traction motor temperature sensor)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Motor temperature sensor 6P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Motor Temperature Sensor Voltage (TRC)	Less than 0.3	V	B	B

Does the current condition(s) match the threshold?

YES

Traction motor temperature sensor is OK. Go to step 3.

NO

Faulty traction motor temperature sensor. **Replace the transmission (e-CVT) assembly** .

3. Shorted wire check (TMOT line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Do the 12 volt battery terminal disconnection procedure** .

   -3. Disconnect the following connector.

PCU 33P connector

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Motor temperature sensor 6P connector: disconnected
Test point 1	**PCU 33P connector No. 10**
Test point 2	Body ground

   Is there 1 MΩ or more?

   YES

   Replace the PCU .

   NO

   Repair a short in the TMOT wire between the traction motor temperature sensor and the PCU.

DTC P0A2D (237)

DTC P0A2D : Traction Motor Temperature Sensor Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A2D Traction Motor Temperature Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A2D Traction Motor Temperature Sensor Circuit High	B	B	B

   Is DTC P0A2D indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TMOT line, SGTEMP/SGTMOT line)

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0713 Transmission Fluid Temperature Sensor Circuit High	B	B	B
P0A2D Traction Motor Temperature Sensor Circuit High	B	B	B
P0CF1 PCU Coolant Temperature Sensor Circuit High	B	B	B

Are DTC P0713, P0A2D, and P0CF1 indicated at the same time?

YES

Go to step 5.

NO

Go to step 3.

3. Open wire check (TMOT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

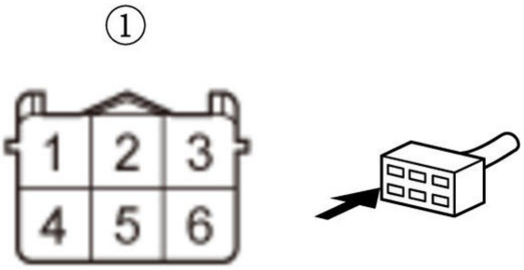
-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connectors.

PCU 33P connector
Motor temperature sensor 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Motor temperature sensor 6P connector: disconnected
Test point 1	**PCU 33P connector No. 10**
Test point 2	Motor temperature sensor 6P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

Go to step 4.

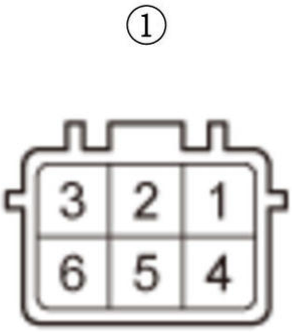
NO

Repair an open in the TMOT wire between the traction motor temperature sensor and the PCU.

4. Traction motor temperature sensor check

-1. At the sensor side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Motor temperature sensor 6P connector: disconnected
Test point 1	Motor temperature sensor 6P connector (male terminals) No. 2: ①
Test point 2	Motor temperature sensor 6P connector (male terminals) No. 3: ①



Is there continuity?

YES

Replace the PCU .

NO

Faulty traction motor temperature sensor. Replace the transmission (e-CVT) assembly .

5. Open wire check (SGTEMP/SGTMOT line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

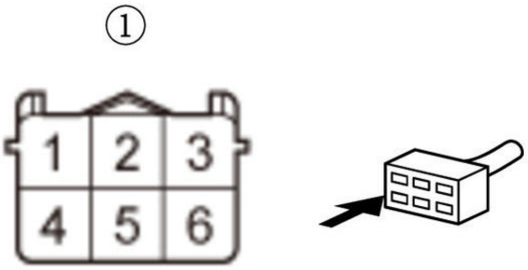
   -2. Do the 12 volt battery terminal disconnection procedure .

   -3. Disconnect the following connectors.

PCU 33P connector
Motor temperature sensor 6P connector

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Motor temperature sensor 6P connector: disconnected
Test point 1	PCU 33P connector No. 17
Test point 2	Motor temperature sensor 6P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Go to step 6.

NO

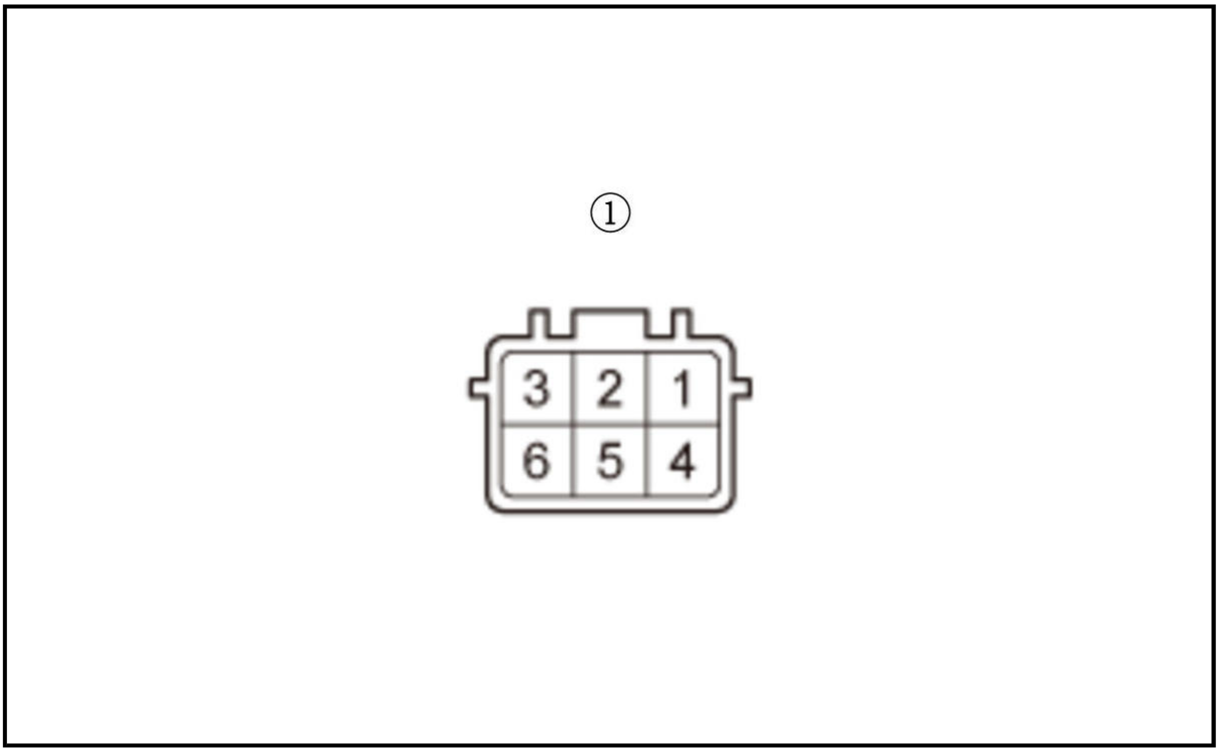
Repair an open in the SGTEMP/SGTMOT wire between the traction motor temperature sensor and the PCU.

6. Traction motor temperature sensor check

   -1. At the sensor side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected

B	Motor temperature sensor 6P connector: disconnected
Test point 1	Motor temperature sensor 6P connector (male terminals) No. 2: ①
Test point 2	Motor temperature sensor 6P connector (male terminals) No. 3: ①



Is there continuity?

YES

Replace the PCU .

NO

Faulty traction motor temperature sensor. **Replace the transmission (e-CVT) assembly** .

DTC P0A2F (313)

DTC P0A2F : Traction Motor Over Temperature

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A2F Traction Motor Over Temperature	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Test-drive the vehicle in the range of the recorded freeze data parameters.

Freeze Data

-2. Monitor the OBD STATUS for DTC P0A2F in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0A2F Traction Motor Over Temperature	B

Does the HDS indicate FAILED?

YES

Go to step 2.

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. ATF check

-1. Turn the vehicle to the OFF (LOCK) mode.

Check these items:

- **Check the ATF level** .
- Check for deteriorated ATF.
- Check for any ATF leakage (from gaskets, hoses, O-rings, etc.).
- Check for dirt, leaves, or insects on ATF cooler.

Is it OK?

YES

Replace the transmission (e-CVT) assembly .

NO

Repair or replace parts as needed.

DTC P0A3C (39)

DTC P0A3C : Traction Motor Inverter Over Temperature

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A3C Traction Motor Inverter Over Temperature	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D92 PCU Coolant Electric Water Pump Control Circuit	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D9A PCU Coolant Electric Water Pump Circuit	B	B	B

Is DTC P1D92 or P1D9A indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Problem verification

-1. Test-drive the vehicle in the range of the recorded freeze data parameters.

Freeze Data

-2. Monitor the OBD STATUS for DTC P0A3C in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0A3C Traction Motor Inverter Over Temperature	B

Does the HDS indicate FAILED?

YES

Go to step 4.

NO

Go to step 3.

3. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1440 Traction Motor Inverter Gate Line Open	B	B	B

Is DTC P1440 indicated?

YES

Go to the DTC P1440 troubleshooting .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

4. Cooling system check

-1. **Do the PCU coolant circuit inspection** .

Is it OK?

YES

Replace the PCU .

NO

Repair or replace parts as needed.

DTC P0A3E (286)

DTC P0A3E : Generator Motor Inverter Over Temperature

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A3E Generator Motor Inverter Over Temperature	B	B	B

DTC (Electric Powertrain)

1. DTC check 1

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D92 PCU Coolant Electric Water Pump Control Circuit	B	B	B
P1D9A PCU Coolant Electric Water Pump Circuit	B	B	B

   Is DTC P1D92 or P1D9A indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Problem verification

   -1. Test-drive the vehicle in the range of the recorded freeze data parameters.

   Freeze Data

   -2. Monitor the OBD STATUS for DTC P0A3E in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0A3E Generator Motor Inverter Over Temperature	B

   Does the HDS indicate FAILED?

   YES

   Go to step 4.

   NO

Go to step 3.

3. DTC check 2

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D8A Generator Motor Inverter Gate Line Open	B	B	B

Is DTC P1D8A indicated?

YES

Go to the DTC P1D8A troubleshooting .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

4. Cooling system check

   -1. **Do the PCU coolant circuit inspection** .

Is it OK?

YES

Replace the PCU .

NO

Repair or replace parts as needed.

DTC P0A3F (89), P0A40 (197), P0A41 (198)

DTC P0A3F : Traction Motor Rotor Position Sensor Circuit

DTC P0A40 : Traction Motor Rotor Position Sensor Circuit Range/Performance

DTC P0A41 : Traction Motor Rotor Position Sensor Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A3F Traction Motor Rotor Position Sensor Circuit	B	B	B
P0A40 Traction Motor Rotor Position Sensor Circuit Range/Performance	B	B	B
P0A41 Traction Motor Rotor Position Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Monitor the OBD STATUS for DTC P0A3F, P0A40, and P0A41 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0A3F Traction Motor Rotor Position Sensor Circuit	B
P0A40 Traction Motor Rotor Position Sensor Circuit Range/Performance	B

DTC Description	OBD STATUS
P0A41 Traction Motor Rotor Position Sensor Circuit Low	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 2.

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep the vehicle in the ON mode until the status changes. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Traction motor motor rotor position sensor circuit check

-1. **Do the traction motor motor rotor position sensor circuit inspection** .

Is it OK?

YES

The traction motor motor rotor position sensor circuit is OK. Faulty traction motor motor rotor position sensor. **Replace the transmission (e-CVT) assembly** .

NO

Repair an open or short in the traction motor motor rotor position sensor circuit between the PCU and the traction motor motor rotor position sensor.

DTC P0A4B (293), P0A4C (473), P0A4D (474)

DTC P0A4B : Generator Motor Rotor Position Sensor Circuit

DTC P0A4C : Generator Motor Rotor Position Sensor Circuit Range/Performance

DTC P0A4D : Generator Motor Rotor Position Sensor Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A4B Generator Motor Rotor Position Sensor Circuit	B	B	B
P0A4C Generator Motor Rotor Position Sensor Circuit Range/Performance	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A4D Generator Motor Rotor Position Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Monitor the OBD STATUS for DTC P0A4B, P0A4C, and P0A4D in the DTCs MENU with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A4B Generator Motor Rotor Position Sensor Circuit	B	B	B
P0A4C Generator Motor Rotor Position Sensor Circuit Range/Performance	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A4D Generator Motor Rotor Position Sensor Circuit Low	B	B	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. Go to step 2.

   NO

   If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep the vehicle in the ON mode until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Generator motor motor rotor position sensor circuit check

   -1. Do the generator motor motor rotor position sensor circuit inspection .

   Is it OK?

   YES

   The generator motor motor rotor position sensor circuit is OK. Faulty generator motor motor rotor position sensor. Replace the transmission (e-CVT) assembly .

   NO

   Repair an open or short in the generator motor motor rotor position sensor circuit between the PCU and the generator motor motor rotor position sensor.

DTC P0A5E (24), P0A5F (25), P0A61 (26), P0A62 (27), P0A64 (28), P0A65 (29)

DTC P0A5E : Traction Motor Phase U Current Low

DTC P0A5F : Traction Motor Phase U Current High

DTC P0A61 : Traction Motor Phase V Current Low

DTC P0A62 : Traction Motor Phase V Current High

DTC P0A64 : Traction Motor Phase W Current Low

DTC P0A65 : Traction Motor Phase W Current High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A5E Traction Motor Phase U Current Low	B	B	B
P0A5F Traction Motor Phase U Current High	B	B	B
P0A61 Traction Motor Phase V Current Low	B	B	B
P0A62 Traction Motor Phase V Current High	B	B	B
P0A64 Traction Motor Phase W Current Low	B	B	B
P0A65 Traction Motor Phase W Current High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A5E Traction Motor Phase U Current Low	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A5F Traction Motor Phase U Current High	B	B	B
P0A61 Traction Motor Phase V Current Low	B	B	B
P0A62 Traction Motor Phase V Current High	B	B	B
P0A64 Traction Motor Phase W Current Low	B	B	B
P0A65 Traction Motor Phase W Current High	B	B	B

Is DTC P0A5E, P0A5F, P0A61, P0A62, P0A64, and/or P0A65 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0A70 (276), P0A71 (275), P0A73 (279), P0A74 (278), P0A76 (282), P0A77 (281)

DTC P0A70 : Generator Motor Phase U Current Low

DTC P0A71 : Generator Motor Phase U Current High

DTC P0A73 : Generator Motor Phase V Current Low

DTC P0A74 : Generator Motor Phase V Current High

DTC P0A76 : Generator Motor Phase W Current Low

DTC P0A77 : Generator Motor Phase W Current High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A70 Generator Motor Phase U Current Low	B	B	B
P0A71 Generator Motor Phase U Current High	B	B	B
P0A73 Generator Motor Phase V Current Low	B	B	B
P0A74 Generator Motor Phase V Current High	B	B	B
P0A76 Generator Motor Phase W Current Low	B	B	B
P0A77 Generator Motor Phase W Current High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A70 Generator Motor Phase U Current Low	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A71 Generator Motor Phase U Current High	B	B	B
P0A73 Generator Motor Phase V Current Low	B	B	B
P0A74 Generator Motor Phase V Current High	B	B	B
P0A76 Generator Motor Phase W Current Low	B	B	B
P0A77 Generator Motor Phase W Current High	B	B	B

Is DTC P0A70, P0A71, P0A73, P0A74, P0A76, and/or P0A77 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0A78

DTC P0A78 : Traction Motor Inverter Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0A78, troubleshoot those DTCs first, then recheck for P0A78.
-
    - P1437, P1440, P15A5, P1A56, P1A57, P1A64, P1A65, P1D05, P1D18, P1D70, P1D7A, P1D7B, P1D7D, P1D7E, P1D85, P1DDB

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A78 Traction Motor Inverter Performance	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC P0A78 and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Update the motor control module if it does not have the latest software .

DTC P0A7A (GENERATOR MOTOR CONTROL MODULE)

DTC P0A7A : Generator Motor Inverter Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0A7A, troubleshoot those DTCs first, then recheck for P0A7A.
-
    - Traction motor control module: P1A63, P1A87, P1A88, P1A89, P1D1B, P1D1C, P1D1D, P1D77, P1D78, P1D79, P1D81, P1D9D, P1DA0, P1DA1, P1DA4, P1DA6, P1DA8, P1DAA, P1DD8, P1DD9, P1DE3, P1DE4, P1DE5, P1DE6, P1DE7, P1DE8, P1DE9, P1DEA, P1F3C
    - Generator motor control module: P1D7F, P1D8A, P1D8C, P1D8D, P1D97

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A7A Generator Motor Inverter Performance	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are DTC P0A7A and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Update the motor control module if it does not have the latest software .

DTC P0A7A (TRACTION MOTOR CONTROL MODULE)

DTC P0A7A : Generator Motor Inverter Performance (Traction Motor Control Module Detected)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0A7A, troubleshoot those DTCs first, then recheck for P0A7A.
-
    - Traction motor control module: P1A63, P1A87, P1A88, P1A89, P1D1B, P1D1C, P1D1D, P1D77, P1D78, P1D79, P1D81, P1D9D, P1DA0, P1DA1, P1DA4, P1DA6, P1DA8, P1DAA, P1DD8, P1DD9, P1DE3, P1DE4, P1DE5, P1DE6, P1DE7, P1DE8, P1DE9, P1DEA, P1F3C
    - Generator motor control module: P1D7F, P1D8A, P1D8C, P1D8D, P1D97

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A7A Generator Motor Inverter Performance (Traction Motor Control Module Detected)	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are DTC P0A7A and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Update the motor control module if it does not have the latest software .

DTC P0A90 (1040)

DTC P0A90 : Traction Motor Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A90 Traction Motor Performance	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC P0A90 and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Turn the vehicle to the ON mode.

   -4. Turn the EV switch OFF.

   -5. Turn the vehicle to the READY TO DRIVE mode.

   -6. Position to D, and test-drive at 34 mph (55 km/h) for 5 seconds.

   -7. Monitor the OBD STATUS for DTC P0A90 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0A90 Traction Motor Performance	B

Does the HDS indicate FAILED?

YES

Faulty traction motor. Replace the transmission (e-CVT) assembly .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep the vehicle in the ON mode until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0A92 (1041)

DTC P0A92 : Generator Motor Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A92 Generator Motor Performance	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC P0A92 and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Turn the vehicle to the ON mode.

   -4. Turn the EV switch OFF.

   -5. Turn the vehicle to the READY TO DRIVE mode.

-6. Position to D, and test-drive at 34 mph (55 km/h) for 5 seconds.

-7. Monitor the OBD STATUS for DTC P0A92 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0A92 Generator Motor Performance	B

Does the HDS indicate FAILED?

YES

Faulty generator motor. **Replace the transmission (e-CVT) assembly** .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0AED (109)

DTC P0AED : Traction Motor Inverter Temperature Sensor 1 Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AED Traction Motor Inverter Temperature Sensor 1 Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AED Traction Motor Inverter Temperature Sensor 1 Circuit	B	B	B

Is DTC P0AED indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0AEE (435)

DTC P0AEE : Traction Motor Inverter Temperature Sensor 1 Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AEE Traction Motor Inverter Temperature Sensor 1 Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

    -4. Turn the vehicle to the ON mode.

    -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AEE Traction Motor Inverter Temperature Sensor 1 Circuit Range/Performance	B	B	B

Is DTC P0AEE indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0AEF (110)

DTC P0AEF : Traction Motor Inverter Temperature Sensor 1 Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AEF Traction Motor Inverter Temperature Sensor 1 Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AEF Traction Motor Inverter Temperature Sensor 1 Circuit Low	B	B	B

Is DTC P0AEF indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0AF0 (111)

DTC P0AF0 : Traction Motor Inverter Temperature Sensor 1 Circuit High

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AF0 Traction Motor Inverter Temperature Sensor 1 Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AF0 Traction Motor Inverter Temperature Sensor 1 Circuit High	B	B	B

Is DTC P0AF0 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0AF2 (1020)

DTC P0AF2 : Traction Motor Inverter Temperature Sensor 2 Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AF2 Traction Motor Inverter Temperature Sensor 2 Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode, and wait for about 6 hours.

    -4. Turn the vehicle to the ON mode.

    -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AF2 Traction Motor Inverter Temperature Sensor 2 Circuit	B	B	B

    Is DTC P0AF2 indicated?

    YES

    Replace the PCU .

    NO

    Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0AF3 (1019)

DTC P0AF3 : Traction Motor Inverter Temperature Sensor 2 Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AF3 Traction Motor Inverter Temperature Sensor 2 Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

    -4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AF3 Traction Motor Inverter Temperature Sensor 2 Circuit Range/Performance	B	B	B

Is DTC P0AF3 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0AF4 (459)

DTC P0AF4 : Traction Motor Inverter Temperature Sensor 2 Circuit Low

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AF4 Traction Motor Inverter Temperature Sensor 2 Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AF4 Traction Motor Inverter Temperature Sensor 2 Circuit Low	B	B	B

Is DTC P0AF4 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0AF5 (458)

DTC P0AF5 : Traction Motor Inverter Temperature Sensor 2 Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AF5 Traction Motor Inverter Temperature Sensor 2 Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AF5 Traction Motor Inverter Temperature Sensor 2 Circuit High	B	B	B

   Is DTC P0AF5 indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0BCC (287)

DTC P0BCC : Generator Motor Inverter Temperature Sensor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BCC Generator Motor Inverter Temperature Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Raise the vehicle on a lift** .

   -5. Turn the vehicle to READY TO DRIVE mode.

-6. Test-drive the vehicle under these conditions for 1 minute:

- Position to D, but do not operate the accelerator pedal.

  NOTE: Do not apply the brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.

- Motor Speed (GEN) is more than 1000 RPM for 10 seconds.

Signal	Current conditions	
	Values	Unit
Motor Speed (GEN)	B	B

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BCC Generator Motor Inverter Temperature Sensor Circuit	B	B	B

Is DTC P0BCC indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0BCD (436)

DTC P0BCD : Generator Motor Inverter Temperature Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BCD Generator Motor Inverter Temperature Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BCD Generator Motor Inverter Temperature Sensor Circuit Range/Performance	B	B	B

Is DTC P0BCD indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0BCE (288)

DTC P0BCE : Generator Motor Inverter Temperature Sensor Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BCE Generator Motor Inverter Temperature Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BCE Generator Motor Inverter Temperature Sensor Circuit Low	B	B	B

Is DTC P0BCE indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0BCF (289)

DTC P0BCF : Generator Motor Inverter Temperature Sensor Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BCF Generator Motor Inverter Temperature Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BCF Generator Motor Inverter Temperature Sensor Circuit High	B	B	B

Is DTC P0BCF indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0BE6 (86)

DTC P0BE6 : Traction Motor Phase U Current Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BE6 Traction Motor Phase U Current Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Monitor the OBD STATUS for DTC P0BE6 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0BE6 Traction Motor Phase U Current Sensor Circuit Range/Performance	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep the vehicle in the ON mode until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0BEA (87)

DTC P0BEA : Traction Motor Phase V Current Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BEA Traction Motor Phase V Current Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Monitor the OBD STATUS for DTC P0BEA in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0BEA Traction Motor Phase V Current Sensor Circuit Range/Performance	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep the vehicle in the ON mode until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0BEE (88)

DTC P0BEE : Traction Motor Phase W Current Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BEE Traction Motor Phase W Current Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Monitor the OBD STATUS for DTC P0BEE in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0BEE Traction Motor Phase W Current Sensor Circuit Range/Performance	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep the vehicle in the ON mode until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0BFD

DTC P0BFD : Traction Motor Phase U-V-W Current Sensor Correlation

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0BFD, troubleshoot those DTCs first, then recheck for P0BFD.
-
  - P1D11

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0BFD Traction Motor Phase U-V-W Current Sensor Correlation	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are DTC P0BFD and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Update the motor control module if it does not have the latest software .

DTC P0C0C (1110)

DTC P0C0C : Traction Motor Inverter Power Supply Circuit Low

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0C0C Traction Motor Inverter Power Supply Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0C0C Traction Motor Inverter Power Supply Circuit Low	B	B	B

   Is DTC P0C0C indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1673 IGHLD Relay Circuit	B	B	B

   Is DTC P1673 indicated?

   YES

Go to the DTC P1673 troubleshooting .

NO

Go to step 3.

3. Open wire check (IGA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

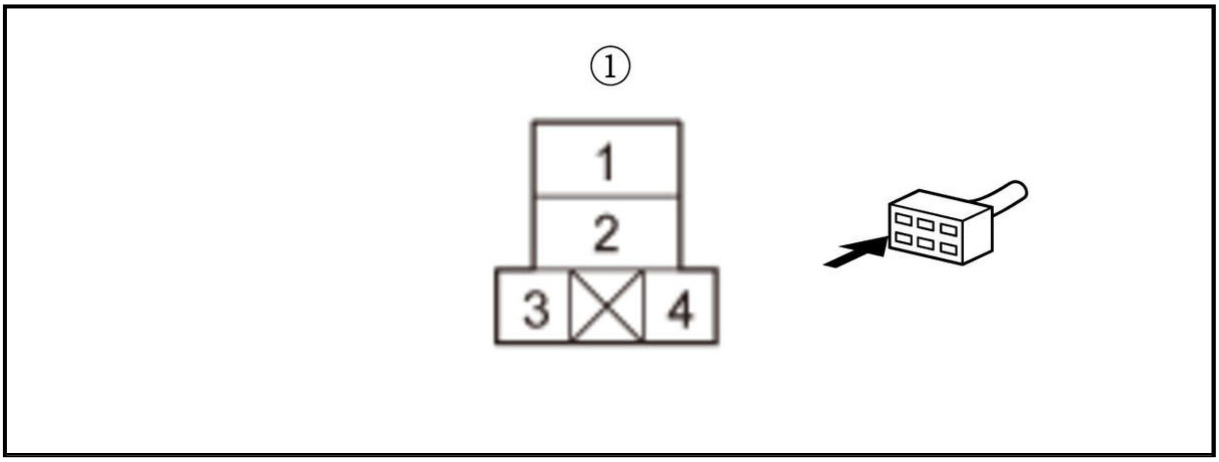
-3. **Remove the IGHLD1 relay** .

-4. Disconnect the following connector.

PCU 33P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IGHLD1 relay: disconnected
B	PCU 33P connector: disconnected
Test point 1	**PCU 33P connector No. 11**
Test point 2	IGHLD1 relay 4P socket (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Go to step 4.

NO

Repair an open in the IGA wire between the PCU and the IGHLD1 relay.

4. Shorted wire check (IGA line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	IGHLD1 relay: disconnected
B	PCU 33P connector: disconnected
Test point 1	**PCU 33P connector No. 11**

Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the PCU .

NO

Repair a short in the IGA wire between the PCU and the IGHLD1 relay.

DTC P0C39 (1023)

DTC P0C39 : DC-DC Converter Temperature Sensor Range/Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0C39 DC-DC Converter Temperature Sensor Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0C39 DC-DC Converter Temperature Sensor Range/Performance	B	B	B

Is DTC P0C39 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0C3A (1022)

DTC P0C3A : DC-DC Converter Temperature Sensor Low

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0C3A DC-DC Converter Temperature Sensor Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0C3A DC-DC Converter Temperature Sensor Low	B	B	B

   Is DTC P0C3A indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0C3B (1021)

DTC P0C3B : DC-DC Converter Temperature Sensor High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0C3B DC-DC Converter Temperature Sensor High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0C3B DC-DC Converter Temperature Sensor High	B	B	B

Is DTC P0C3B indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0C4E (93)

DTC P0C4E : Traction Motor Rotor Position Exceeded Learning Limit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0C4E Traction Motor Rotor Position Exceeded Learning Limit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. **Do the traction motor motor rotor position calibration** .

Is calibration completed?

YES

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

Faulty traction motor motor rotor position sensor. **Replace the transmission (e-CVT) assembly** .

DTC TROUBLESHOOTING

DTC P0CE9

DTC P0CE9 : PCU Electric Coolant Pump Control Circuit Open

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0CE9, troubleshoot those DTCs first, then recheck for P0CE9.
-
    - P1D92, P1D99

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0CE9 PCU Electric Coolant Pump Control Circuit Open	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC P0CE9 and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Update the motor control module if it does not have the latest software .

DTC P0CEA

DTC P0CEA : PCU Electric Coolant Pump Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0CEA, troubleshoot those DTCs first, then recheck for P0CEA.
-
    - P1D93, P1D9A

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0CEA PCU Electric Coolant Pump Performance	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC P0CEA and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Update the motor control module if it does not have the latest software .

DTC P0CED (454)

DTC P0CED : PCU Electric Coolant Pump Enable Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0CED PCU Electric Coolant Pump Enable Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then wait at least 1 minute.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0CED PCU Electric Coolant Pump Enable Circuit	B	B	B

   Is DTC P0CED indicated?

   YES

Replace the PCU electric coolant pump relay .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0CEE (1064)

DTC P0CEE : PCU Coolant Temperature Sensor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0CEE PCU Coolant Temperature Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and wait 6 hours.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0CEE PCU Coolant Temperature Sensor Circuit	B	B	B

Is DTC P0CEE indicated?

YES

Replace the PCU coolant temperature sensor .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0CEF (1065)

DTC P0CEF : PCU Coolant Temperature Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0CEF PCU Coolant Temperature Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0CEF PCU Coolant Temperature Sensor Circuit Range/Performance	B	B	B

Is DTC P0CEF indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0CF0 (1063)

DTC P0CF0 : PCU Coolant Temperature Sensor Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0CF0 PCU Coolant Temperature Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
PCU Coolant Temperature Sensor Voltage (TRC)	Less than 0.08	V	B	B

Does the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area ((TWPCU/PCU_TW_SNSR line, PCU coolant temperature sensor)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

PCU coolant temperature sensor 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
PCU Coolant Temperature Sensor Voltage (TRC)	About 5.0 V	V	B	B

Does the current condition(s) match the threshold?

YES

Replace the PCU coolant temperature sensor .

NO

The PCU coolant temperature sensor is OK. Go to step 3.

3. Shorted wire check (TWPCU/PCU_TW_SNSR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connector.

PCU 33P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	PCU coolant temperature sensor 2P connector: disconnected
Test point 1	**PCU 33P connector No. 16**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the PCU .

NO

Repair a short in the TWPCU/PCU_TW_SNSR wire between the PCU coolant temperature sensor and the PCU.

DTC P0CF1 (1062)

DTC P0CF1 : PCU Coolant Temperature Sensor Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0CF1 PCU Coolant Temperature Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
PCU Coolant Temperature Sensor Voltage (TRC)	More than 4.9	V	B	B

   Does the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (PCU coolant temperature sensor, others)

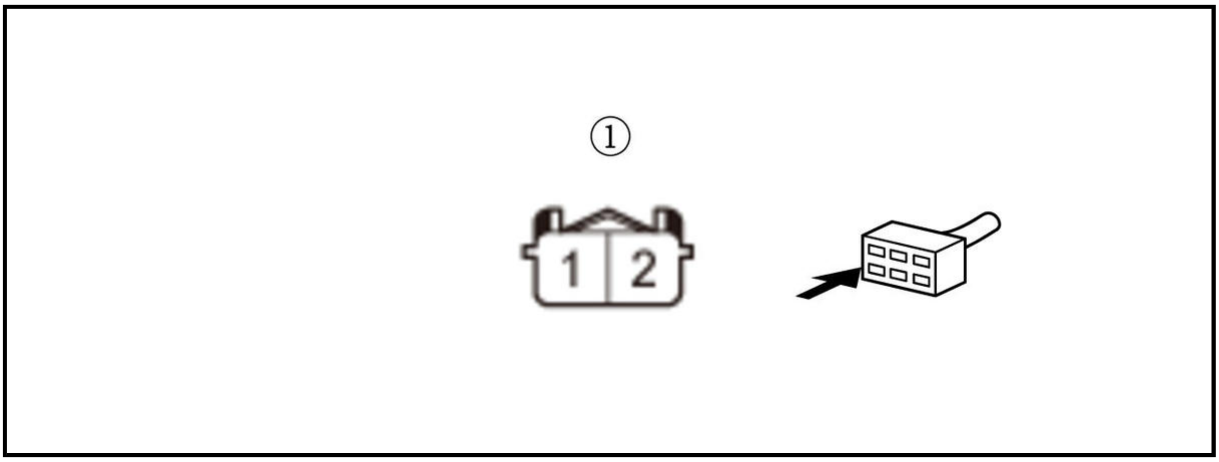
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

PCU coolant temperature sensor 2P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	PCU coolant temperature sensor 2P connector (female terminals) No. 1: ①
Terminal B	PCU coolant temperature sensor 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
PCU Coolant Temperature Sensor Voltage (TRC)	More than 4.9	V	B	B

Does the current condition(s) match the threshold?

YES

The PCU coolant temperature sensor is OK. Go to step 3.

NO

Replace the PCU coolant temperature sensor .

3. Determine possible failure area (TWPCU/PCU_TW_SNSR line, others)

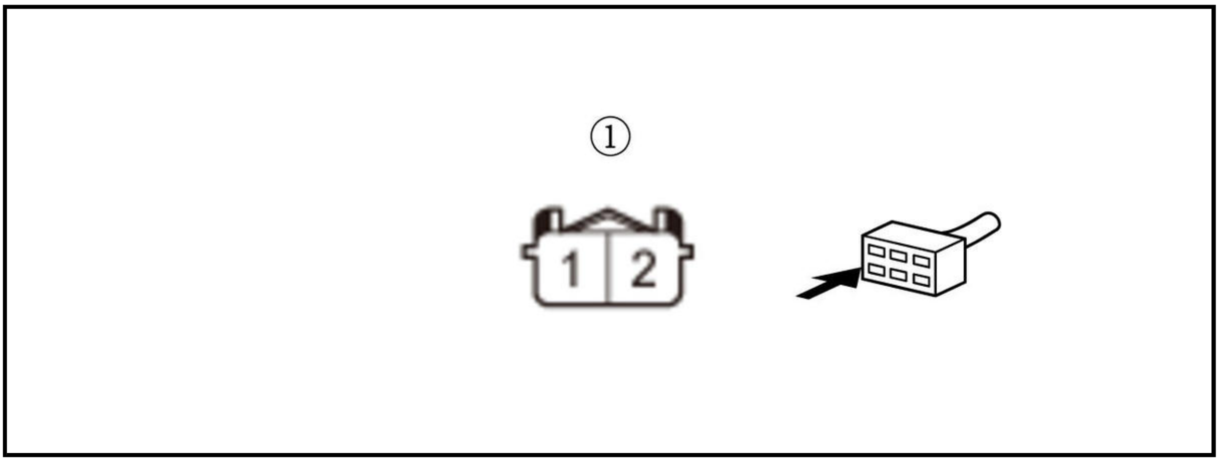
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the PCU coolant temperature sensor 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCU coolant temperature sensor 2P connector: disconnected
Test point 1	PCU coolant temperature sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SGTEMP/SGTMP/PCU_TW_SNSR_GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

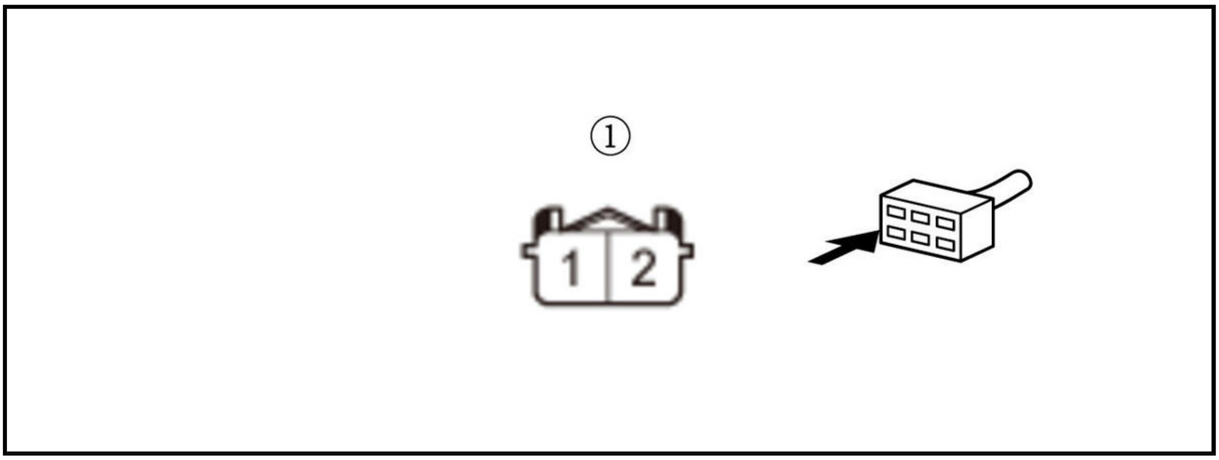
-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connector.

PCU 33P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	PCU coolant temperature sensor 2P connector: disconnected
Test point 1	**PCU 33P connector No. 17**
Test point 2	PCU coolant temperature sensor 2P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Replace the PCU .

NO

Repair an open in the SGTEMP/SGTMP/PCU_TW_SNSR_GND wire between the PCU coolant temperature sensor and the PCU.

5. Open wire check (TWPCU/PCU_TW_SNSR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

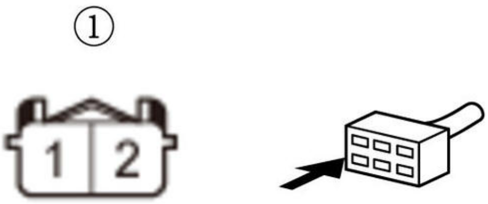
-2. Do the 12 volt battery terminal disconnection procedure .

-3. Disconnect the following connector.

PCU 33P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	PCU coolant temperature sensor 2P connector: disconnected
Test point 1	PCU 33P connector No. 16
Test point 2	PCU coolant temperature sensor 2P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

Replace the PCU .

NO

Repair an open in the TWPCU/PCU_TW_SNSR wire between the PCU coolant temperature sensor and the PCU.

DTC P0D32 (1025) (MOTOR CONTROL MODULE)

DTC P0D32 : DC-DC Converter Over Temperature (Traction Motor Control Module Detected)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0D32 DC-DC Converter Over Temperature (Traction Motor Control Module Detected)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0D32 DC-DC Converter Over Temperature (Traction Motor Control Module Detected)	B	B	B

Is DTC P0D32 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0DFA

DTC P0DFA : Generator Motor Phase U-V-W Current Sensor Correlation

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P0DFA, troubleshoot those DTCs first, then recheck for P0DFA.
-
    - P1D13

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0DFA Generator Motor Phase U-V-W Current Sensor Correlation	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are DTC P0DFA and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Update the motor control module if it does not have the latest software .

DTC P0DFB (294)

DTC P0DFB : Generator Motor Rotor Position Sensor Exceeding Learn Limit

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC will be stored when the generator motor motor rotor position sensor is poor installation.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0DFB Generator Motor Rotor Position Sensor Exceeding Learn Limit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. **Do the generator motor motor rotor position sensor calibration** .

Is calibration completed?

YES

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

Faulty generator motor motor rotor position sensor. **Replace the transmission (e-CVT) assembly** .

DTC P0E01 (274)

DTC P0E01 : Generator Motor Phase U Current Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0E01 Generator Motor Phase U Current Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Monitor the OBD STATUS for DTC P0E01 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0E01 Generator Motor Phase U Current Sensor Circuit Range/Performance	B

   Does the HDS indicate FAILED?

   YES

   Replace the PCU .

   NO

   If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep the vehicle in the ON mode until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0E05 (277)

DTC P0E05 : Generator Motor Phase V Current Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0E05 Generator Motor Phase V Current Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Monitor the OBD STATUS for DTC P0E05 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0E05 Generator Motor Phase V Current Sensor Circuit Range/Performance	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep the vehicle in the ON mode until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0E09 (280)

DTC P0E09 : Generator Motor Phase W Current Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0E09 Generator Motor Phase W Current Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Monitor the OBD STATUS for DTC P0E09 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0E09 Generator Motor Phase W Current Sensor Circuit Range/Performance	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep the vehicle in the ON mode until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0E56 (1032)

DTC P0E56 : DC-DC Converter Voltage Sensor Circuit Low

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0E56 DC-DC Converter Voltage Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0E56 DC-DC Converter Voltage Sensor Circuit Low	B	B	B

   Is DTC P0E56 indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P0E57 (1031)

DTC P0E57 : DC-DC Converter Voltage Sensor Circuit High

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0E57 DC-DC Converter Voltage Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0E57 DC-DC Converter Voltage Sensor Circuit High	B	B	B

Is DTC P0E57 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1437 (41)

DTC P1437 : Traction Motor Inverter Short

WARNING:

This procedure includes high voltage measurements with the electric powertrain system turned on. To avoid serious injury from electrical shocks while testing the high voltage cable, use insulated gloves, select a DC range of 500 V or more on your digital multimeter, and be careful not to contact each tester probes and not to contact any metal parts while you measure the high voltage cable.

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1437 Traction Motor Inverter Short	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the READY TO DRIVE mode.

   -5. Position to D, and release the brake pedal.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1437 Traction Motor Inverter Short	B	B	B

Is DTC P1437 indicated?

YES

Go to step 3

NO

Go to step 2

2. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1440 Traction Motor Inverter Gate Line Open	B	B	B

Is DTC P1440 indicated?

YES

Go to the DTC P1440 troubleshooting.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Traction motor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the service plug** .

-3. **Remove the PCU** .

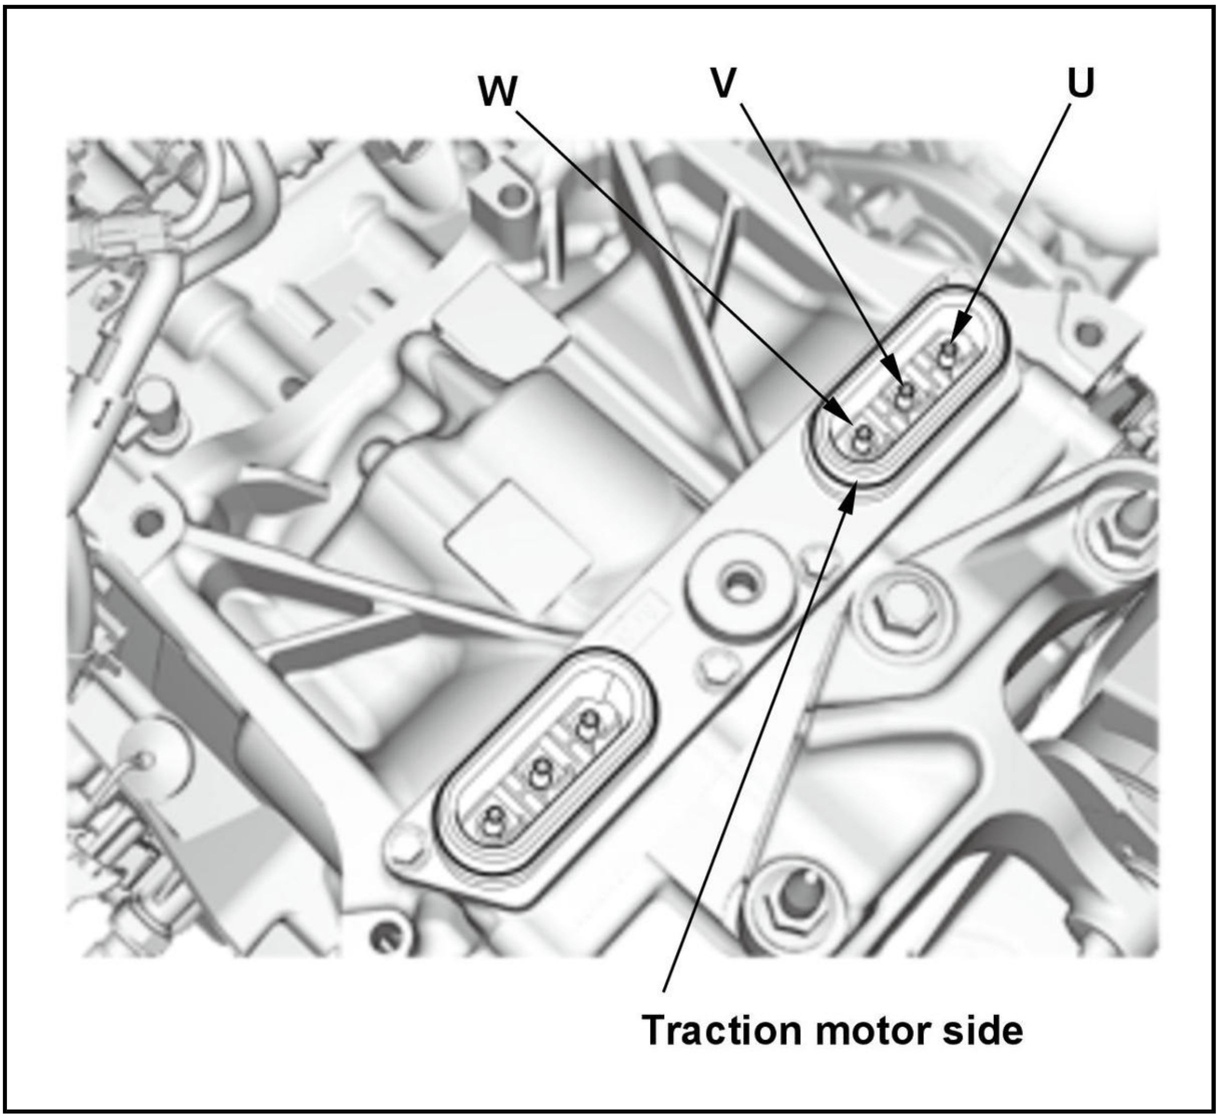
-4. At the traction motor 3-phase terminals side, measure the resistance between the following test points individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCU: removed

NOTICE:

When measuring terminals, make sure to use an ohmmeter that is capable of measuring milli-ohm range. Make sure to take the measurement when the transmission temperature is about 68B°F (20B°C) (rated resistance value is at 68B°F (20B°C)) as the resistance figures may vary.

Connector	Terminals	Value (mΩ)
Traction motor high voltage terminals	U - V	About 38.4-40.4
	U - W	About 38.4-40.4



Is resistance value OK?

YES

Go to step 4.

NO

Faulty traction motor. Replace the transmission (e-CVT) assembly .

4. Traction motor motor rotor position sensor circuit check

-1. Do the traction motor motor rotor position sensor circuit check .

Is it OK?

YES

Replace the PCU and the transmission (e-CVT) assembly .

NO

Repair an open or short in the traction motor motor rotor position sensor circuit between the PCU and the traction motor motor rotor position sensor.

DTC P1440 (57)

DTC P1440 : Traction Motor Inverter Gate Line Open

WARNING:

This procedure includes high voltage measurements with the electric powertrain system turned on. To avoid serious injury from electrical shocks while testing the high voltage cable, use insulated gloves, select a DC range of 500 V or more on your digital multimeter, and be careful not to contact each tester probes and not to contact any metal parts while you measure the high voltage cable.

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1440 Traction Motor Inverter Gate Line Open	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Test-drive the vehicle in the range of the recorded freeze data parameters.

   Freeze Data

   -2. Monitor the OBD STATUS for DTC P1440 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1440 Traction Motor Inverter Gate Line Open	B

   Does the HDS indicate FAILED?

   YES

   Go to step 2.

   NO

   If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Traction motor motor rotor position sensor circuit check

   -1. **Do the traction motor motor rotor position sensor circuit check** .

   Is it OK?

   YES

   Go to step 3.

   NO

   Repair an open or short in the traction motor motor rotor position sensor circuit between the PCU and the traction motor motor rotor position sensor.

3. Traction motor check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the service plug** .

-3. Remove the PCU .

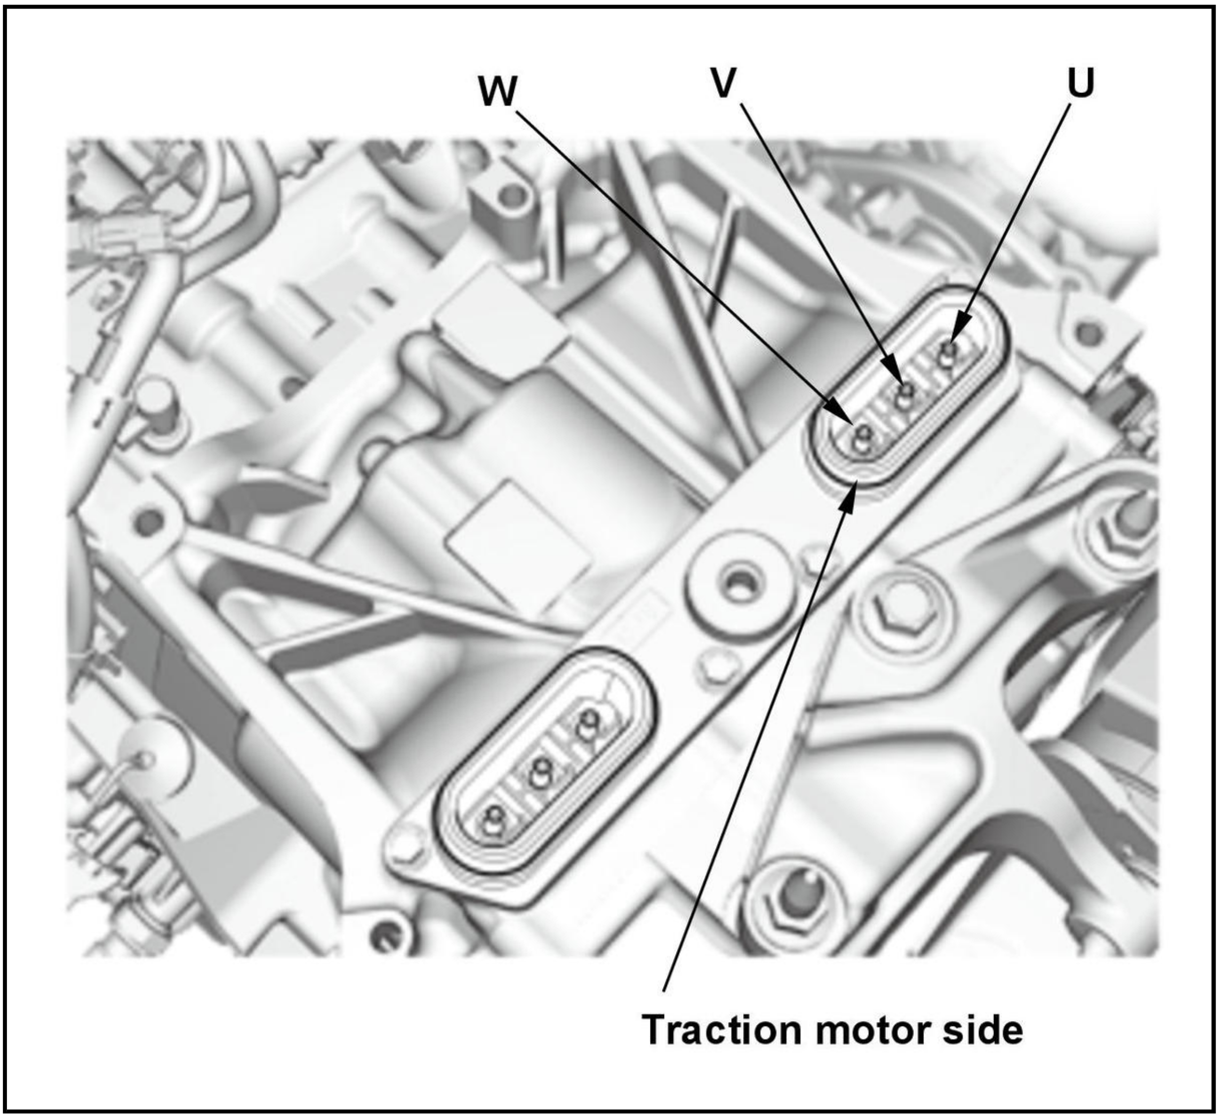
-4. At the traction motor 3-phase terminals side, measure the resistance between the following test points individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCU: removed

NOTICE:

When measuring terminals, make sure to use an ohmmeter that is capable of measuring milli-ohm range. Make sure to take the measurement when the transmission temperature is about 68B°F (20B°C) (rated resistance value is at 68B°F (20B°C)) as the resistance figures may vary.

Connector	Terminals	Value (mΩ)
Traction motor high voltage terminals	U - V	About 38.4-40.4
	U - W	About 38.4-40.4



Is resistance value OK?

YES

Replace the PCU .

NO

Faulty traction motor. **Replace the transmission (e-CVT) assembly** .

DTC P15A5 (85)

DTC P15A5 : Traction Motor Inverter Current Too High

WARNING:

This procedure includes high voltage measurements with the electric powertrain system turned on. To avoid serious injury from electrical shocks while testing the high voltage cable, use insulated gloves, select a DC range of 500 V or more on your digital multimeter, and be careful not to contact each tester probes and not to contact any metal parts while you measure the high voltage cable.

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P15A5 Traction Motor Inverter Current Too High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Test-drive the vehicle in the range of the recorded freeze data parameters.

   Freeze Data

   -2. Monitor the OBD STATUS for DTC P15A5 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P15A5 Traction Motor Inverter Current Too High	B

   Does the HDS indicate FAILED?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1440 Traction Motor Inverter Gate Line Open	B	B	B

   Is DTC P1440 indicated?

   YES

   Go to the DTC 1440 troubleshooting.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Traction motor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the service plug** .

-3. **Remove the PCU** .

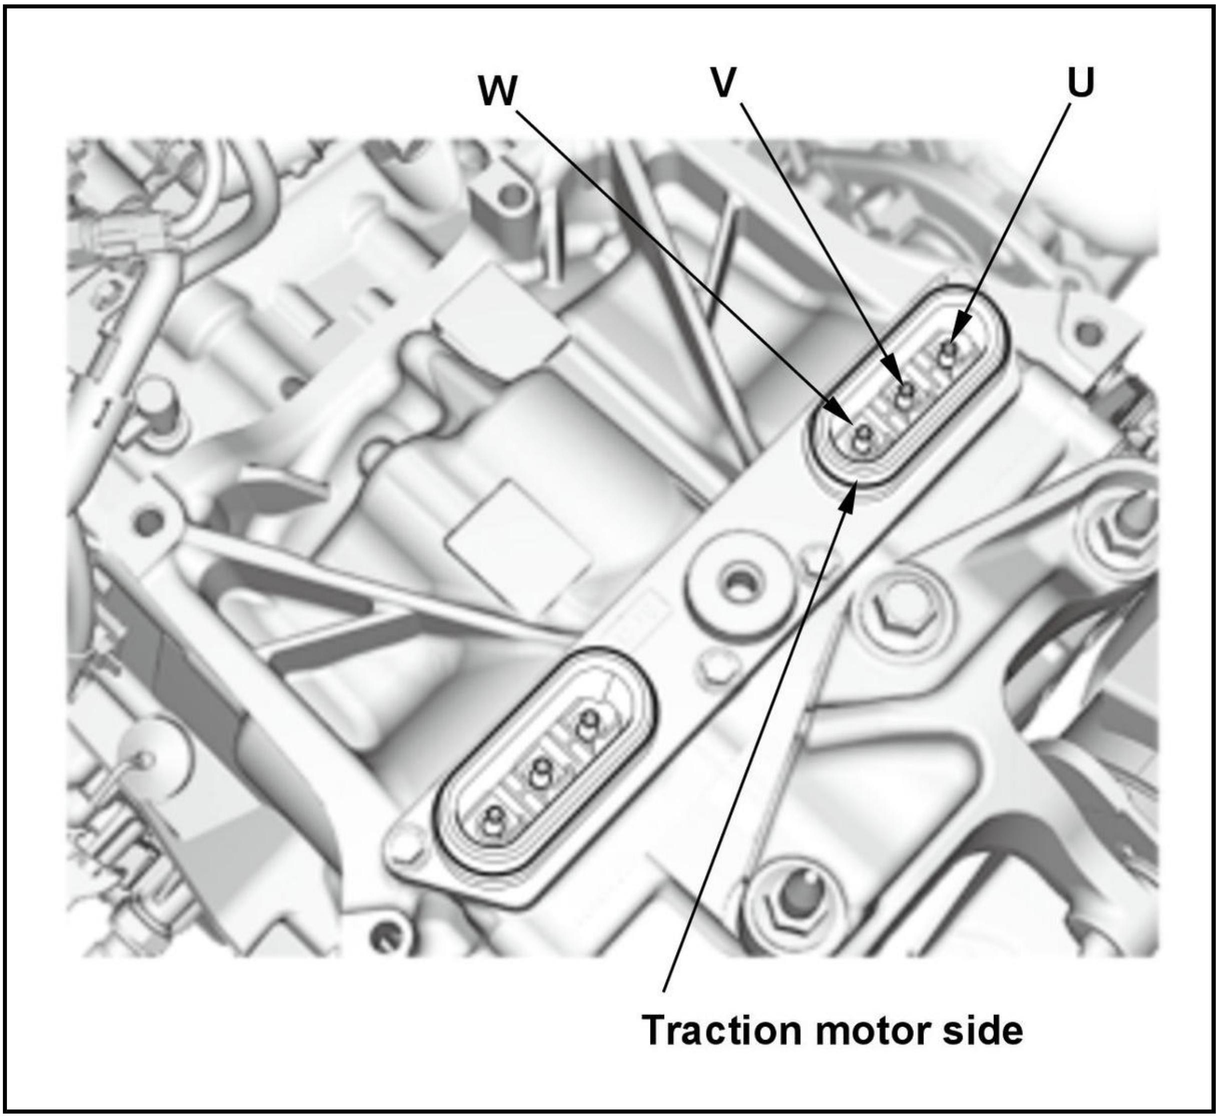
-4. At the traction motor 3-phase terminals side, measure the resistance between the following test points individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCU: removed

NOTICE:

When measuring terminals, make sure to use an ohmmeter that is capable of measuring milli-ohm range. Make sure to take the measurement when the transmission temperature is about 68B°F (20B°C) (rated resistance value is at 68B°F (20B°C)) as the resistance figures may vary.

Connector	Terminals	Value (mΩ)
Traction motor high voltage terminals	U - V	About 38.4-40.4
	U - W	About 38.4-40.4



Is resistance value OK?

YES

Replace the PCU .

NO

Faulty traction motor. Replace the transmission (e-CVT) assembly .

DTC P1A54 (461), P1A55 (462)

DTC P1A54 : Traction Motor Control Module Torque Control Performance

DTC P1A55 : Traction Motor Control Module Torque Adjustment Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A54 Traction Motor Control Module Torque Control Performance	B	B	B
P1A55 Traction Motor Control Module Torque Adjustment Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Test-drive the vehicle in the range of the recorded freeze data parameters.

   Freeze Data

   -2. Monitor the OBD STATUS for DTC P1A54 or P1A55 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1A54 Traction Motor Control Module Torque Control Performance	B
P1A55 Traction Motor Control Module Torque Adjustment Performance	B

   Does the HDS indicate FAILED?

   YES

   Replace the PCU .

   NO

   If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1A56 (463)

DTC P1A56 : Traction Motor Current Too High

WARNING:

This procedure includes high voltage measurements with the electric powertrain system turned on. To avoid serious injury from electrical shocks while testing the high voltage cable, use insulated gloves, select a DC range of 500 V or more on your digital multimeter, and be careful not to contact each tester probes and not to contact any metal parts while you measure the high voltage cable.

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A56 Traction Motor Current Too High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Test-drive the vehicle in the range of the recorded freeze data parameters.

   Freeze Data

   -2. Monitor the OBD STATUS for DTC P1A56 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1A56 Traction Motor Current Too High	B

   Does the HDS indicate FAILED?

   YES

   Go to step 2.

   NO

   If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Traction motor motor rotor position sensor circuit check

   -1. **Do the traction motor motor rotor position sensor circuit check** .

   Is it OK?

   YES

   Go to step 3.

   NO

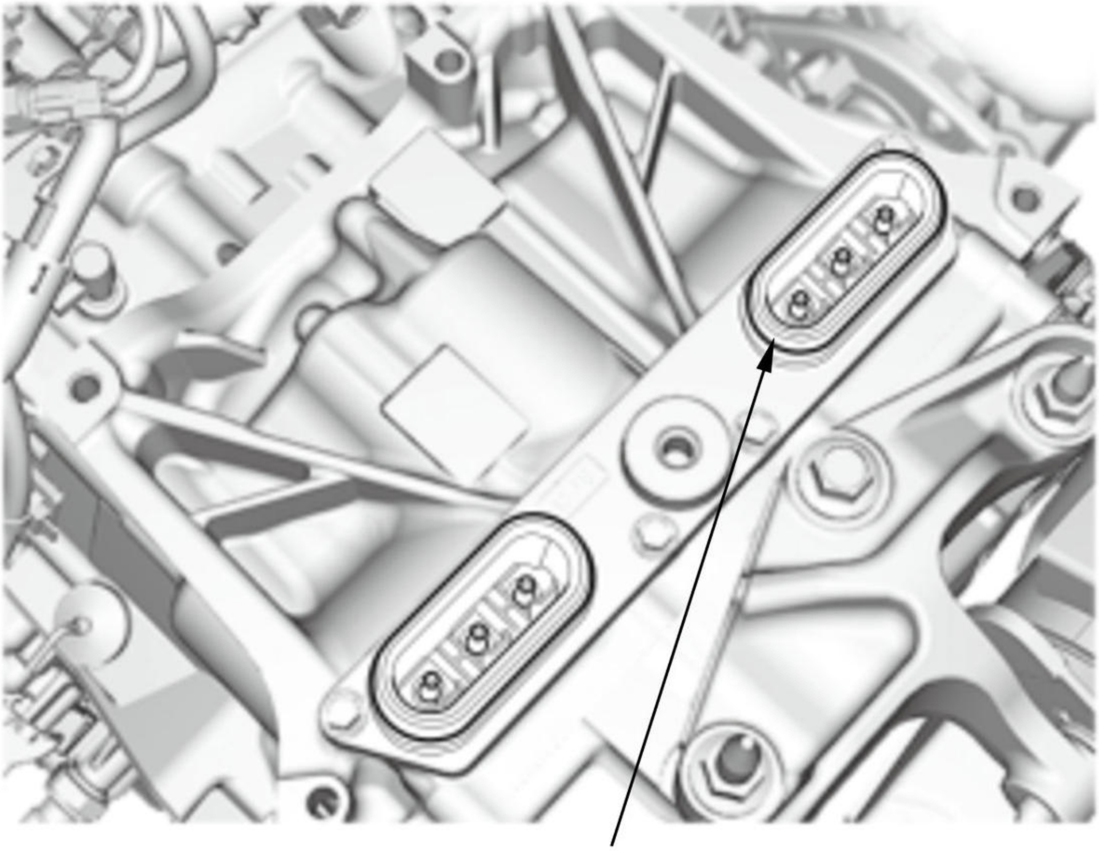
   Repair an open or short in the traction motor motor rotor position sensor circuit between the PCU and the traction motor motor rotor position sensor.

3. Traction motor visual check

   -1. **Remove the service plug** .

   -2. **Remove the PCU** .

   -3. At the traction motor 3-phase terminals side, check the terminals damage, or obstructions.



Are the terminals OK?

YES

Replace the PCU .

NO

Faulty traction motor. Replace the transmission (e-CVT) assembly .

DTC P1A57 (464)

DTC P1A57 : Traction Motor Phase Current Sensor

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A57 Traction Motor Phase Current Sensor	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Test-drive the vehicle in the range of the recorded freeze data parameters.

   Freeze Data

-2. Monitor the OBD STATUS for DTC P1A57 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1A57 Traction Motor Phase Current Sensor	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1A63 (1089)

DTC P1A63 : VCU V2 Voltage Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A63 VCU V2 Voltage Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A63 VCU V2 Voltage Sensor Circuit Range/Performance	B	B	B

Is DTC P1A63 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1A64 (460)

DTC P1A64 : PCU Internal Failure (Communication Error)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A64 PCU Internal Failure (Communication Error)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A64 PCU Internal Failure (Communication Error)	B	B	B

Is DTC P1A64 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1A65 (1090)

DTC P1A65 : Motor Inverter Internal Failure

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A65 Motor Inverter Internal Failure	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A65 Motor Inverter Internal Failure	B	B	B

Is DTC P1A65 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1A87 (1111)

DTC P1A87 : VCU V0 Voltage Sensor Circuit Range/Performance (Over Voltage Range)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A87 VCU V0 Voltage Sensor Circuit Range/Performance (Over Voltage Range)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A87 VCU V0 Voltage Sensor Circuit Range/Performance (Over Voltage Range)	B	B	B

Is DTC P1A87 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1A88 (1113)

DTC P1A88 : VCU V1 Voltage Sensor Circuit Range/Performance (Under Voltage Range)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A88 VCU V1 Voltage Sensor Circuit Range/Performance (Under Voltage Range)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A88 VCU V1 Voltage Sensor Circuit Range/Performance (Under Voltage Range)	B	B	B

   Is DTC P1A88 indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1A89 (1112)

DTC P1A89 : VCU V1 Voltage Sensor Circuit Range/Performance (Over Voltage Range)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A89 VCU V1 Voltage Sensor Circuit Range/Performance (Over Voltage Range)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1A89 VCU V1 Voltage Sensor Circuit Range/Performance (Over Voltage Range)	B	B	B

Is DTC P1A89 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D05 (457)

DTC P1D05 : Traction Motor Control Module Internal Communication Failure

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D05 Traction Motor Control Module Internal Communication Failure	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D05 Traction Motor Control Module Internal Communication Failure	B	B	B

Is DTC P1D05 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D11 (30)

DTC P1D11 : Traction Motor Phase Current Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D11 Traction Motor Phase Current Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Test-drive the vehicle in the range of the recorded freeze data parameters.

Freeze Data

-2. Monitor the OBD STATUS for DTC P1D11 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1D11 Traction Motor Phase Current Sensor Circuit Range/Performance	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D13 (283)

DTC P1D13 : Generator Motor Phase Current Sensor Range/Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D13 Generator Motor Phase Current Sensor Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Test-drive the vehicle in the range of the recorded freeze data parameters.

Freeze Data

-2. Monitor the OBD STATUS for DTC P1D13 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1D13 Generator Motor Phase Current Sensor Range/Performance	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D18 (1026)

DTC P1D18 : Traction Motor Temperature Sense Failure

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D18 Traction Motor Temperature Sense Failure	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D18 Traction Motor Temperature Sense Failure	B	B	B

   Is DTC P1D18 indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D1B (448)

DTC P1D1B : VCU V2S Voltage Sensor Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D1B VCU V2S Voltage Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D1B VCU V2S Voltage Sensor Circuit High	B	B	B

Is DTC P1D1B indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D1C (450)

DTC P1D1C : VCU V2S Voltage Sensor Circuit

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D1C VCU V2S Voltage Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D1C VCU V2S Voltage Sensor Circuit	B	B	B

Is DTC P1D1C indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D1D (1015)

DTC P1D1D : VCU V0 Voltage Sensor Circuit Low

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D1D VCU V0 Voltage Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D1D VCU V0 Voltage Sensor Circuit Low	B	B	B

Is DTC P1D1D indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D6E (236)

DTC P1D6E : Traction Motor Temperature Sensor Circuit Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D6E Traction Motor Temperature Sensor Circuit Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and wait 6 hours.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D6E Traction Motor Temperature Sensor Circuit Performance	B	B	B

Is DTC P1D6E indicated?

YES

Go to step 2.

NO

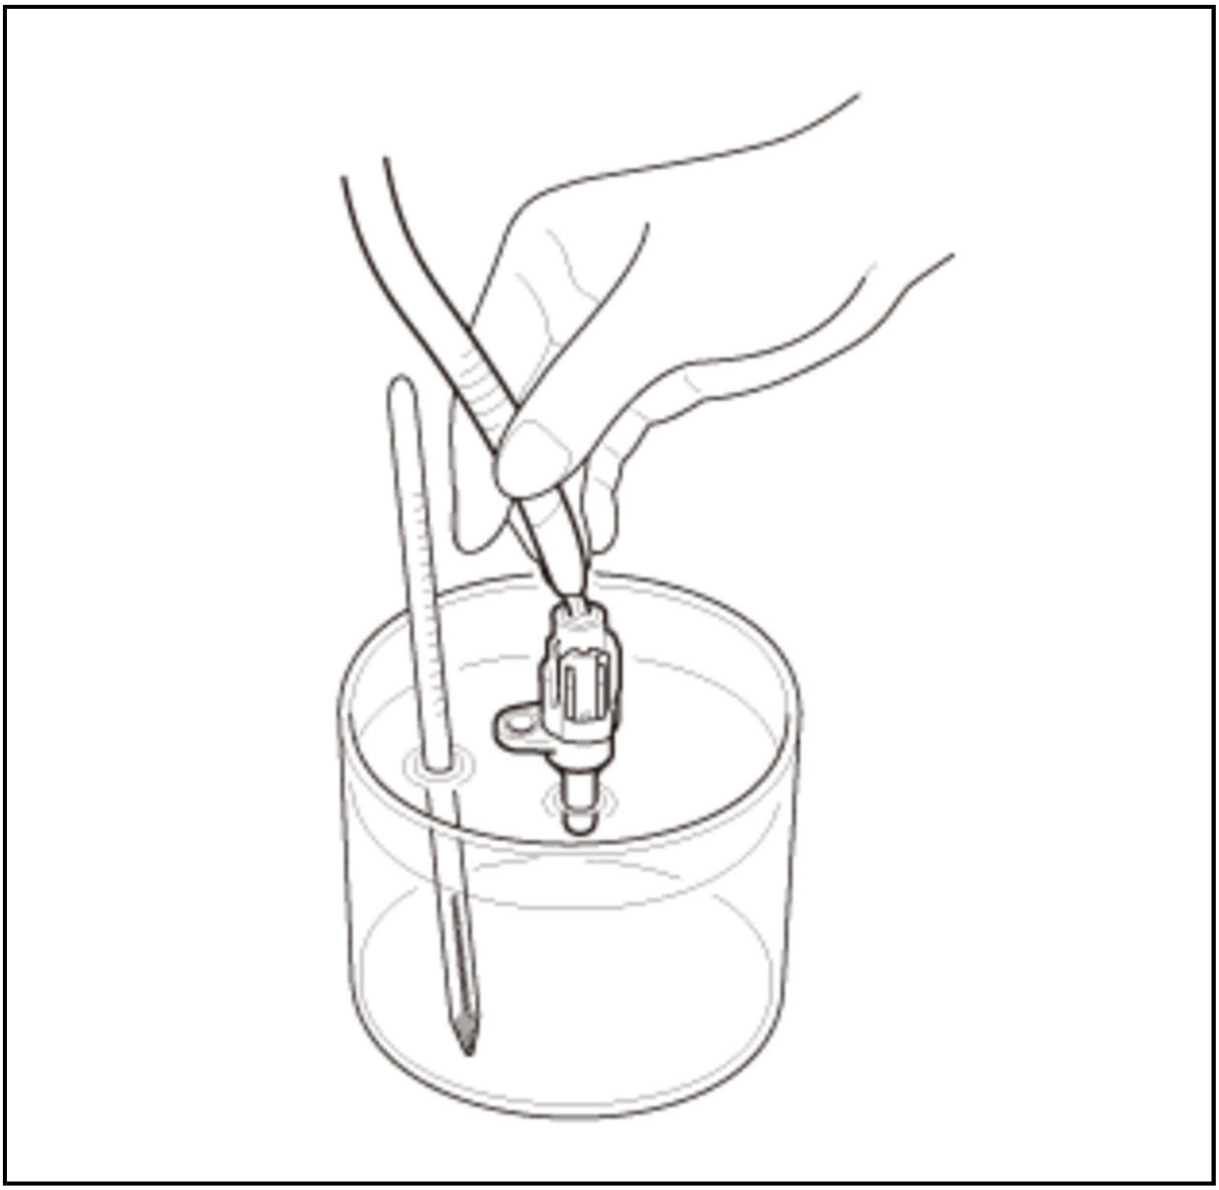
Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Transmission fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the transmission fluid temperature sensor** , but leave it connected.

-3. Submerge the sensor and a thermometer in a container of water.



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
ATF Temperature (TRC)	B	B

Does the live data for the transmission fluid temperature sensor match the temperature reading from the thermometer?

YES

Replace the transmission (e-CVT) assembly .

NO

Replace the transmission fluid temperature sensor .

DTC P1D70 (246)

DTC P1D70 : Traction Motor Phase Current Sensor Multiple Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D70 Traction Motor Phase Current Sensor Multiple Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D70 Traction Motor Phase Current Sensor Multiple Performance	B	B	B

   Is DTC P1D70 indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D72 (321)

DTC P1D72 : Traction Motor Temperature Sensor Circuit Range/Performance (Lo Side)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D72 Traction Motor Temperature Sensor Circuit Range/Performance (Lo Side)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Test-drive the vehicle in the range of the recorded freeze data parameters.

   Freeze Data

   -2. Monitor the OBD STATUS for DTC P1D72 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1D72 Traction Motor Temperature Sensor Circuit Range/Performance (Lo Side)	B

   Does the HDS indicate FAILED?

YES

Faulty traction motor temperature sensor. **Replace the transmission (e-CVT) assembly** .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D77 (332)

DTC P1D77 : VCU I1 Current Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D77 VCU I1 Current Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Test-drive the vehicle in the range of the recorded freeze data parameters.

Freeze Data

-2. Monitor the OBD STATUS for DTC P1D77 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1D77 VCU I1 Current Sensor Circuit Range/Performance	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D78 (331)

DTC P1D78 : VCU I1 Current Sensor Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D78 VCU I1 Current Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D78 VCU I1 Current Sensor Circuit Low	B	B	B

Is DTC P1D78 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D79 (330)

DTC P1D79 : VCU I1 Current Sensor Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D79 VCU I1 Current Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D79 VCU I1 Current Sensor Circuit High	B	B	B

Is DTC P1D79 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D7A (341)

DTC P1D7A : Reactor Temperature Sensor Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D7A Reactor Temperature Sensor Circuit Range/Performance Problem	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and wait 6 hours.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D7A Reactor Temperature Sensor Circuit Range/Performance Problem	B	B	B

   Is DTC P1D7A indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D7B (343)

DTC P1D7B : Reactor Over Temperature (Traction Motor Control Module Detected)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D7B Reactor Over Temperature (Traction Motor Control Module Detected)	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D92 PCU Electric Coolant Pump Control Circuit	B	B	B
P1D9A PCU Electric Coolant Pump Circuit	B	B	B

Is DTC P1D92 or P1D9A indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Problem verification

-1. Test-drive the vehicle in the range of the recorded freeze data parameters.

Freeze Data

-2. Monitor the OBD STATUS for DTC P1D7B in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1D7B Reactor Over Temperature (Traction Motor Control Module Detected)	B

Does the HDS indicate FAILED?

YES

Go to step 3.

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. PCU coolant circuit check

-1. **Do the PCU coolant circuit inspection** .

Is it OK?

YES

Check the cooling fan operation. If it is OK, **replace the PCU** .

NO

Repair or replace parts as needed.

DTC P1D7D (340)

DTC P1D7D : Reactor Temperature Sensor 1 Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D7D Reactor Temperature Sensor 1 Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D7D Reactor Temperature Sensor 1 Circuit Low	B	B	B

   Is DTC P1D7D indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D7E (339)

DTC P1D7E : Reactor Temperature Sensor 1 Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D7E Reactor Temperature Sensor 1 Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D7E Reactor Temperature Sensor 1 Circuit High	B	B	B

Is DTC P1D7E indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D7F (481)

DTC P1D7F : Generator Motor Inverter Malfunction Signal Low (Generator Motor Control Module Detected)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D7F Generator Motor Inverter Malfunction Signal Low (Generator Motor Control Module Detected)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D7F Generator Motor Inverter Malfunction Signal Low (Generator Motor Control Module Detected)	B	B	B

Is DTC P1D7F indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D81 (483)

DTC P1D81 : VCU Malfunction Signal Low (Traction Motor Control Module Detected)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D81 VCU Malfunction Signal Low (Traction Motor Control Module Detected)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

    -4. Turn the vehicle to the ON mode.

    -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D81 VCU Malfunction Signal Low (Traction Motor Control Module Detected)	B	B	B

    Is DTC P1D81 indicated?

    YES

    Replace the PCU .

    NO

    Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D85 (479)

DTC P1D85 : Traction Motor Inverter Malfunction Signal Low (Traction Motor Control Module Detected)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D85 Traction Motor Inverter Malfunction Signal Low (Traction Motor Control Module Detected)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

    -4. Turn the vehicle to the ON mode.

    -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D85 Traction Motor Inverter Malfunction Signal Low (Traction Motor Control Module Detected)	B	B	B

Is DTC P1D85 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D8A (295)

DTC P1D8A : Generator Motor Inverter Gate Line Open

WARNING:

This procedure includes high voltage measurements with the electric powertrain system turned on. To avoid serious injury from electrical shocks while testing the high voltage cable, use insulated gloves, select a DC range of 500 V or more on your digital multimeter, and be careful not to contact each tester probes and not to contact any metal parts while you measure the high voltage cable.

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D8A Generator Motor Inverter Gate Line Open	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Test-drive the vehicle in the range of the recorded freeze data parameters.

Freeze Data

-2. Monitor the OBD STATUS for DTC P1D8A in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1D8A Generator Motor Inverter Gate Line Open	B

Does the HDS indicate FAILED?

YES

Go to step 2.

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Generator motor motor rotor position sensor circuit check

-1. **Do the generator motor motor rotor position sensor circuit check** .

Is it OK?

YES

Go to step 3.

NO

Repair an open or short in the generator motor motor rotor position sensor circuit between the PCU and the generator motor motor rotor position sensor.

3. Generator motor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the service plug** .

-3. **Remove the PCU** .

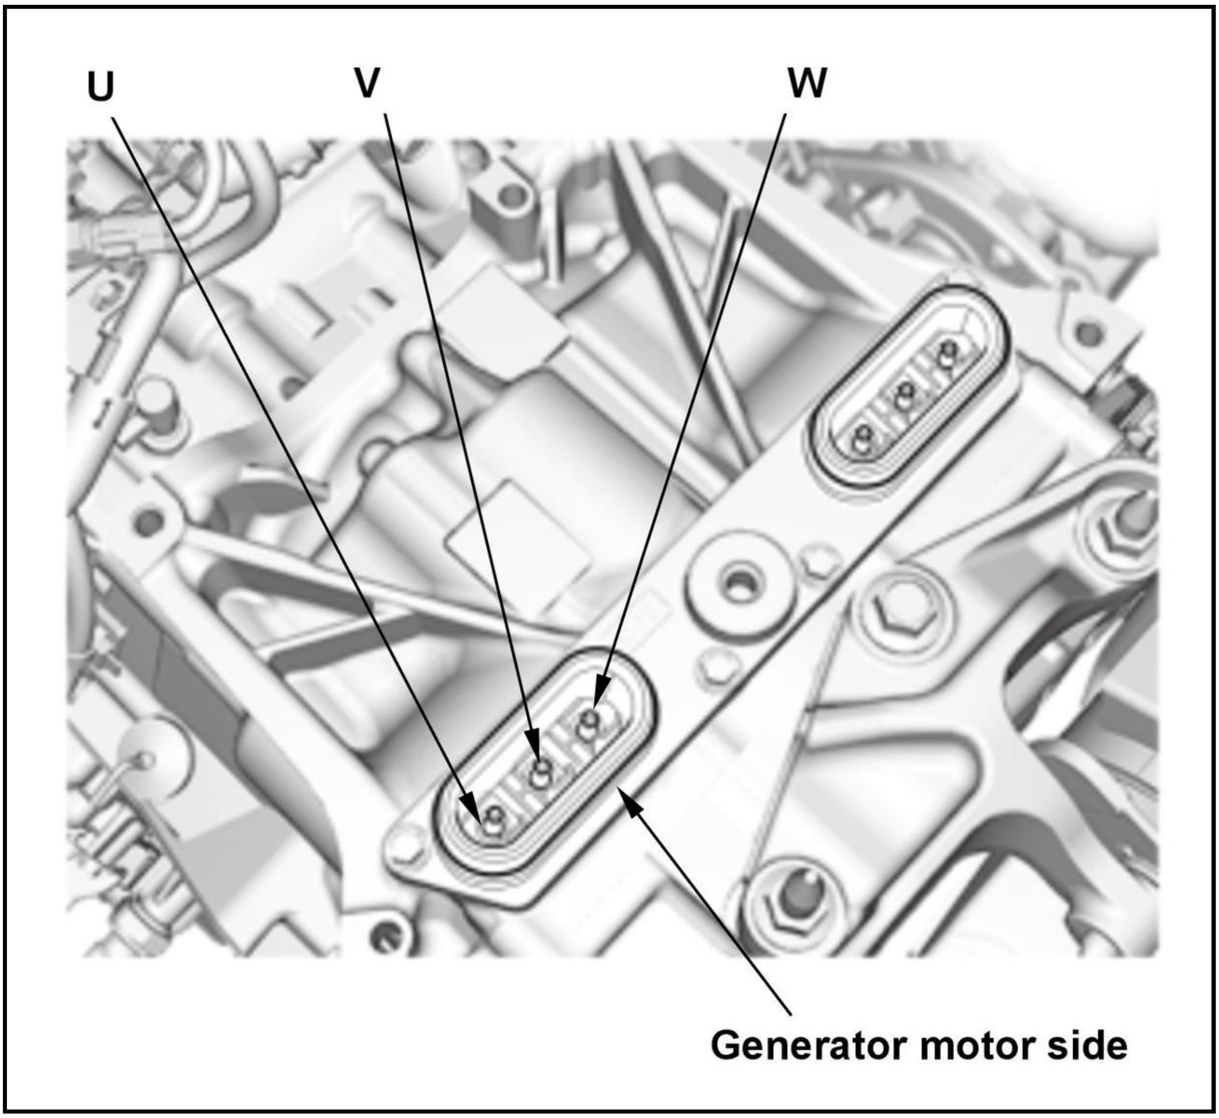
-4. At the generator motor 3-phase terminals side, measure the resistance between the following test points individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCU: removed

NOTICE:

When measuring terminals, make sure to use an ohmmeter that is capable of measuring milli-ohm range. Make sure to take the measurement when the transmission temperature is about 68B°F (20B°C) (rated resistance value is at 68B°F (20B°C)) as the resistance figures may vary.

Connector	Terminals	Value (mΩ)
Generator motor high voltage terminals	U - V	About 31.7-33.7
	U - W	About 31.7-33.7



Is resistance value OK?

YES

Replace the PCU .

NO

Faulty generator motor. Replace the transmission (e-CVT) assembly .

DTC P1D8C (284)

DTC P1D8C : Generator Motor Inverter Over Current

WARNING:

This procedure includes high voltage measurements with the electric powertrain system turned on. To avoid serious injury from electrical shocks while testing the high voltage cable, use insulated gloves, select a DC range of 500 V or more on your digital multimeter, and be careful not to contact each tester probes and not to contact any metal parts while you measure the high voltage cable.

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D8C Generator Motor Inverter Over Current	B	B	B

1. Problem verification

   -1. Test-drive the vehicle in the range of the recorded freeze data parameters.

   Freeze Data

   -2. Monitor the OBD STATUS for DTC P1D8C in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1D8C Generator Motor Inverter Over Current	B

   Does the HDS indicate FAILED?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D8A Generator Motor Inverter Gate Line Open	B	B	B

   Is DTC P1D8A indicated?

   YES

   Go to the DTC P1D8A troubleshooting.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Generator motor check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the service plug** .

   -3. **Remove the PCU** .

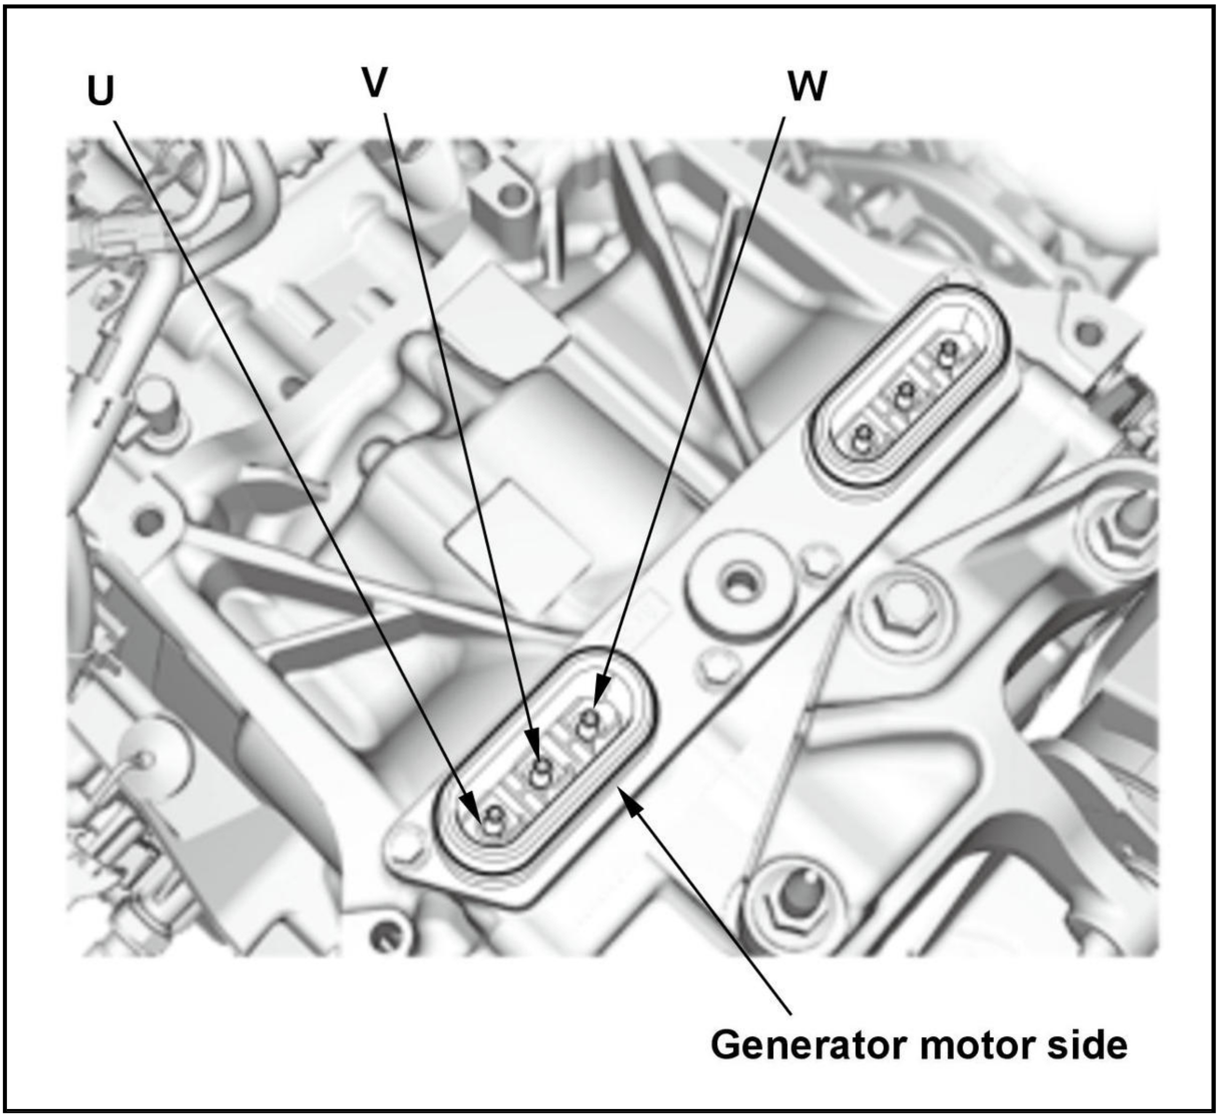
   -4. At the generator motor 3-phase terminals side, measure the resistance between the following test points individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCU: removed

   NOTICE:

   When measuring terminals, make sure to use an ohmmeter that is capable of measuring milli-ohm range. Make sure to take the measurement when the transmission temperature is about 68B°F (20B°C) (rated resistance value is at 68B°F (20B°C)) as the resistance figures may vary.

Connector	Terminals	Value (mΩ)
Generator motor high voltage terminals	U - V	About 31.7-33.7
	U - W	About 31.7-33.7



Is resistance value OK?

YES

Replace the PCU .

NO

Faulty generator motor. Replace the transmission (e-CVT) assembly .

DTC P1D8D (285)

DTC P1D8D : Generator Motor Inverter Short

WARNING:

This procedure includes high voltage measurements with the electric powertrain system turned on. To avoid serious injury from electrical shocks while testing the high voltage cable, use insulated gloves, select a DC range of 500 V or more on your digital multimeter, and be careful not to contact each tester probes and not to contact any metal parts while you measure the high voltage cable.

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D8D Generator Motor Inverter Short	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. **Enter the maintenance mode** , then start the engine.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D8D Generator Motor Inverter Short	B	B	B

   Is DTC P1D8D indicated?

   YES

   Go to step 4.

   NO

   Go to step 2.

2. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D8A Generator Motor Inverter Gate Line Open	B	B	B

   Is DTC P1D8A indicated?

   YES

   Go to the DTC P1D8A troubleshooting.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Generator motor motor rotor position sensor circuit check

   -1. **Do the generator motor motor rotor position sensor circuit check** .

   Is it OK?

   YES

Go to step 4.

NO

Repair an open or a short in the generator motor motor rotor position sensor circuit between the PCU and the generator motor motor rotor position sensor.

4. Generator motor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the service plug** .

-3. **Remove the PCU** .

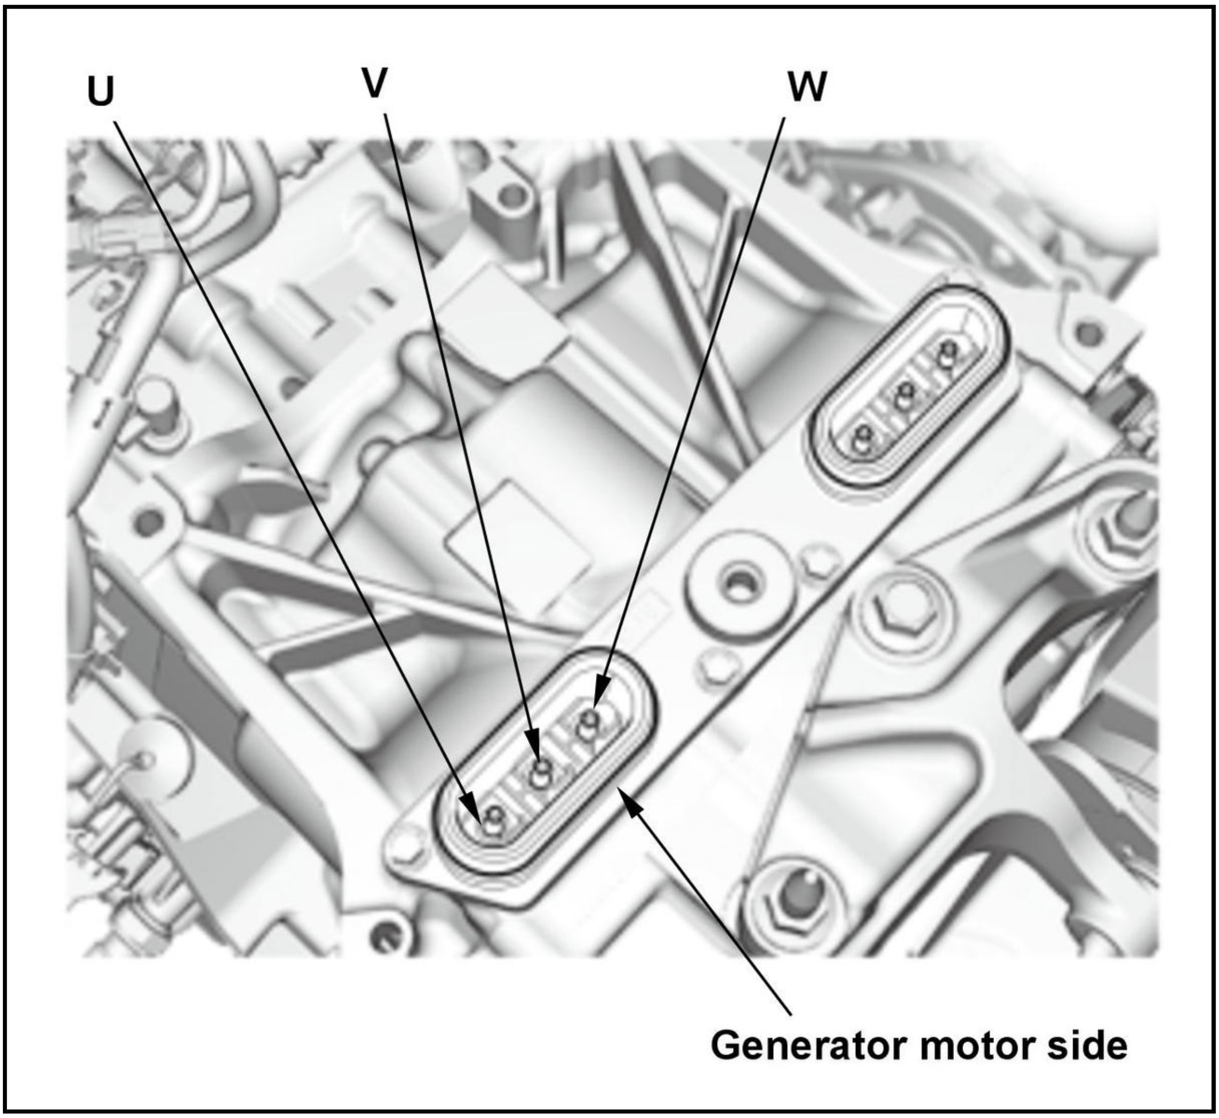
-4. At the generator motor 3-phase terminals side, measure the resistance between the following test points individually.

Test condition	Vehicle OFF (LOCK) mode
B	PCU: removed

NOTICE:

When measuring terminals, make sure to use an ohmmeter that is capable of measuring milli-ohm range. Make sure to take the measurement when the transmission temperature is about 68B°F (20B°C) (rated resistance value is at 68B°F (20B°C)) as the resistance figures may vary.

Connector	Terminals	Value (mΩ)
Generator motor high voltage terminals	U - V	About 31.7-33.7
	U - W	About 31.7-33.7



Is resistance value OK?

YES

Replace the PCU .

NO

Faulty generator motor. Replace the transmission (e-CVT) assembly .

DTC P1D92 (230)

DTC P1D92 : PCU Electric Coolant Pump Control Circuit

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D92 PCU Electric Coolant Pump Control Circuit	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1673 IGHLD Relay Circuit	B	B	B

Is DTC P1673 indicated?

YES

Go to the DTC P1673 troubleshooting .

NO

Go to step 2

2. Problem verification 1

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Turn the vehicle to the ON mode.

   -4. Select the ELECTRIC WATER PUMP TEST in the FUNCTION TEST with the HDS, then select START.

   Electric Water Pump Test

   -5. Wait 10 seconds.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D92 PCU Electric Coolant Pump Control Circuit	B	B	B

Is DTC P1D92 indicated?

YES

Go to step 4.

NO

Go to step 3.

3. Problem verification 2

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Select the ELECTRIC WATER PUMP TEST in the FUNCTION TEST with the HDS, then select STOP.

   Electric Water Pump Test

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D92 PCU Electric Coolant Pump Control Circuit	B	B	B

Is DTC P1D92 indicated?

YES

Go to step 4.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

4. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A13**

Is the fuse OK?

YES

Go to step 5.

NO

Replace the No. A13 fuse. Also check for a short to ground on the No. A13 fuse circuit if needed.

5. Determine possible failure area (PCU electric coolant pump relay circuit, others)

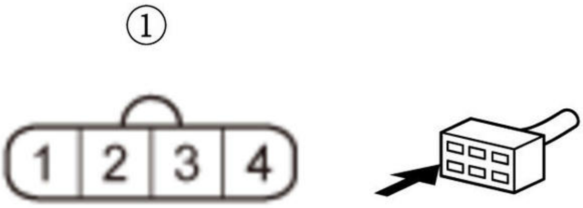
-1. Disconnect the following connector.

PCU electric coolant pump 4P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCU electric coolant pump 4P connector: disconnected
Test point 1	PCU electric coolant pump 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 6.

NO

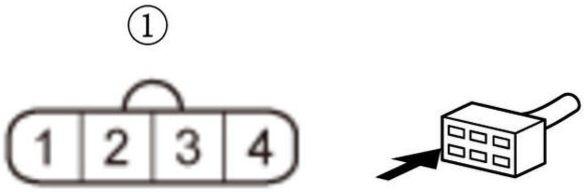
Go to step 11.

6. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU electric coolant pump 4P connector: disconnected
Test point 1	PCU electric coolant pump 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Go to step 7.

NO

Repair an open in the GND wire between the PCU electric coolant pump and G352.

7. Shorted wire check (NEWP/PCU_W/P_NEWP line)

-1. **Do the 12 volt battery terminal disconnection procedure** .

-2. Disconnect the following connector.

PCU 33P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU electric coolant pump 4P connector: disconnected
B	PCU 33P connector: disconnected
Test point 1	**PCU 33P connector No. 7**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 8.

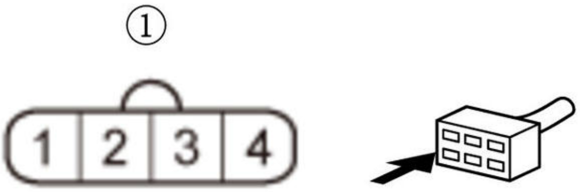
NO

Repair a short in the NEWP/PCU_W/P_NEWP wire between the PCU electric coolant pump and the PCU.

8. Open wire check (NEWP/PCU_W/P_NEWP line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU electric coolant pump 4P connector: disconnected
B	PCU 33P connector: disconnected
Test point 1	PCU electric coolant pump 4P connector (female terminals) No. 2: ①
Test point 2	**PCU 33P connector No. 7**



Is there 1.0 Ω or less?

YES

Go to step 9.

NO

Repair an open in the NEWP/PCU_W/P_NEWP wire between the PCU electric coolant pump and the PCU.

9. Shorted wire check (EWP/PCU_W/P_EWP line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU electric coolant pump 4P connector: disconnected
B	PCU 33P connector: disconnected
Test point 1	**PCU 33P connector No. 18**
Test point 1	Body ground

Is there 1 MΩ or more?

YES

Go to step 10.

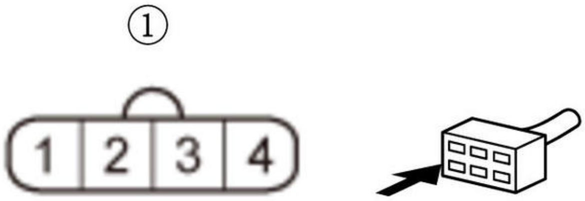
NO

Repair a short in the EWP/PCU_W/P_EWP wire between the PCU electric coolant pump and the PCU.

10. Open wire check (EWP/PCU_W/P_EWP line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU electric coolant pump 4P connector: disconnected
B	PCU 33P connector: disconnected
Test point 1	PCU electric coolant pump 4P connector (female terminals) No. 3: ①
Test point 2	**PCU 33P connector No. 18**



Is there 1.0 Ω or less?

YES

Replace the PCU electric coolant pump , then recheck. If DTC P1D92 is still indicated, **replace the PCU** .

NO

Repair an open in the EWP/PCU_W/P_EWP wire between the PCU electric coolant pump and the PCU.

11. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the PCU electric coolant pump relay** .

-3. **Test the PCU electric coolant pump relay** .

Is the relay OK?

YES

Go to step 12.

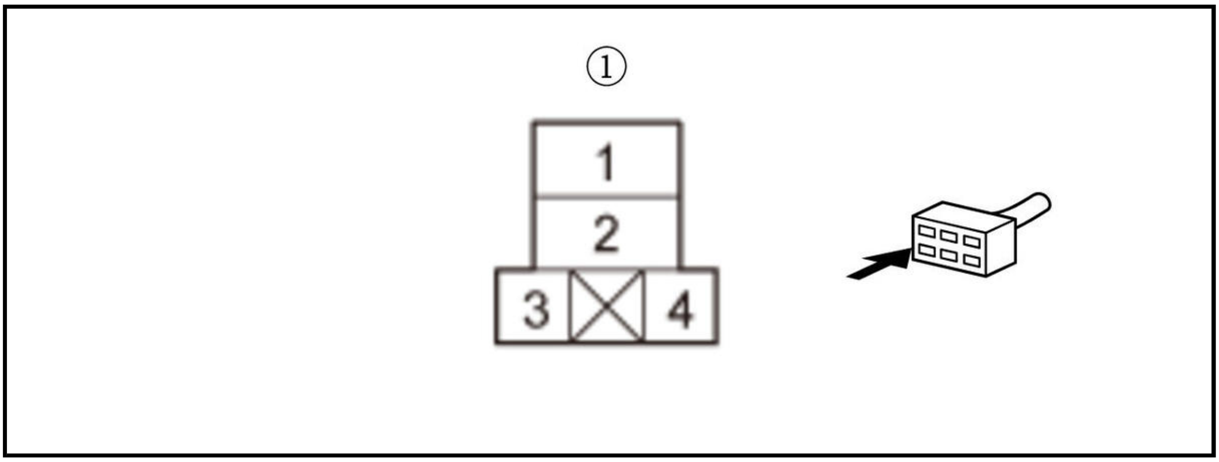
NO

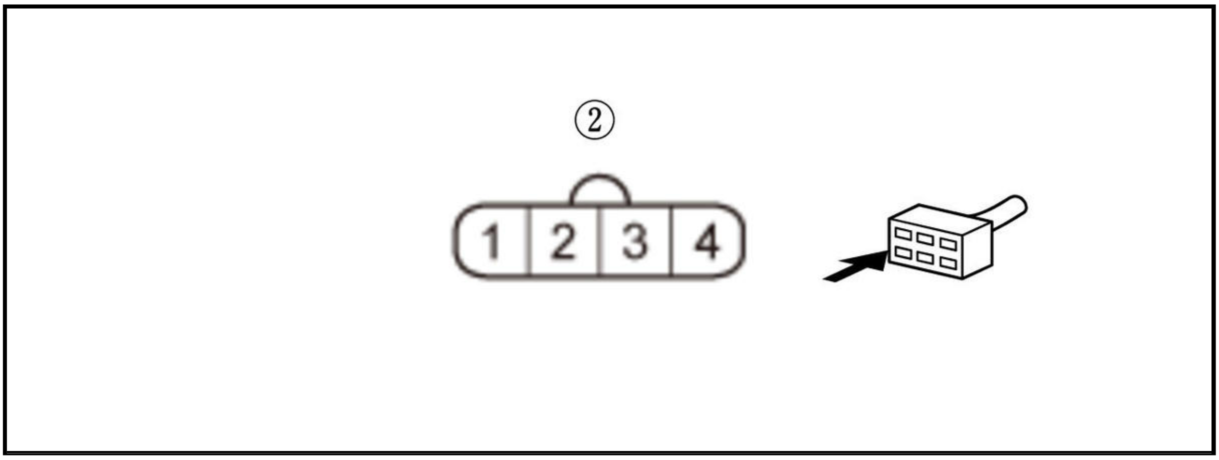
Replace the PCU electric coolant pump relay.

12. Open wire check (PCU_EWP_RLY_OUT line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCU electric coolant pump 4P connector: disconnected
B	PCU electric coolant pump relay: disconnected
Test point 1	PCU electric coolant pump relay 4P socket (female terminals) No. 2: ①
Test point 2	PCU electric coolant pump 4P connector (female terminals) No. 4: ②





Is there 1.0 Ω or less?

YES

Go to step 13.

NO

Repair an open in the PCU_EWP_RLY_OUT wire between the PCU electric coolant pump relay and the PCU electric coolant pump.

13. Open wire check (IG_PCU_EWP/PCU_EWP_RLY_CL- line)

-1. **Do the 12 volt battery terminal disconnection procedure** .

-2. **Reinstall the PCU electric coolant pump relay** .

-3. Disconnect the following connector.

PCU 33P connector

-4. **Do the 12 volt battery terminal reconnection procedure** .

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCU electric coolant pump 4P connector: disconnected

B	PCU 33P connector: disconnected
Test point 1	**PCU 33P connector No. 33**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the PCU .

NO

Repair an open in the IG_PCU_EWP/PCU_EWP_RLY_CL- wire between the PCU electric coolant pump relay and the PCU.

DTC P1D93 (232)

DTC P1D93 : PCU Coolant Over Temperature

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D93 PCU Coolant Over Temperature	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0634 PCU Internal Temperature Too High	B	B	B
P0A3C Traction Motor Inverter Over Temperature	B	B	B
P0A3E Generator Motor Inverter Over Temperature	B	B	B
P0D32 DC-DC Converter Over Temperature (Traction Motor Control Module Detected)	B	B	B
P1D7B Reactor Over Temperature (Traction Motor Control Module Detected)	B	B	B
P1F3C VCU Over Temperature	B	B	B

Is DTC P0634, P0A3C, P0A3E, P0D32, P1D7B or P1F3C indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Problem verification

-1. Test-drive the vehicle in the range of the recorded freeze data parameters.

Freeze Data

-2. Monitor the OBD STATUS for DTC P1D93 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1D93 PCU Coolant Over Temperature	B

Does the HDS indicate FAILED?

YES

Go to step 3.

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. PCU coolant circuit check

-1. **Do the PCU coolant circuit inspection** .

Is it OK?

YES

Check the cooling fan operation. If it is OK, **replace the PCU coolant temperature sensor** .

NO

Repair or replace parts as needed.

DTC P1D97 (366)

DTC P1D97 : Generator Motor Phase Current Sensors Multiple Failure

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D97 Generator Motor Phase Current Sensors Multiple Failure	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D97 Generator Motor Phase Current Sensors Multiple Failure	B	B	B

Is DTC P1D97 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1D99 (228)

DTC P1D99 : PCU Electric Coolant Pump

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D99 PCU Electric Coolant Pump	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Select the ELECTRIC WATER PUMP TEST in the Electric Powertrain FUNCTION TEST with the HDS. Then do the START.

Electric Water Pump Test

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D99 PCU Electric Coolant Pump	B	B	B

Is DTC P1D99 indicated?

YES

Go to step 2.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A13**

Is the fuse OK?

YES

Go to step 3.

NO

Replace the No. A13 fuse. Also check for a short to ground on the No. A13 fuse circuit if needed.

3. Relay check

-1. **Remove the PCU electric coolant pump relay** .

-2. **Test the PCU electric coolant pump relay** .

Is the relay OK?

YES

Go to step 4.

NO

Replace the PCU electric coolant pump relay.

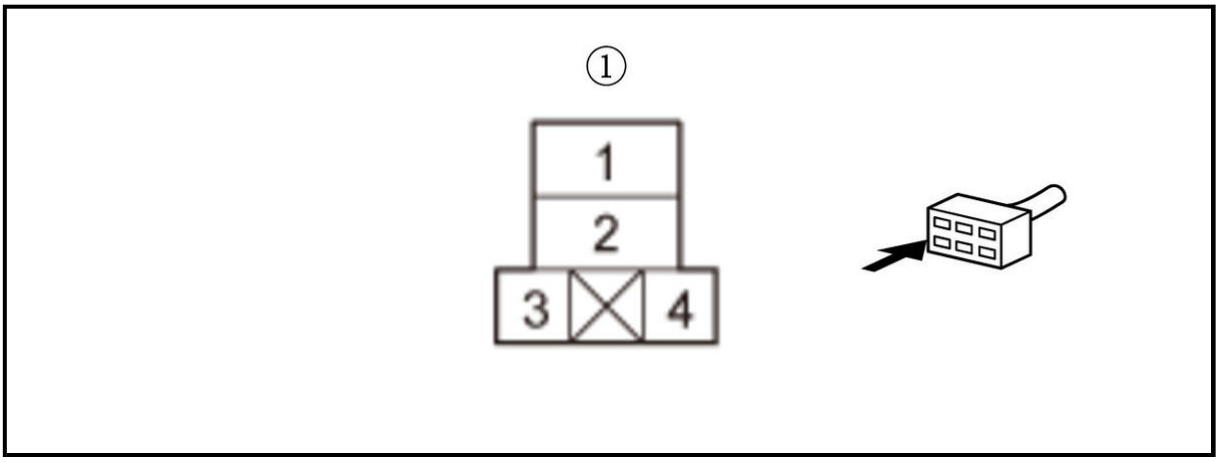
4. Open wire check (IGA line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode PCU electric coolant pump relay: disconnected
Test point 1	PCU electric coolant pump relay 4P socket (female terminals) No. 3: ①

Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

NO

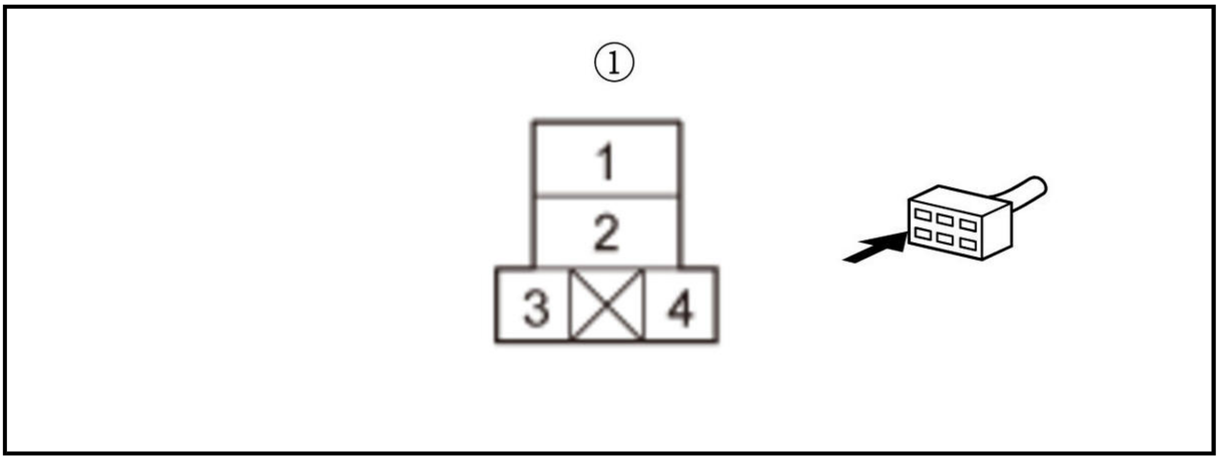
Repair an open in the IGA wire between the PCU electric coolant pump relay and the IGHLD1 relay.

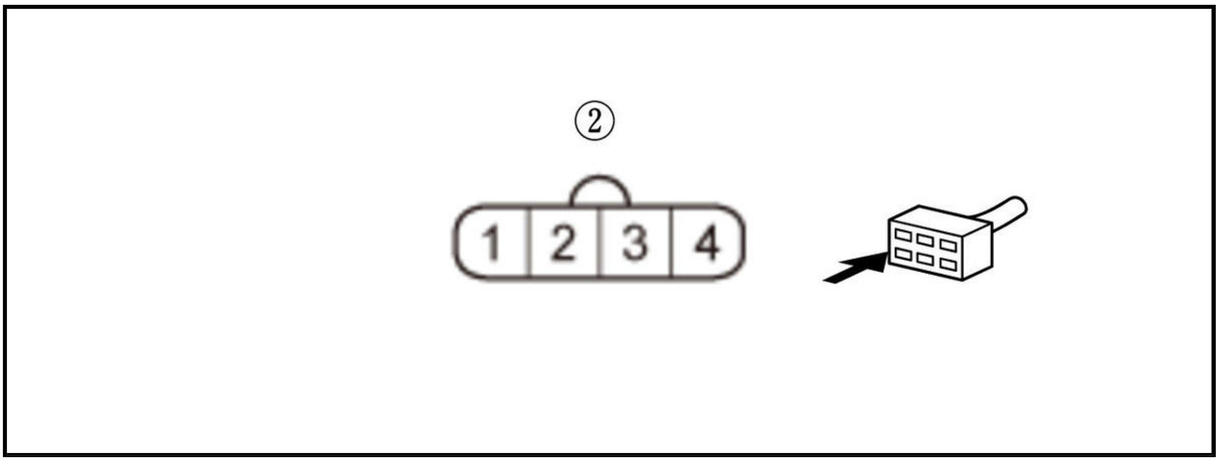
5. Open wire check (PCU_EWP_RLY_OUT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCU electric coolant pump relay: disconnected
B	PCU electric coolant pump 4P connector: disconnected
Test point 1	PCU electric coolant pump relay 4P socket (female terminals) No. 2: ①
Test point 2	PCU electric coolant pump 4P connector (female terminals) No. 4: ②





Is there 1.0 Ω or less?

YES

Go to step 6.

NO

Repair an open in the PCU_EWP_RLY_OUT wire between the PCU electric coolant pump relay and the PCU electric coolant pump.

6. Open wire check (PCU_EWP_RLY_CL-/IG_PCU_EWP line)

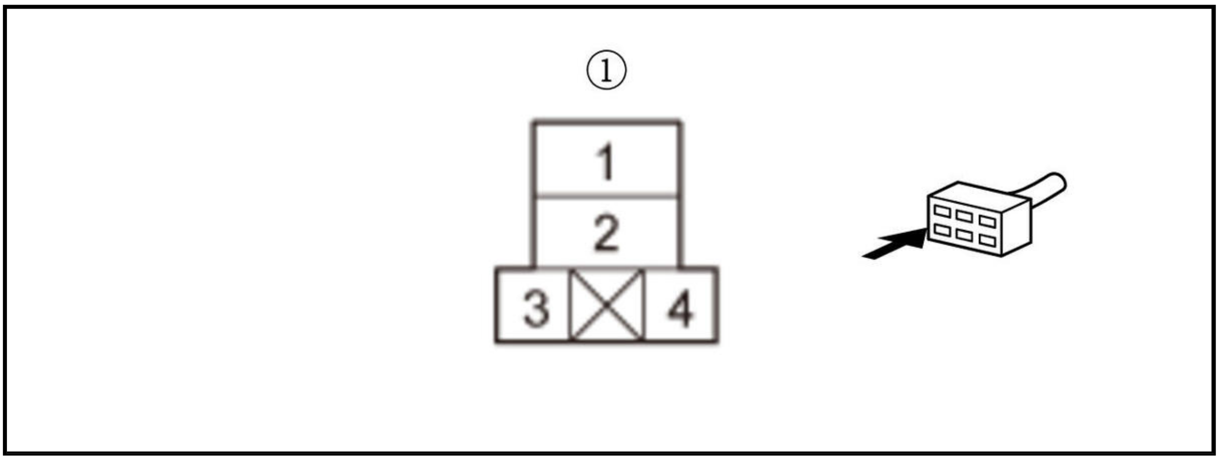
-1. **Do the 12 volt battery terminal disconnection procedure** .

-2. Disconnect the following connector.

PCU 33P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCU electric coolant pump relay: disconnected
	PCU electric coolant pump 4P connector: disconnected
B	PCU 33P connector: disconnected
Test point 1	PCU electric coolant pump relay 4P socket (female terminals) No. 4: ①
Test point 2	**PCU 33P connector (female terminals) No. 33**



Is there 1.0 Ω or less?

YES

Go to step 7.

NO

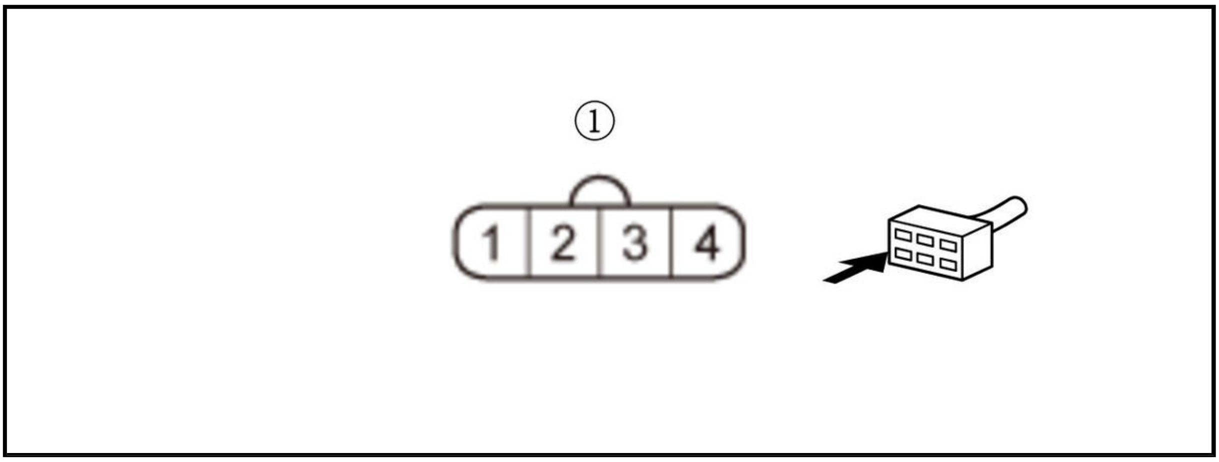
Repair an open in the PCU_EWP_RLY_CL-/IG_PCU_EWP wire between the PCU electric coolant pump relay and the PCU.

7. Open wire check (PCU_W/P_NEWP/NEWP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU electric coolant pump relay: disconnected
B	PCU electric coolant pump 4P connector: disconnected
B	PCU 33P connector: disconnected
Test point 1	PCU electric coolant pump 4P connector (female terminals) No. 2: ①
Test point 2	PCU 33P connector (female terminals) No. 7



Is there 1.0 Ω or less?

YES

Go to step 8.

NO

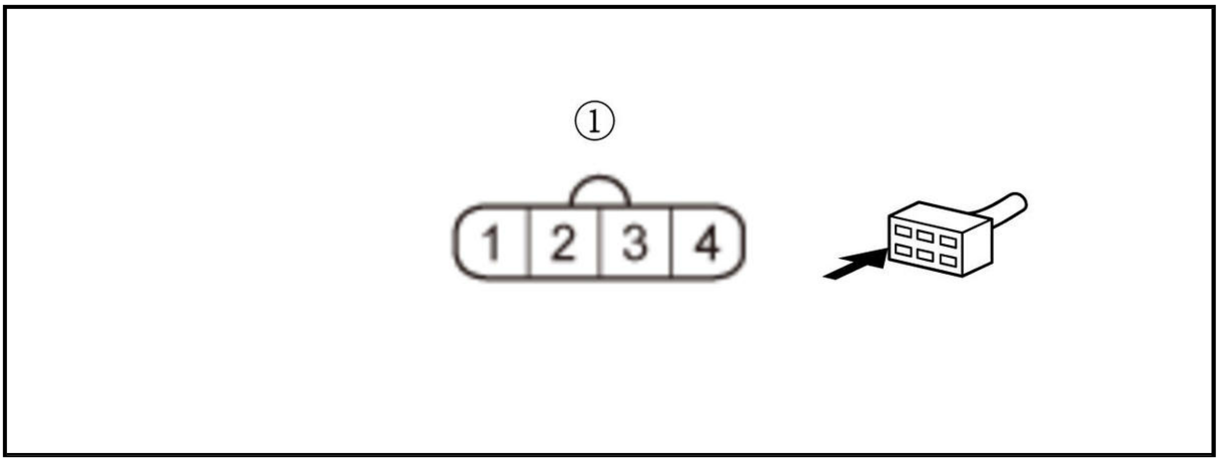
Repair an open in the PCU_W/P_NEWP/NEWP wire between the PCU electric coolant pump and the PCU.

8. Shorted wire check (PCU_W/P_NEWP/NEWP line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU electric coolant pump relay: disconnected
B	PCU electric coolant pump 4P connector: disconnected
B	PCU 33P connector: disconnected
Test point 1	PCU electric coolant pump 4P connector (female terminals) No. 2: ①

Test point 2	Body ground



Is there 1 MΩ or more?

YES

Replace the PCU electric coolant pump , then recheck. If DTC P1D99 is still indicated, **replace the PCU** .

NO

Repair a short to ground in the PCU_W/P_NEWP/NEWP wire between the PCU electric coolant pump and the PCU.

DTC P1D9A (229)

DTC P1D9A : PCU Electric Coolant Pump Circuit

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- At a cold district, low concentration coolant can cause this DTC.
- After troubleshooting, **do the PCU coolant air bleeding procedure** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D9A PCU Electric Coolant Pump Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Check the coolant level and the coolant concentration** .

   -4. Select the ELECTRIC WATER PUMP TEST in the Electric Powertrain FUNCTION TEST with the HDS. Then do the START.

   Electric Water Pump Test

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D9A PCU Electric Coolant Pump Circuit	B	B	B

Is DTC P1D9A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Go to step 3.

2. Shorted wire check (PCU_W/P_EWP/EWP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

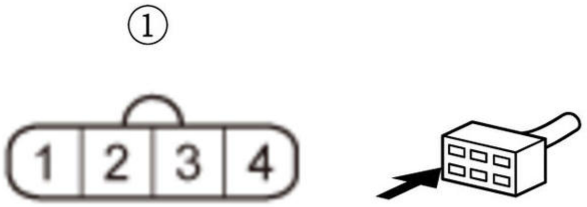
-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connectors.

PCU electric coolant pump 4P connector	
PCU 33P connector	

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU electric coolant pump 4P connector: disconnected
B	PCU 33P connector: disconnected
Test point 1	PCU electric coolant pump 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Replace the PCU electric coolant pump , then recheck. If DTC P1D9A is still indicated, **replace the PCU** .

NO

Repair a short in the PCU_W/P_EWP/EWP wire between the PCU electric coolant pump and the PCU.

3. Cooling system check

-1. **Do the PCU coolant circuit inspection** .

Is it OK?

YES

Go to step 4.

NO

Repair or replace parts as needed.

4. PCU electric coolant pump operation check

-1. **Do the PCU coolant air bleeding procedure** .

-2. Turn the vehicle to the ON mode.

-3. Select the ELECTRIC WATER PUMP TEST in the Electric Powertrain FUNCTION TEST with the HDS. Then do the START.

Electric Water Pump Test

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Value	Unit	Value	Unit
PCU Electric Coolant Pump Speed (TRC)	1171 - 2894	RPM	B	B

Do the current condition(s) match the threshold?

YES

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

Replace the PCU electric coolant pump , then recheck. If DTC P1D9A is still indicated, **replace the PCU** .

DTC P1D9D (335)

DTC P1D9D : VCU Temperature Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D9D VCU Temperature Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Wait 1 minute.

NOTE: Make sure the engine is not running.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D9D VCU Temperature Sensor Circuit Range/Performance	B	B	B

Is DTC P1D9D indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DA0 (437)

DTC P1DA0 : VCU Inverter Temperature Sensor Circuit Low

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DA0 VCU Inverter Temperature Sensor Circuit Low	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DA0 VCU Inverter Temperature Sensor Circuit Low	B	B	B

Is DTC P1DA0 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DA1 (438)

DTC P1DA1 : VCU Inverter Temperature Sensor Circuit High

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DA1 VCU Inverter Temperature Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

    -4. Turn the vehicle to the ON mode.

    -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DA1 VCU Inverter Temperature Sensor Circuit High	B	B	B

    Is DTC P1DA1 indicated?

    YES

    Replace the PCU .

    NO

    Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DA4 (486)

DTC P1DA4 : VCU Inverter Short

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DA4 VCU Inverter Short	B	B	B

DTC (Electric Powertrain)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Raise the vehicle on a lift .

-5. Turn the vehicle to the READY TO DRIVE mode.

-6. Position to D, and test-drive at 50 mph (80 km/h) or more for 1 minute.

NOTE: Do not apply the brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.

-7. Monitor the OBD STATUS for DTC P1DA4 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1DA4 VCU Inverter Short	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DA6 (443), P1DA8 (447), P1DAA (451)

DTC P1DA6 : VCU V1 Voltage Sensor Circuit Range/Performance

DTC P1DA8 : VCU V2M Voltage Sensor Circuit Range/Performance

DTC P1DAA : VCU V2S Voltage Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DA6 VCU V1 Voltage Sensor Circuit Range/Performance	B	B	B
P1DA8 VCU V2M Voltage Sensor Circuit Range/Performance	B	B	B
P1DAA VCU V2S Voltage Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the READY TO DRIVE mode.

-5. Position to D, and release the brake pedal.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DA6 VCU V1 Voltage Sensor Circuit Range/Performance	B	B	B
P1DA8 VCU V2M Voltage Sensor Circuit Range/Performance	B	B	B
P1DAA VCU V2S Voltage Sensor Circuit Range/Performance	B	B	B

Is DTC P1DA6, P1DA8 and/or P1DAA indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DD8 (439)

DTC P1DD8 : VCU Inverter Temperature Sensor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DD8 VCU Inverter Temperature Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DD8 VCU Inverter Temperature Sensor Circuit	B	B	B

Is DTC P1DD8 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DD9 (1012)

DTC P1DD9 : VCU I1 Current Sensor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DD9 VCU I1 Current Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DD9 VCU I1 Current Sensor Circuit	B	B	B

Is DTC P1DD9 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DDB (361)

DTC P1DDB : Reactor Temperature Sensor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DDB Reactor Temperature Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DDB Reactor Temperature Sensor Circuit	B	B	B

Is DTC P1DDB indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DE3 (440)

DTC P1DE3 : VCU V1 Voltage Sensor Circuit High

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE3 VCU V1 Voltage Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE3 VCU V1 Voltage Sensor Circuit High	B	B	B

Is DTC P1DE3 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DE4 (442)

DTC P1DE4 : VCU V1 Voltage Sensor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE4 VCU V1 Voltage Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE4 VCU V1 Voltage Sensor Circuit	B	B	B

   Is DTC P1DE4 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AE1 HV Battery Precharge Contactor Circuit	B	B	B
P0DA8 HV Battery Voltage/Motor Inverter Voltage Correlation	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D65 HV System Shutdown (Collision Detection Signal Detected)	B	B	B

   Is DTC P0AE1, P0DA8, and/or P1D65 indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Replace the PCU .

DTC P1DE5 (444)

DTC P1DE5 : VCU V2M Voltage Sensor Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE5 VCU V2M Voltage Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE5 VCU V2M Voltage Sensor Circuit High	B	B	B

   Is DTC P1DE5 indicated?

   YES

   Replace the PCU .

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DE6 (446)

DTC P1DE6 : VCU V2M Voltage Sensor Circuit

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE6 VCU V2M Voltage Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE6 VCU V2M Voltage Sensor Circuit	B	B	B

Is DTC P1DE6 indicated?

YES

Go to step 2.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AE1 HV Battery Precharge Contactor Circuit	B	B	B
P0DA8 HV Battery Voltage/Motor Inverter Voltage Correlation	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D65 HV System Shutdown (Collision Detection Signal Detected)	B	B	B

Is DTC P0AE1, P0DA8, and/or P1D65 indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Replace the PCU .

DTC P1DE7 (1014)

DTC P1DE7 : VCU V0 Voltage Sensor Circuit High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE7 VCU V0 Voltage Sensor Circuit High	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE7 VCU V0 Voltage Sensor Circuit High	B	B	B

Is DTC P1DE7 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DE8 (1016)

DTC P1DE8 : VCU V0 Voltage Sensor Circuit

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE8 VCU V0 Voltage Sensor Circuit	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE8 VCU V0 Voltage Sensor Circuit	B	B	B

Is DTC P1DE8 indicated?

YES

Replace the PCU .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DE9 (1017)

DTC P1DE9 : VCU V0 Voltage Sensor Circuit Range/Performance

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DE9 VCU V0 Voltage Sensor Circuit Range/Performance	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Raise the vehicle on a lift** .

   -5. Turn the vehicle to the READY TO DRIVE mode.

   -6. Position to D, and test-drive at 50 mph (80 km/h) or more for 1 minute.

   NOTE: Do not apply the brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.

   -7. Monitor the OBD STATUS for DTC P1DE9 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1DE9 VCU V0 Voltage Sensor Circuit Range/Performance	B

   Does the HDS indicate FAILED?

   YES

   Replace the PCU .

   NO

   If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1DEA (1018)

DTC P1DEA : VCU V0 Voltage Control Failure

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1DEA VCU V0 Voltage Control Failure	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

-4. Raise the vehicle on a lift .

-5. Turn the vehicle to the READY TO DRIVE mode.

-6. Position to D, and test-drive at 50 mph (80 km/h) or more for 1 minute.

NOTE: Do not apply the brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.

-7. Monitor the OBD STATUS for DTC P1DEA in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1DEA VCU V0 Voltage Control Failure	B

Does the HDS indicate FAILED?

YES

Replace the PCU .

NO

If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1F3C (336)

DTC P1F3C : VCU Over Temperature

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1F3C VCU Over Temperature	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1D92 PCU Coolant Electric Water Pump Control Circuit	B	B	B
P1D9A PCU Coolant Electric Water Pump Circuit	B	B	B

Is DTC P1D92 or P1D9A indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Problem verification

   -1. Test-drive the vehicle in the range of the recorded freeze data parameters.

   Freeze Data

   -2. Monitor the OBD STATUS for DTC P1F3C in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1F3C VCU Over Temperature	B

   Does the HDS indicate FAILED?

   YES

   Go to step 3.

   NO

   If the HDS indicates PASSED, the system is OK at this time but has an intermittent failure. If the HDS indicates NOT COMPLETED, keep test-driving until an indication comes on. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. PCU coolant circuit check

   -1. **Do the PCU coolant circuit inspection** .

   Is it OK?

   YES

   Check the cooling fan operation. If it is OK, **replace the PCU** .

   NO

   Repair or replace parts as needed.

DTC U0029 (107) (MOTOR CONTROL MODULE)

DTC U0029 : F-CAN Malfunction (Traction Motor Control Module Bus-Off)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0029 F-CAN Malfunction (Traction Motor Control Module Bus-Off)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

-5. Check for CAN gateway system DTCs with the HDS.

DTC Description	Confirmed DTC
B	B

DTC (CAN GATEWAY)

Are any DTCs indicated?

YES

The failure is duplicated. Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U0029-00, U0047-00 (VSA CONTROL UNIT)

DTC U0029-00 : CAN Communication Failure (Bus OFF Ch 1)

DTC U0047-00 : CAN Communication Failure (Bus OFF Ch 2)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
U0029-00 CAN Communication Failure (Bus OFF Ch 1)	B
U0047-00 CAN Communication Failure (Bus OFF Ch 2)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Communication Failure (Bus OFF Ch 1)	B
U0047-00 CAN Communication Failure (Bus OFF Ch 2)	B

Is DTC U0029-00 or U0047-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

2. DTC check (CAN gateway system)

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Are DTC(s) indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. F-CAN circuit communication check

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

VSA modulator-control unit (Bus B) is Not Available

Go to step 4.

VSA modulator-control unit (Bus C) is Not Available

Go to step 5.

VSA modulator-control unit (Bus B and C) is Available

Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

4. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector

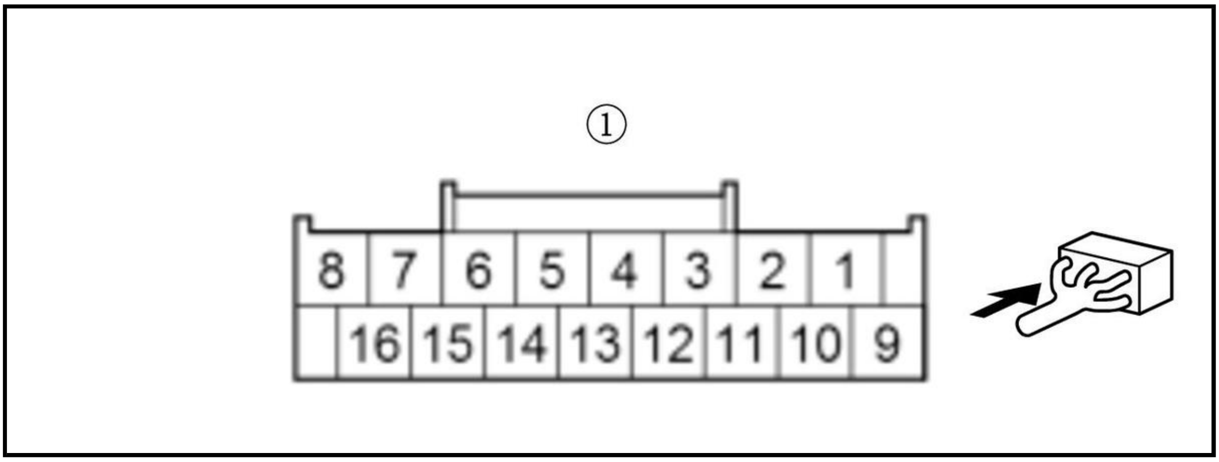
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 40**
Test point 2	CAN gateway 16P connector (female terminals) No. 6: ①

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 28**

Test point 2	CAN gateway 16P connector (female terminals) No. 14: ①



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

5. Open wire check (F-CAN C_H, F-CAN C_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

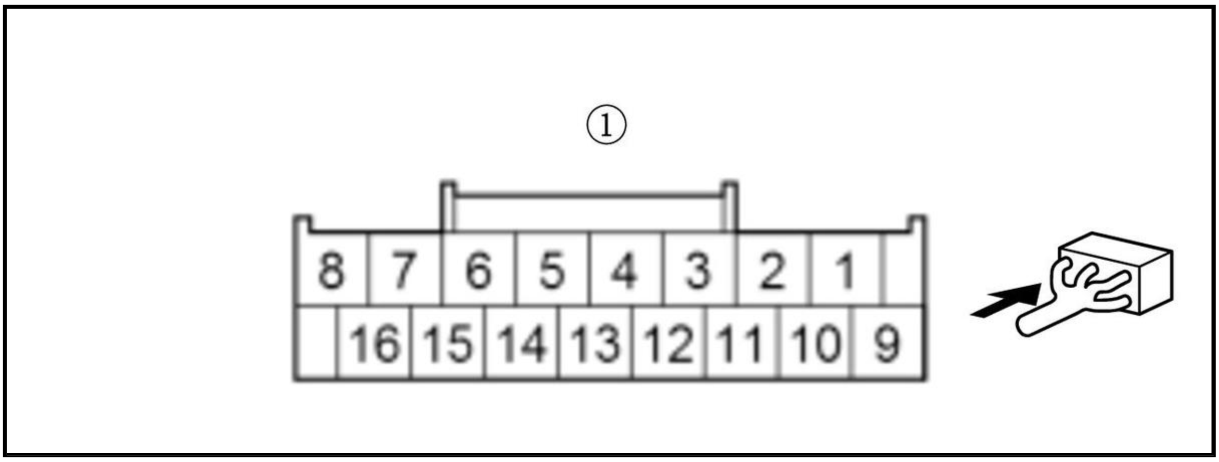
-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 46**
Test point 2	CAN gateway 16P connector (female terminals) No. 5: ①

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 34**
Test point 2	CAN gateway 16P connector (female terminals) No. 13: ①



Is there 1.0 Ω or less?

YES

The F-CAN C_H and F-CAN C_L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

DTC U0038 (98) (MOTOR CONTROL MODULE)

DTC U0038 : EP-CAN Malfunction (Traction Motor Control Module Bus-Off)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Traction Motor Control Module Bus-Off)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait 6 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Traction Motor Control Module Bus-Off)	B	B	B

Is DTC U0038 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted unit check (PCM)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Traction Motor Control Module Bus-Off)	B	B	B

Is DTC U0038 indicated?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

3. Shorted unit check (battery condition monitor module)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the **service plug** and the **IPU cover** .

-3. Disconnect the following connector.

Battery condition monitor module connector E (32P)

-4. **Do the 12 volt battery terminal reconnection procedure** .

-5. Turn the vehicle to the ON mode.

-6. Clear the DTC with the HDS.

-7. Turn the vehicle to the OFF (LOCK) mode.

-8. Turn the vehicle to the ON mode, and wait 6 seconds.

-9. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Traction Motor Control Module Bus-Off)	B	B	B

Is DTC U0038 indicated?

YES

Go to step 4.

NO

Replace the battery condition monitor module .

4. Shorted unit check (SBW shifter control module)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

SBW shifter control module 20P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Traction Motor Control Module Bus-Off)	B	B	B

Is DTC U0038 indicated?

YES

Go to step 5.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good SBW shifter assembly** .

5. Shorted unit check (park pawl actuator driver unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Park pawl actuator driver unit 26P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 EP-CAN Malfunction (Traction Motor Control Module Bus-Off)	B	B	B

Is DTC U0038 indicated?

YES

Go to step 6.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good park pawl actuator driver unit** .

6. Shorted wire check (EP-CAN A_H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

-3. Disconnect the following connector.

PCU 33P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	PCU 33P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	**PCU 33P connector No. 27**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 7.

NO

Repair a short in the EP-CAN A_H wire between the PCM, the battery condition monitor module, the SBW shifter control module, the park pawl actuator driver unit, and the PCU.

7. Shorted wire check (EP-CAN A_L line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	PCM connector A (50P): disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	PCU 33P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	**PCU 33P connector No. 28**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 8.

NO

Repair a short in the EP-CAN A_L wire between the PCM, the battery condition monitor module, the SBW shifter control module 20P connector, the Park pawl actuator driver unit 26P connector, and the PCU.

8. Shorted wire check (EP-CAN A_H wire to EP-CAN A_L wire)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	PCU 33P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	**PCU 33P connector No. 27**
Test point 2	**PCU 33P connector No. 28**

Is there 1 MΩ or more?

YES

The EP-CAN A_H wire and the EP-CAN A_L wire are OK. **Replace the PCU** .

NO

Repair a short in the EP-CAN A_H wire to the EP-CAN A_L wire between the PCM, the battery condition monitor module, the SBW shifter control module, the park pawl actuator driver unit, and the PCU.

DTC U0100 (MOTOR CONTROL MODULE)

DTC U0100 : CAN Malfunction (Traction Motor Control Module - PCM)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC U0100, troubleshoot those DTCs first, then recheck for U0100.
-
    - U1204, U1600

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0100 CAN Malfunction (Traction Motor Control Module - PCM)	B	B	B

DTC (Electric Powertrain)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   DTC (Electric Powertrain)

   Are DTC U0100 and any other DTCs indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Update the motor control module if it does not have the latest software .

DTC U0100-00, U0101-00, U0126-00, U0129-00, U0151-00, U0155-00 (VSA CONTROL UNIT)

DTC U0100-00 : CAN Communication Failure with ECM/ISU

DTC U0101-00 : CAN Communication Failure with PCM/TCM

DTC U0126-00 : CAN Communication Failure with Absolute Steering Wheel Angle Sensor

DTC U0129-00 : CAN Communication Failure with AHB/ESB/EBB

DTC U0151-00 : CAN Communication Failure with SRS

DTC U0155-00 : CAN Communication Failure with Meter

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- According to the detected DTC(s), confirm the control unit that the VSA modulator-control unit lost communication with has the proper power supply and ground connection. Refer to the input testing for that control unit if necessary.

DTC Description	DTC
U0100-00 CAN Communication Failure with ECM/ISU	B
U0101-00 CAN Communication Failure with PCM/TCM	B
U0126-00 CAN Communication Failure with Absolute Steering Wheel Angle Sensor	B
U0129-00 CAN Communication Failure with AHB/ESB/EBB	B
U0151-00 CAN Communication Failure with SRS	B
U0155-00 CAN Communication Failure with Meter	B

DTC (VSA)

1. DTC check (VSA modulator-control unit)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Test-drive the vehicle at 6 mph (10 km/h) or more.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U0100-00 CAN Communication Failure with ECM/ISU	B
U0101-00 CAN Communication Failure with PCM/TCM	B
U0126-00 CAN Communication Failure with Absolute Steering Wheel Angle Sensor	B
U0129-00 CAN Communication Failure with AHB/ESB/EBB	B
U0151-00 CAN Communication Failure with SRS	B

DTC Description	DTC
U0155-00 CAN Communication Failure with Meter	B

Is DTC indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. DTC check (CAN gateway system)

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Are DTC(s) indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

VSA modulator-control unit (Bus B) is Not Available

Go to step 4.

VSA modulator-control unit (Bus C) is Not Available

Go to step 5.

VSA modulator-control unit (Bus B and C) is Available

Go to step 6.

4. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

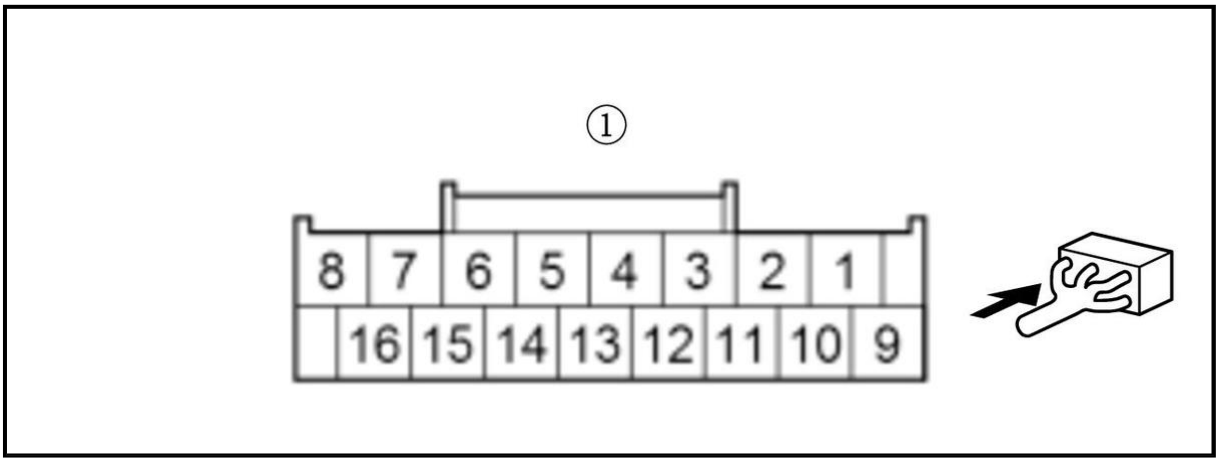
-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 40**
Test point 2	CAN gateway 16P connector (female terminals) No. 6: ①

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 28**
Test point 2	CAN gateway 16P connector (female terminals) No. 14: ①



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

5. Open wire check (F-CAN C_H, F-CAN C_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

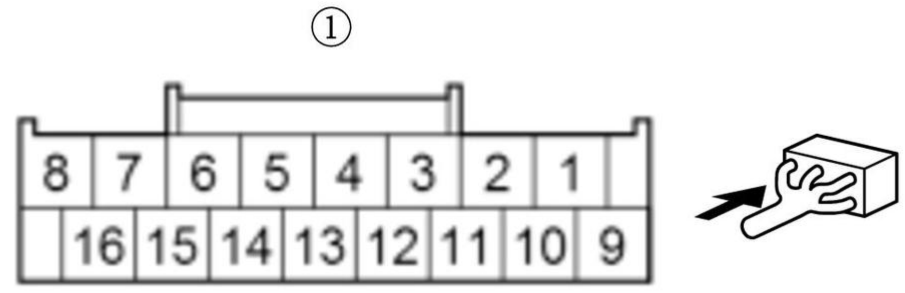
-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA modulator-control unit 46P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test circuit 1	B
Test point 1	**VSA modulator-control unit 46P connector No. 46**
Test point 2	CAN gateway 16P connector (female terminals) No. 5: ①

Test circuit 2	B
Test point 1	**VSA modulator-control unit 46P connector No. 34**
Test point 2	CAN gateway 16P connector (female terminals) No. 13: ①



Is there 1.0 Ω or less?

YES

The F-CAN C_H and F-CAN C_L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

6. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

-2. According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100-00	PCM	A, B
U0101-00	PCM	A, B
U0126-00	EPS control unit	C
U0129-00	Electric servo brake control unit	B, C
U0151-00	SRS unit	C
U0155-00	Gauge control module	D

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

U0100-00: PCM (Bus A) is Not Available

Go to step 7.

U0100-00: PCM (Bus B) is Not Available

Go to step 8.

U0101-00: PCM (Bus A) is Not Available

Go to step 7.

U0101-00: PCM (Bus B) is Not Available

Go to step 8.

U0126-00: EPS control unit (Bus C) is Not Available

Go to step 9.

U0129-00: Electric servo brake control unit (Bus B) is Not Available

Go to step 8.

U0129-00: Electric servo brake control unit (Bus C) is Not Available

Go to step 9.

U0151-00: SRS unit (Bus C) is Not Available

Go to step 9.

U0155-00: Gauge control module (Bus D) is Not Available

Go to step 10.

7. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors according to the detected DTC.

DTC	Connector
B	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0101-00	PCM connector A (50P)

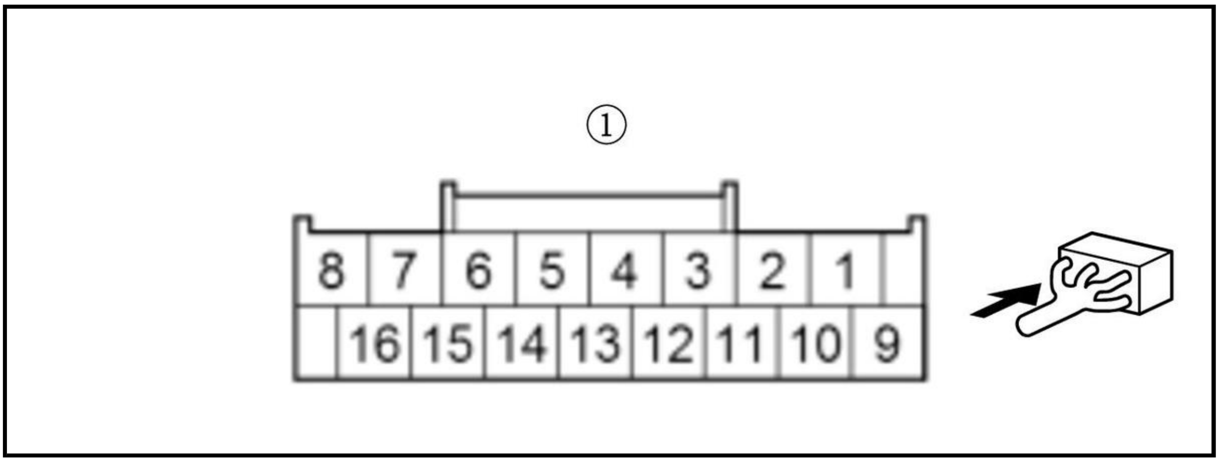
NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector.

SCS Short

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmitting control unit connector(s) for indicated DTCs: disconnected
B	CAN gateway 16P connector: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37
	F-CAN A_L		No. 11		No. 36
U0101-00	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37
	F-CAN A_L		No. 11		No. 36



Is there 1.0 Ω or less?

YES

The F-CAN A_H and F-CAN A_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0100-00	**PCM**
U0101-00	**PCM**

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

8. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors according to the detected DTC.

DTC	Connector
B	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0101-00	PCM connector A (50P)
U0129-00	Electric servo brake control unit 22P connector

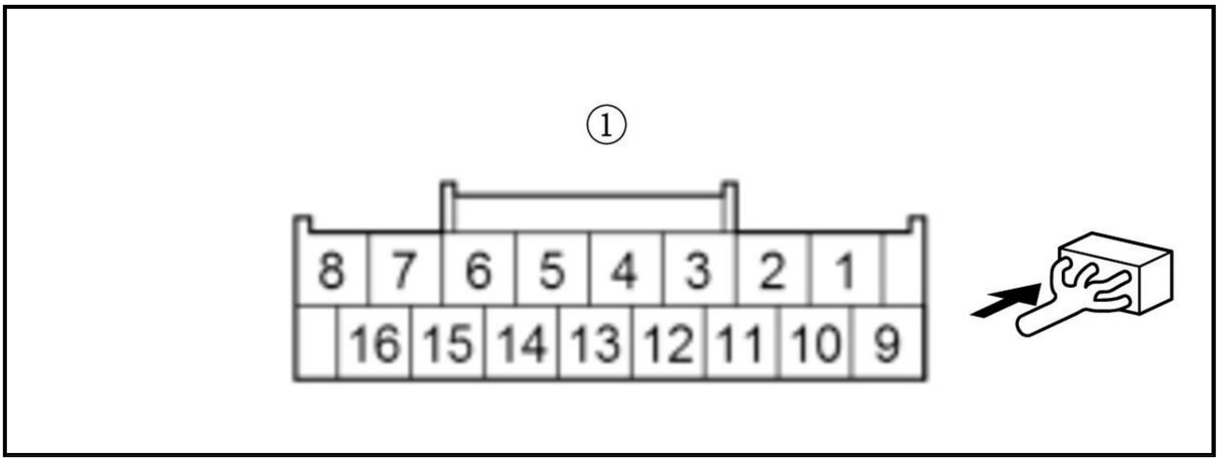
NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector.

SCS Short

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmitting control unit connector(s) for indicated DTCs: disconnected
B	CAN gateway 16P connector: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38
U0101-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38
U0129-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**Electric servo brake control unit 22P connector**	No. 15
	F-CAN B_L		No. 14		No. 14



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0100-00	**PCM**
U0101-00	**PCM**
U0129-00	**Electric servo brake control unit/pedal feel simulator**

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

9. Open wire check (F-CAN C_H, F-CAN C_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors according to the detected DTC.

DTC	Connector
B	CAN gateway 16P connector
U0126-00	EPS control unit connector B (6P)
U0129-00	Electric servo brake control unit 22P connector
U0151-00	SRS unit connector A (39P)

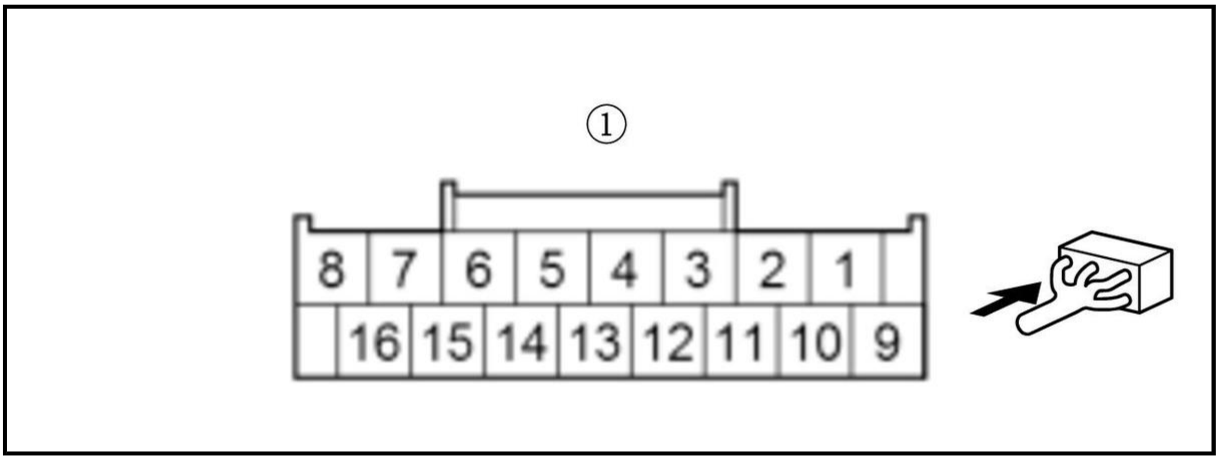
NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** and wait for at least 3 minutes.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmitting control unit connector(s) for indicated DTCs: disconnected
B	CAN gateway 16P connector: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0126-00	F-CAN C_H	CAN gateway 16P connector (female	No. 5	**EPS control unit connector B (6P)**	No. 1

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
	F-CAN C_L	terminals): ①	No. 13		No. 3
U0129-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**Electric servo brake control unit 22P connector**	No. 19
	F-CAN C_L		No. 13		No. 18
U0151-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**SRS unit connector A (39P)**	No. 34
	F-CAN C_L		No. 13		No. 35



Is there 1.0 Ω or less?

YES

The F-CAN C_H and F-CAN C_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0126-00	**EPS motor/control unit**
U0129-00	**Electric servo brake control unit/pedal feel simulator**
U0151-00	**SRS unit**

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

10. Open wire check (F-CAN D_H, F-CAN D_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors according to the detected DTC.

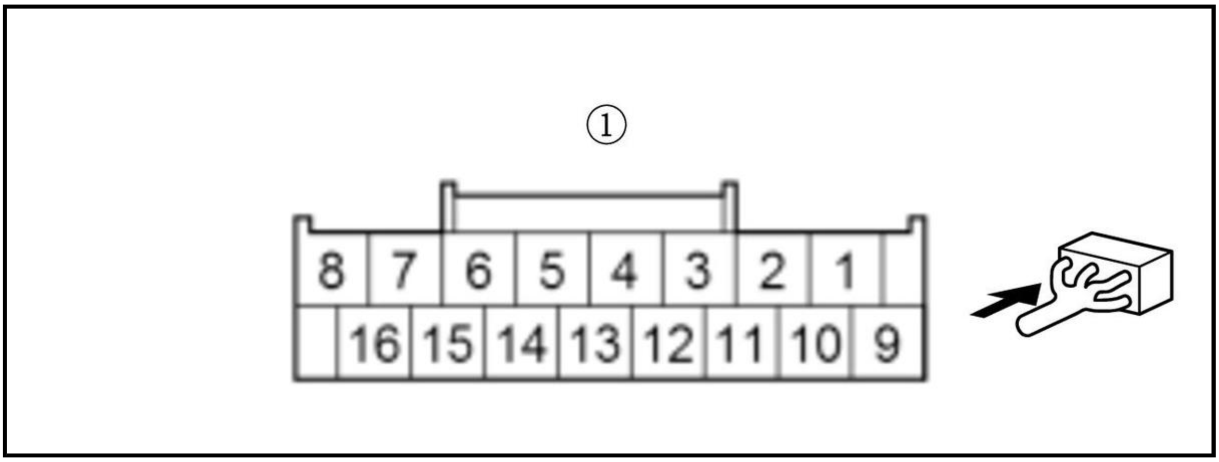
DTC	Connector
B	CAN gateway 16P connector
U0155-00	Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Transmitting control unit connector(s) for indicated DTCs: disconnected
B	CAN gateway 16P connector: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0155-00	F-CAN D_H	CAN gateway 16P connector (female terminals): ①	No. 7	Gauge control module connector A (32P)	No. 19
	F-CAN D_L		No. 15		No. 20



Is there 1.0 Ω or less?

YES

The F-CAN D_H and F-CAN D_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0155-00	Gauge control module

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

DTC U0111 (MOTOR CONTROL MODULE)

DTC U0111 : CAN Malfunction (Traction Motor Control Module - Battery Condition Monitor Module)

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If any of the DTCs listed below are indicated at the same time as DTC U0111, troubleshoot those DTCs first, then recheck for U0111.
-
    - U1206, U1603

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0111 CAN Malfunction (Traction Motor Control Module - Battery Condition Monitor Module)	B	B	B

DTC (Electric Powertrain)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (Electric Powertrain)

Are DTC U0111 and any other DTCs indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Update the motor control module if it does not have the latest software .

DTC U0146 (305) (MOTOR CONTROL MODULE)

DTC U0146 : F-CAN Malfunction (Traction Motor Control Module - CAN Gateway)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0146 F-CAN Malfunction (Traction Motor Control Module - CAN Gateway)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0146 F-CAN Malfunction (Traction Motor Control Module - CAN Gateway)	B	B	B

Is DTC U0146 indicated?

YES

Go to step 2.

NO

Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CAN gateway system DTCs check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	Confirmed DTC
B	B

DTC (CAN GATEWAY)

Are any DTCs indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

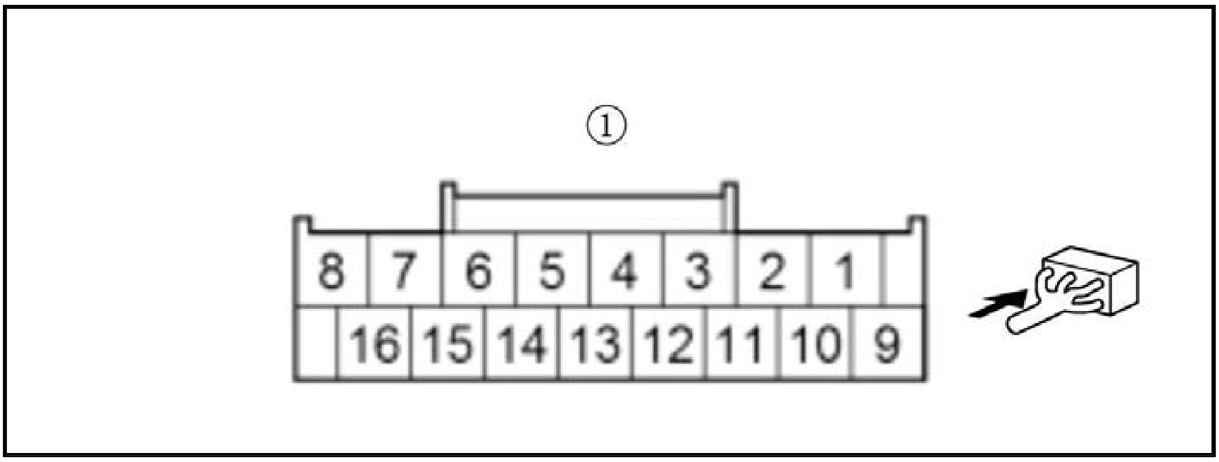
-3. Disconnect the following connectors.

CAN gateway 16P connector
PCU 33P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCU 33P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 3: ①
Test point 2	**PCU 33P connector No. 5**

Test point 1	CAN gateway 16P connector (female terminals) No. 11: ①
Test point 2	**PCU 33P connector No. 6**



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. **Replace the PCU** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the CAN gateway and the PCU.

DTC U0311 (123) (MOTOR CONTROL MODULE)

DTC U0311 : Traction Motor Control Module Programming Error (Version Mismatch)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0311 Traction Motor Control Module Programming Error (Version Mismatch)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. **Do the motor control module update procedure** .

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0311 Traction Motor Control Module Programming Error (Version Mismatch)	B	B	B

Is DTC U0311 indicated?

YES

Replace the PCU .

NO

The update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC U0401-68 (VSA CONTROL UNIT)

DTC U0401-68 : (ECM Failure)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
U0401-68 (ECM Failure)	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0401-68 (ECM Failure)	B

   Is DTC U0401-68 indicated?

   YES

   The failure is duplicated. Go to PGM-FI system troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

DTC U0402-68 (VSA CONTROL UNIT)

DTC U0402-68 : (TCM Failure)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
U0402-68 (TCM Failure)	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0402-68 (TCM Failure)	B

Is DTC U0402-68 indicated?

YES

The failure is duplicated. Go to PGM-FI system troubleshooting .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

DTC U0418-68 (VSA CONTROL UNIT)

DTC U0418-68 : (ESB/EBB Failure)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
U0418-68 (ESB/EBB Failure)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0418-68 (ESB/EBB Failure)	B

Is DTC U0418-68 indicated?

YES

The failure is duplicated. Go to electric servo brake system troubleshooting .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

DTC U1204 (95), U1206 (64) (MOTOR CONTROL MODULE)

DTC U1204 : EP-CAN Malfunction (Traction Motor Control Module - PCM)

DTC U1206 : EP-CAN Malfunction (Traction Motor Control Module - Battery Condition Monitor Module)

NOTE:

- Before you troubleshoot, review the general troubleshooting information .

- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the motor control module.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1204 EP-CAN Malfunction (Traction Motor Control Module - PCM)	B	B	B
U1206 EP-CAN Malfunction (Traction Motor Control Module - Battery Condition Monitor Module)	B	B	B

DTC (Electric Powertrain)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1204 EP-CAN Malfunction (Traction Motor Control Module - PCM)	B	B	B
U1206 EP-CAN Malfunction (Traction Motor Control Module - Battery Condition Monitor Module)	B	B	B

   Is DTC U1204 or DTC U1206 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure. The system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (EP-CAN A_H line, EP-CAN A_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. DTC U1204: Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. **Do the 12 volt battery terminal disconnection procedure** .

   -4. DTC U1206: Remove the **service plug** and the **IPU cover** .

   -5. Disconnect the following connectors.

PCU 33P connector
DTC U1204: PCM connector A (50P)
DTC U1206: Battery condition monitor module connector E (32P)

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U1204	EP-CAN A_H	PCU 33P connector	No. 27	PCM connector A (50P)	No. 21
	EP-CAN A_L		No. 28		No. 20
U1206	EP-CAN A_H	PCU 33P connector	No. 27	Battery condition monitor module connector E (32P)	No. 11
	EP-CAN A_L		No. 28		No. 10

Is there 1.0 Ω or less?

YES

The EP-CAN A_H wire and the EP-CAN A_L wire are OK.

According to the detected DTC on the following table, substitute, or replace the corresponding unit.

DTC	Operation for transmitting control unit
U1204	Replace the PCM .
U1206	Replace the battery condition monitor module .

NO

Repair an open in the EP-CAN A_H wire or the EP-CAN A_L wire between the transmitting control unit and the PCU.

DTC U1600 (102), U1603 (100) (MOTOR CONTROL MODULE)

DTC U1600 : F-CAN Malfunction (Traction Motor Control Module - PCM)

DTC U1603 : F-CAN Malfunction (Traction Motor Control Module - Battery Condition Monitor Module)

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the motor control module.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1600 F-CAN Malfunction (Traction Motor Control Module - PCM)	B	B	B
U1603 F-CAN Malfunction (Traction Motor Control Module - Battery Condition Monitor Module)	B	B	B

DTC (Electric Powertrain)

1. CAN gateway system DTCs check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for CAN gateway system DTCs with the HDS.

DTC Description	Confirmed DTC
B	B

DTC (CAN GATEWAY)

Are any DTCs indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 2.

2. F-CAN circuit communication check (receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the PCU detect the CAN gateway Bus channel A?

Bus A is Not Available

Go to step 3.

Bus A is Detected

Go to step 4.

3. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the 12 volt battery terminal disconnection procedure** .

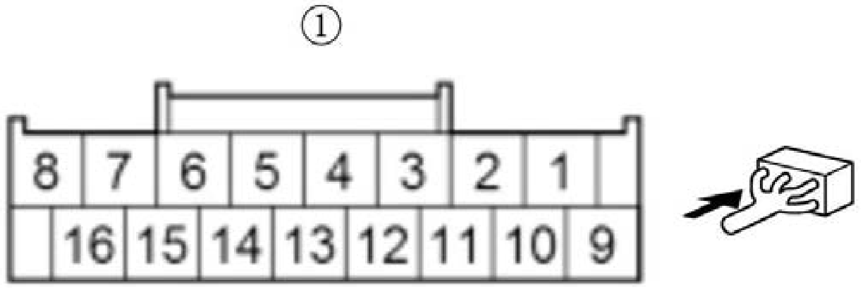
-3. Disconnect the following connectors.

PCU 33P connector
CAN gateway 16P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCU 33P connector: disconnected
	CAN gateway 16P connector: disconnected
Test point 1	**PCU 33P connector No. 5**
Test point 2	CAN gateway 16P connector (female terminals) No. 3: ①

Test point 1	**PCU 33P connector No. 6**
Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1.0 Ω or less?

YES

Replace the PCU .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the CAN gateway and the PCU.

4. F-CAN circuit communication check (transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

-2. According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U1600	PCM	A, B
U1603	Battery condition monitor module	A

Is it detected normally?

Detected normal

Intermittent failure. The system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U1600: PCM is Not Available for Bus A

Go to step 5.

U1600: PCM is Not Available for Bus B

Go to step 6.

U1603: Battery condition monitor module is Not Available for Bus A

Go to step 5.

5. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. DTC U1600: Jump the SCS line with the HDS, and wait more than 1 minute.

-3. DTC U1603: Remove the **service plug** and the **IPU cover** .

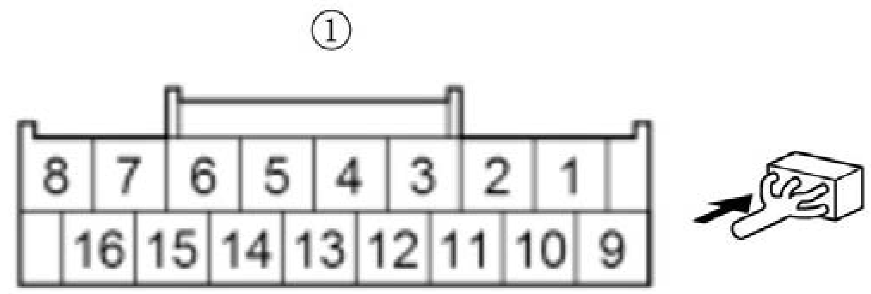
-4. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U1600	PCM connector A (50P)
U1603	Battery condition monitor module connector E (32P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U1600	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37
	F-CAN A_L		No. 11		No. 36
U1603	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**Battery condition monitor module connector E (32P)**	No. 9
	F-CAN A_L		No. 11		No. 8



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK.

According to the detected DTC on the following table, substitute, or replace the corresponding unit.

DTC	Operation for transmitting control unit
U1600	**Replace the PCM** .

DTC	Operation for transmitting control unit
U1603	**Replace the battery condition monitor module** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

SCS Short

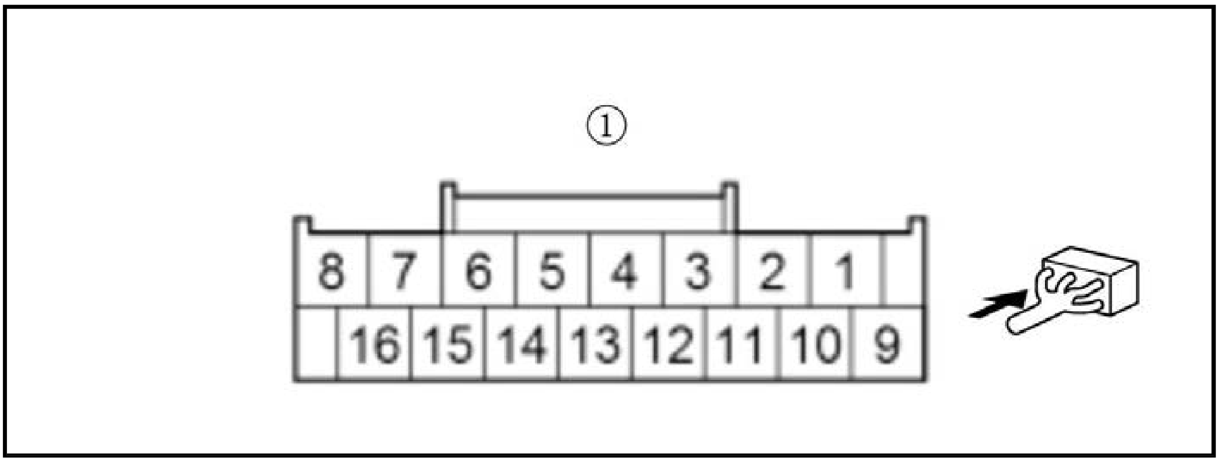
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U1600	PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U1600	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK.

According to the detected DTC on the following table, substitute, or replace the corresponding unit.

DTC	Operation for transmitting control unit
U1600	Replace the PCM .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the transmitting control unit and the CAN gateway.

DTC U3000-49 (VSA CONTROL UNIT)

DTC U3000-49 : ECU Internal Circuit Failure

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
U3000-49 ECU Internal Circuit Failure	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Test-drive the vehicle at 25 mph (40 km/h) or more.

   NOTE: Drive the vehicle on the road, not on a lift.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U3000-49 ECU Internal Circuit Failure	B

Is DTC U3000-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

DTC U3000-51 (VSA CONTROL UNIT)

DTC U3000-51 : ECU Software Update Failure

NOTE:

- Before you troubleshoot, review the general troubleshooting information .

- Do not turn the vehicle to the OFF (LOCK) mode while updating the VSA modulator-control unit. If you turn the vehicle to the OFF (LOCK) mode before completion, the VSA modulator-control unit will be damaged.

DTC Description	DTC
U3000-51 ECU Software Update Failure	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U3000-51 ECU Software Update Failure	B

   Is DTC U3000-51 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. VSA modulator-control unit check (update)

   -1. **Update the VSA modulator-control unit** .

   -2. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   Is DTC U3000-51 indicated?

   YES

   The failure is duplicated. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

   NO

   Troubleshooting is complete. If any other DTCs are indicated, go to the indicated DTCs troubleshooting.

DTC U3003-16 (VSA CONTROL UNIT)

DTC U3003-16 : Electric Parking Brake Control Unit Power Source Circuit (+B) Low Voltage

NOTE: **Before you troubleshoot, review the general troubleshooting information.**

DTC Description	**DTC**
U3003-16 Electric Parking Brake Control Unit Power Source Circuit (+B) Low Voltage	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Wait 15 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	**DTC**
U3003-16 Electric Parking Brake Control Unit Power Source Circuit (+B) Low Voltage	B

   Is DTC U3003-16 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. DTC check (electric powertrain system)

   -1. Check for electric powertrain system DTCs with the HDS.

DTC Description	**Confirmed DTC**	**Pending DTC**	**Freeze Frame**
B	B	B	B

   Is DTC indicated?

   YES

   Go to indicated DTCs troubleshooting.

   NO

   Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

DTC U3003-17 (VSA CONTROL UNIT)

DTC U3003-17 : Electric Parking Brake Control Unit Power Source Circuit (+B) High Voltage

NOTE: **Before you troubleshoot, review the general troubleshooting information.**

DTC Description	DTC
U3003-17 Electric Parking Brake Control Unit Power Source Circuit (+B) High Voltage	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U3003-17 Electric Parking Brake Control Unit Power Source Circuit (+B) High Voltage	B

   Is DTC U3003-17 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. VSA modulator-control unit check

   -1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BATTERY VOLTAGE	More than 16.5	V	B	B

   Do the current condition(s) match the threshold?

   YES

   Check the 12 volt battery , and **check the electric powertrain system DTCs** .

   NO

   Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

DTC U3006-16 (VSA CONTROL UNIT)

DTC U3006-16 : Power Source Failure for ECU (Low Voltage)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
U3006-16 Power Source Failure for ECU (Low Voltage)	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Test-drive the vehicle at 6 mph (10 km/h) or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U3006-16 Power Source Failure for ECU (Low Voltage)	B

   Is DTC U3006-16 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. DTC check (electric powertrain system)

   -1. Check for electric powertrain system DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   Is DTC indicated?

   YES

   Go to indicated DTCs troubleshooting.

   NO

   Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

DTC U3006-17 (VSA CONTROL UNIT)

DTC U3006-17 : Power Source Failure for ECU (High Voltage)

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC
U3006-17 Power Source Failure for ECU (High Voltage)	B

DTC (VSA)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U3006-17 Power Source Failure for ECU (High Voltage)	B

Is DTC U3006-17 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. VSA modulator-control unit check

   -1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BATTERY VOLTAGE	More than 16.5	V	B	B

Do the current condition(s) match the threshold?

YES

Check the 12 volt battery , and **check the electric powertrain system DTCs** .

NO

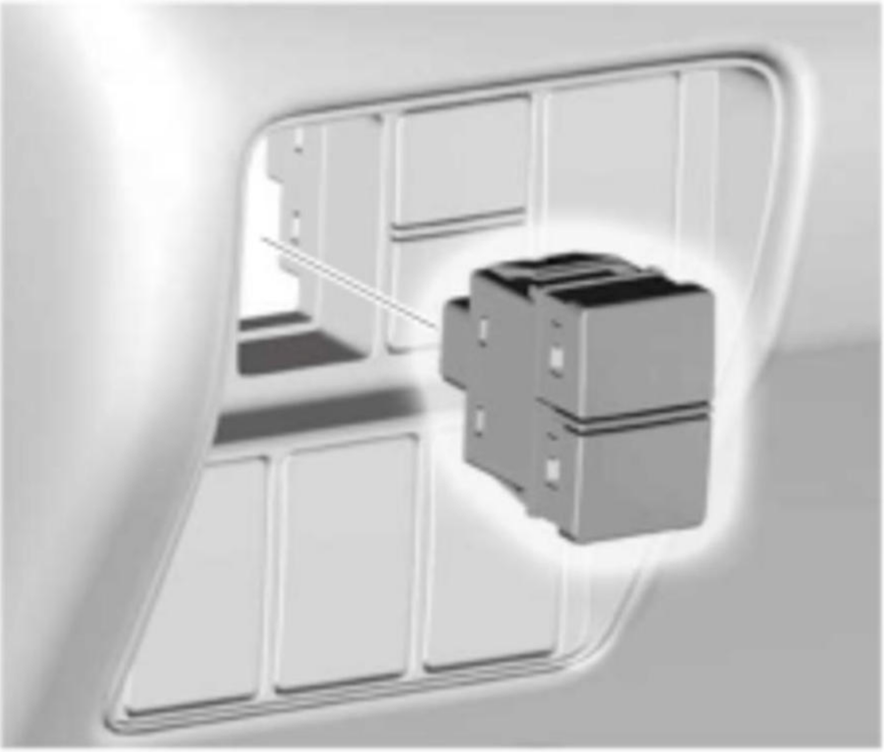
Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

REMOVAL & INSTALLATION TEST

VSA OFF SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1. Driver's Dashboard Undercover - Remove
2. Driver's Dashboard Lower Cover - Remove
3. VSA Off Switch - Remove



NOTE: Position of the switch is different depending on the model.

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

Test

1. VSA Off Switch - Test

Switch Illumination Circuit Check:

1. On the switch side, check the LED for illumination by applying power and ground to the terminals according to the table.**NOTE:**

Important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

2. If the result is not as specified, replace the switch.

REMOVAL AND INSTALLATION

VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION

Removal

NOTE:

- **Review the Service Precautions before doing repairs or service** .
- Do not damage or drop the VSA modulator-control unit as it is sensitive.
- Do not use power tools when removing the VSA modulator-control unit.
- When replacing the VSA modulator-control unit, do the immobilizer system registration.

1. 12 Volt Battery Terminal - Disconnect

1. Open the driver's door, and wait 3 minutes or more.

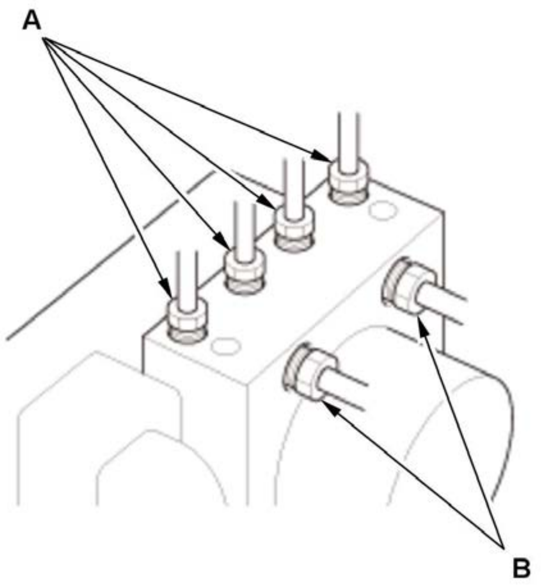
NOTE:

Do not turn the vehicle to the ON mode.

2. **Do the 12 volt battery terminal disconnection procedure**

.

2. VSA Modulator-Control Unit - Remove



1. Disconnect the 10 mm brake lines (A).

NOTE:

Before disconnecting the brake lines from the VSA modulator, mark them or make note of their original location.

2. Disconnect the 12 mm brake lines (B).

	3. Disconnect the connector (A) by pushing the lock (B) and pulling up the lever (C); the connector disconnects itself.

	4. Remove the brake line (A) from the brake line clamp (B). 5. Remove the VSA modulator-control unit (C) with the bracket (D).

3. VSA Modulator-Control Unit Bracket - Remove

	1. Remove the modulator bracket (A) from the modulator sub bracket (B). 2. Remove the VSA modulator-control unit (C) from the modulator sub bracket.

Installation

NOTE:

- **How to read the torque specifications** .
- **Review the Service Precautions before doing repairs or service** .
- Do not damage or drop the VSA modulator-control unit as it is sensitive.
- Do not use power tools when installing the VSA modulator-control unit.
- When replacing the VSA modulator-control unit, do the immobilizer system registration.

1. VSA Modulator-Control Unit Bracket - Install

 A B C 27 (2.8, 20) 9.5 (0.97, 7.0)	1. Install the VSA modulator-control unit (A) to the modulator sub bracket (B). 2. Install the modulator bracket (C) to the modulator sub bracket.

2. VSA Modulator-Control Unit - Install

 9.5 (0.97, 7.0) 9.8 (1.00, 7.2) A B C D	1. Install the VSA modulator-control unit (A) with the bracket (B). 2. Install the brake line (C) to the brake line clamp (D).

	3. Align the connecting surface of the VSA modulator-control unit connector (A). 4. Pull down the lever (B) of the VSA modulator-control unit connector, then confirm the connector is fully seated.

 D 10 mm 15 (1.5, 11) E 10 mm 15 (1.5, 11) B 10 mm 15 (1.5, 11) C 10 mm 15 (1.5, 11) A 12 mm 22 (2.2, 16)	5. Connect the brake lines. **NOTE:** **Brake lines are connected to the master cylinder (A), the right-rear (B), the left-front (C), the right-front (D), and the left-rear (E) brake systems.**

3. 12 Volt Battery Terminal - Connect
4. Brake System- Bleed
5. Immobilizer System - Register

NOTE:

- When replacing the VSA modulator-control unit, do the immobilizer system registration.
- Failure to complete the immobilizer system registration will lead to a no-start condition the next time the 12 volt battery is disconnected.

Without keyless access system

1. Do the immobilizer system registration procedure .

With keyless access system

1. Do the keyless access system registration procedure .

6. VSA Modulator-Control Unit Software - Check

1. Make sure the VSA modulator-control unit has the latest software. If it does not have the latest, update the software in the VSA modulator-control unit .

7. VSA Modulator-Control Unit After Install - Check

1. Turn the vehicle to the ON mode.

2. Apply and release the parking brake 2 times, then make sure that the brake system indicator (red) goes OFF.

NOTE:

If the brake system indicator (red) does not go OFF, check for poor connection at the VSA modulator-control unit connector.

3. Turn the vehicle to the OFF (LOCK) mode.

8. VSA Sensor Neutral Position - Memorize
9. TPMS - Calibrate

WHEEL SPEED SENSOR REMOVAL AND INSTALLATION

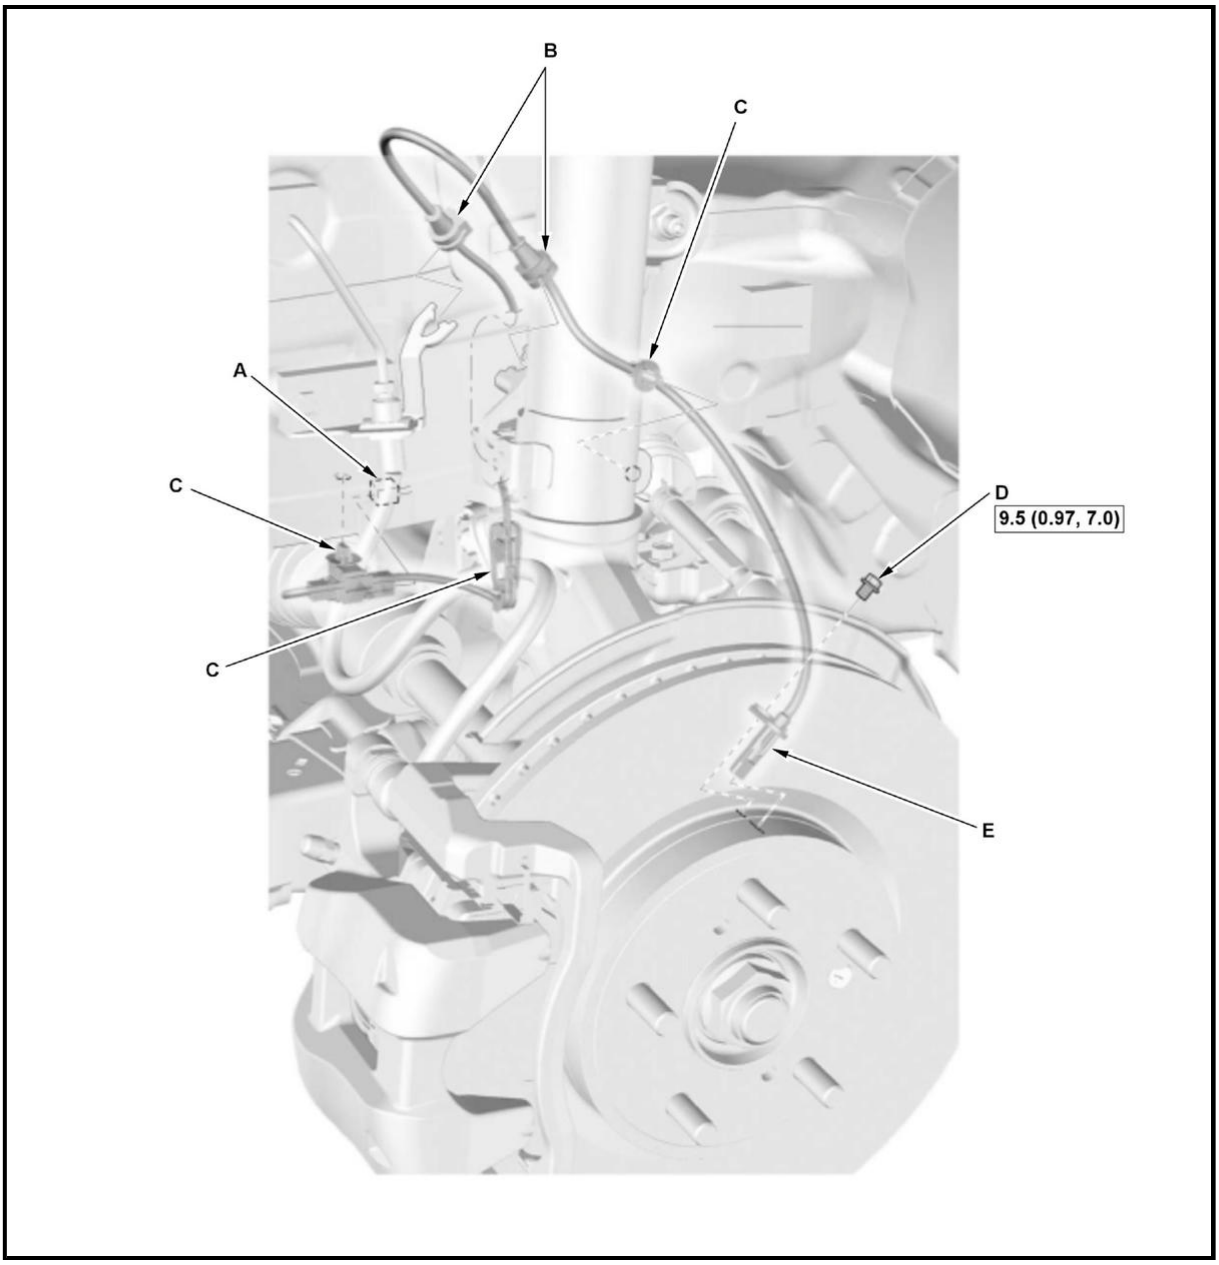
Removal and Installation

NOTE: How to read the torque specifications .

Front

1. Vehicle - Lift
2. Front Wheel - Remove
3. Front Wheel Speed Sensor - Remove

    1. Disconnect the connector (A).



2. Remove the wire guide rubbers (B), the clips (C), and the bolt (D).

3. Remove the wheel speed sensor (E).

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

NOTE:

- **Install the sensor carefully to avoid twisting the wires.**
- **If the wheel speed sensor comes in**

contact with the wheel bearing, it will become faulty.

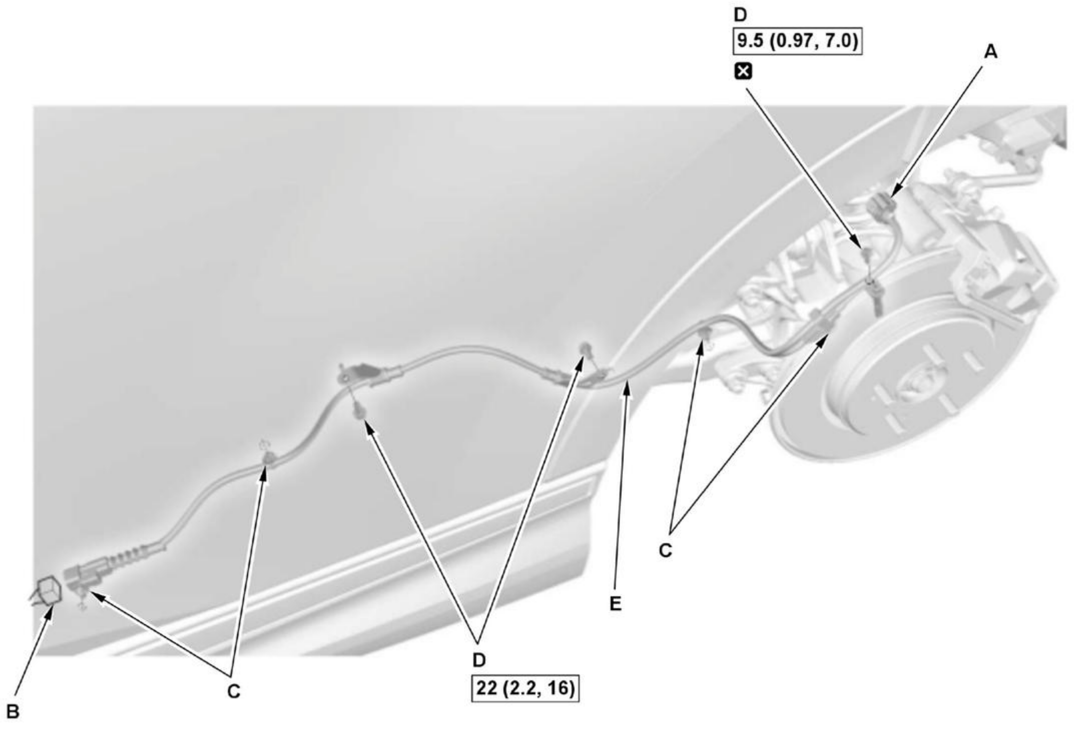
- **Make sure there is no debris in the sensor mounting hole.**

Rear

5. Vehicle - Lift
6. Rear Wheel - Remove
7. Rear Wheel Speed Sensor - Remove

1. Disconnect the connector (A).

NOTE: **If the connector lock tab is difficult to release, push in on the connector body before pushing on the release lock.**



2. Disconnect the connector (B).

3. Remove the clips (C).

4. Remove the bolts (D).

5. Remove the wheel speed sensor (E).

8. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

NOTE:

- **Install the sensor carefully to avoid twisting the wires.**
- **If the wheel speed sensor comes in contact with the hub bearing unit, it will become faulty.**
- **Make sure there is no debris in the sensor mounting hole.**

REMOVAL AND INSTALLATION

VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION

Removal

NOTE:

- Review the Service Precautions before doing repairs or service .
- Do not damage or drop the VSA modulator-control unit as it is sensitive.
- Do not use power tools when removing the VSA modulator-control unit.

DESCRIPTION & OPERATION

VSA SYSTEM DESCRIPTION

Overview

The VSA system stabilizes the vehicle behavior by controlling the braking force and engine torque.

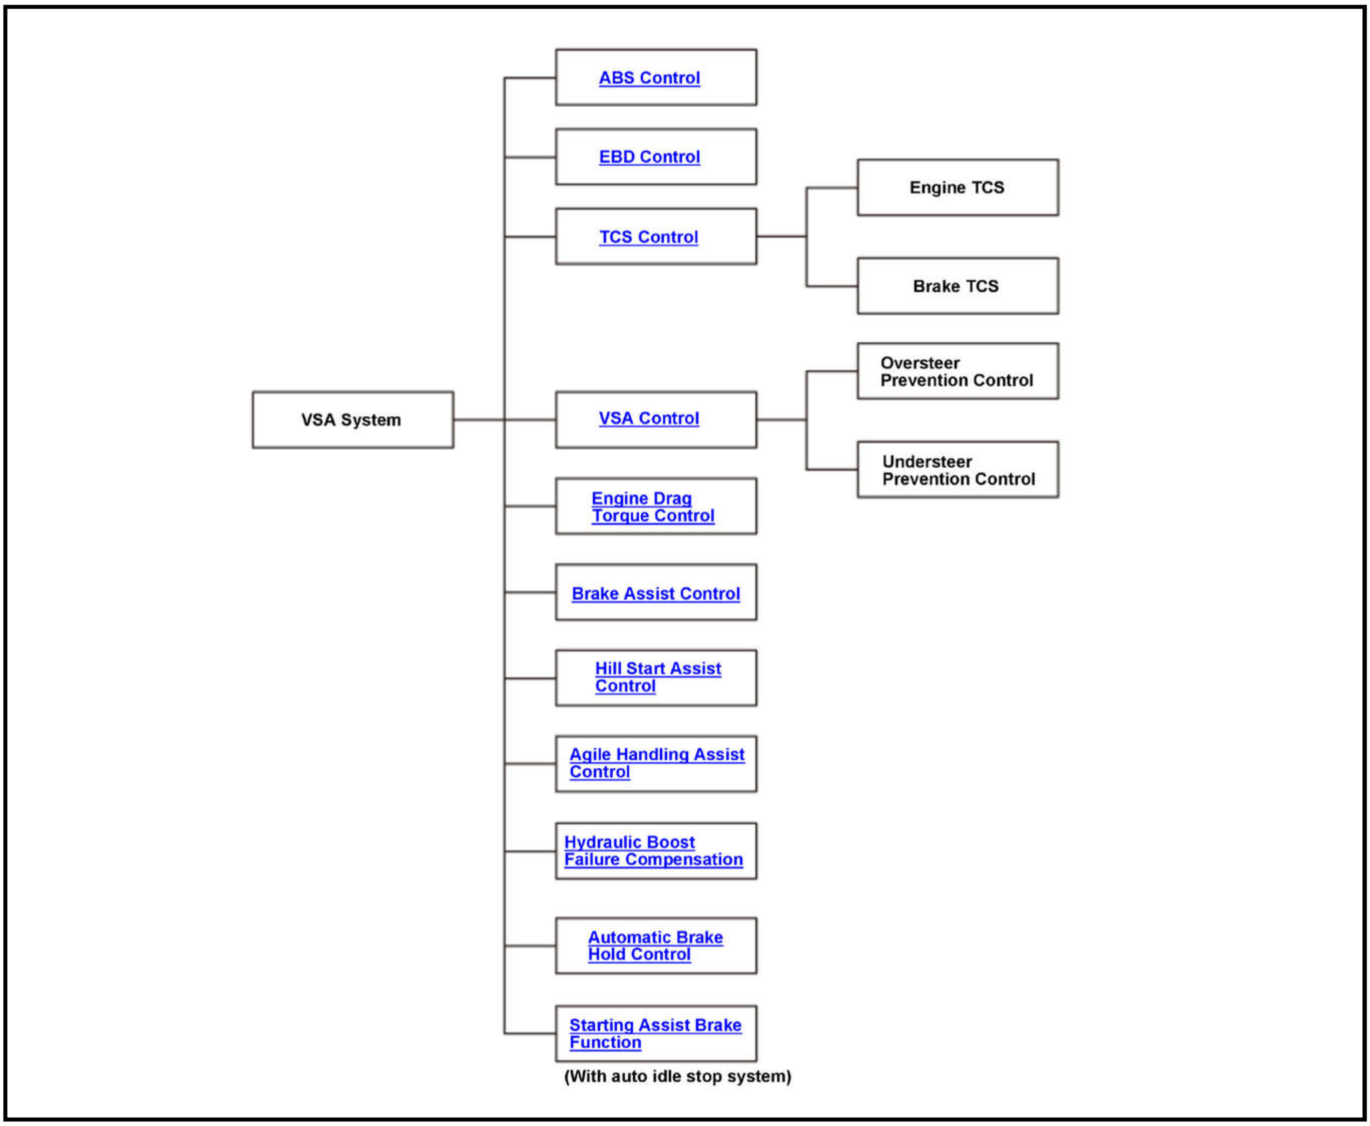
The VSA system consists of the following primary components:

- VSA modulator-control unit
- Wheel speed sensors
- Magnetic encoders
- VSA OFF switch
- System indicator

For locations of each component on vehicle, **refer to Component Location Index**, and for functions of indicator, **refer to How to Troubleshoot the VSA system**.

Control Unit Operation

The VSA system performs the following controls.



VSA System
ABS Control
EBD Control
TCS Control
Engine TCS
Brake TCS
VSA Control
Oversteer Prevention Control
Understeer Prevention Control
Engine Drag Torque Control
Brake Assist Control
Hill Start Assist Control
Agile Handling Assist Control
Hydraulic Boost Failure Compensation
Automatic Brake Hold Control
Starting Assist Brake Function
(With auto idle stop system)

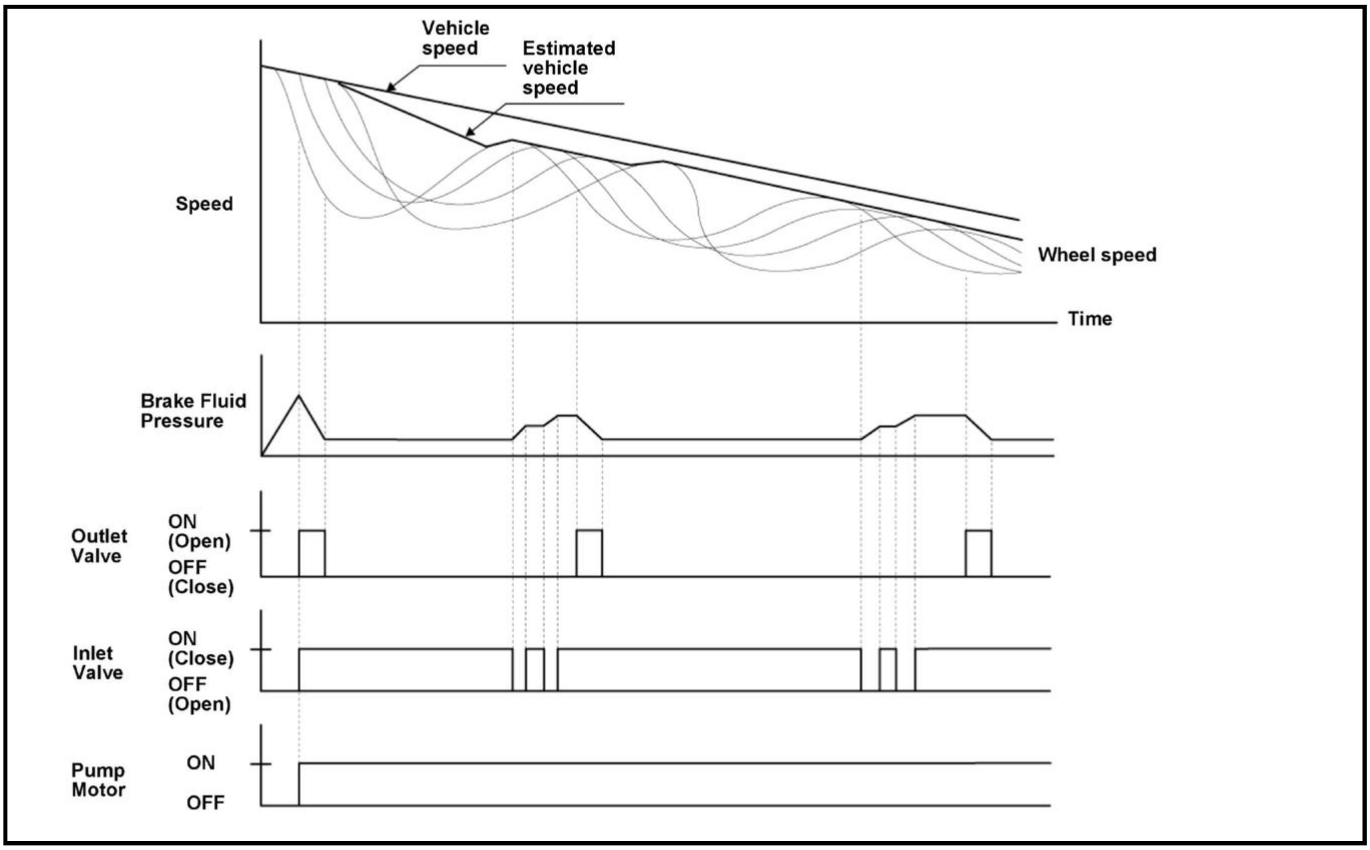
VSA SYSTEM DESCRIPTION - ABS CONTROL

Overview

The ABS control maintains stability by preventing wheel lock during hard braking or braking on a slippery road surface and helps the driver retain steering control.

Control

When wheel speed is significantly reduced from estimated vehicle speed, the VSA modulator-control unit closes the inlet valve and opens the outlet valve momentarily to reduce brake fluid pressure and the pump motor starts to run. As wheel speed increases, the VSA modulator-control unit maintains brake fluid pressure by keeping the inlet valve closed. Brake fluid pressure is increased when wheel speed matches the estimated speed of the vehicle. The VSA modulator-control unit repeats this valve control operation to control the ABS function.



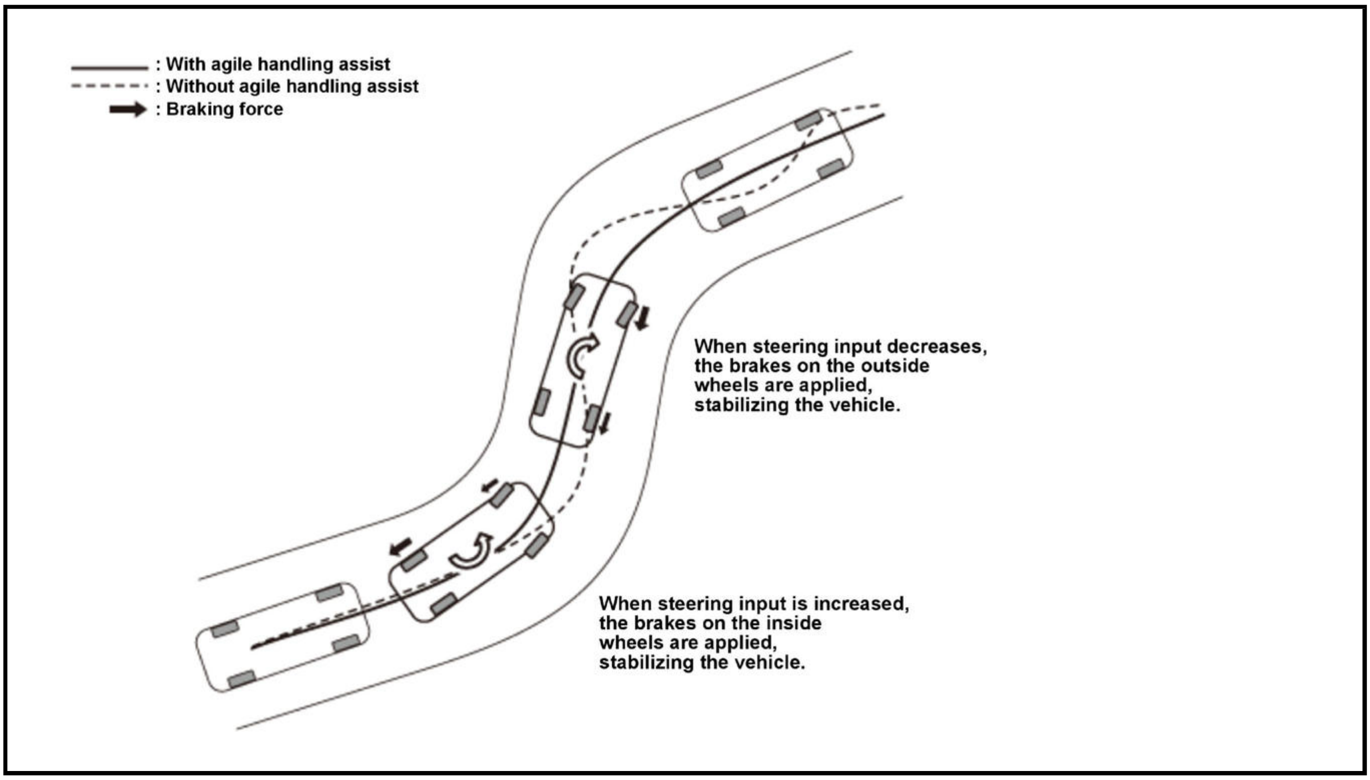
VSA SYSTEM DESCRIPTION - AGILE HANDLING ASSIST CONTROL

Overview

Where previous VSA systems activated at the limit of a turn, the agile handling assist control activates across everyday driving situations providing a safer and more enjoyable driving experience.Agile handling assist responds to the increase/decrease in steering input and vehicle action is made smooth at the same time as it improves response to steering operation and reduced steering effort. The action of steering is accomplished with a smaller amount of steering operation.

Control

Agile Handling Assist Control Overview



: With agile handling assist
: Without agile handling assist
: Braking force
When steering input decreases, the brakes on the outside wheels are applied, stabilizing the vehicle.
When steering input is increased, the brakes on the inside wheels are applied, stabilizing the vehicle.

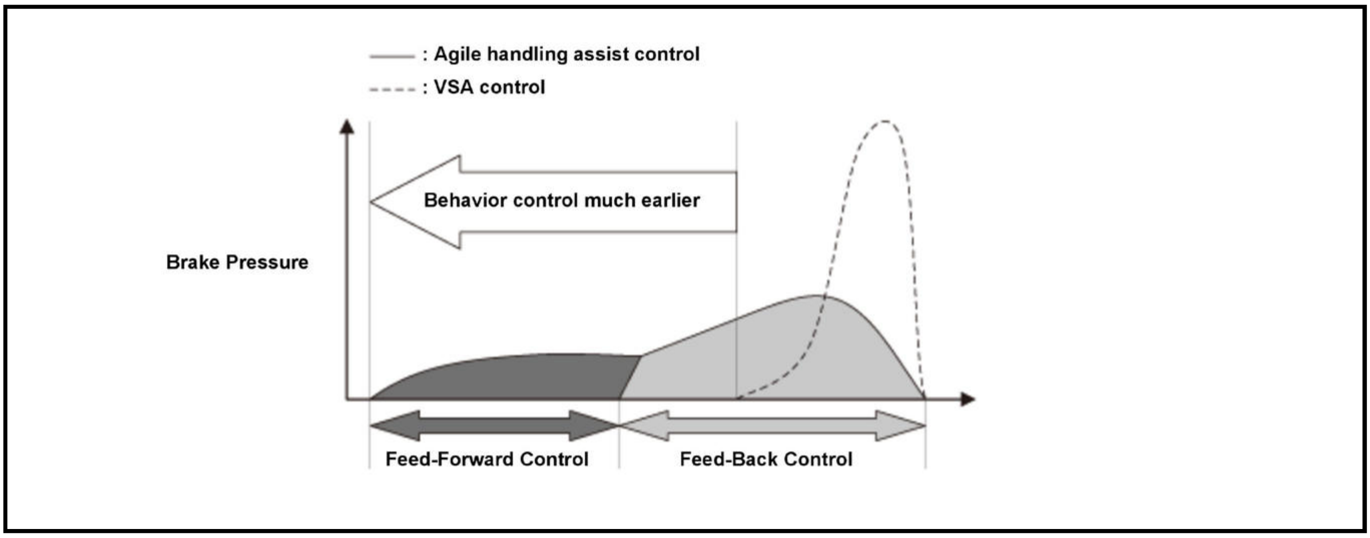
Reduction of phase delay in normal range
Yaw Rate Feed-Back Control
Reduction of phase delay near limit
Yaw Rate
Yaw Moment Interface
VSA Modulator
VSA Control Logic

Brake Pressure Control Image



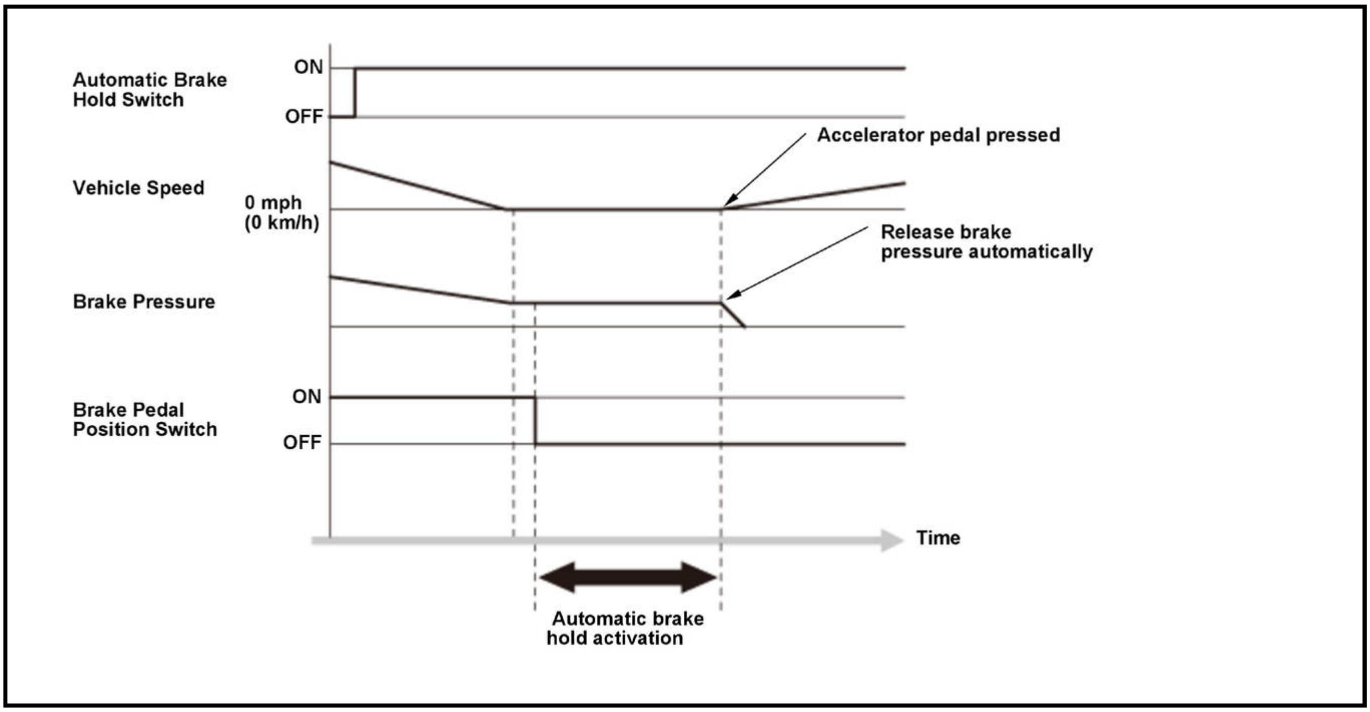
VSA SYSTEM DESCRIPTION - AUTOMATIC BRAKE HOLD

Overview

With automatic brake hold, the vehicle's brakes are applied when the vehicle is stopped, such as being stopped in traffic, even if the brake pedal is released. There is no need to keep pressing the brake pedal while stopped in heavy traffic or at traffic lights.

Control

As the accelerator pedal is pressed, the automatic brake hold feature is cancelled and returns to the stand by mode. If the automatic brake hold features is applied for an extended time (approx.10 minutes), the electric parking brake will engage to hold the vehicle.



VSA SYSTEM DESCRIPTION - BRAKE ASSIST CONTROL

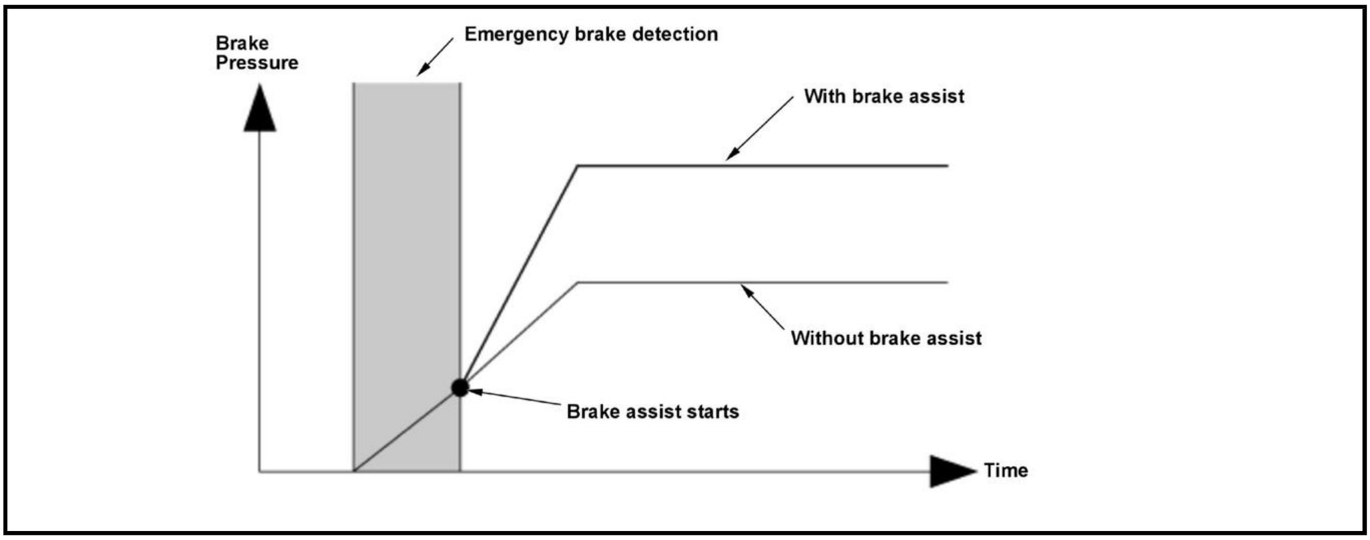
Overview

The brake assist control shortens the braking distance by increasing the driver's applied brake force during emergency braking.

Control

The VSA modulator-control unit constantly monitors brake operation through the pressure sensor. If the pedal stroke speed and pedal stroke amount exceed the threshold, it is considered to be emergency braking. When emergency braking is determined to be taking place, the VSA modulator-control unit increases braking force compared to normal braking and shortens the braking distance.

Brake Assist Operation Image



VSA SYSTEM DESCRIPTION - COMPONENTS

VSA Modulator

The VSA modulator unit consists of the inlet solenoid valve, the outlet solenoid valve, the VSA NO (normally open) solenoid valve, the VSA NC (normally closed) solenoid valve, the reservoir, the pump, the pressure sensor, and the pump motor. The hydraulic control has four modes; pressure intensifying, pressure retaining, pressure reducing, and pressure intensifying mode.

Pressure intensifying mode (VSA)	closed (current control)	open	open	closed	• Master cylinder fluid is pumped out by the pump through the VSA NC solenoid valve to the caliper. • Caliper fluid pressure exceeds master cylinder pressure. • The VSA modulator unit controls amount of intensified fluid pressure to respond to each mode

Mode	VSA NOSolenoidValve	VSA NCSolenoidValve	InletSolenoidValve	OutletSolenoidValve	Brake Fluid
					through current control of VSA NO solenoid valve.

Wheel Speed Sensor

The VSA system uses 4 wheel speed sensors to monitor individual wheel speed. The wheel speed sensor is a semiconductor, Hall effect sensor, and detects the magnetic field of a magnetic encoder installed on the inner sealing surface of each hub and wheel bearing assembly. The frequency of the sensor output signal is proportional to the speed of the wheel and this signal information is sent to the VSA control unit.

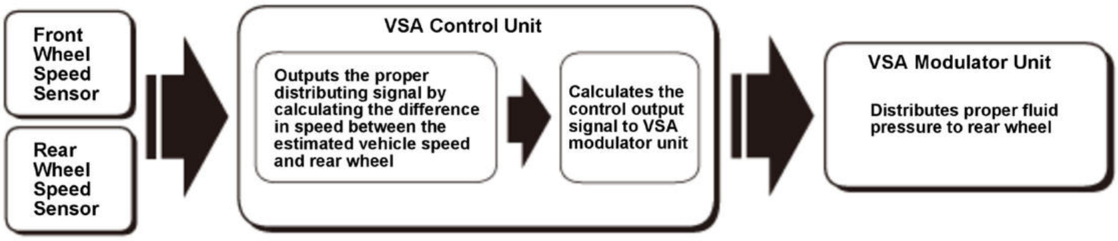
NOTE: This illustration is a typical sample of front side wheel speed sensor.

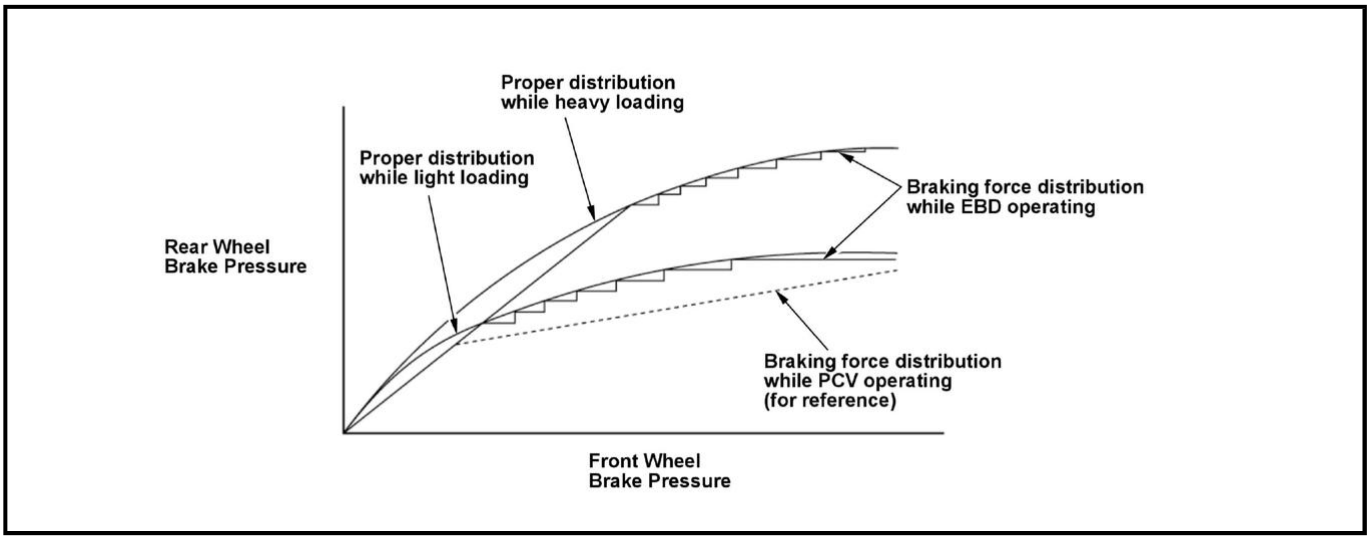
VSA SYSTEM DESCRIPTION - EBD CONTROL

Overview

The EBD system actively controls the distribution of the front and rear braking forces to correspond with changes in the load condition and displacement of the load due to deceleration.

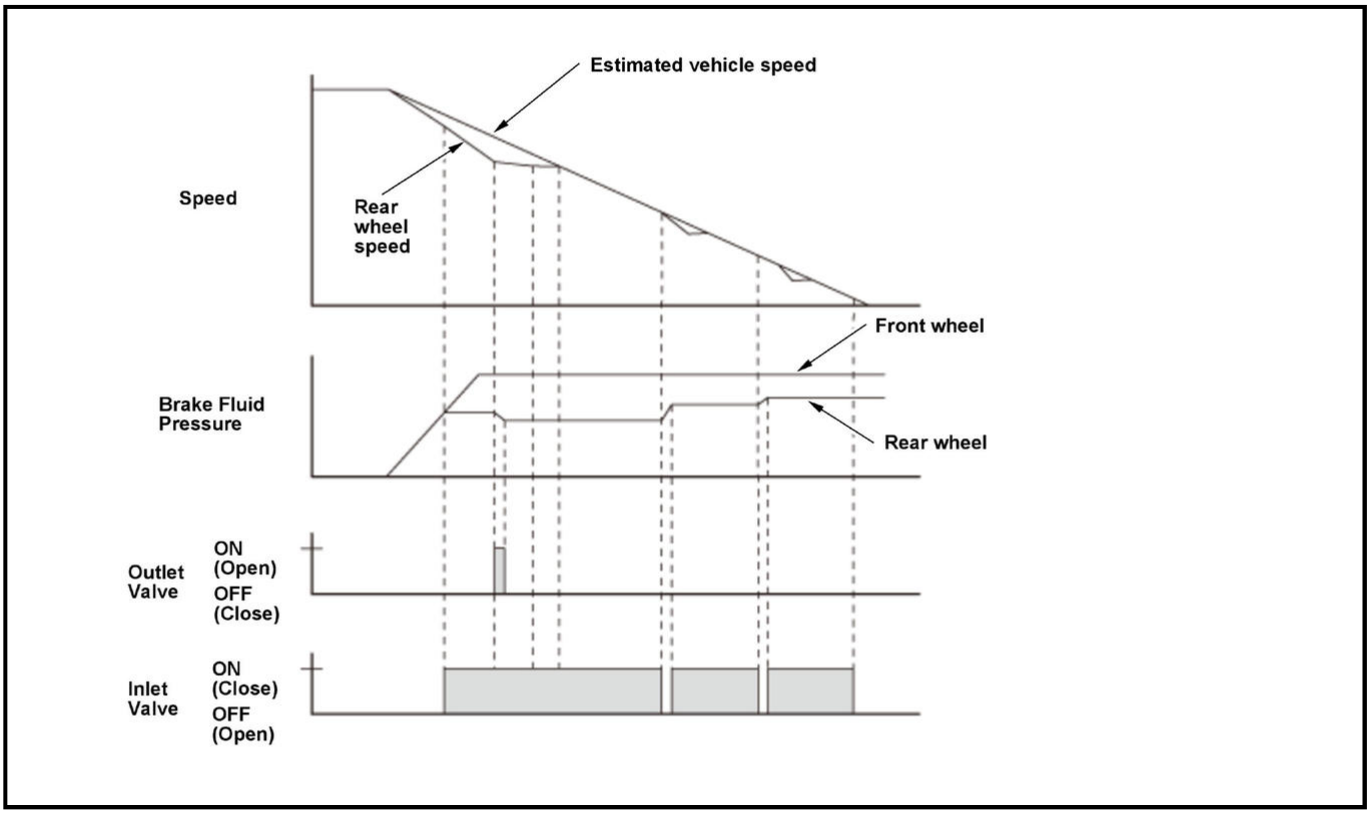


Front Wheel Speed Sensor
Rear Wheel Speed Sensor
VSA Control Unit
Outputs the proper distributing signal by calculating the difference in speed between the estimated vehicle speed and rear wheel
Calculates the control output signal to VSA modulator unit
VSA Modulator Unit
Distributes proper fluid pressure to rear wheel



Control

When rear wheel speed is less than the estimated vehicle speed, the VSA modulator-control unit closes the inlet valve to maintain brake fluid pressure. As wheel speed increases, the VSA modulator-control unit opens the inlet valve momentarily to increase the brake fluid pressure. When lower pressure is required, the modulator unit opens the outlet valve momentarily decreasing fluid pressure. The VSA modulator-control unit repeats this valve control operation to control the EBD function.



VSA SYSTEM DESCRIPTION - ENGINE DRAG TORQUE CONTROL

Overview

Downshifting on a slippery road may cause vehicle instability because engine braking may lock up the wheels. When engine braking begins to cause the wheels to lock up, the engine drag torque control commands the PCM to increase the torque, helping to prevent tire slip.

Control

The VSA modulator-control unit calculates the vehicle speed and acceleration of each wheel from each wheel speed sensor signal and makes a judgment on the slip condition of the wheel. The VSA modulator-control unit adjusts the engine torque based on the slip condition.

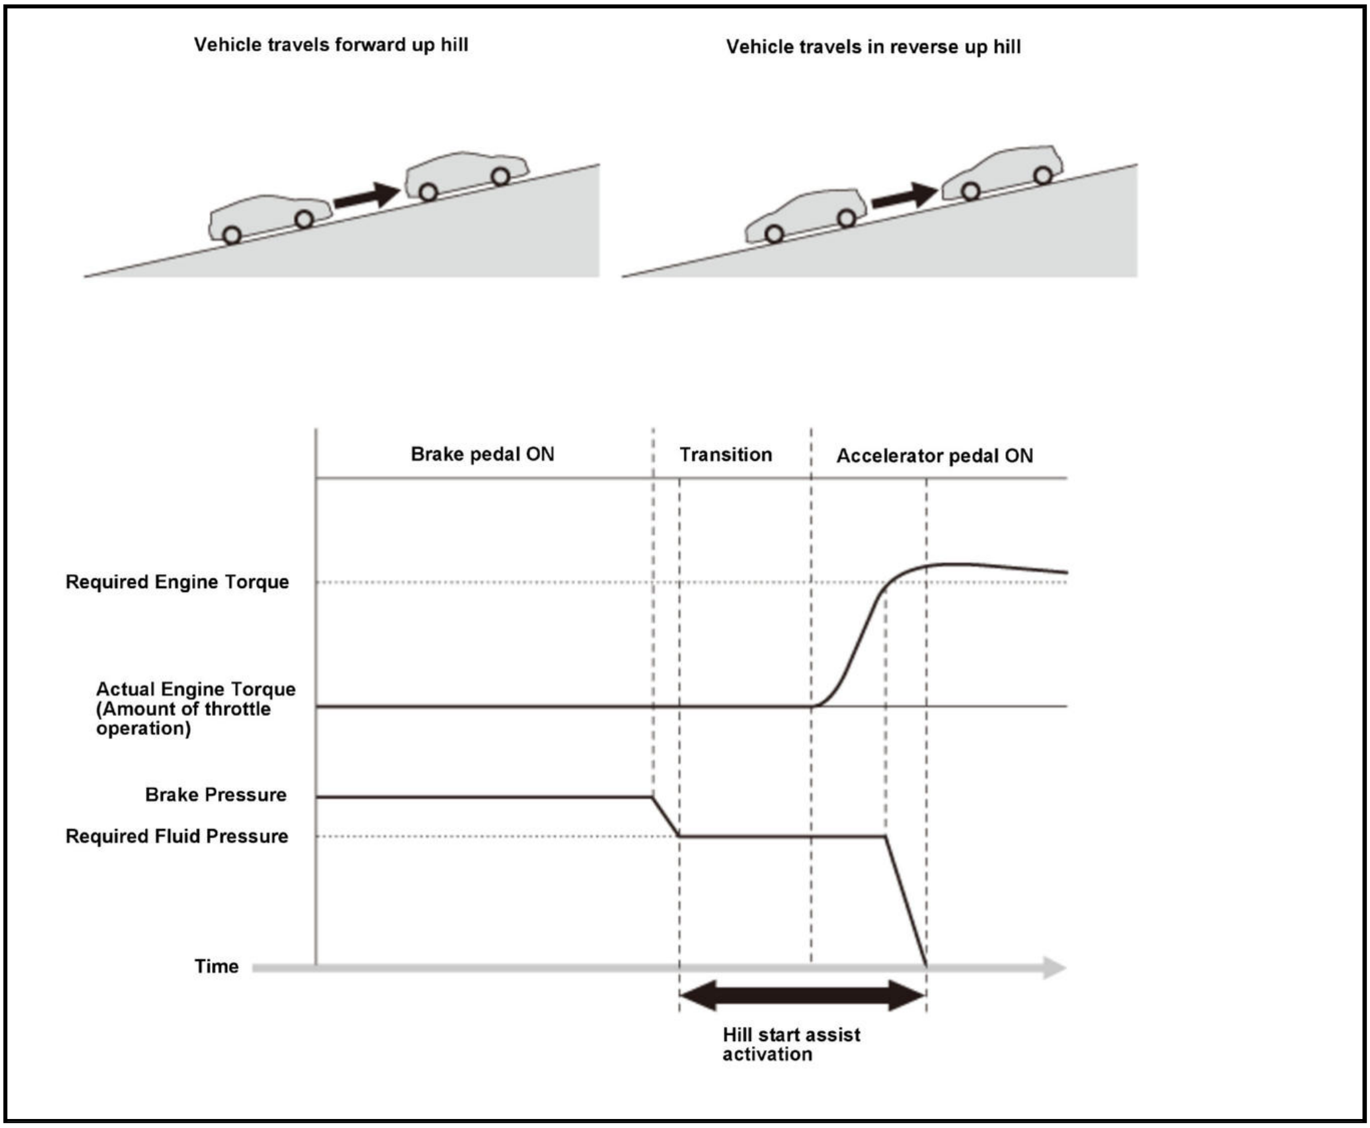
VSA SYSTEM DESCRIPTION - HILL START ASSIST CONTROL

Overview

The hill start assist control assists drivers by automatically controlling brake pressure when starting a vehicle on a steep hill; this assist prevents the vehicle from rolling on a hill for a few seconds while the driver moves their foot from the brake pedal to the accelerator pedal. The hill start assist control may not be activated when the driver does not press the brake strongly enough upon stopping the vehicle or when the driver releases the brake pedal gradually upon starting the vehicle.

Control

The control unit reads the angle of inclination from the longitudinal acceleration signal and that all four wheels are stopped, then it calculates the amount of fluid pressure required to keep the vehicle from rolling backward.This takes place as the control unit sees the brake pressure decrease when the driver lifts their foot off of the brake pedal and moves it onto the accelerator pedal. After the driver transitions to the accelerator pedal and the engine torque is restored to the predetermined level required to start-up the engine, the hill start assist control will release the brake fluid pressure. The hill start assist control will release the brake fluid pressure if the accelerator pedal is not pressed for a certain period of time after the brake pedal has been released.



Vehicle travels forward up hill

VSA SYSTEM DESCRIPTION - HYDRAULIC BOOST FAILURE COMPENSATION

Overview

If the electric brake booster system malfunctions, the operating force of the brake pedal becomes larger than under normal conditions. In this case, the hydraulic boost failure compensation uses the pressurization control of the VSA system to reduce the operating force of the brake pedal.

Control

The VSA modulator-control unit calculates control quantity based on the signals of the brake pedal position switch, the wheel speed sensors, and the pressure sensor, then increases the caliper pressure by driving the pump motor and solenoid valves.

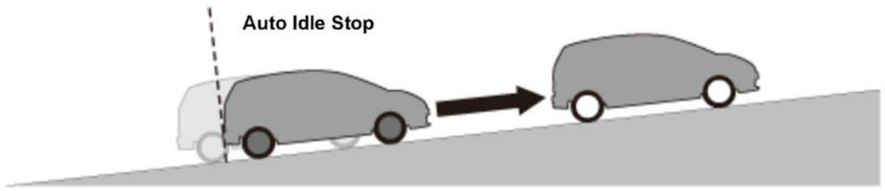
VSA SYSTEM DESCRIPTION - STARTING ASSIST BRAKE FUNCTION (WITH AUTO IDLE STOP SYSTEM) (2020 2021)

Overview

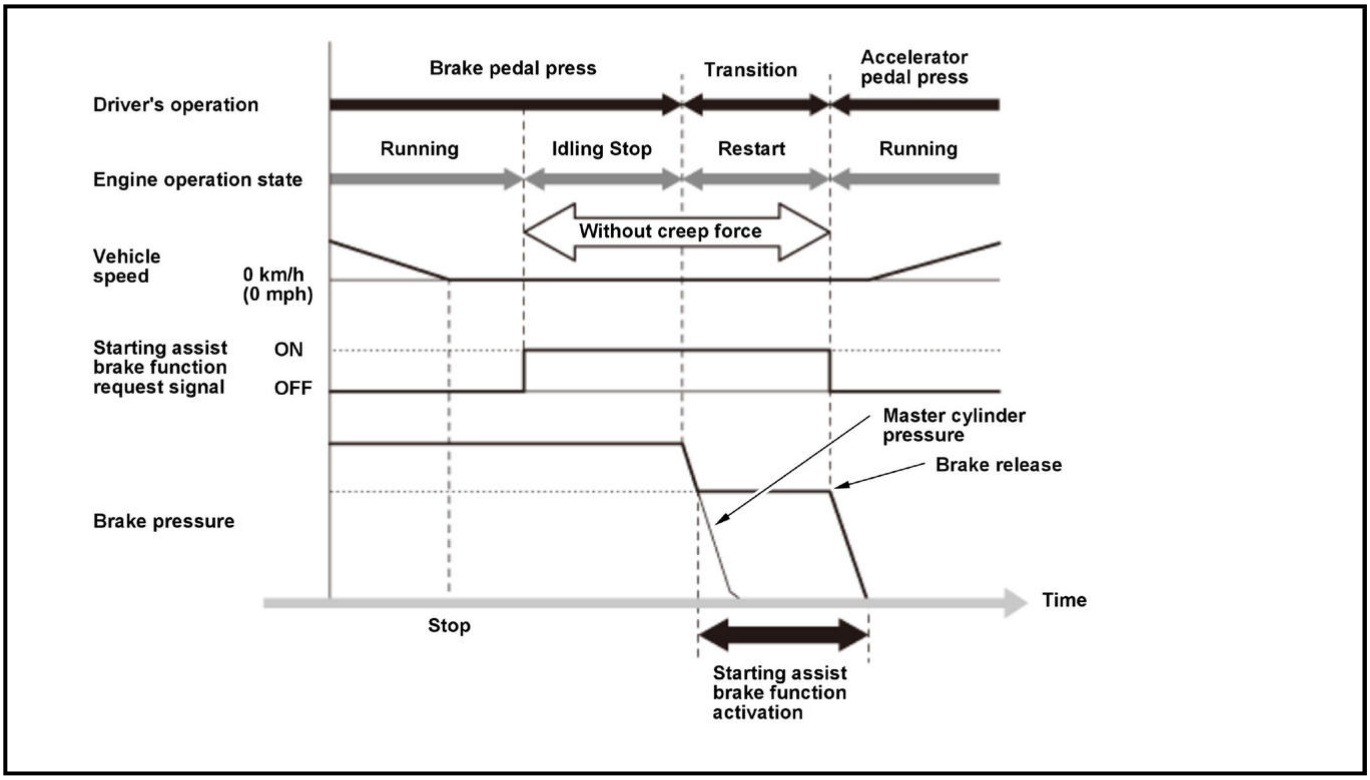
The starting assist brake function holds the brake pressure for a few seconds when there is no creep forces while auto idling stop is activating. This function prevents slight moving of the vehicle when restarts the engine, and also prevents the vehicle from moving backwards on a hill while the driver transitions from the brake pedal to the accelerator pedal.



Auto Idle Stop

Control

When the PCM is ready to output an operation request signal for starting assist brake function and the brake pedal is released by the driver, the starting assist brake function holds the brake pressure according to the gradient of the slope.After the driver transitions to the accelerator pedal, the engine is restarted, and the creep force is restored to the programmed level, the starting assist brake function will release the brake pressure.The starting assist brake function may not be activated when the driver does not press the brake strongly enough upon stopping the vehicle or when the driver releases the brake pedal gradually upon starting the vehicle.



VSA SYSTEM DESCRIPTION - SYSTEM DIAGRAM

The system diagram of the VSA system is shown below.

For locations of each component on vehicle, refer to Component Location Index:

- VSA modulator-control unit, Wheel speed sensor, VSA OFF switch, Automatic brake hold switch
- PCM
- TCM (L15BE engine)
- Gauge control module, Brake fluid level switch
- SRS unit
- EPS control unit
- Electric brake booster
- Brake pedal position switch, Brake light relay
- Millimeter wave radar (With ACC)

F-CAN Communication Data

VSA System Receiving Signal

Transmitting Unit	Signal Name
PCM	• VSA control enable/disable signal • Accelerator pedal position signal • Engine speed signal • Engine torque signal • Vehicle speed signal • Brake pedal position switch signal • Starting assist brake function activation request *1 • Service check signal • System failure Information
TCM *2	• Vehicle speed signal • Shift position signal
Gauge control module	• VSA OFF switch signal

Transmitting Unit	Signal Name
	Brake fluid level switch signal Automatic brake hold switch signal
SRS unit	Yaw rate signal Lateral acceleration signal Longitudinal acceleration signal Driver's seat belt buckle switch status
EPS control unit	Steering angle signal
Electric brake booster	System operating state signal System failure Information Brake pedal stroke sensor state signal
Millimeter wave radar *3	Deceleration request signal System operating state signal System failure Information

*1: With auto idle stop system

*2: L15BE engine

*3: With ACC

VSA System Transmitting Signal

Transmitting Unit	Signal Name
VSA modulator-control unit	Engine torque control request signal Shift control request signal Wheel speed signals Master cylinder pressure signal Indicator drive signal Buzzer request signal Automatic brake hold request signal Target brake pressure signal *1 System operating state signal System failure Information

*1: With ACC

VSA SYSTEM DESCRIPTION - TCS CONTROL

Overview

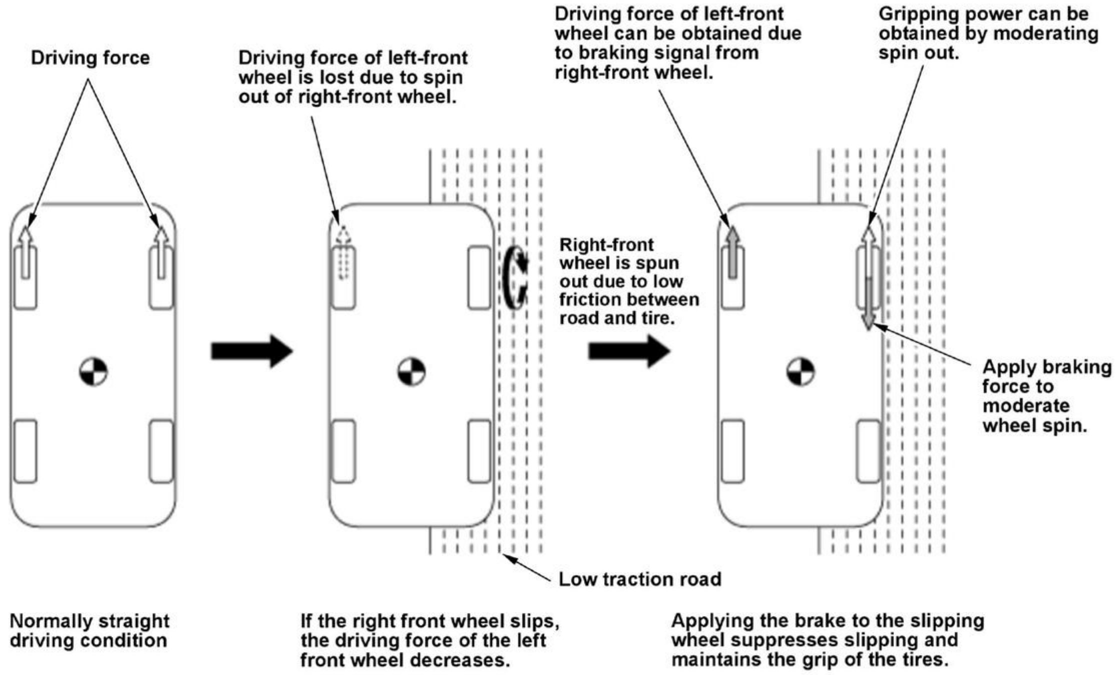
The TCS control makes a judgment on the speed and slip condition (spinning) of each wheel from each wheel speed sensor signal. If both driving wheels are spinning, the engine TCS control is performed. If one wheel alone is slipping, the brake TCS control is performed.

Engine TCS Control

If the VSA control unit detects a drive wheel slipping during starting, accelerating or cornering, a torque down signal is sent to the PCM. The torque of the driving wheel is reduced by the PCM to maintain tire grip on the road surface.

Brake TCS Control

During brake TCS control, the VSA control unit sends a signal to the modulator unit when wheel slipping is detected.



Driving force
Driving force of left-front wheel is lost due to spin out of right-front wheel.
Driving force of left-front wheel can be obtained due to braking signal from right-front wheel.
Gripping power can be obtained by moderating spin out.
Right-front wheel is spun out due to low friction between road and tire.
Apply braking force to moderate wheel spin.
Low traction road
Normally straight driving condition
If the right front wheel slips, the driving force of the left front wheel decreases.
Applying the brake to the slipping wheel suppresses slipping and maintains the grip of the tires.

This illustration is a typical sample of shows front-wheel drive model.

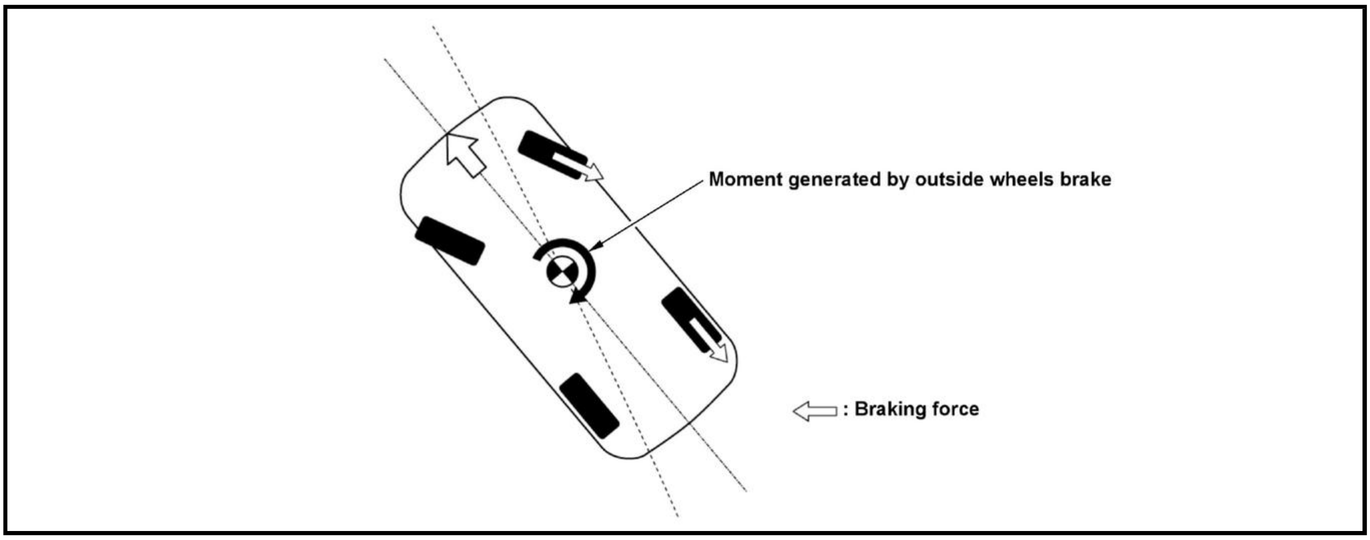
VSA SYSTEM DESCRIPTION - VSA CONTROL

Overview

The VSA modulator-control unit calculates the target yaw rate from the wheel speed signal, lateral acceleration signal and steering angle signal and compares the calculated target yaw rate against the actual yaw rate to make a judgment on the slip condition of the vehicle. The VSA modulator-control unit calculates the target fluid pressure based on this condition, determines one of three fluid pressure control modes (increase, decrease or hold), and adjusts the fluid pressure of the applicable wheel accordingly.

Oversteer Suppression Control

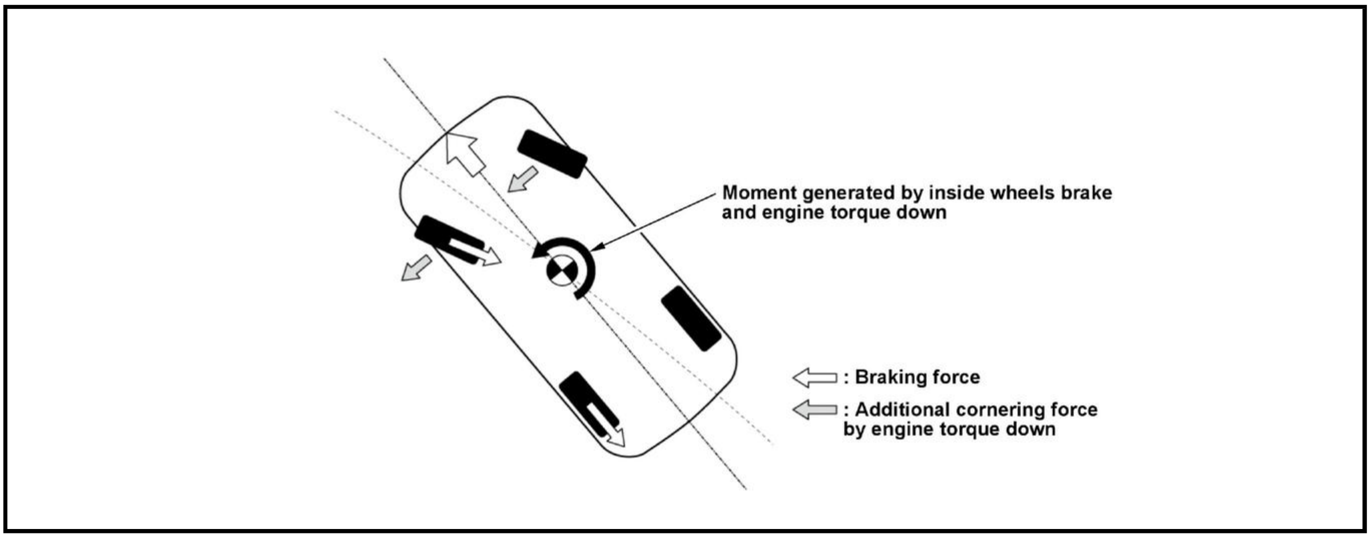
The oversteer suppression control outputs a brake pressure signal that is optimally distributed between the outside front and rear wheels through the VSA modulator-control unit when the vehicle goes into oversteer. This generates a moment that suppresses oversteer and stabilizes the vehicle.



Moment generated by outside wheels brake
⇦ : Braking force

Understeer Suppression Control

The understeer suppression control outputs a brake pressure signal that is optimally distributed between the inside front and rear wheels. This generates a moment that suppresses understeer through the VSA modulator-control unit when the vehicle goes into understeer. During acceleration, an engine torque down signal is also output to the PCM, which increases the cornering force of the driving wheels in order to maintain steerability and improve line traceability.



Moment generated by inside wheels brake and engine torque down
⇦ : Braking force
⇦ : Additional cornering force by engine torque down

VSA SYSTEM DESCRIPTION - VSA OFF MODE

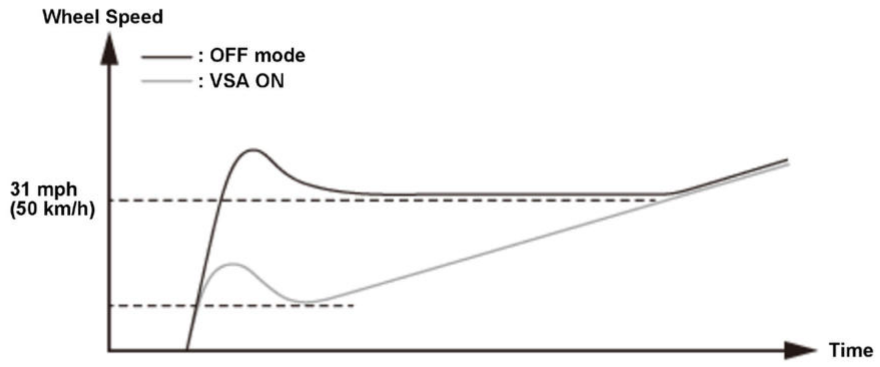
Overview

When the VSA OFF switch is pressed, the VSA OFF indicator will illuminate and the VSA will go into the OFF mode. In the VSA OFF mode, the TCS control is changed, but the other controls will not turn off.

TCS Control During VSA OFF mode

- If the TCS activates, the VSA indicator blinks while the VSA OFF indicator is still on.
- By terminating the TCS function at low speeds, the driver can gain traction on loose sand or deep snow.
- During a standing start from varying road surfaces under the left and right side of the vehicle, the TCS function helps gain traction.
- When the vehicle is on a lift while being serviced and its tires are not in contact with any surface, the wheel speed will not exceed 31 mph (50 km/h).
- The TCS function is fully disabled when the VSA maintenance mode is activated.

TCS Operation Image



VSA Maintenance Mode

Enter the VSA maintenance mode when the vehicle is on a lift or two-wheel dynamometer, where you need the wheel spin speed to exceed 31 mph (50 km/h).For information on how to enter and exit the VSA maintenance mode, refer to **"How to enter VSA maintenance mode"** in the Removal and Installation section of the shop manual.

SERVICE

VSA SENSOR NEUTRAL POSITION MEMORIZATION

Procedure

NOTE:

- The VSA sensor neutral position must be learned whenever you do any of these actions:
-
  - -

    Update or replace the VSA modulator-control unit.
-
  - -

    Update or replace the SRS unit.
-
  - -

    Remove the steering wheel.
-
  - -

    Disconnect the steering joint.
-
  - -

    Wheel alignment adjustment.
- Before doing the memorization procedure, park the vehicle on a flat and level surface.
- After doing the VSA sensor neutral position memorization, do the related procedure (s).

1. **HDS - Connect**
2. VSA Sensor Neutral Position - Memorize

> **NOTE:** Do not press the brake pedal during this procedure.
>
> 1. Set the steering wheel in the straight ahead position.
>
> 2. Select the ADJUSTMENT from the ABS/TCS/VSA menu with the HDS, then select ALL SENSOR, and follow the screen prompts.

REWRITE

VSA MODULATOR-CONTROL UNIT UPDATE

Procedure

NOTE:

- To ensure the latest program is installed, do a VSA modulator-control unit update whenever the VSA modulator-control unit is replaced.
- High temperature in the engine compartment might cause the VSA modulator-control unit to become too hot to run the update. If the engine has been running before this procedure, open the hood and cool the engine compartment.

1. VSA Modulator-Control Unit - Update
2. **VSA Sensor Neutral Position - Memorize**

GENERAL INFORMATION

HOW TO ENTER VSA SYSTEM MAINTENANCE MODE

Procedure

1. Maintenance Mode - Enter

> **NOTE:**
>
> - Entering condition of VSA Maintenance Mode.
> - When the VSA Maintenance Mode is activated, the VSA and TCS functions are disabled.
> - During the Maintenance Mode, the VSA OFF indicator flashes and the VSA indicator is on. When the vehicle is turned to the OFF (LOCK) mode or the VSA OFF switch is pressed again, the Maintenance Mode is cancelled and both indicators go off.
> - If you do not properly follow the steps to enter the VSA maintenance mode, or you do not complete the procedure within 30 seconds, turn the vehicle to the OFF (LOCK) mode, wait for 10 seconds, and try again.

- To terminate the maintenance mode, do the either one of the following procedures.
-
    - -

      Turn the vehicle to the OFF (LOCK) mode.
    - -

      Press VSA OFF switch for 0.5 sec. (make sure VSA indicator and VSA OFF indicator go off).
- When the VSA detects a malfunction, the Maintenance Mode is cancelled.

1. Turn the vehicle to the ON mode and do the following procedure within 30 seconds.

2. Release the parking brake and hold down the brake pedal.

3. While holding down the brake pedal, press and hold the VSA OFF switch. When the VSA OFF indicator turns on, press and hold the VSA OFF switch again until the VSA OFF indicator goes off.

4. Release the brake pedal and apply the parking brake.

5. While the brake pedal is released, press and hold the VSA OFF switch. When the VSA OFF indicator turns on, press and hold the VSA OFF switch again until the VSA OFF indicator goes off.

6. Hold down the brake pedal while apply the parking brake.

7. Press and hold the VSA OFF switch while both brakes are applied. When the VSA OFF indicator turns on, press and hold the VSA OFF switch again until the VSA OFF indicator flashes and the VSA indicator turns on.

SYMPTOM TROUBLESHOOTING

VSA SYSTEM SYMPTOM TROUBLESHOOTING - ABS INDICATOR, BRAKE SYSTEM INDICATOR (RED), VSA INDICATOR, AND BRAKE SYSTEM INDICATOR (AMBER) DO NOT GO OFF (WITH CAN GATEWAY (WITH AUTO IDLE STOP SYSTEM)) (2020 2021)

ABS indicator, brake system indicator (red), VSA indicator, and brake system indicator (amber) do not go off

1. All DTCs check

   -1. All DTCs check with the HDS.

   All DTCs

   Are there DTCs indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Fuse check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. A3-2

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A3-2 fuse circuit.

3. Fuse check 2

-1. Check the following fuse.

Fuse	**No. F4**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 4.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. F4 fuse circuit.

4. Fuse check 3

-1. Check the following fuse.

Fuse	**No. D34**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 5.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. D34 fuse circuit.

5. Fuse check 4

-1. Check the following fuse.

Fuse	**No. F5**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 6.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. F5 fuse circuit.

6. DC-DC converter IG1 relay 2 check

-1. **Remove the DC-DC converter IG1 relay 2** , and **test it** .

Is the relay OK?

YES

The relay is OK. Reinstall the relay, then go to step 7.

NO

Replace the DC-DC converter IG1 relay 2 .

7. Open wire check (IG1 RELAY1 line)

-1. Disconnect the following connector.

VSA modulator-control unit 46P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 14**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 RELAY1 wire is OK. Go to step 12.

NO

Go to step 8.

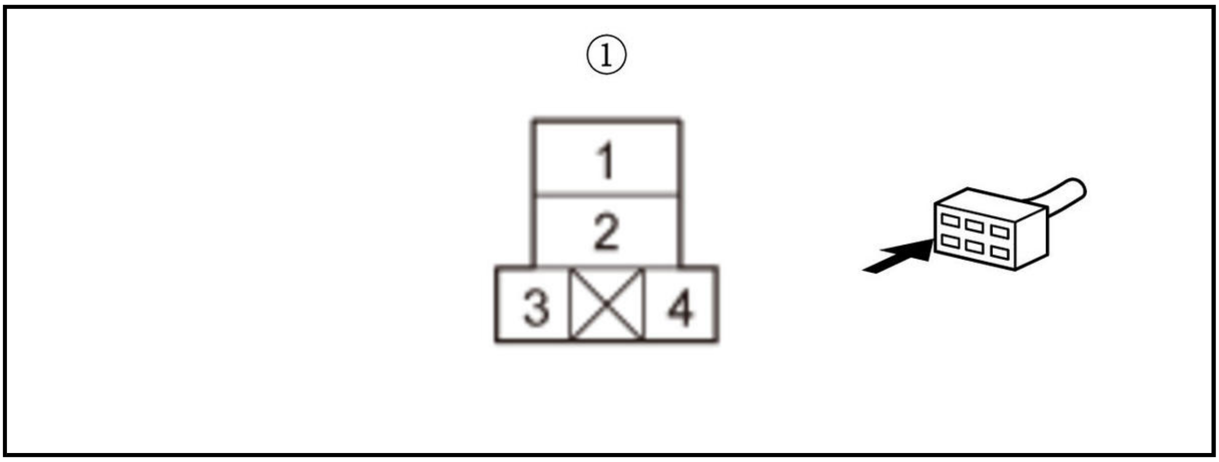
8. Open wire check (IG1 RELAY1, IG1 RLY2 OUT lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the DC-DC converter IG1 relay 2** .

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Â	DC-DC converter IG1 relay 2: removed
Test point 1	**VSA modulator-control unit 46P connector No. 14**
Test point 2	DC-DC converter IG1 relay 2 4P socket (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The IG1 RELAY1 and the IG1 RLY2 OUT wires are OK. Go to step 9.

NO

Repair an open in the wire between the VSA modulator-control unit and the DC-DC converter IG1 relay 2.

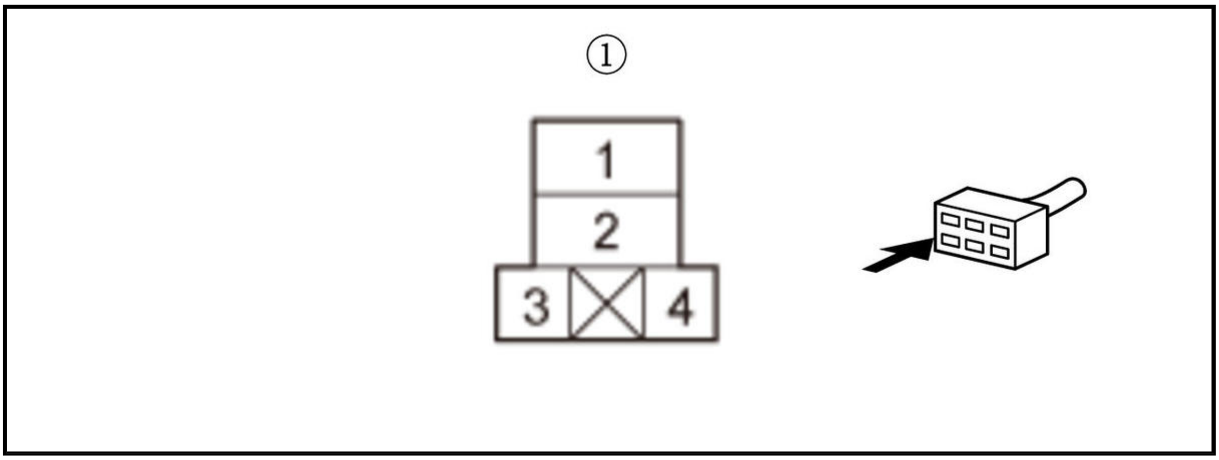
9. Open wire check (DCDC OUT2 line)

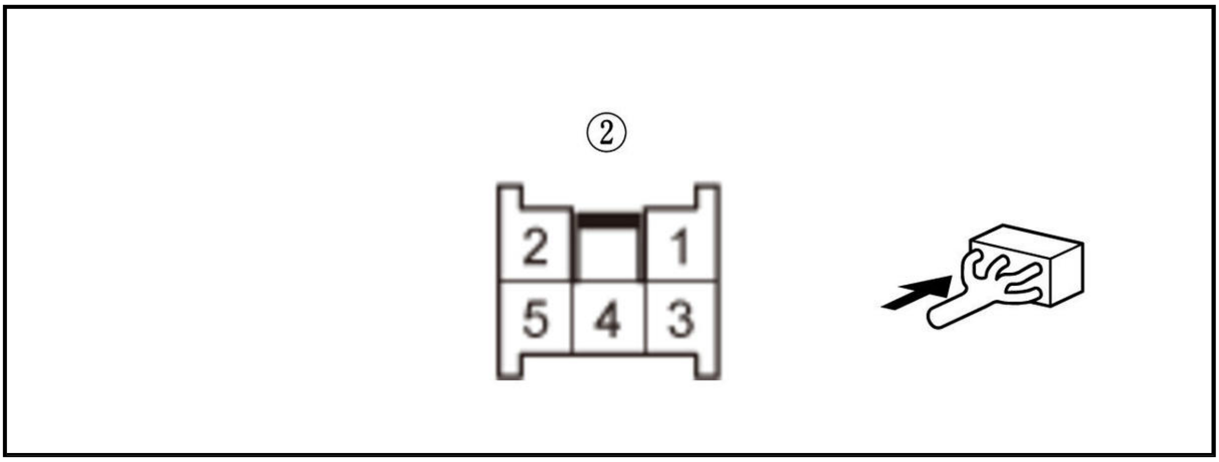
   -1. Disconnect the following connector.

DC-DC converter connector B (5P)

   -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Â	DC-DC converter IG1 relay 2: removed
Â	DC-DC converter connector B (5P): disconnected
Test point 1	DC-DC converter IG1 relay 2 4P socket (female terminals) No. 2: ①
Test point 2	DC-DC converter connector B (5P) (female terminals) No. 5: ②





Is there 1.0 Ω or less?

YES

The DCDC OUT2 wire is OK. Go to step 10.

NO

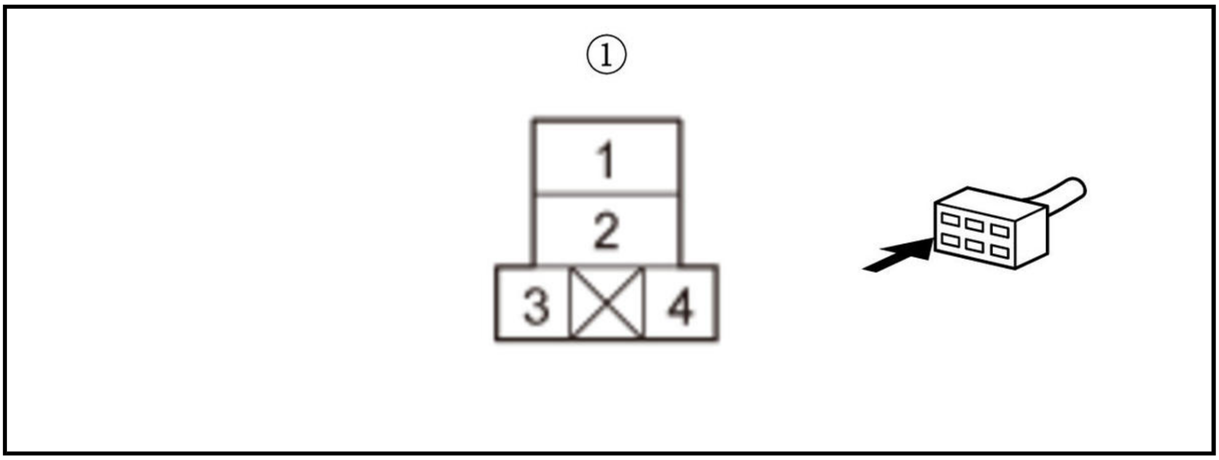
Repair an open in the wire between the DC-DC converter and the DC-DC converter IG1 relay 2.

10. Open wire check (IG1 VSA/ABS line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	VSA modulator-control unit 46P connector: disconnected
Â	DC-DC converter IG1 relay 2: removed
Â	DC-DC converter connector B (5P): disconnected
Test point 1	DC-DC converter IG1 relay 2 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 VSA/ABS wire is OK. Go to step 11.

NO

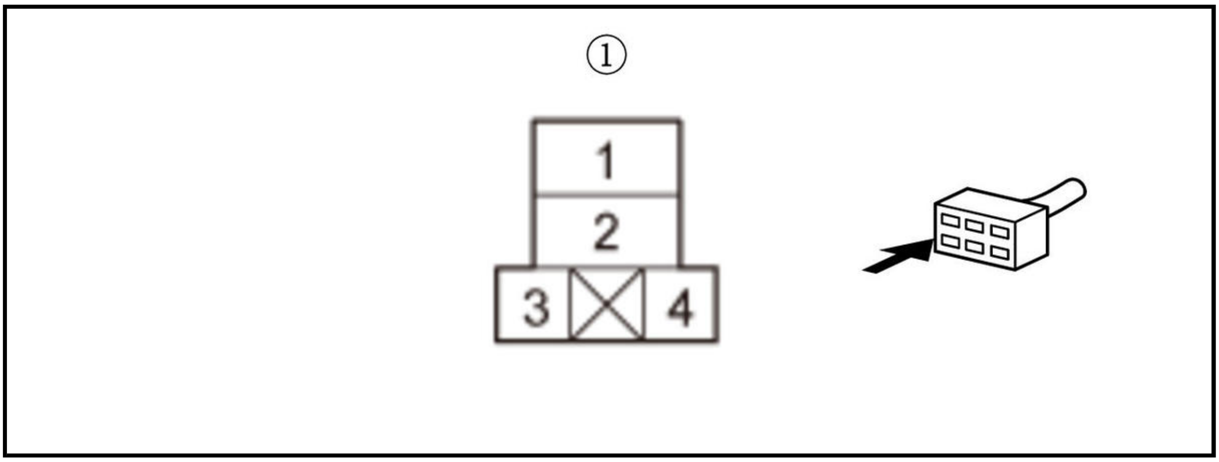
Repair an open in the wire between the under-dash fuse/relay box and the DC-DC converter IG1 relay 2.

11. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Â	DC-DC converter IG1 relay 2: removed
Â	DC-DC converter connector B (5P): disconnected
Test point 1	DC-DC converter IG1 relay 2 4P socket (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. **Replace the DC-DC converter** .

NO

Repair an open in the wire between the DC-DC converter IG1 relay 2 and body ground (G402).

12. Open wire check (+B ABS/VSA FSR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VSA modulator-control unit 46P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The +B ABS/VSA FSR wire is OK. Go to step 13.

NO

Repair an open in the wire between the under-hood fuse/relay box and the VSA modulator-control unit.

13. Open wire check (+B VSA line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected

Test point 1	**VSA modulator-control unit 46P connector No. 18**
Test point 2	Body ground

Is there battery voltage?

YES

The +B VSA wire is OK. Go to step 14.

NO

Repair an open in the wire between the auxiliary under-dash fuse/relay box and the VSA modulator-control unit.

14. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 2**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 15.

NO

Repair an open in the wire between the VSA modulator-control unit and body ground (G201).

15. F-CAN circuit communication check

-1. Reconnect the following connector.

VSA modulator-control unit 46P connector

-2. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Gauge control module (Bus A) is Not Available

Go to step 16.

VSA modulator-control unit (Bus A) is Not Available

Go to step 17.

VSA modulator-control unit (Bus B) is Not Available

Go to step 18.

VSA modulator-control unit and gauge control module are Available

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

16. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

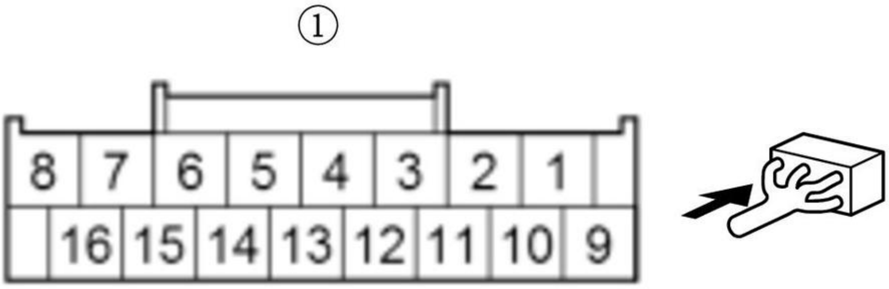
Gauge control module connector A (32P)
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Gauge control module connector A (32P): disconnected
Â	CAN gateway 16P connector: disconnected

Test circuit 1	Â
Test point 1	**Gauge control module connector A (32P) No. 19**
Test point 2	CAN gateway 16P connector (female terminals) No. 3: ①

Test circuit 2	Â
Test point 1	**Gauge control module connector A (32P) No. 20**
Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1.0 Ω or less?

YES

The F-CAN A_H and F-CAN A_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

NO

Repair an open in the wire between the gauge control module and the CAN gateway.

17. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

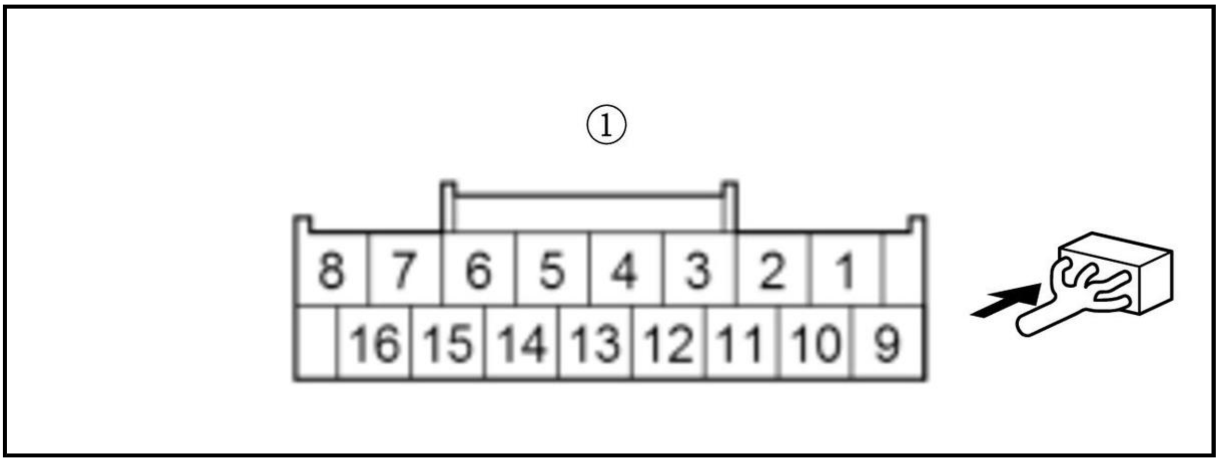
-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Â	CAN gateway 16P connector: disconnected
Test circuit 1	Â
Test point 1	**VSA modulator-control unit 46P connector No. 40**
Test point 2	CAN gateway 16P connector (female terminals) No. 3: ①

Test circuit 2	Â
Test point 1	**VSA modulator-control unit 46P connector No. 28**
Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1.0 Ω or less?

YES

The F-CAN A_H and F-CAN A_L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

18. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

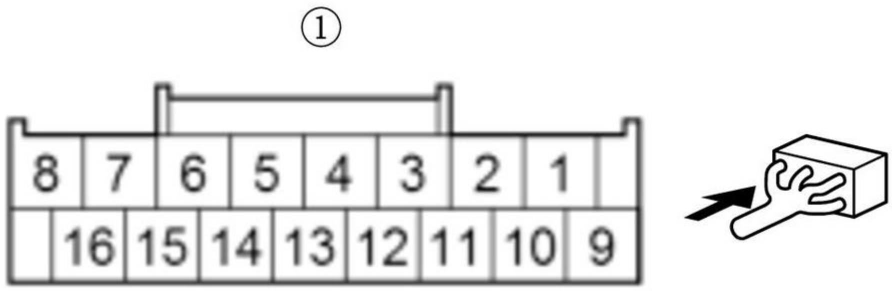
-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Â	CAN gateway 16P connector: disconnected
Test circuit 1	Â
Test point 1	**VSA modulator-control unit 46P connector No. 46**
Test point 2	CAN gateway 16P connector (female terminals) No. 6: ①

Test circuit 2	Â
Test point 1	**VSA modulator-control unit 46P connector No. 34**
Test point 2	CAN gateway 16P connector (female terminals) No. 14: ①



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

VSA SYSTEM SYMPTOM TROUBLESHOOTING - ABS INDICATOR, BRAKE SYSTEM INDICATOR (RED), VSA INDICATOR, AND BRAKE SYSTEM INDICATOR (AMBER) DO NOT GO OFF (WITH CAN GATEWAY (WITHOUT AUTO IDLE STOP SYSTEM))

ABS indicator, brake system indicator (red), VSA indicator, and brake system indicator (amber) do not go off

1. DTC check (VSA modulator-control unit)

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
Â	Â	Â

   Is DTC indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. DTC check (CAN gateway system)

   -1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
Â	Â

   Is DTC indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Go to step 3.

3. Gauge control module operation check

   -1. Do the gauge control module self-diagnostic function .

   Is the gauge control module OK?

   YES

   Go to step 4.

   NO

   Replace the gauge control module .

4. Fuse check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. A3-2 (40 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 5.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A3-2 (40 A) fuse circuit.

5. Fuse check 2

-1. Check the following fuse.

Fuse	No. D34 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 6.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. D34 (10 A) fuse circuit.

6. Open wire check (IG1 VSA/ABS line)

-1. Disconnect the following connector.

VSA modulator-control unit 46P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 14**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 VSA/ABS wire is OK. Go to step 7.

NO

Repair an open in the wire between the No. D34 (10 A) fuse in the under-dash fuse/relay box and the VSA modulator-control unit.

7. Open wire check (+B ABS/VSA FSR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Test point 1	VSA modulator-control unit 46P connector No. 1
Test point 2	Body ground

Is there battery voltage?

YES

The +B ABS/VSA FSR wire is OK. Go to step 8.

NO

Repair an open in the wire between the under-hood fuse/relay box and the VSA modulator-control unit.

8. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Test point 1	VSA modulator-control unit 46P connector No. 2
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 9.

NO

Repair an open in the wire between the VSA modulator-control unit and body ground (G201).

9. F-CAN circuit communication check

-1. Reconnect the following connector.

VSA modulator-control unit 46P connector

-2. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Gauge control module (Bus A) is Not Available

Go to step 10.

VSA modulator-control unit (Bus A) is Not Available

Go to step 11.

VSA modulator-control unit (Bus B) is Not Available

Go to step 12.

VSA modulator-control unit and gauge control module are Available

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

10. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

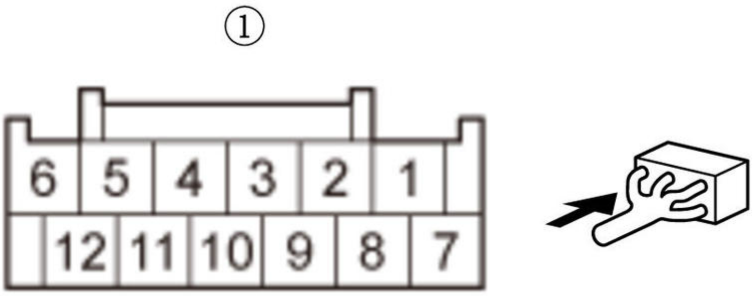
-2. Disconnect the following connectors.

Gauge control module connector A (32P)
CAN gateway 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Gauge control module connector A (32P): disconnected
Â	CAN gateway 12P connector: disconnected
Test circuit 1	Â
Test point 1	**Gauge control module connector A (32P) No. 19**
Test point 2	CAN gateway 12P connector (female terminals) No. 3: ①

Test circuit 2	Â
Test point 1	**Gauge control module connector A (32P) No. 20**
Test point 2	CAN gateway 12P connector (female terminals) No. 9: ①



Is there continuity?

YES

The F-CAN A_H and F-CAN A_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

NO

Repair an open in the wire between the gauge control module and the CAN gateway.

11. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

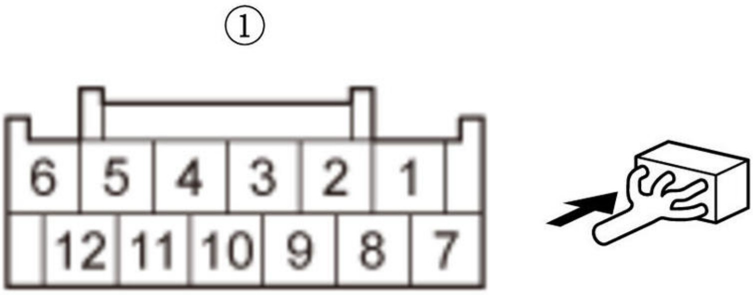
-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
CAN gateway 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Â	CAN gateway 12P connector: disconnected
Test circuit 1	Â
Test point 1	**VSA modulator-control unit 46P connector No. 40**
Test point 2	CAN gateway 12P connector (female terminals) No. 3: ①

Test circuit 2	Â
Test point 1	**VSA modulator-control unit 46P connector No. 28**
Test point 2	CAN gateway 12P connector (female terminals) No. 9: ①



Is there continuity?

YES

The F-CAN A_H and F-CAN A_L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

12. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

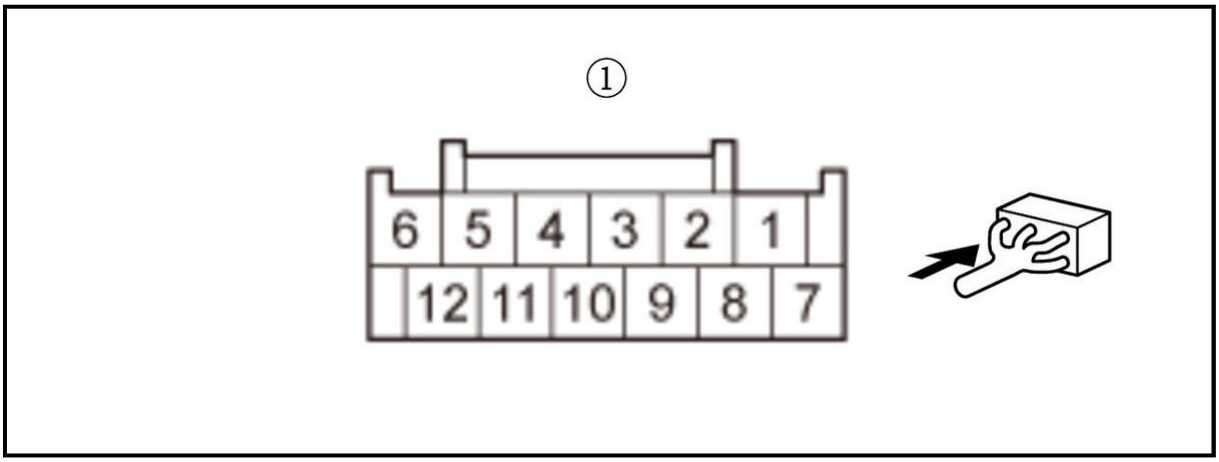
-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
CAN gateway 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Â	CAN gateway 12P connector: disconnected
Test circuit 1	Â
Test point 1	**VSA modulator-control unit 46P connector No. 46**
Test point 2	CAN gateway 12P connector (female terminals) No. 12: ①

Test circuit 2	Â
Test point 1	**VSA modulator-control unit 46P connector No. 34**
Test point 2	CAN gateway 12P connector (female terminals) No. 5: ①



Is there continuity?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

VSA SYSTEM SYMPTOM TROUBLESHOOTING - ABS INDICATOR, BRAKE SYSTEM INDICATOR (RED), VSA INDICATOR, AND BRAKE SYSTEM INDICATOR (AMBER) DO NOT GO OFF (WITHOUT CAN GATEWAY) (2017 2018 2019)

ABS indicator, brake system indicator (red), VSA indicator, and brake system indicator (amber) do not go off

NOTE: Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it does not, **go to the F-CAN circuit troubleshooting** .

1. DTC check (VSA modulator-control unit)

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
Â	Â	Â

Is DTC indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 2.

2. Gauge control module operation check

-1. **Do the gauge control module self-diagnostic function** .

Is the gauge control module OK?

YES

Go to step 3.

NO

Replace the gauge control module .

3. Fuse check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A3-2 (40 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 4.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A3-2 (40 A) fuse circuit.

4. Fuse check 2

-1. Check the following fuse.

Fuse	No. D34 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 5.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. D34 (10 A) fuse circuit.

5. Open wire check (IG1 VSA/ABS line)

-1. Disconnect the following connector.

VSA modulator-control unit 46P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	VSA modulator-control unit 46P connector: disconnected

Test point 1	**VSA modulator-control unit 46P connector No. 14**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 VSA/ABS wire is OK. Go to step 6.

NO

Repair an open in the wire between the No. D34 (10 A) fuse in the under-dash fuse/relay box and the VSA modulator-control unit.

6. Open wire check (+B ABS/VSA FSR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The +B ABS/VSA FSR wire is OK. Go to step 7.

NO

Repair an open in the wire between the No. A3-2 (40 A) fuse in the under-hood fuse/relay box and the VSA modulator-control unit.

7. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 2**
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 8.

NO

Repair an open in the wire between the VSA modulator-control unit and body ground (G201).

8. Open wire check (F-CAN_H, F-CAN_L lines)

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA modulator-control unit 46P connector: disconnected
Â	Gauge control module connector A (32P): disconnected
Test circuit 1	Â
Test point 1	**VSA modulator-control unit 46P connector No. 40**
Test point 2	**Gauge control module connector A (32P) No. 19**

Test circuit 2	Â
Test point 1	**VSA modulator-control unit 46P connector No. 28**
Test point 2	**Gauge control module connector A (32P) No. 20**

Is there continuity?

YES

The F-CAN_H and F-CAN_L wires are OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the gauge control module and the VSA modulator-control unit.

VSA SYSTEM SYMPTOM TROUBLESHOOTING - VSA CANNOT BE TURNED OFF

VSA cannot be turned OFF

1. VSA OFF switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check the VSA OFF switch** .

Is the VSA OFF switch OK?

YES

Go to step 2.

NO

Replace the VSA OFF switch .

2. Determine possible failure area (VSA OFF SW line, GND line)

-1. Disconnect the following connector.

VSA OFF/lid switch 4P connector
VSA OFF/TPMS switch 5P connector
VSA OFF/parking and back-up sensor switch 8P connector
VSA OFF/driver's power tailgate switch 12P connector
VSA OFF/heated windshield wiper area switch 12P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	VSA OFF/lid switch 4P connector: disconnected
Â	VSA OFF/TPMS switch 5P connector: disconnected
Â	VSA OFF/parking and back-up sensor switch 8P connector: disconnected
Â	VSA OFF/driver's power tailgate switch 12P connector: disconnected
Â	VSA OFF/heated windshield wiper area switch 12P connector: disconnected

Test point 1	VSA OFF/lid switch 4P connector (female terminals) No. 4: ①
Â	VSA OFF/TPMS switch 5P connector (female terminals) No. 1: ②
Â	VSA OFF/parking and back-up sensor switch 8P connector (female terminals) No. 8: ③
Â	VSA OFF/driver's power tailgate switch 12P connector (female terminals) No. 11: ④
Â	VSA OFF/heated windshield wiper area switch 12P connector (female terminals) No. 11: ⑤

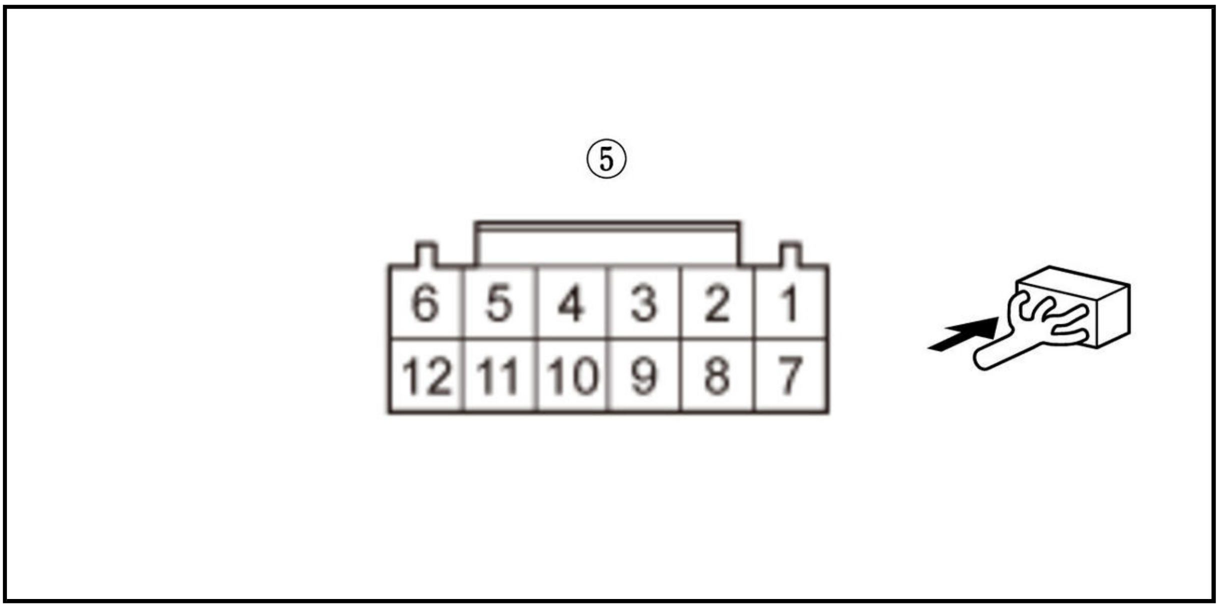
7



Is there battery voltage?

YES

Repair an open in the wire between the VSA OFF switch and body ground (G401).

NO

Go to step 3.

3. Shorted wire check (VSA OFF SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	VSA OFF/lid switch 4P connector: disconnected
Â	VSA OFF/TPMS switch 5P connector: disconnected
Â	VSA OFF/parking and back-up sensor switch 8P connector: disconnected
Â	VSA OFF/driver's power tailgate switch 12P connector: disconnected
Â	VSA OFF/heated windshield wiper area switch 12P connector: disconnected
Â	Gauge control module connector A (32P): disconnected
Test point 1	VSA OFF/lid switch 4P connector (female terminals) No. 4: ①
Â	VSA OFF/TPMS switch 5P connector (female terminals) No. 1: ②
Â	VSA OFF/parking and back-up sensor switch 8P connector (female terminals) No. 8: ③
Â	VSA OFF/driver's power tailgate switch 12P connector (female terminals) No. 11: ④

Is there 1.0 Ω or less?

YES

The VSA OFF SW wire is OK. **Replace the gauge control module** .

NO

Repair an open in the wire between the gauge control module and the VSA OFF switch.

SYMPTOM TROUBLESHOOTING INDEX

VSA SYSTEM SYMPTOM TROUBLESHOOTING INDEX (VSA SYSTEM)

When the vehicle has one of these symptoms, check for VSA diagnostic trouble codes (DTCs) with the HDS. If there are no DTCs, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

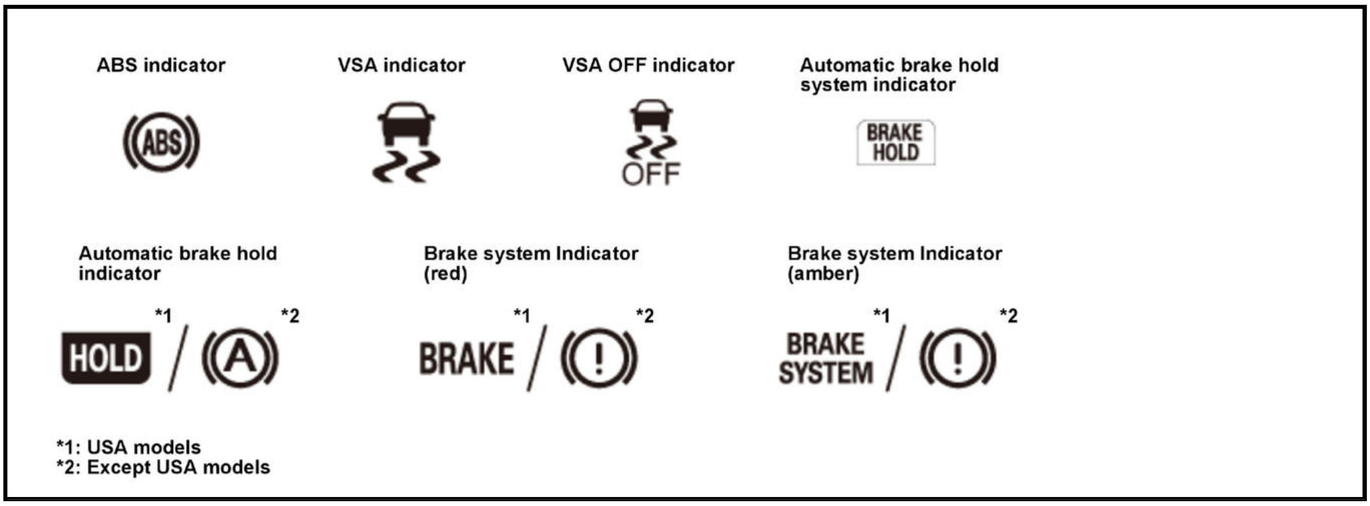
Symptom	Diagnostic procedure	Also check for
HDS does not communicate with the VSA modulator-control unit or the vehicle	**Troubleshoot the F-CAN circuit** .	Power and ground at the VSA modulator-control unit.
ABS indicator, brake system indicator (red), VSA indicator, or VSA OFF indicator does not come on at start-up (bulb check)	**Do the gauge control module self-diagnostic function** .	Â
VSA OFF indicator does not go off	• **Do the VSA sensor neutral position memorization**. • **Do the gauge control module self-diagnostic function** . • **Replace the VSA modulator-control unit** .	Â
ABS indicator, brake system indicator (red), VSA indicator, and brake system indicator (amber) do not go off	**Symptom troubleshooting**.	Â
VSA cannot be turned OFF	• **Symptom troubleshooting**. • **Replace the VSA modulator-control unit** .	Â

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE VSA SYSTEM

System Indicator

This system has seven indicators on the gauge control module.



ABS indicator
VSA indicator
VSA OFF indicator
Automatic brake hold system indicator
BRAKE HOLD
Automatic brake hold indicator
*1
*2
HOLD
Brake system Indicator (red)
*1
*2
BRAKE
Brake system Indicator (amber)
*1
*2
BRAKE SYSTEM
*1: USA models
*2: Except USA models

NOTE: For locations of each indicator, **refer to gauge control module component location index** .

When the system is OK, each indicator comes on for about 2 seconds after turning the vehicle to the ON mode, then it goes off.

When the system detects a problem, a DTC will set and depending upon the failure, the VSA modulator-control unit determines which indicator (s) will turn on. If the problem goes away (system returns to normal), the indicator (s) will be controlled in the following way depending upon the DTC that was set:

- The indicator (s) will come on and stay on when turning the vehicle to the ON mode.
- The indicator (s) will automatically go off.
- The indicator (s) will go off after the vehicle is driven.

ABS Indicator

The ABS indicator comes on when the ABS function is lost. The brakes will still work like a conventional system.

Brake System Indicator (Red)

The brake system indicator (red) will come on when:

- The EBD function is lost.
- The parking brake is applied.
- The brake fluid is low.
- Two or more wheel speed sensors fail.

Brake System Indicator (Amber)

The brake system indicator (amber) comes on, when the brake control system is lost.

VSA Indicator

The VSA indicator comes on when the VSA function is lost. The VSA indicator blinks when the VSA function is activating.

VSA OFF Indicator

The VSA OFF indicator comes on when the VSA is turned OFF by using the VSA OFF switch.

Automatic Brake Hold System Indicator

The automatic brake hold system indicator comes on when the automatic brake hold system is turned ON by using the automatic brake hold switch.

Automatic Brake Hold Indicator

The automatic brake hold indicator comes on when the automatic brake hold function is activating.

Diagnostic Trouble Code (DTC)

- The memory can hold 10 DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are memorized in an EEPROM in the VSA modulator-control unit. Therefore, the memorized DTCs cannot be erased by disconnecting the 12 volt battery. Do the specified procedures to clear the DTCs.

Self-Diagnosis

- Self-diagnosis can be classified into two categories:
-
  - -

    Initial diagnosis: Done right after turning the vehicle to the ON mode and until the ABS, VSA, and brake system indicator (red) go off.
-
  - -

    Regular diagnosis: Done right after the initial diagnosis until turning the vehicle to the OFF (LOCK) mode.
- When the system detects a problem, the VSA modulator-control unit shifts to fail-safe mode.

Kickback

The pump motor operates when the VSA modulator-control unit is functioning, and the fluid in the modulator is forced out to the master cylinder, causing kickback at the brake pedal.

Pump Motor

- The pump motor operates when the VSA modulator-control unit is functioning.
- The VSA modulator-control unit checks the pump motor operation when the vehicle is started and does it's first initial acceleration.

Hydraulic Boost Failure Compensation

This vehicle is equipped with an electric brake booster system. This electric brake booster system uses the VSA modulator-control unit's pressurization control to provide additional brake assist. This is necessary when the electric brake booster system is lost. The hydraulic boost failure compensation can be heard when operating and some kickback will be felt on the brake pedal. The hydraulic boost failure compensation may also be activated in some high altitude conditions. These are considered normal characteristics of this system.

Brake Fluid Replacement/Air Bleeding

Brake fluid replacement and air bleeding procedures are identical to the procedures used on vehicles without the VSA system .

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the ABS, VSA, brake system indicator (red), and/or brake system indicator (amber) are still on. Following a troubleshooting procedure for a DTC that has been cleared but does not reset can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the ABS, VSA, brake system indicator (red), and/or brake system indicator (amber) came on, such as during activation, after activation, when the vehicle was traveling at a certain speed, etc. If necessary, have the customer demonstrate the concern.

2. When the ABS, VSA, brake system indicator (red), and/or brake system indicator (amber) does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. in the circuit indicated by the DTC.

3. After troubleshooting, or the repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions that originally set the DTCs. Make sure the ABS, VSA, brake system indicator (red), and brake system indicator (amber) do not come on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)

NOTE: Make sure the 12 volt battery is in good condition and fully charged.

1. If the system indicators stay on, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it does not, **go to the F-CAN circuit troubleshooting**

4. Check the diagnostic trouble code (DTC) and the freeze data, for all systems, troubleshoot the powertrain DTCs first. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.

NOTE:

- Freeze data indicates the VSA conditions when the first system malfunction that activated the indicator was detected.
- The HDS can read the DTC, the freeze data, the current data, and other system data.
- For specific operations, refer to the HDS Help menu.

How to Retrieve DTCs

1. With the vehicle in OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it does not, **go to the F-CAN circuit troubleshooting**

4. Follow the prompts on the HDS to display the DTC (s) on the screen. After determining the DTC, refer to the DTC troubleshooting. Do the all systems DTC check, and troubleshoot any powertrain DTCs first.

5. Turn the vehicle to the OFF (LOCK) mode.

How to Clear DTCs

1. With the vehicle in OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it does not, go to the F-CAN circuit troubleshooting

4. Clear the DTC (s) by following the screen prompts on the HDS.

5. Turn the vehicle to the OFF (LOCK) mode.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

ABS INDICATOR, BRAKE SYSTEM INDICATOR (RED), VSA INDICATOR, AND BRAKE SYSTEM INDICATOR (AMBER) DO NOT GO OFF (VSA SYSTEM)

Diagnostic procedure

- Symptom troubleshooting.

ABS INDICATOR, BRAKE SYSTEM INDICATOR (RED), VSA INDICATOR, OR VSA OFF INDICATOR DOES NOT COME ON AT START-UP (BULB CHECK) (VSA SYSTEM)

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

HDS DOES NOT COMMUNICATE WITH THE VSA MODULATOR-CONTROL UNIT OR THE VEHICLE (VSA SYSTEM)

Diagnostic procedure

- Troubleshoot the F-CAN circuit .

Also check for

Power and ground at the VSA modulator-control unit.

VSA OFF INDICATOR DOES NOT GO OFF (VSA SYSTEM)

Diagnostic procedure

- Do the VSA sensor neutral position memorization.
- Do the gauge control module self-diagnostic function .
- Replace the VSA modulator-control unit .

VSA CANNOT BE TURNED OFF (VSA SYSTEM)

Diagnostic procedure

- Symptom troubleshooting.
- Replace the VSA modulator-control unit .

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

ABS INDICATOR, BRAKE SYSTEM INDICATOR (RED), VSA INDICATOR, AND BRAKE SYSTEM INDICATOR (AMBER) DO NOT GO OFF

Diagnostic procedure

NOTE: If any of the CAN communication failure DTC is indicated in other system, troubleshoot the DTC first.

- Check for open wire or short wire in the F-CAN circuit;
-
    - -

      Between the gauge control module and the CAN gateway (F-CAN D_H, F-CAN D_L).
    - -

      Between the VSA modulator-control unit and the CAN gateway (F-CAN B_H, F-CAN B_L, F-CAN C_H, F-CAN C_L).
- Check the VSA modulator-control unit power circuit.
-
    - -

      +B_ABS/VSA_FSR, IG1_VSA/ABS
- Check the VSA modulator-control unit ground circuit (GND).
- Do the gauge control module self-diagnostic function .

Also check for

Refer to the followings about the indicator operating condition;

- How to Troubleshoot the VSA System

Refer to the followings about the circuit troubleshooting;

- Gauge control module connector for inputs and outputs
- VSA modulator-control unit connector for inputs and outputs
- VSA system circuit diagram
- Fuse to components index
- Ground to components index

ABS INDICATOR, BRAKE SYSTEM INDICATOR (RED), VSA INDICATOR, OR VSA OFF INDICATOR DOES NOT COME ON AT START-UP (BULB CHECK)

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

HDS DOES NOT COMMUNICATE WITH THE VSA MODULATOR-CONTROL UNIT OR THE VEHICLE

Diagnostic procedure

- Go to the DTC troubleshooting index .

Also check for

Power and ground at the VSA modulator-control unit.

VSA OFF INDICATOR DOES NOT GO OFF

Diagnostic procedure

- Do the VSA sensor neutral position memorization.
- Do the gauge control module self-diagnostic function .
- Replace the VSA modulator-control unit .

VSA CANNOT BE TURNED OFF

Diagnostic procedure

- Symptom troubleshooting.
- Replace the VSA modulator-control unit .

DESCRIPTION & OPERATION

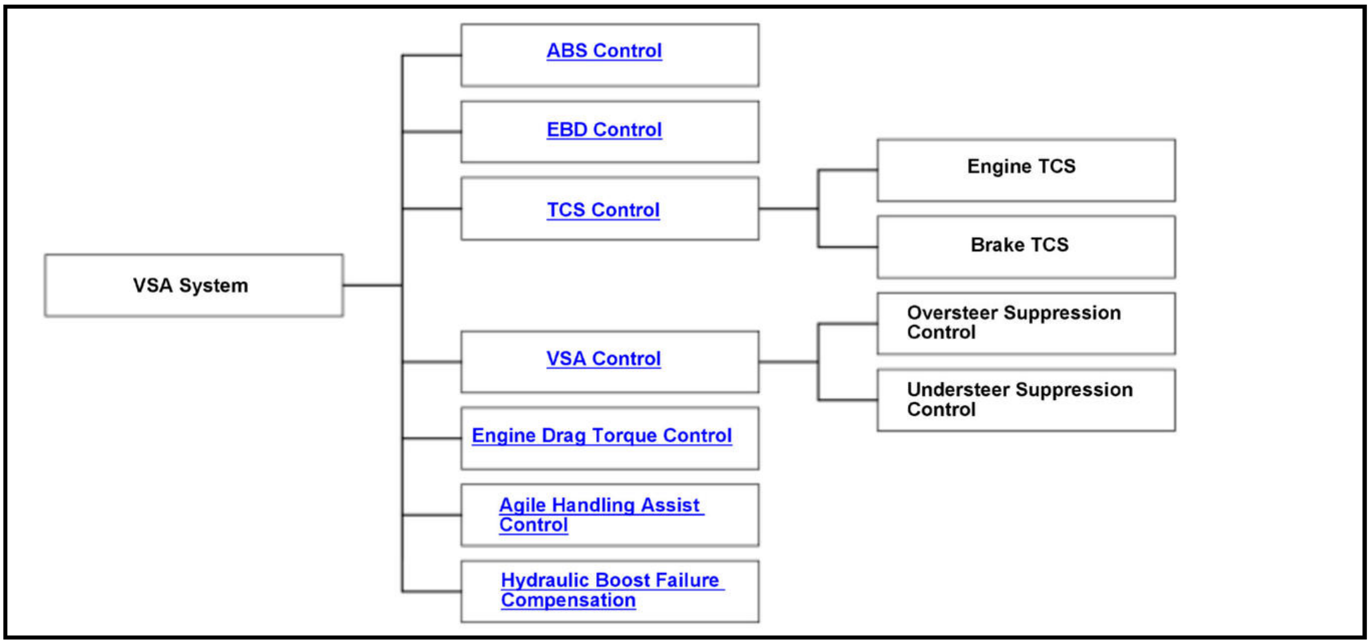
VSA SYSTEM DESCRIPTION

Overview

The VSA system stabilizes the vehicle behavior by controlling the braking force and drive torque.

Control Unit Operation

The VSA system performs the following controls.



VSA System
ABS Control
EBD Control
TCS Control
Engine TCS
Brake TCS
VSA Control
Oversteer Suppression Control
Understeer Suppression Control
Engine Drag Torque Control
Agile Handling Assist Control
Hydraulic Boost Failure Compensation

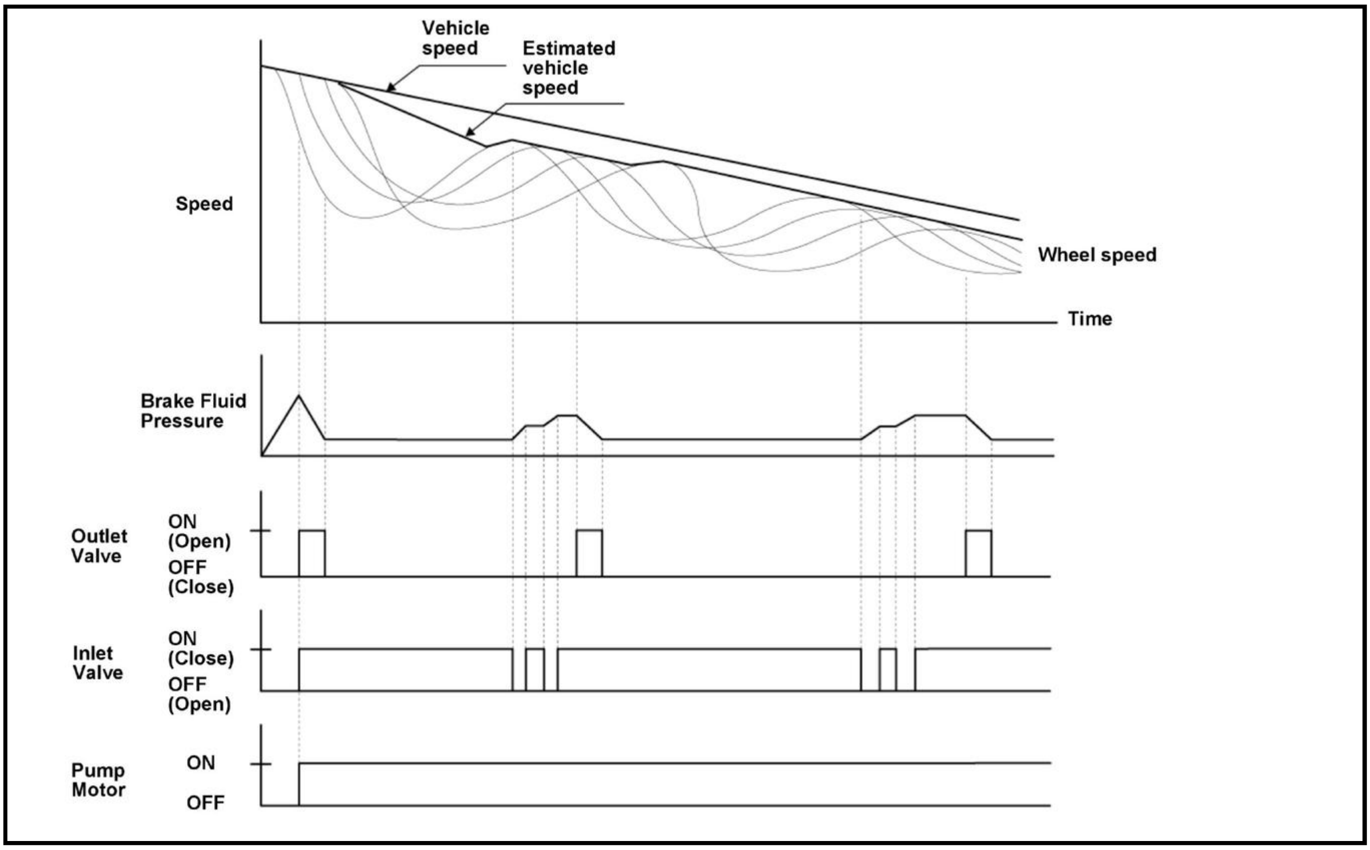
VSA SYSTEM DESCRIPTION - ABS CONTROL

Overview

The ABS control maintains vehicle stability by preventing wheel lock during hard braking or braking on a slippery road surface and helps the driver retain steering control.

Control

When wheel speed is significantly reduced from estimated vehicle speed, the VSA modulator-control unit closes the inlet valve and opens the outlet valve momentarily to reduce brake fluid pressure and the pump motor starts to run. As wheel speed increases, the VSA modulator-control unit maintains brake fluid pressure by keeping the inlet valve closed. Brake fluid pressure is increased when wheel speed matches the estimated speed of the vehicle. The VSA modulator-control unit repeats this valve control operation to control the ABS function.



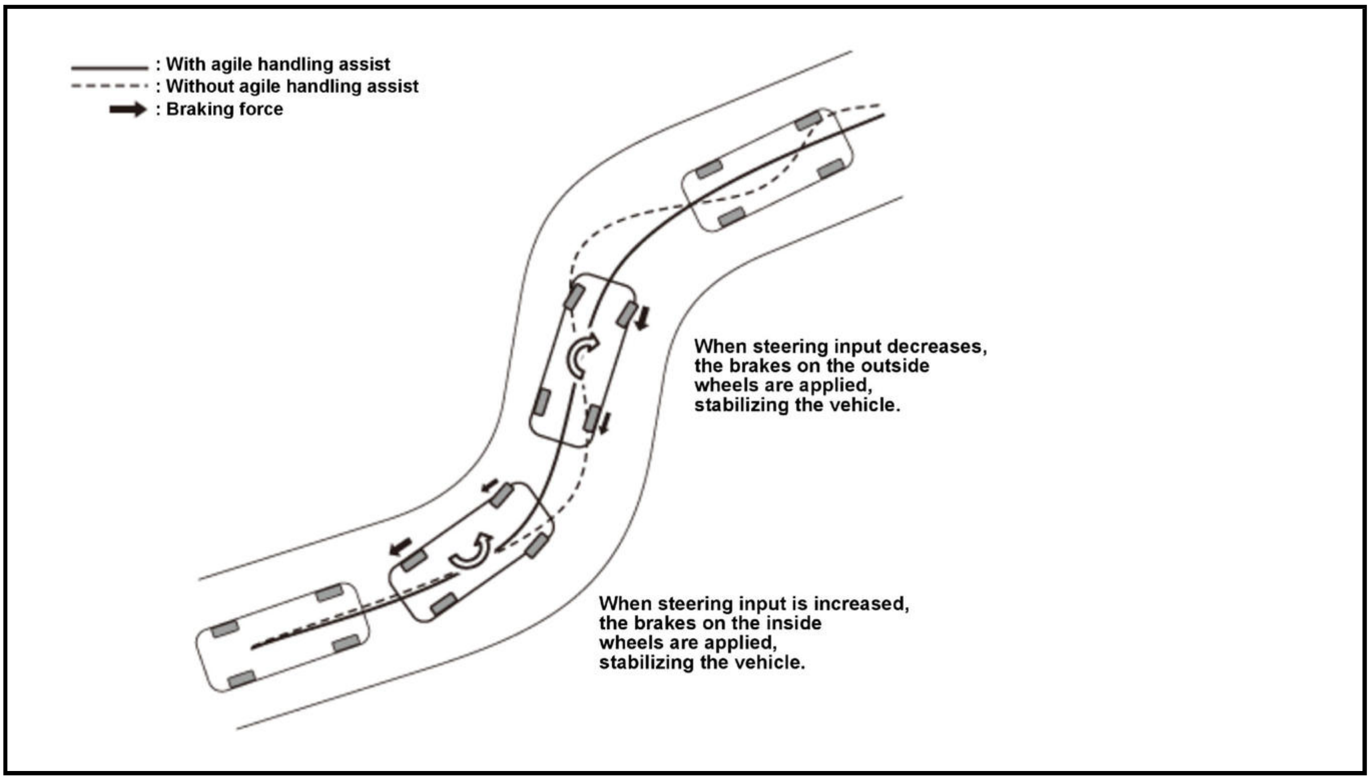
VSA SYSTEM DESCRIPTION - AGILE HANDLING ASSIST CONTROL

Overview

Where previous VSA systems activated at the limit of a turn, the agile handling assist control activates across everyday driving situations providing a safer and more enjoyable driving experience.Agile handling assist responds to the increase/decrease in steering input and vehicle action is made smooth at the same time as it improves response to steering operation and reduced steering effort. The action of steering is accomplished with a smaller amount of steering operation.

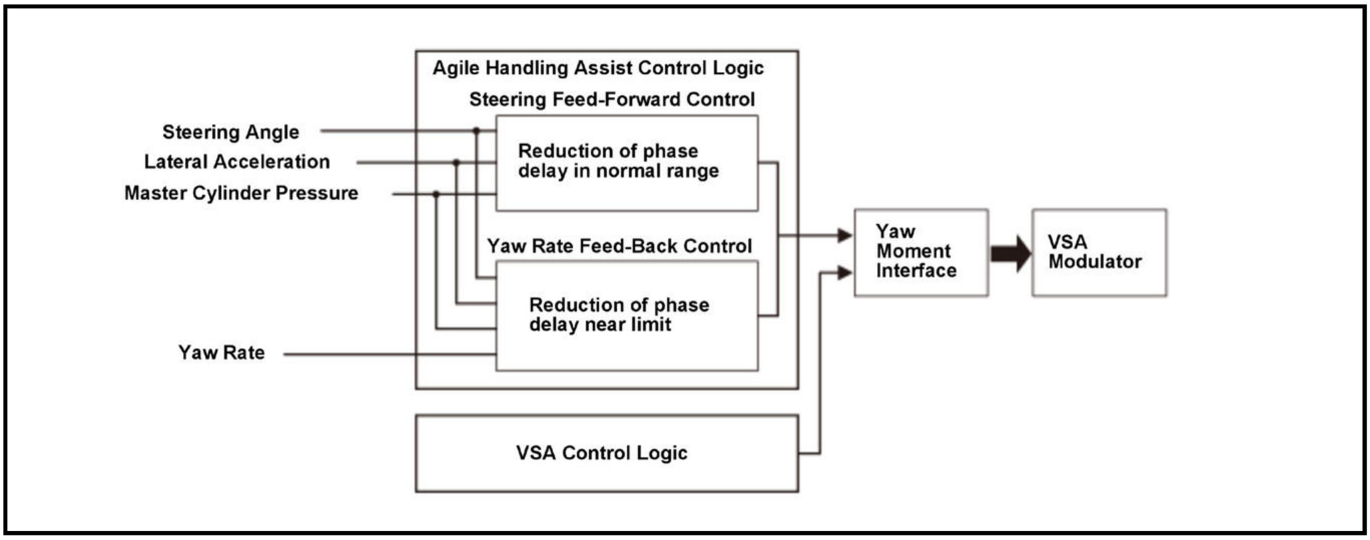
Control

Agile Handling Assist Control Overview



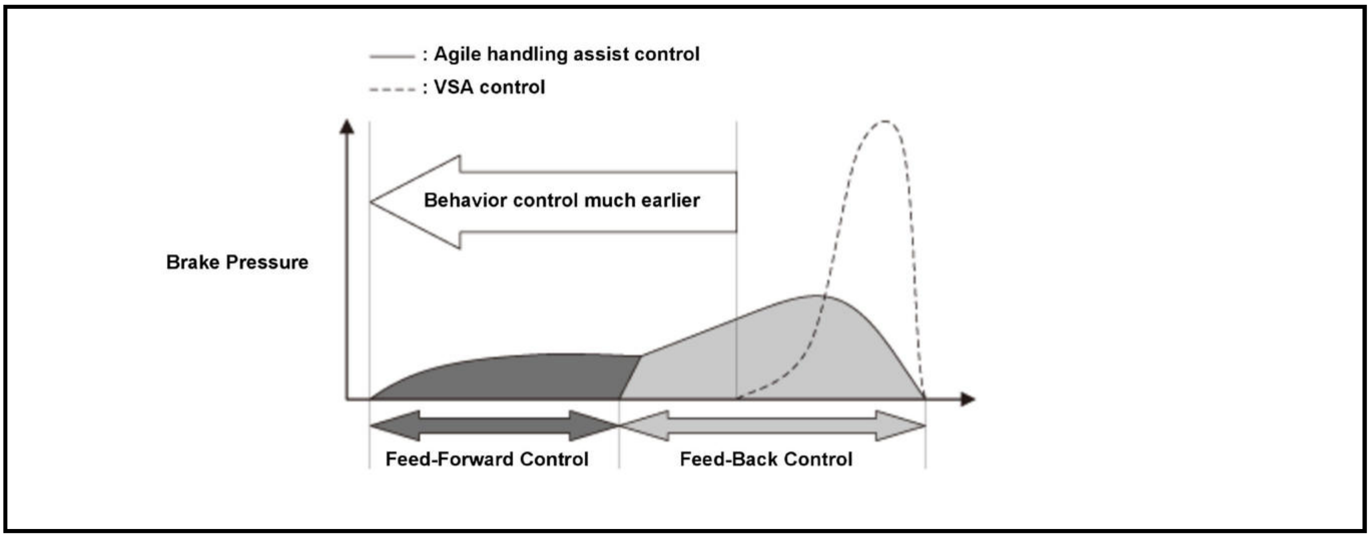
: With agile handling assist
: Without agile handling assist
: Braking force
When steering input decreases, the brakes on the outside wheels are applied, stabilizing the vehicle.
When steering input is increased, the brakes on the inside wheels are applied, stabilizing the vehicle.

Control Block



Agile Handling Assist Control Logic
Steering Feed-Forward Control
Steering Angle
Lateral Acceleration
Master Cylinder Pressure
Reduction of phase delay in normal range
Yaw Rate Feed-Back Control
Reduction of phase delay near limit
Yaw Rate
Yaw Moment Interface
VSA Modulator
VSA Control Logic

Brake Pressure Control Image



VSA SYSTEM DESCRIPTION - COMPONENTS

The VSA system consists of the following primary components:

- VSA modulator-control unit
- Wheel speed sensors
- VSA OFF switch
- System indicator

For locations of each component on vehicle, refer to Component Location Index, and for functions of indicator, refer to How to Troubleshoot the VSA system.

VSA Modulator

The VSA modulator unit consists of the inlet solenoid valve, the outlet solenoid valve, the VSA NO (normally open) solenoid valve, the VSA NC (normally closed) solenoid valve, the reservoir, the pump, the pressure sensor, and the pump motor. The hydraulic control has four modes; pressure intensifying, pressure retaining, pressure reducing, and pressure intensifying mode.

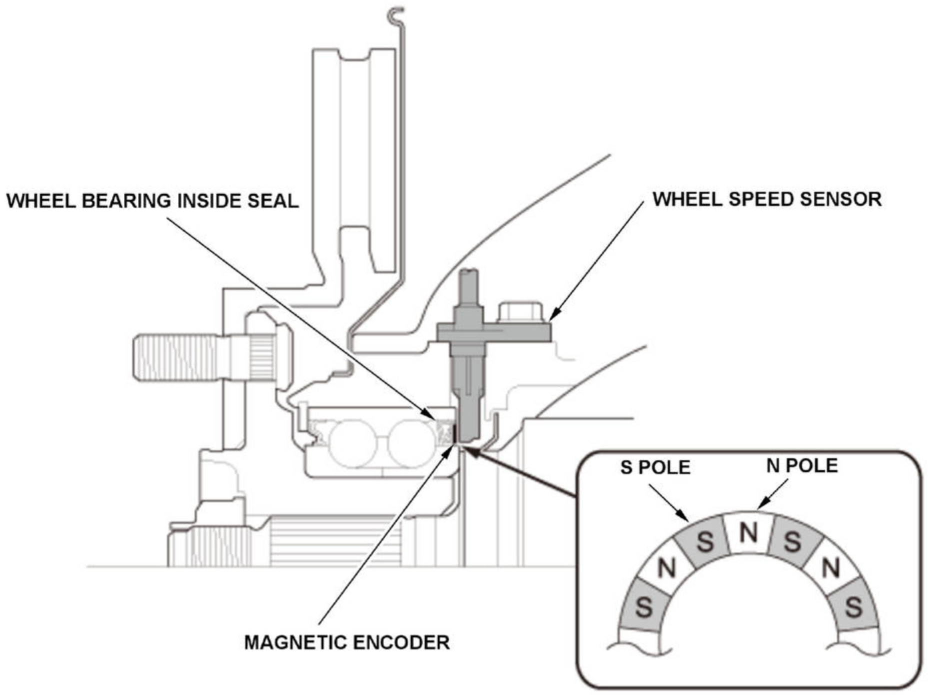
OUT: Outlet Solenoid Valve (Normally Closed)

Mode	VSA NO Solenoid Valve	VSA NC Solenoid Valve	Inlet Solenoid Valve	Outlet Solenoid Valve	Brake Fluid
Pressure intensifying mode	open	closed	open	closed	Master cylinder fluid is pumped out to the caliper.

Mode	VSA NO Solenoid Valve	VSA NC Solenoid Valve	Inlet Solenoid Valve	Outlet Solenoid Valve	Brake Fluid
Pressure retaining mode	open	closed	closed	closed	Caliper fluid is retained by the inlet and outlet solenoid valves.
Pressure reducing mode	open	closed	closed	open	Caliper fluid flows through the outlet solenoid valve to the reservoir.
Pressure intensifying mode (VSA)	closed (current control)	open	open	closed	• Master cylinder fluid is pumped out by the pump through the VSA NC solenoid valve to the caliper. • Caliper fluid pressure exceeds master cylinder pressure. • The VSA modulator unit controls amount of intensified fluid pressure to respond to each mode through current control of VSA NO solenoid valve.

Wheel Speed Sensor

The VSA system uses 4 wheel speed sensors to monitor individual wheel speed. The wheel speed sensor is a semiconductor, Hall effect sensor, and detects the magnetic field of a magnetic encoder installed on the inner sealing surface of each hub and wheel bearing assembly. The frequency of the sensor output signal is proportional to the speed of the wheel and this signal information is sent to the VSA control unit.

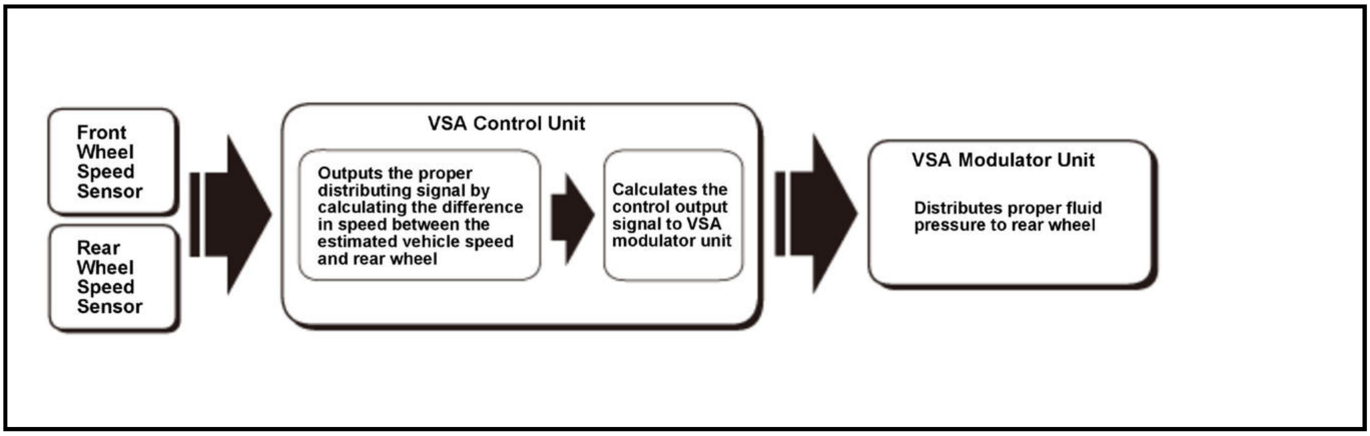


NOTE: This illustration is a typical sample of front side wheel speed sensor.

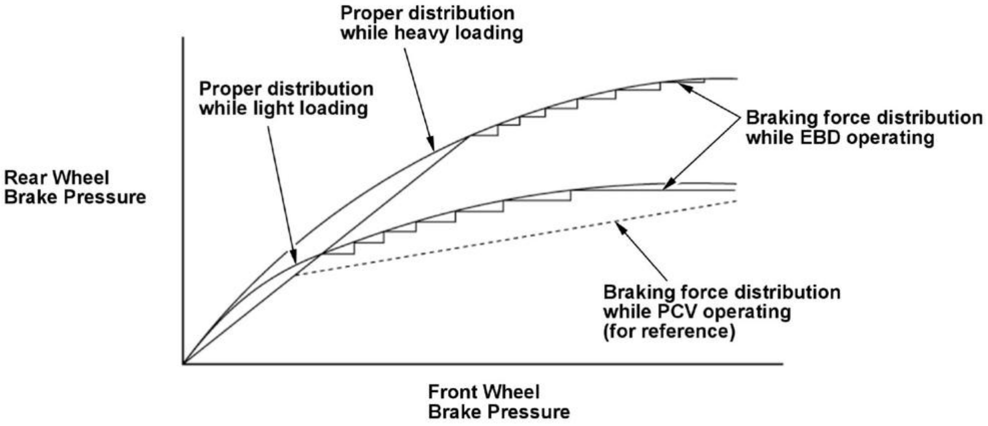
VSA SYSTEM DESCRIPTION - EBD CONTROL

Overview

The EBD system actively controls the distribution of the front and rear braking forces to correspond with changes in the load condition and displacement of the load due to deceleration.

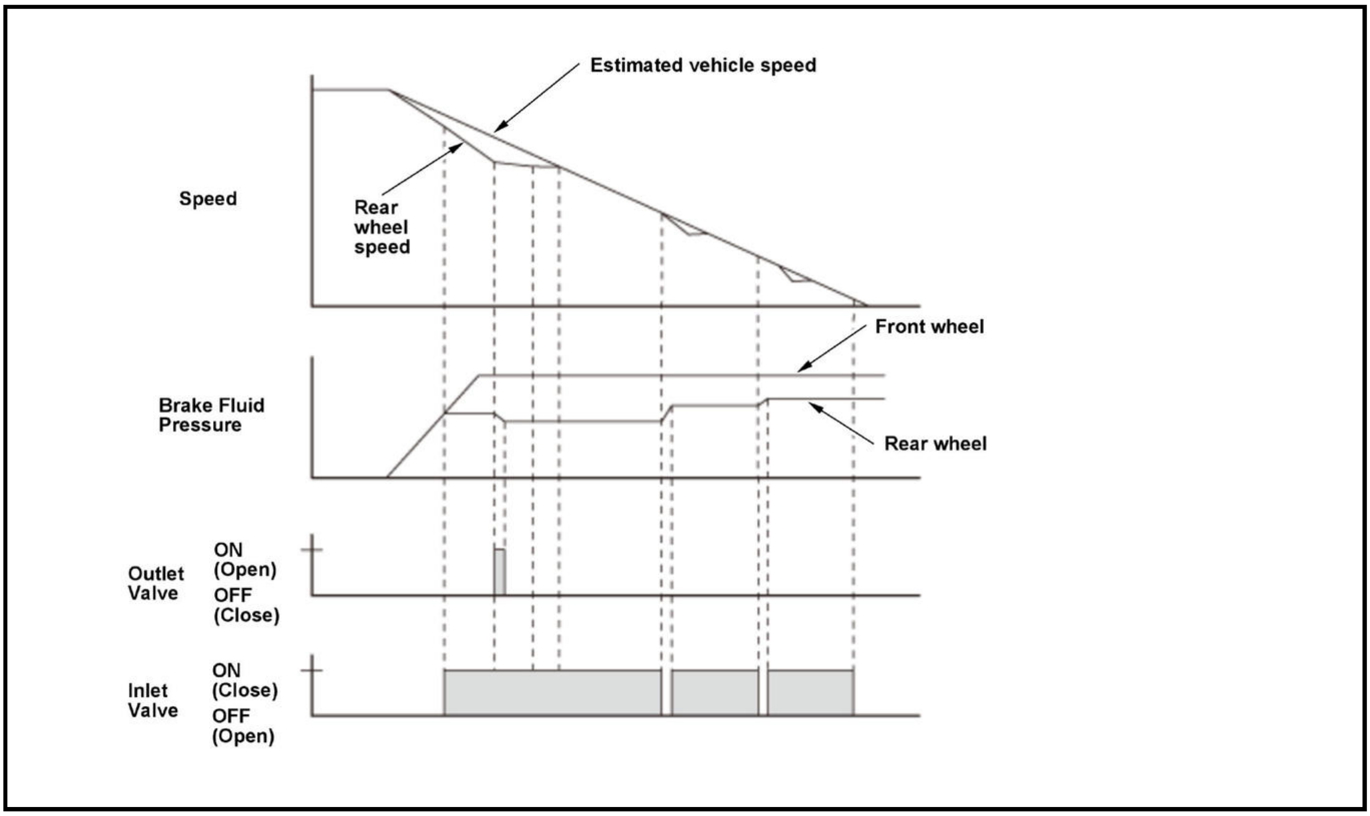


Front Wheel Speed Sensor
Rear Wheel Speed Sensor
VSA Control Unit
Outputs the proper distributing signal by calculating the difference in speed between the estimated vehicle speed and rear wheel
Calculates the control output signal to VSA modulator unit
VSA Modulator Unit
Distributes proper fluid pressure to rear wheel



Control

When rear wheel speed is less than the estimated vehicle speed, the VSA modulator-control unit closes the inlet valve to maintain brake fluid pressure. As wheel speed increases, the VSA modulator-control unit opens the inlet valve momentarily to increase the brake fluid pressure. When lower pressure is required, the modulator unit opens the outlet valve momentarily decreasing fluid pressure. The VSA modulator-control unit repeats this valve control operation to control the EBD function.



VSA SYSTEM DESCRIPTION - ENGINE DRAG TORQUE CONTROL

Overview

Downshifting on a slippery road may cause vehicle instability because the engine braking may lock up the wheels. When engine braking begins to cause the wheels to lock up, the engine drag torque control commands the PCM to increase the torque, helping to prevent tire slip.

Control

The VSA modulator-control unit calculates the vehicle speed and acceleration of each wheel from each wheel speed sensor signal and makes judgment on the slip condition of the wheel. The VSA modulator-control unit adjusts the engine torque based on the slip condition.

VSA SYSTEM DESCRIPTION - HYDRAULIC BOOST FAILURE COMPENSATION

Overview

If the electric servo brake system has malfunction, the operating force of brake pedal becomes larger than under a normal condition. In this case, the hydraulic boost failure compensation uses the pressurization control of the VSA system to reduce the operating force of brake pedal.

Control

The VSA modulator-control unit calculates control quantity from the signals of the brake pedal position switch, the wheel speed sensors, and the pressure sensor, then increases the caliper pressure by driving the pump motor and solenoid valves.

VSA System Receiving Signal

Transmitting Unit	Signal Name
Gauge control module	• VSA OFF switch signal • Brake fluid level switch signal

Transmitting Unit	Signal Name
PCM	• VSA control enable/disable signal • Accelerator pedal position signal • Drive torque signal • Power plant speed signal • Shift position signal • Brake pedal position switch signal • Service check signal • System failure information
EPS control unit	• Steering angle signal
SRS unit	• Yaw rate signal • Lateral acceleration signal • Longitudinal acceleration signal • System failure information
Electric servo brake control unit	• Hydraulic boost failure compensation control request signal • Driver's input brake pressure signal • Pressurization control activation signal • System failure information

VSA System Primary Transmitting Signal

Transmitting Unit	Signal Name
VSA modulator-control unit	• Drive torque control request signal • Shift control request signal • Wheel speed signal • Master cylinder pressure signal • Vehicle understeering state • Estimated longitudinal acceleration signal • Estimated L/R ' differential signal • Buzzer request signal • Indicator drive signal • System operating information • System failure information

VSA SYSTEM DESCRIPTION - TCS CONTROL

Overview

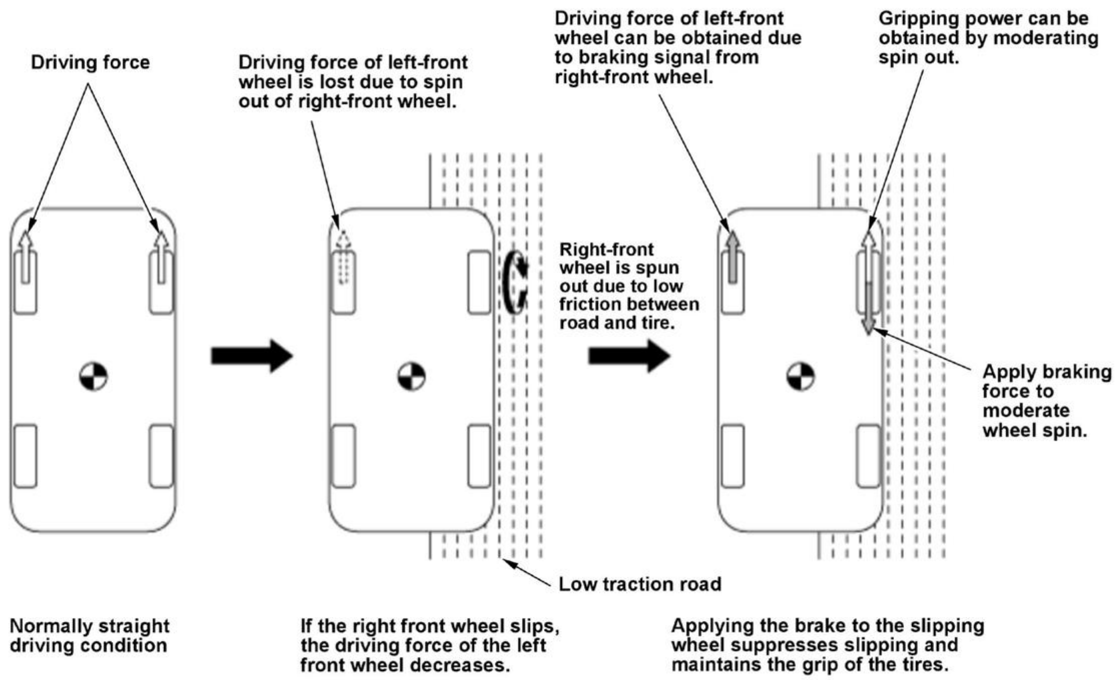
The TCS control makes a judgment on the speed and slip condition (spinning) of each wheel from each wheel speed sensor signal. If both driving wheels are spinning, the engine TCS control is performed. If one wheel alone is slipping, the brake TCS control is performed.

Engine TCS Control

If the VSA control unit detects a drive wheel slipping during starting, accelerating or cornering, a torque down signal is sent to the PCM. The torque of the driving wheel is reduced by the PCM to maintain tire grip on the road surface.

Brake TCS Control

During brake TCS control, the VSA control unit sends a signal to the modulator unit when wheel slipping is detected.



Driving force
Driving force of left-front wheel is lost due to spin out of right-front wheel.
Driving force of left-front wheel can be obtained due to braking signal from right-front wheel.
Gripping power can be obtained by moderating spin out.
Right-front wheel is spun out due to low friction between road and tire.
Apply braking force to moderate wheel spin.
Low traction road
Normally straight driving condition
If the right front wheel slips, the driving force of the left front wheel decreases.
Applying the brake to the slipping wheel suppresses slipping and maintains the grip of the tires.

This illustration is a typical sample of shows front-wheel drive model.

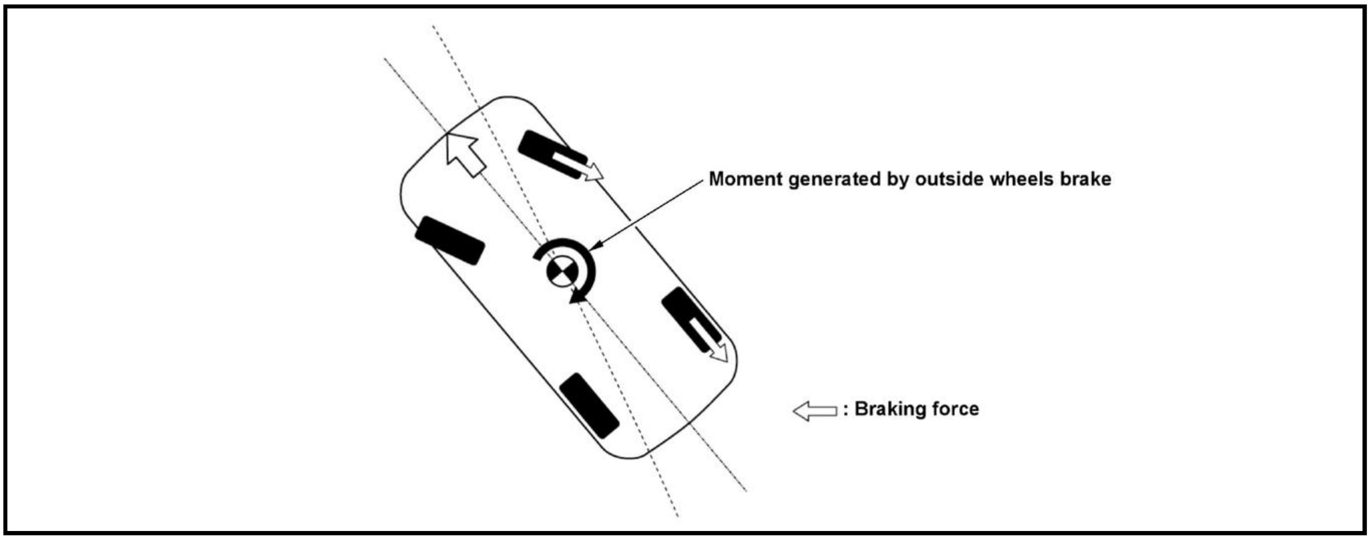
VSA SYSTEM DESCRIPTION - VSA CONTROL

Overview

The VSA modulator-control unit calculates the target yaw rate from the wheel speed signal, lateral acceleration signal and steering angle signal and compares the calculated target yaw rate against the actual yaw rate to make a judgment on the slip condition of the vehicle. The VSA modulator-control unit calculates the target fluid pressure based on this condition, determines one of three fluid pressure control modes (increase, decrease or hold), and adjusts the fluid pressure of the applicable wheel accordingly.

Oversteer Suppression Control

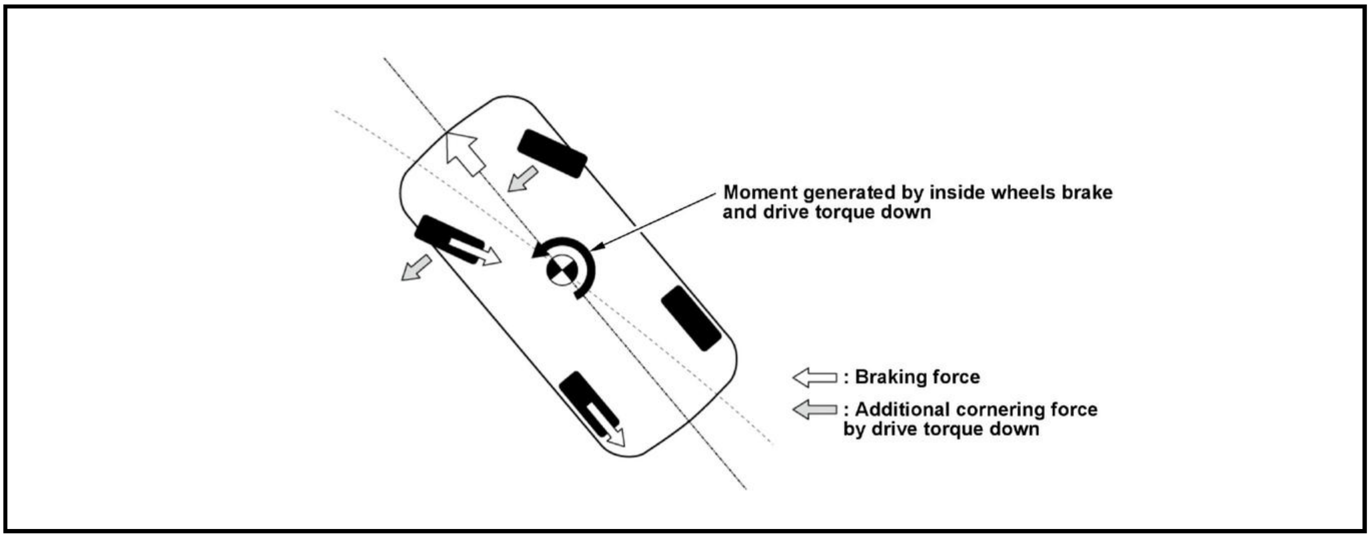
The oversteer suppression control outputs a brake pressure signal that is optimally distributed between the outside front and rear wheels through the VSA modulator-control unit when the vehicle goes into oversteer. This generates a moment that suppresses oversteer and stabilizes the vehicle.



Moment generated by outside wheels brake
⇦ : Braking force

Understeer Suppression Control

The understeer suppression control outputs a brake pressure signal that is optimally distributed between the inside front and rear wheels. This generates a moment that suppresses understeer through the VSA modulator-control unit when the vehicle goes into understeer. During acceleration, a drive torque down signal is also output to the PCM, which increases the cornering force of the driving wheels in order to maintain steerability and improve line traceability.



Moment generated by inside wheels brake and drive torque down
⇦ : Braking force
⇦ : Additional cornering force by drive torque down

VSA SYSTEM DESCRIPTION - VSA OFF MODE

Overview

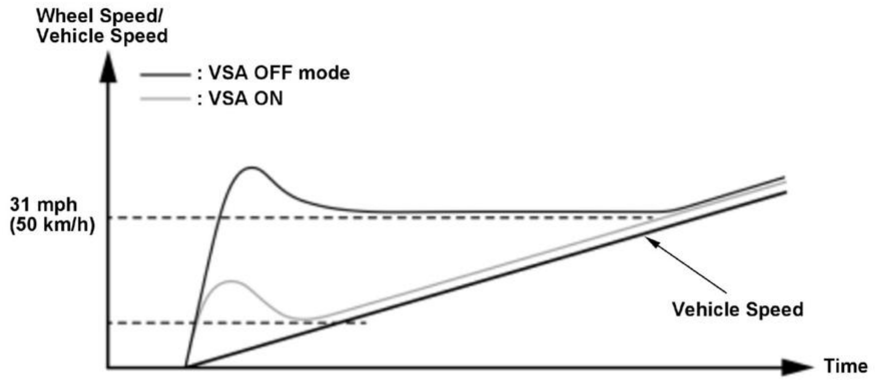
When the VSA OFF switch is pressed, the VSA OFF indicator will illuminate and the VSA will go into the OFF mode. In the VSA OFF mode, the TCS control is changed, but the other controls will not turn off.

TCS Control During VSA OFF mode

- If the TCS activates, the VSA indicator blinks while the VSA OFF indicator is still on.
- By terminating the TCS function at low speeds, the driver can gain traction on loose sand or deep snow.
- During a standing start from varying road surfaces under the left and right side of the vehicle, the TCS function helps gain traction.

- When the vehicle is on a lift while being serviced and its tires are not in contact with any surface, the wheel speed will not exceed 31 mph (50 km/h).
- The TCS function is fully disabled when the VSA maintenance mode is activated.

TCS Operation Image



VSA Maintenance Mode

Enter the VSA maintenance mode when the vehicle is on a lift or two-wheel dynamometer, where you need the wheel spin speed to exceed 31 mph (50 km/h). For information on how to enter and exit the VSA maintenance mode, refer to **"How to enter VSA maintenance mode"** in the Removal and Installation section of the shop service information.

GENERAL INFORMATION

HOW TO ENTER VSA SYSTEM MAINTENANCE MODE

Procedure

1. Maintenance Mode - Enter

NOTE:

- For information about entering condition of VSA Maintenance Mode, refer to **"VSA System Description - VSA OFF MODE"**.
- When the VSA Maintenance Mode is activated, the VSA and TCS functions are disabled.
- During the Maintenance Mode, the VSA OFF indicator flashes and the VSA indicator is on. When the vehicle is turned to the OFF (LOCK) mode or the VSA OFF switch is pressed again, the Maintenance Mode is cancelled and both indicators go off.
- If you do not properly follow the steps to enter the VSA maintenance mode, or you do not complete the procedure within 30 seconds, turn the vehicle to the OFF (LOCK) mode, wait for 10 seconds, and try again.
- To terminate the maintenance mode, do the either one of the following procedures:
-
    - -

      Turn the vehicle to the OFF (LOCK) mode.
    - -

      Press VSA OFF switch for 0.5 sec. (make sure VSA indicator and VSA OFF indicator go off).

- When the VSA detects a malfunction, the Maintenance Mode is cancelled.

1. Turn the vehicle to the ON mode and do the following procedure within 30 seconds.

2. Release the parking brake and hold down the brake pedal.

3. While holding down the brake pedal, press and hold the VSA OFF switch. When the VSA OFF indicator turns on, press and hold the VSA OFF switch again until the VSA OFF indicator goes off.

4. Release the brake pedal and apply the parking brake.

5. While the brake pedal is released, press and hold the VSA OFF switch. When the VSA OFF indicator turns on, press and hold the VSA OFF switch again until the VSA OFF indicator goes off.

6. Hold down the brake pedal while apply the parking brake.

7. Press and hold the VSA OFF switch while both brakes are applied. When the VSA OFF indicator turns on, press and hold the VSA OFF switch again until the VSA OFF indicator flashes and the VSA indicator turns on.

SYMPTOM TROUBLESHOOTING INDEX

VSA SYSTEM SYMPTOM TROUBLESHOOTING INDEX

When the vehicle has one of these symptoms, check for VSA diagnostic trouble codes (DTCs) with the HDS. If there are no DTCs, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure	Also check for
HDS does not communicate with the VSA modulator-control unit or the vehicle	**Go to the DTC troubleshooting index** .	Power and ground at the VSA modulator-control unit.
ABS indicator, brake system indicator (red), VSA indicator, or VSA OFF indicator does not come on at start-up (bulb check)	**Do the gauge control module self-diagnostic function** .	B
VSA OFF indicator does not go off	• **Do the VSA sensor neutral position memorization**. • **Do the gauge control module self-diagnostic function** . • **Replace the VSA modulator-control unit** .	B
ABS indicator, brake system indicator (red), VSA indicator, and brake system indicator (amber) do not go off	**NOTE:** If any of the CAN communication failure DTC is indicated in other system, troubleshoot the DTC first. • Check for open wire or short wire in the F-CAN circuit; • • - Between the gauge control module and the CAN gateway (F-CAN D_H, F-CAN D_L).	Refer to the followings about the indicator operating condition; • **How to Troubleshoot the VSA System** Refer to the followings about the circuit troubleshooting;

Symptom	Diagnostic procedure	Also check for
	- - Between the VSA modulator-control unit and the CAN gateway (F-CAN B_H, F-CAN B_L, F-CAN C_H, F-CAN C_L). - Check the VSA modulator-control unit power circuit. - - - +B_ABS/VSA_FSR, IG1_VSA/ABS - Check the VSA modulator-control unit ground circuit (GND). - **Do the gauge control module self-diagnostic function** .	- **Gauge control module connector for inputs and outputs** - **VSA modulator-control unit connector for inputs and outputs** - **VSA system circuit diagram** - **Fuse to components index** - **Ground to components index**
VSA cannot be turned OFF	- **Symptom troubleshooting**. - **Replace the VSA modulator-control unit** .	B

REWRITE

VSA MODULATOR-CONTROL UNIT UPDATE

Procedure

NOTE:

- To ensure the latest program is installed, do a VSA modulator-control unit update whenever the VSA modulator-control unit is replaced.
- High temperature in the engine compartment might cause the VSA modulator-control unit to become too hot to run the update. If the engine has been running before this procedure, open the hood and cool the engine compartment.

1. VSA Modulator-Control Unit - Update
2. **VSA Sensor Neutral Position - Memorize**
3. **TPMS - Calibrate**

SYMPTOM TROUBLESHOOTING

VSA SYSTEM SYMPTOM TROUBLESHOOTING - VSA CANNOT BE TURNED OFF

1. VSA OFF switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the VSA OFF switch .

Is the VSA OFF switch OK?

YES

Go to step 2.

NO

Replace the VSA OFF switch .

2. Determine possible failure area (VSA_OFF_SW line, GND line)

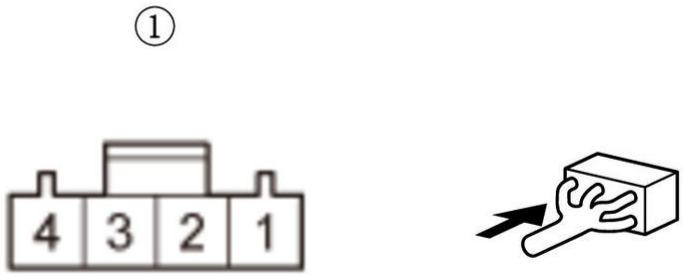
-1. Disconnect the following connector.

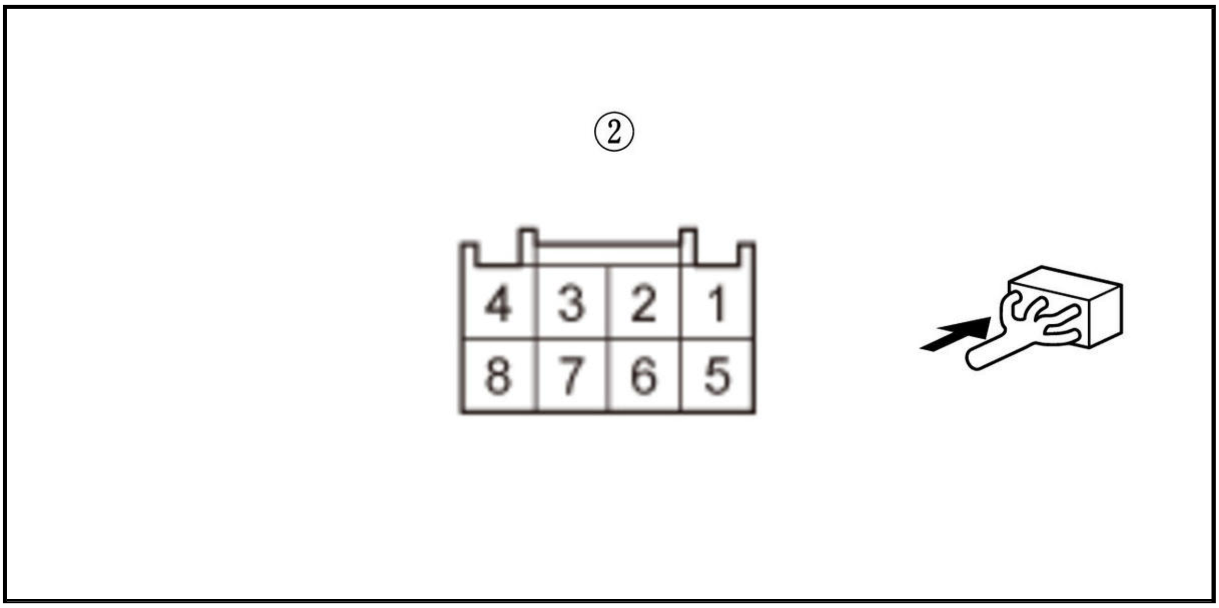
VSA OFF/lid switch 4P connector
VSA OFF/parking and back-up sensor switch 8P connector
VSA OFF/driver's power tailgate switch 12P connector

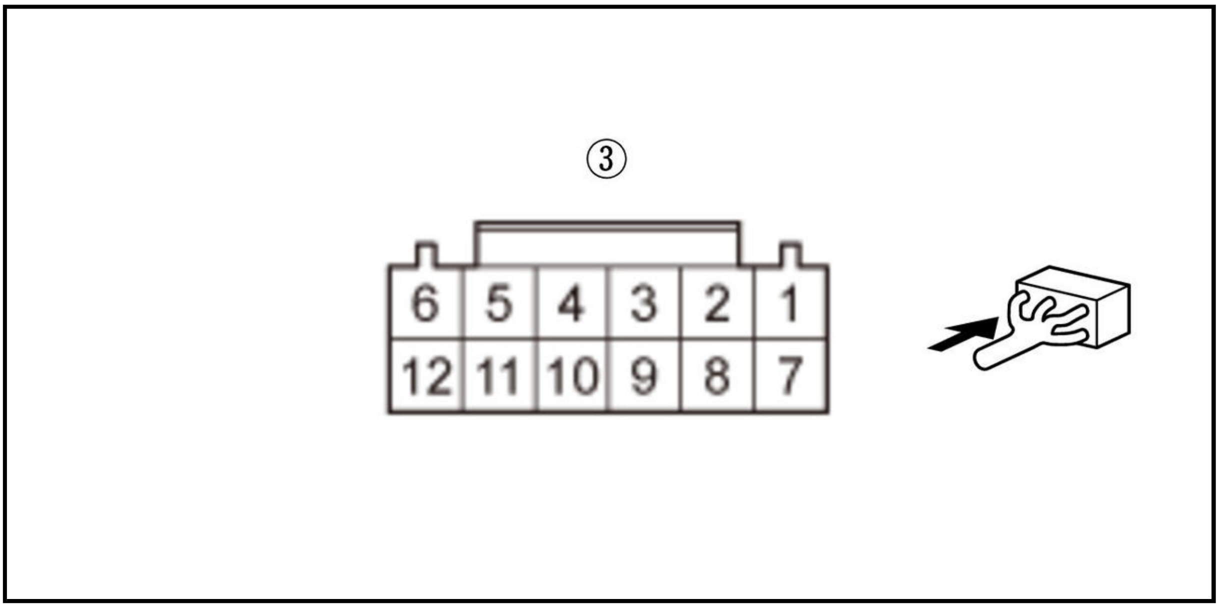
-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	VSA OFF/lid switch 4P connector: disconnected
B	VSA OFF/parking and back-up sensor switch 8P connector: disconnected
B	VSA OFF/driver's power tailgate switch 12P connector: disconnected
Test point 1	VSA OFF/lid switch 4P connector (female terminals) No. 4: ①
B	VSA OFF/parking and back-up sensor switch 8P connector (female terminals) No. 8: ②
B	VSA OFF/driver's power tailgate switch 12P connector (female terminals) No. 11: ③
Test point 2	Body ground







Is there battery voltage?

YES

Repair an open in the wire between the VSA OFF switch and body ground (G401).

NO

Go to step 3.

3. Shorted wire check (VSA_OFF_SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

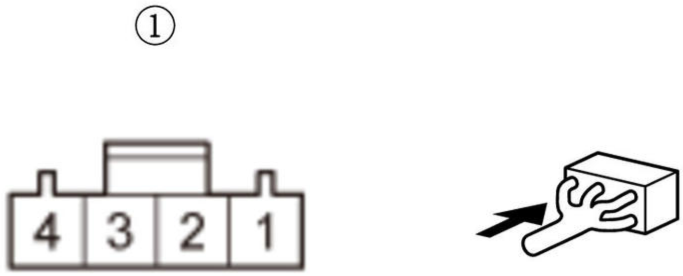
Gauge control module connector A (32P)

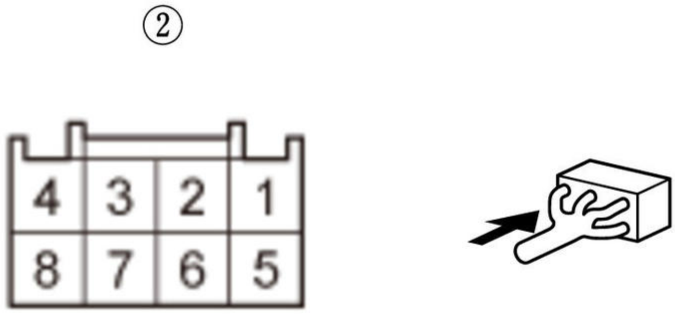
-3. Measure the resistance between test points 1 and 2.

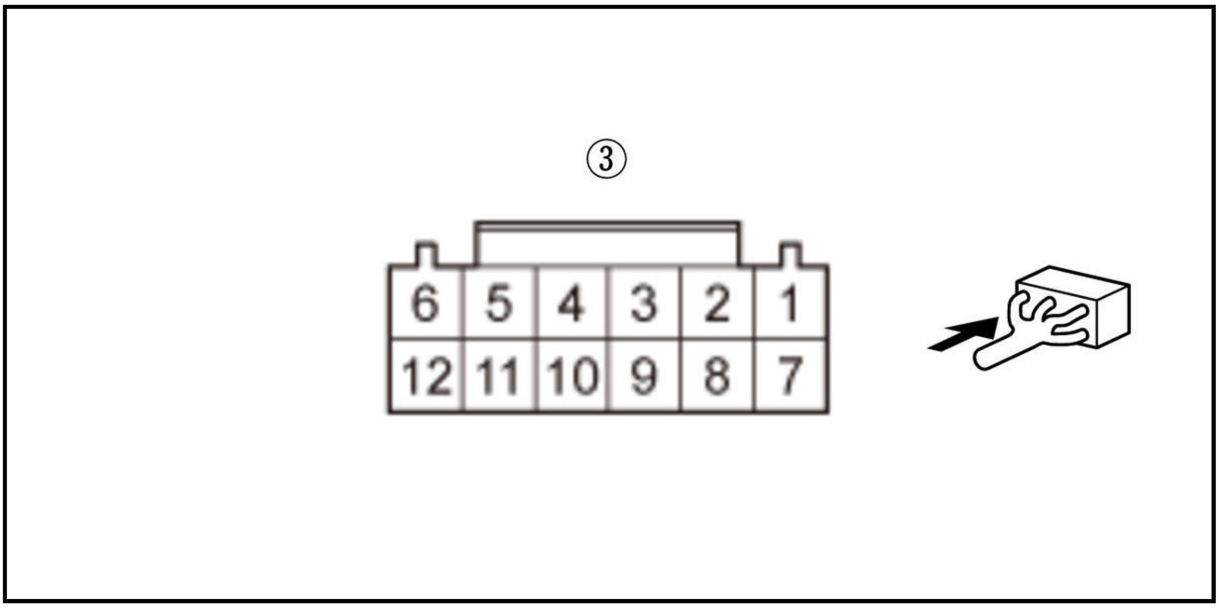
Test condition	Vehicle OFF (LOCK) mode
B	VSA OFF/lid switch 4P connector: disconnected
B	VSA OFF/parking and back-up sensor switch 8P connector: disconnected

B	VSA OFF/driver's power tailgate switch 12P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	VSA OFF/lid switch 4P connector (female terminals) No. 4: ①
B	VSA OFF/parking and back-up sensor switch 8P connector (female terminals) No. 8: ②

B	VSA OFF/driver's power tailgate switch 12P connector (female terminals) No. 11: ③
Test point 2	Body ground







Is there 1 MΩ or more?

YES

Go to step 4.

NO

Repair a short to body ground in the wire between the gauge control module and the VSA OFF switch.

4. Open wire check (VSA_OFF_SW line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	VSA OFF/lid switch 4P connector: disconnected
B	VSA OFF/parking and back-up sensor switch 8P connector: disconnected
B	VSA OFF/driver's power tailgate switch 12P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	VSA OFF/lid switch 4P connector (female terminals) No. 4: ①
B	VSA OFF/parking and back-up sensor switch 8P connector (female terminals) No. 8: ②
B	VSA OFF/driver's power tailgate switch 12P connector (female terminals) No. 11: ③

3
2
1
12
11
10
9
8
7

Is there 1.0 Ω or less?

YES

The VSA_OFF_SW wire is OK. **Replace the gauge control module** .

NO

Repair an open in the wire between the gauge control module and the VSA OFF switch.

SERVICE PROCEDURE

VSA SENSOR NEUTRAL POSITION MEMORIZATION

Procedure

NOTE:

- The VSA sensor neutral position must be learned whenever you do any of these actions:
-
    - -

      Updating or replacing the VSA modulator-control unit.
-
    - -

      Updating or replacing the SRS unit.
-
    - -

      Removing and installing the steering wheel.
-
    - -

      Disconnecting and reconnecting the steering joint.
-
    - -

      Wheel alignment adjustment.
- Before doing the memorization procedure, park the vehicle on a flat and level surface.

1. HDS - Connect
2. VSA Sensor Neutral Position - Memorize

NOTE: Do not press the brake pedal during this procedure.

1. Set the steering wheel in the straight ahead position.

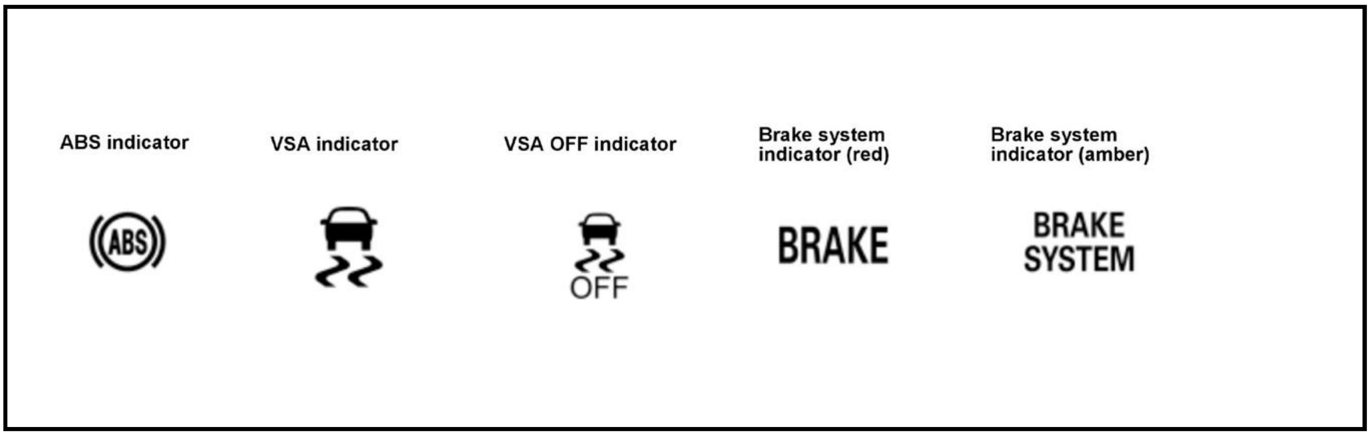
2. Select ADJUSTMENT from ABS/VSA menu with the HDS, then select ALL SENSOR, and follow the screen prompts.

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE VSA SYSTEM

System Indicator

This system has five indicators on the gauge control module.



NOTE: For locations of each indicator, refer to gauge control module component location index .

When the system is OK, each indicator comes on for about 2 seconds after turning the vehicle to the ON mode, then it goes off.

When the system detects a problem, a DTC will set and depending upon the failure, the VSA modulator-control unit determines which indicator(s) will turn on. If the problem goes away (system returns to normal), the indicator(s) will be controlled in the following way depending upon the DTC that was set:

- The indicator(s) will come on and stay on when turning the vehicle to the ON mode.
- The indicator(s) will automatically go off.
- The indicator(s) will go off after the vehicle is driven.

ABS Indicator

The ABS indicator comes on when the ABS function is lost. The brakes will still work like a conventional system.

Brake System Indicator (Red)

The brake system indicator (red) will come on when:

- The EBD function is lost.
- The parking brake is applied.
- The brake fluid is low.
- Two or more wheel speed sensors fail.

Brake System Indicator (Amber)

The brake system indicator (amber) comes on, when the brake control system is lost.

VSA Indicator

- The VSA indicator comes on when the VSA function is lost.
- The VSA indicator blinks when the VSA function is activating.

VSA OFF Indicator

The VSA OFF indicator comes on when the VSA is turned OFF by using the VSA OFF switch.

Diagnostic Trouble Code (DTC)

- The memory can hold 10 DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.

- The DTCs are memorized in an EEPROM in the VSA modulator-control unit. Therefore, the memorized DTCs cannot be erased by disconnecting the 12 volt battery. Do the specified procedures to clear the DTCs.

Self-Diagnosis

- Self-diagnosis can be classified into two categories:
-
    - -

      Initial diagnosis: Done right after turning the vehicle to the ON mode and until the ABS, VSA, brake system indicator (red), and brake system indicator (amber) go off.
-
    - -

      Regular diagnosis: Done right after the initial diagnosis until turning the vehicle to the OFF (LOCK) mode.
- When the system detects a problem, the VSA modulator-control unit shifts to fail-safe mode.

Kickback

The pump motor operates when the VSA modulator-control unit is functioning. When the vehicle is equipped with the electric servo brake, the tandem motor cylinder uses the brake fluid internally, and that will not cause kickback at the brake pedal.

Pump Motor

- The pump motor operates when the VSA modulator-control unit is functioning.
- The VSA modulator-control unit checks the pump motor operation when the vehicle is started and does its first initial acceleration.

Hydraulic Boost Failure Compensation

This vehicle is equipped with an electric servo brake. If the electric servo brake system has malfunctions, the operating force of the brake pedal becomes larger than under normal conditions. In this case, the hydraulic boost failure compensation uses the pressurization control of the VSA system to reduce the operating force of the brake pedal.

Brake Fluid Replacement

Brake fluid replacement procedures are identical to the procedures of electric servo brake .

Brake Fluid Air Bleeding

Brake fluid air bleeding procedures are identical to the procedures of electric servo brake .

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the ABS, VSA, brake system indicator (red), and/or brake system indicator (amber) are still on. Following a troubleshooting procedure for a DTC that has been cleared but does not reset can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the ABS, VSA, brake system indicator (red), and/or brake system indicator (amber) came on, such as during activation, after activation, when the vehicle was traveling at a certain speed, etc. If necessary, have the customer demonstrate the concern.

2. When the ABS, VSA, brake system indicator (red), and/or brake system indicator (amber) does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. in the circuit indicated by the DTC.

3. After troubleshooting, or the repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions that originally set the DTCs. Make sure the ABS, VSA, brake system indicator (red), and brake system indicator (amber) do not come on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)

NOTE: Make sure the 12 volt battery is in good condition and fully charged.

1. If the system indicators stay on, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it does not, **go to the DTC troubleshooting index**

4. Check the diagnostic trouble code (DTC) and the freeze data (except ABS/VSA system), for all systems, troubleshoot the powertrain DTCs first. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.

NOTE:

- The HDS can read the DTC, the freeze data (except ABS/VSA system), the current data, and other system data.
- For specific operations, refer to the HDS Help menu.

How to Retrieve DTCs

1. With the vehicle in OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it does not, **go to the DTC troubleshooting index**

4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC troubleshooting. Do the all systems DTC check, and troubleshoot any powertrain DTCs first.

5. Turn the vehicle to the OFF (LOCK) mode.

How to Clear DTCs

1. With the vehicle in OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it does not, **go to the DTC troubleshooting index**

4. Clear the DTC(s) by following the screen prompts on the HDS.

5. Turn the vehicle to the OFF (LOCK) mode.

to determine which repair information applies to vehicles built for the Canadian market.

Information for other vehicles is not available or known.

BODY CONSTRUCTION

EXTERIOR PARTS CONSTRUCTION

NOTE:

- To confirm which parts are sold as replacement parts, refer to the appropriate Parts Catalog.
- The parts marked with numbers are sold as replacement parts.
- The parts marked with letters are not sold separately and are shown only for reference.
- The numbers in brackets after the part names show thickness; unit: mm (in), and the next numbers of thickness show tensile strength; unit: MPa.
- Zn: Zinc-plating
- MPa is steel tensile strength (grade) in megapascals. Honda defines 340-780 MPa tensile as high-strength steel (HSS). 980 MPa and higher tensile is ultra high-strength steel (UHSS).

DOOR AND BUMPER REINFORCEMENT BEAMS, AND ULTRA HIGH-STRENGTH STEEL PARTS (UHSS) (1500 MPA)

The door reinforcement beams are made from ultra high-strength steel (UHSS).

The front bumper reinforcement beam and the rear bumper reinforcement beam are made from aluminum alloy.

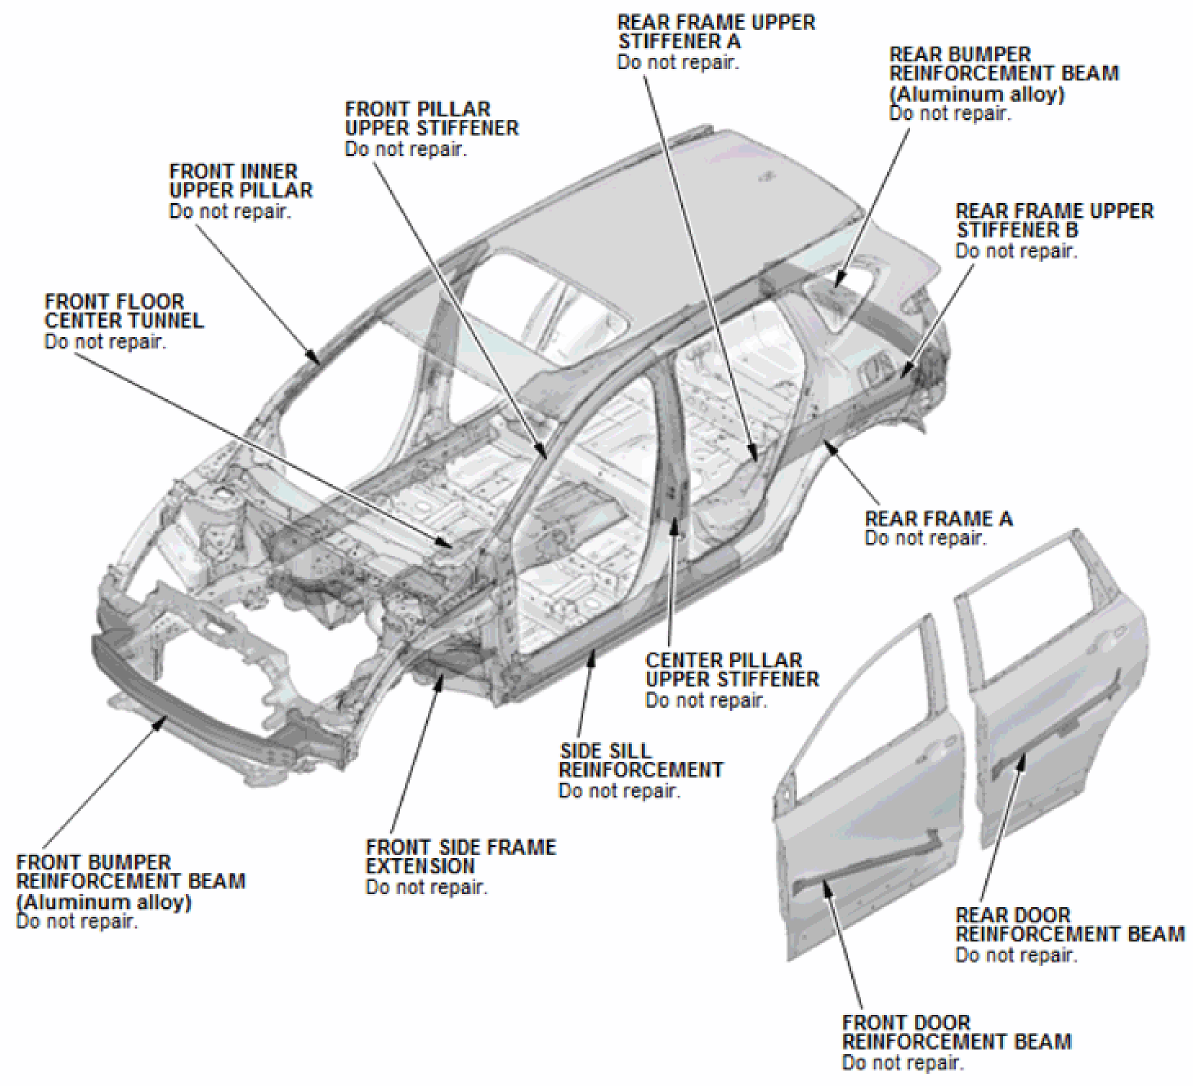
The front pillar upper stiffener, the front inner upper pillar, the center pillar upper stiffener, the front side frame extension, the side sill reinforcement, the front floor center tunnel, rear frame upper stiffener A, rear frame upper stiffener B, and rear frame A are made from ultra high-strength steel (UHSS) (1500 MPa).

Ultra high-strength steel (UHSS) (1500 MPa) sheet: This is an ultra high-strength material manufacturing procedure. A heated steel sheet is press-formed in the metal mold and then quenched to create ultra high-strength steel.

If the ultra high-strength steel is heated, the strength of the steel is reduced. If the ultra high-strength steel is damaged, for example, in a collision, and the reinforcement beams or the ultra high-strength steel (UHSS) (1500 MPa) sheet are bent, the beams of the ultra high-strength steel (UHSS) (1500 MPa) sheet may crack when attempting to straighten them. If a door beam is damaged, the whole door assembly must be replaced.

For this reason, the door, bumper reinforcement beams, and the ultra high-strength steel (UHSS) (1500 MPa) sheet should NEVER be repaired if they are damaged; they must be replaced if they are damaged.

NOTE: **At the range indicated to "Rear Floor/Rear Frame Replacement", the sectioning is possible for rear frame A and rear frame upper stiffener B ; refer to Rear Floor/Rear Frame Replacement .**



REAR FRAME UPPER STIFFENER A

Installation

NOTE:

- **Position the replacement parts.**

  Before doing the main welding, check the body dimensions:

  - **Front Bulkhead Position See FRONT BULKHEAD POSITION DIMENSION .**
  - **Engine Compartment See ENGINE COMPARTMENT DIMENSION .**
  - **Front Wheelhouse Upper Member Position See FRONT WHEELHOUSE UPPER MEMBER POSITION DIMENSION .**
  - **Engine Compartment And Front Floor, Under View See ENGINE COMPARTMENT AND FRONT FLOOR, UNDER VIEW DIMENSION .**
  - **Frame Repair Chart See FRAME REPAIR CHART .**
- **Temporarily install the related parts, then check for differences in level and clearance. Check the external parts fitting positions. Make sure the body lines flow smoothly. See EXTERNAL PARTS FITTING POSITIONS .**
- **Confirm the sheet thickness, tensile strength, and existence of the zinc treatment on both sides, and set the welder to conform to the welding conditions by according to the Front Body Construction (See FRONT BODY CONSTRUCTION).**
- **Welding symbols (The welding symbols with dashed lines have a meaning of the spot welding of the part which is not visible). (See SYMBOLS DEFINITION).**
- **() and ()*: Any numerical value in between these parentheses indicate the number of welds required.**

Front Side Frame, Front-End Parts - Weld

1. Weld the side frame support (A), the side frame extension front (C), the subframe front plate (D), and the subframe front bracket (E) to the front side frame (F), the backplate extension (G), and front damper extension B.

()*: Welding positions with high-strength steel parts. **Confirm the plug welding conditions.** (See MAG WELDING CONDITIONS FOR HIGH-STRENGTH STEEL PARTS (EXCEPT 1500 MPA) .)

- **Temporarily install the related parts, then check for differences in level and clearance. Check the external parts fitting positions. Make sure the body lines flow smoothly. See EXTERNAL PARTS FITTING POSITIONS .**
- **Confirm the sheet thickness, tensile strength, and existence of the zinc treatment on both sides, and set the welder to conform to the welding conditions by according to the Front Body Construction (See FRONT BODY CONSTRUCTION).**
- **Welding symbols (The welding symbols with dashed lines have a meaning of the spot welding of the part which is not visible). (See SYMBOLS DEFINITION .**
- **() and ()*: Any numerical value in between these parentheses indicate the number of welds required.**

1. **Front Side Frame - Weld**
   1. Weld the front side frame (A) to the side frame extension (B) and the side frame bulkhead (C).

(■)*: Welding positions with the side frame extension, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 13 and 15 in the table shown below.** (See SPOT WELDING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

SPOT WELDING CONDITION DESCRIPTION

No. 13	8000 A	600 ms	3432 N (350 kgf)
No. 15	9000 A	800 ms	3432 N (350 kgf)

Welding positions (D): Must be welded according to the following conditions.

Plug hole diameter: φ 10 mm (0.39 in) Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

()*: Welding positions with high-strength steel parts. **Confirm the plug welding conditions.** (See MAG WELDING CONDITIONS FOR HIGH-STRENGTH STEEL PARTS (EXCEPT 1500 MPA) .)

2. **Front Side Frame, Front-End Parts - Weld**
   - Weld the side frame extension front (A), the subframe front plate (C), and the subframe front bracket (D) to the front side frame (E) and front damper extension B
3. **Front Side Frame and Front Side Backplate - Weld**
   a. Clamp the front side backplate (A) to the front side frame (B).
   b. Weld the front side backplate (A) to the front side frame (B), the damper housing set (C), and the side frame extension front (D), the subframe front plate (E), the subframe front bracket (F), and the side frame extension (G).

(■)*: Welding positions with the side frame extension, include ultra high-strength steel (1500 MPa) parts.

Welding positions (H): Must be welded according to the following conditions.

Plug hole diameter: φ 10 mm (0.39 in)

Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

Installation

NOTE:

- **Position the replacement parts.**

  Before doing the main welding, check the body dimensions:

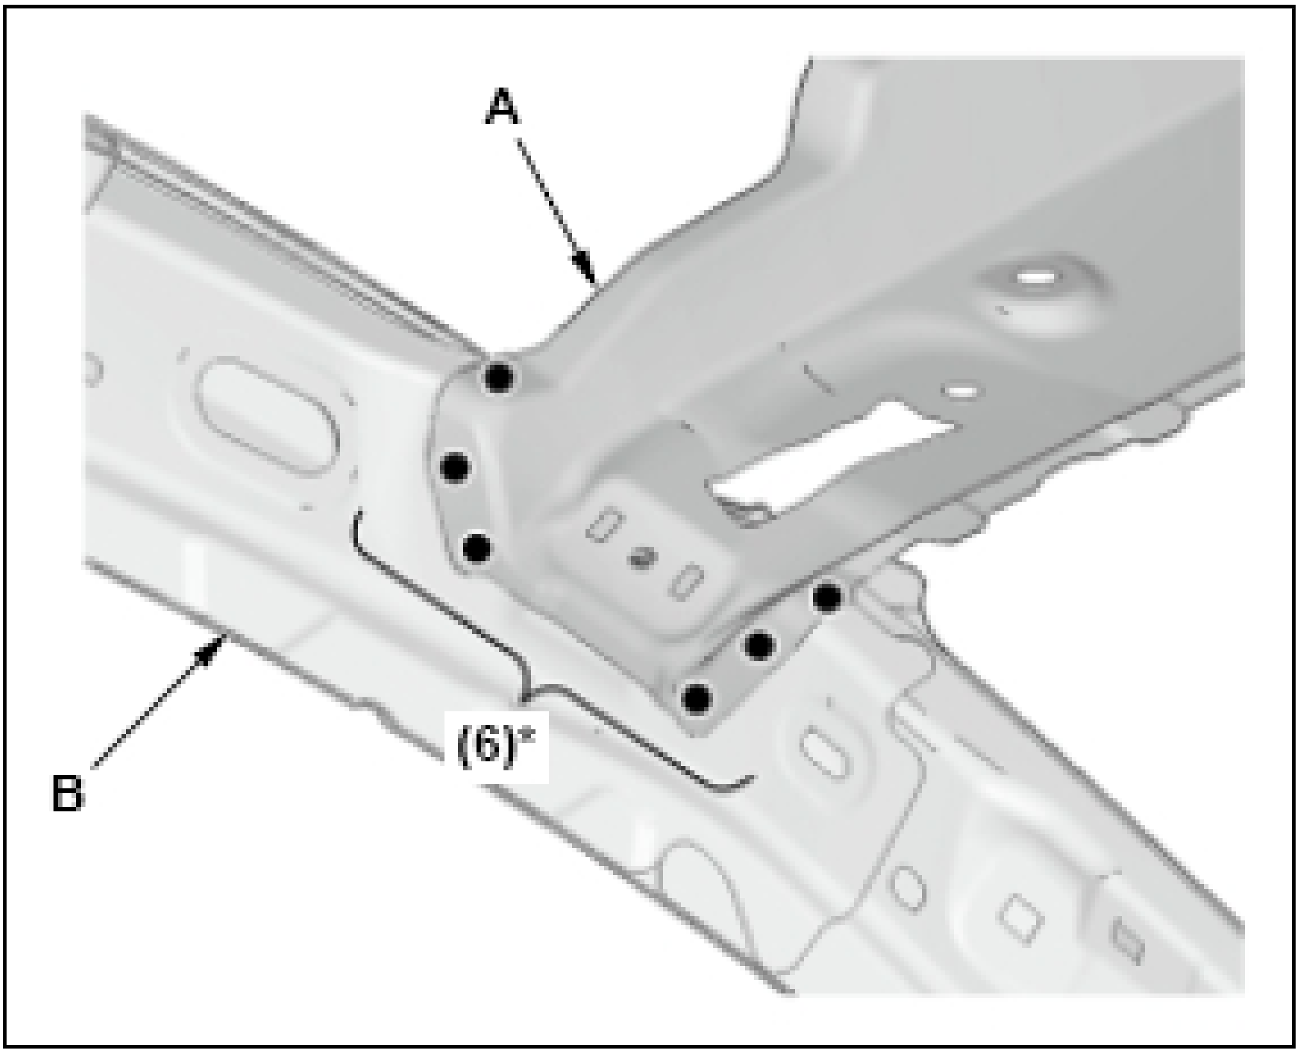
  - **Inner panel positions INNER PANEL POSITIONS DIMENSION .**
  - **Rear pillar gutter and rear panel positions See REAR PILLAR GUTTER AND REAR PANEL POSITIONS DIMENSION .**
  - **Windshield and door openings See WINDSHIELD AND DOOR OPENINGS .**
  - **Tailgate opening See TAILGATE OPENING DIMENSION .**
- **Temporarily install the related parts, then check for differences in level and clearance. Check the external parts fitting positions. Make sure the body lines flow smoothly. See EXTERNAL PARTS FITTING POSITIONS .**
- **Confirm the sheet thickness, tensile strength, and existence of the zinc treatment on both sides, and set the welder to conform to the welding conditions by according to the Roof and Side Panel Construction (See ROOF AND SIDE PANEL CONSTRUCTION).**
- **Welding symbols (The welding symbols with dashed lines have a meaning of the spot welding of the part which is not visible). See SYMBOLS DEFINITION .**
- **() and ()*: Any numerical value in between these parentheses indicate the number of welds required.**
- ▭ **Torque: N.m (lbf.ft)**

Roof Rails and Roof Arch A - Weld

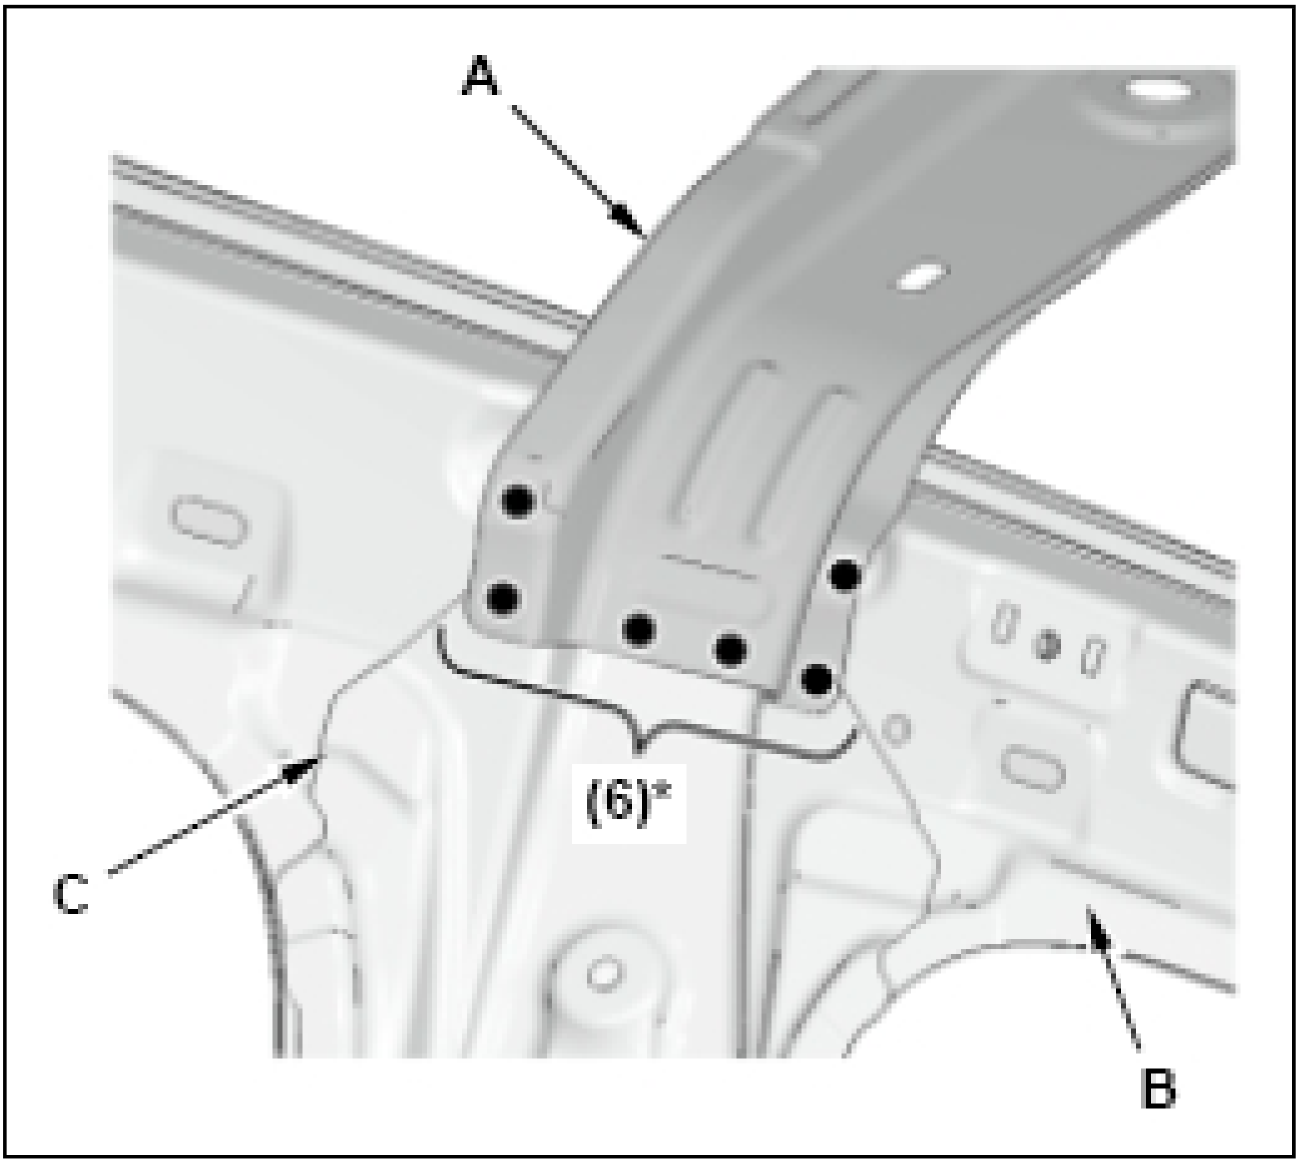
1. Weld the front roof rail (A) to the roof side rail (B).

   ()*: Welding positions with high-strength steel parts. **Confirm the plug welding conditions.** (See **MAG WELDING CONDITIONS FOR HIGH-STRENGTH STEEL PARTS (EXCEPT 1500 MPA)** .)

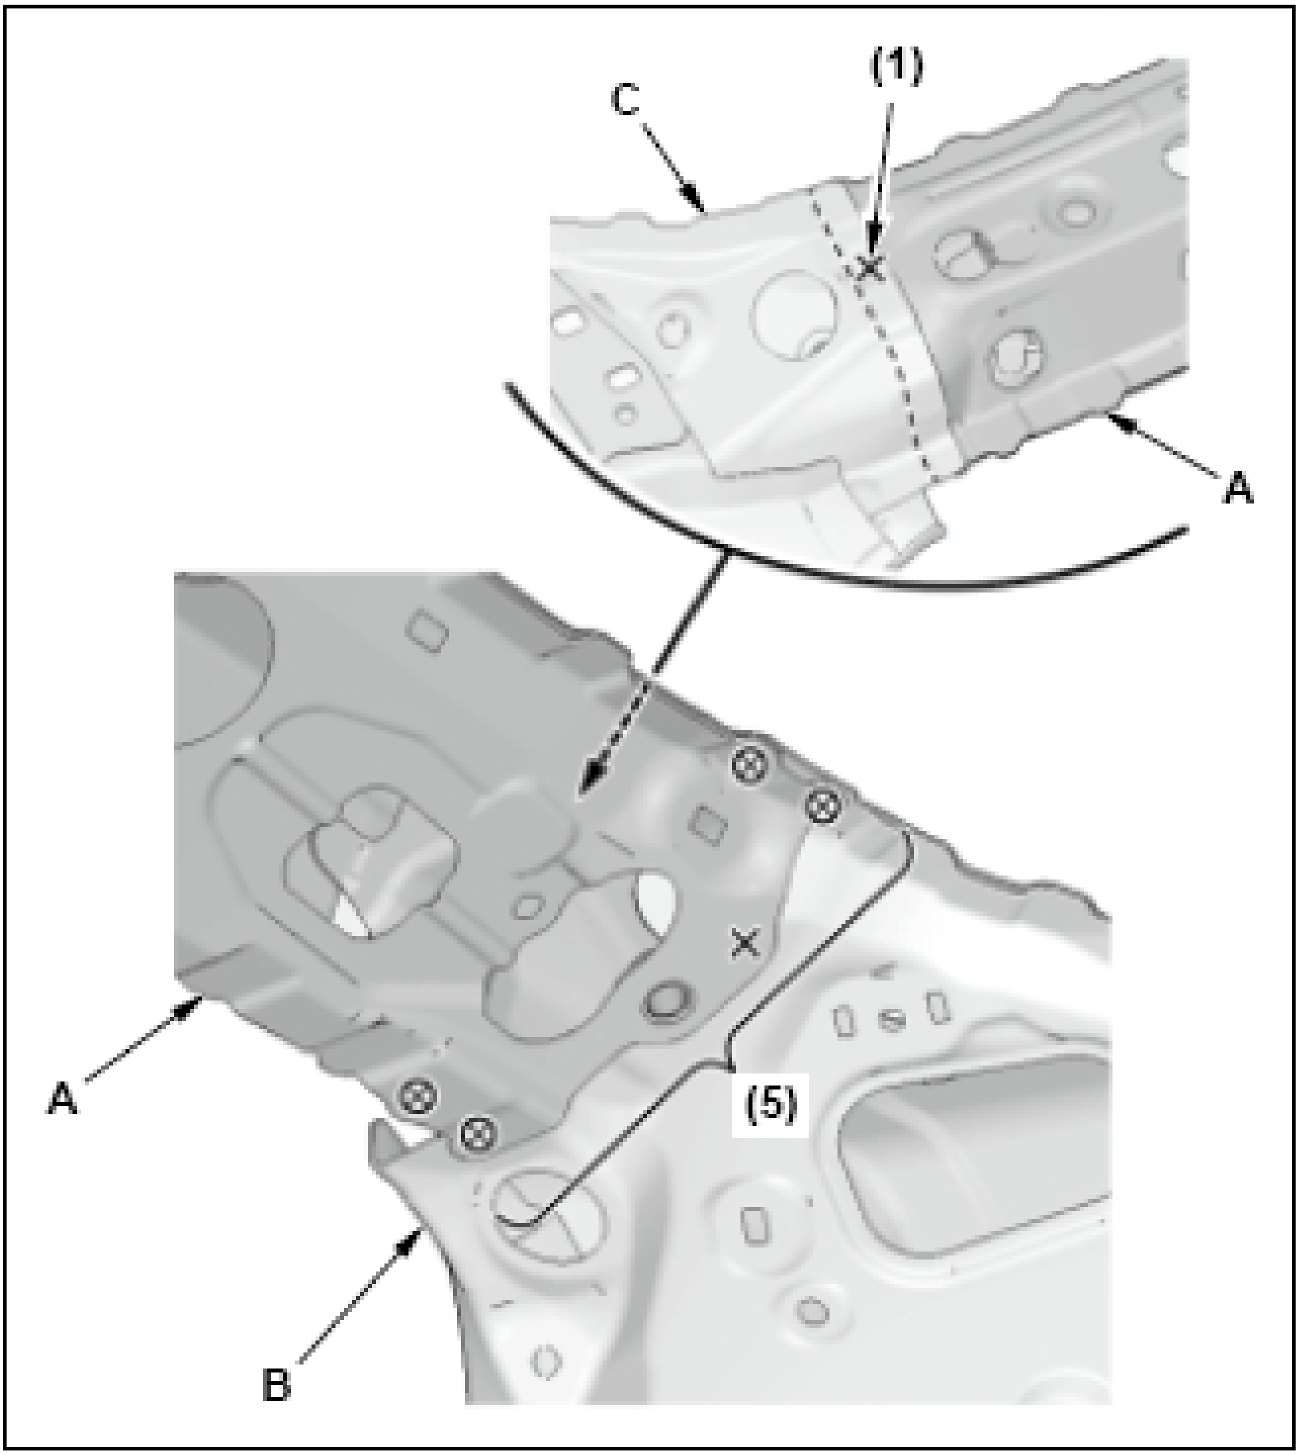


2. Without moonroof: Weld roof arch A to the roof side rail (B) and the center inner pillar (C).

   ()*: Welding positions with high-strength steel parts. **Confirm the plug welding conditions.** (See MAG WELDING CONDITIONS FOR HIGH-STRENGTH STEEL PARTS (EXCEPT 1500 MPA) .)



3. Weld the rear roof rail (A) to the rear inner upper pillar (B) and the rear pillar upper stiffener (C).



Roof Panel - Weld

1. Apply adhesive (A) on the flanges of the roof panel (B) and the roof gutter areas (C) of the body as shown.

   Adhesive: 3M 07333 or a commercially available equivalent

   NOTE: **Refer to the manufacturers instructions for details.**

Installation

NOTE:

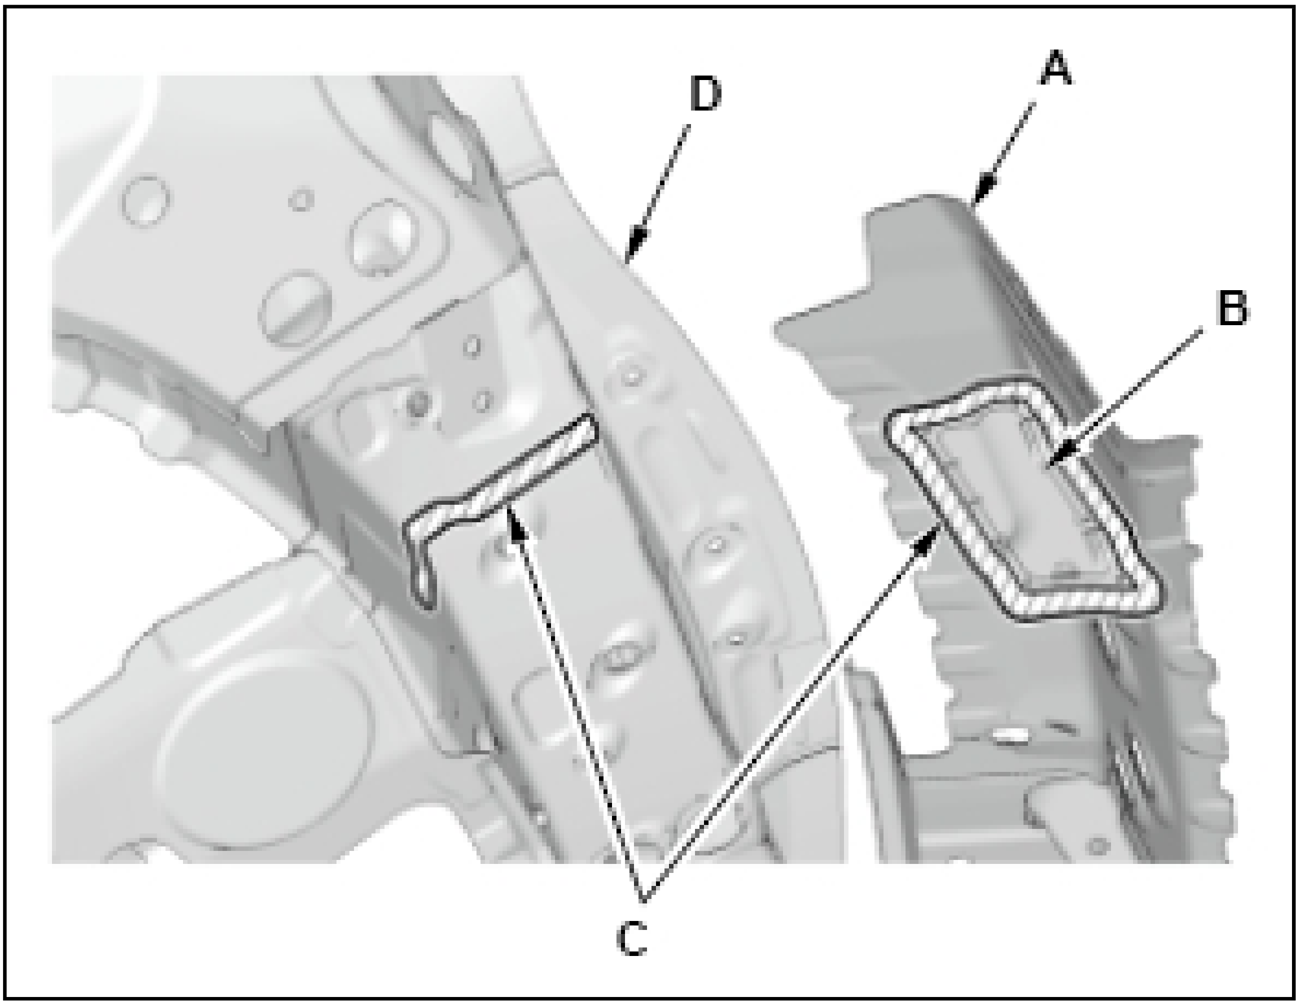
- **Position the replacement parts.**

  Before doing the main welding, check the body dimensions:

  - **Door hinge positions See DOOR HINGE POSITIONS DIMENSION .**
  - **Rear pillar gutter and rear panel positions See REAR PILLAR GUTTER AND REAR PANEL POSITIONS DIMENSION .**
  - **Windshield and door openings See WINDSHIELD AND DOOR OPENINGS .**
  - **Tailgate opening See TAILGATE OPENING DIMENSION .**
- **Temporarily install the related parts, then check for differences in level and clearance. Check the external parts fitting positions. Make sure the body lines flow smoothly. See EXTERNAL PARTS FITTING POSITIONS .**
- **Confirm the sheet thickness, tensile strength, and existence of the zinc treatment on both sides, and set the welder to conform to the welding conditions by according to the Roof and Side Panel Construction and Floor and Rear Body Construction. (See ROOF AND SIDE PANEL CONSTRUCTION And FLOOR AND REAR BODY CONSTRUCTION).**
- **Welding symbols (The welding symbols with dashed lines have a meaning of the spot welding of the part which is not visible). See SYMBOLS DEFINITION .**
- **(): Any numerical value in between these parentheses indicate the number of welds required.**

Rear Pillar Stiffener - Weld

1. Remove the rear pillar stiffener (A) together with the rear upper inner separator (B) from the new rear inner pillar complete.
2. Apply the sealer (C) without gaps all the way around the new upper inner separator and the rear inner pillar (D).



3. Weld the rear pillar stiffener (A) to the rear pillar upper stiffener (B), the rear inner pillar (C), and the rear panel side rear stiffener (D).

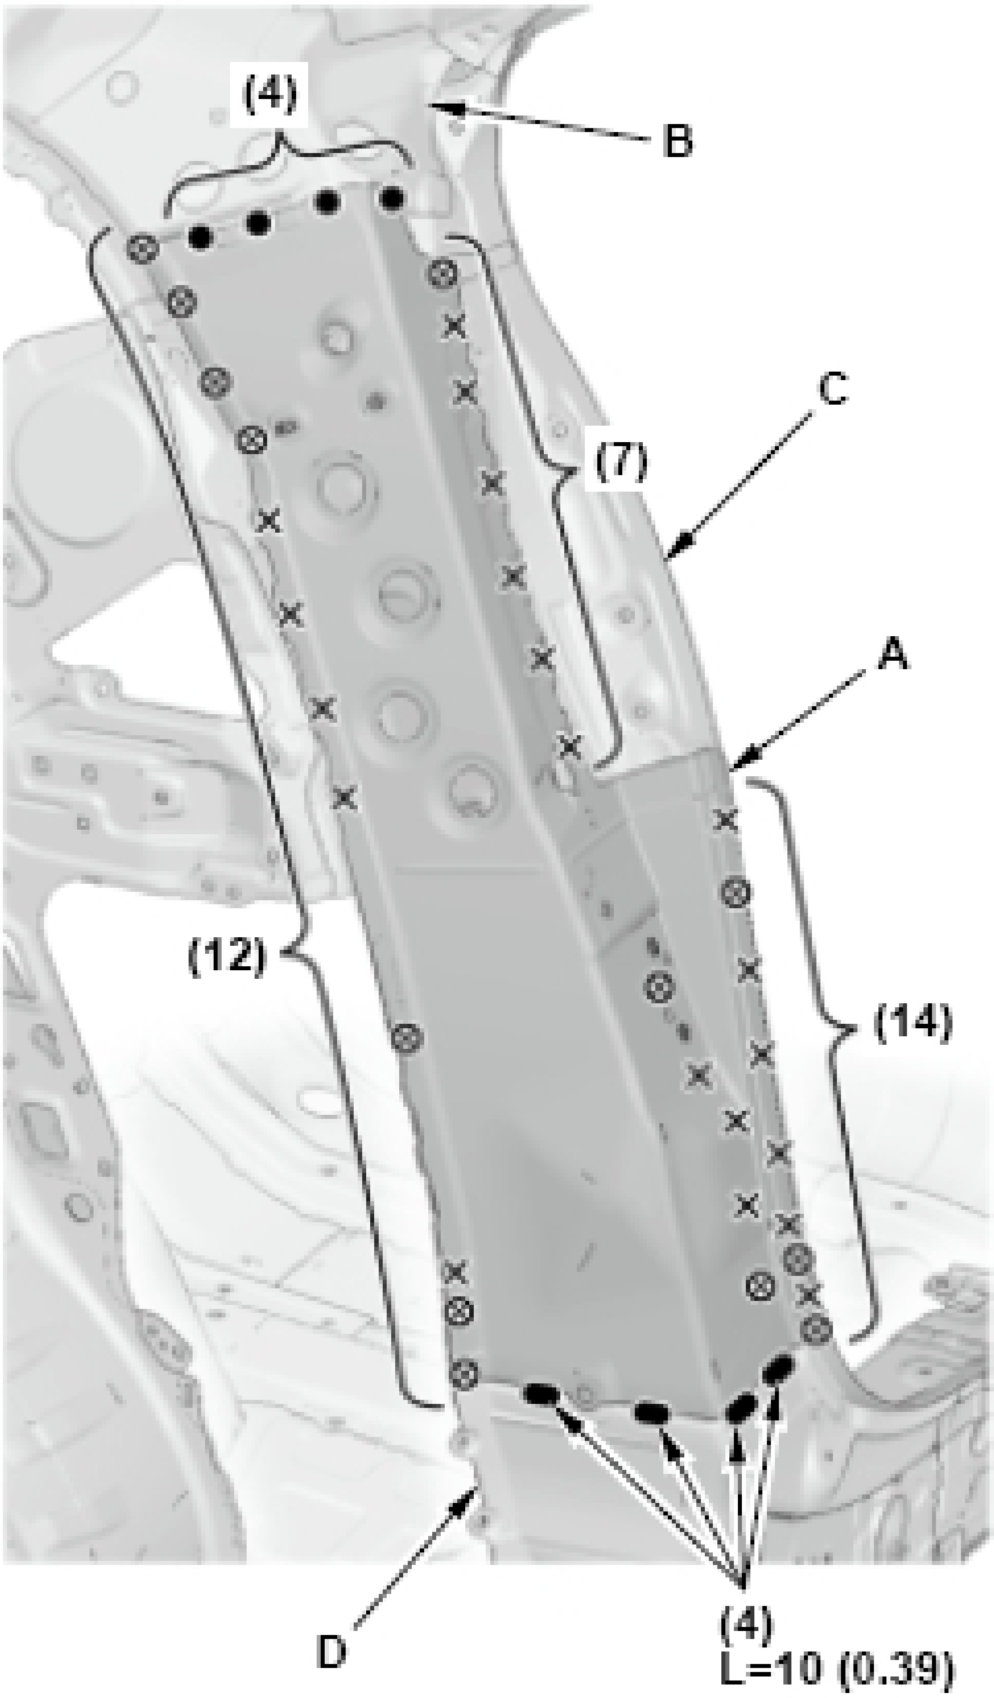


Fig. 30: Rear Pillar Stiffener Removal Weld Measurements And Locations
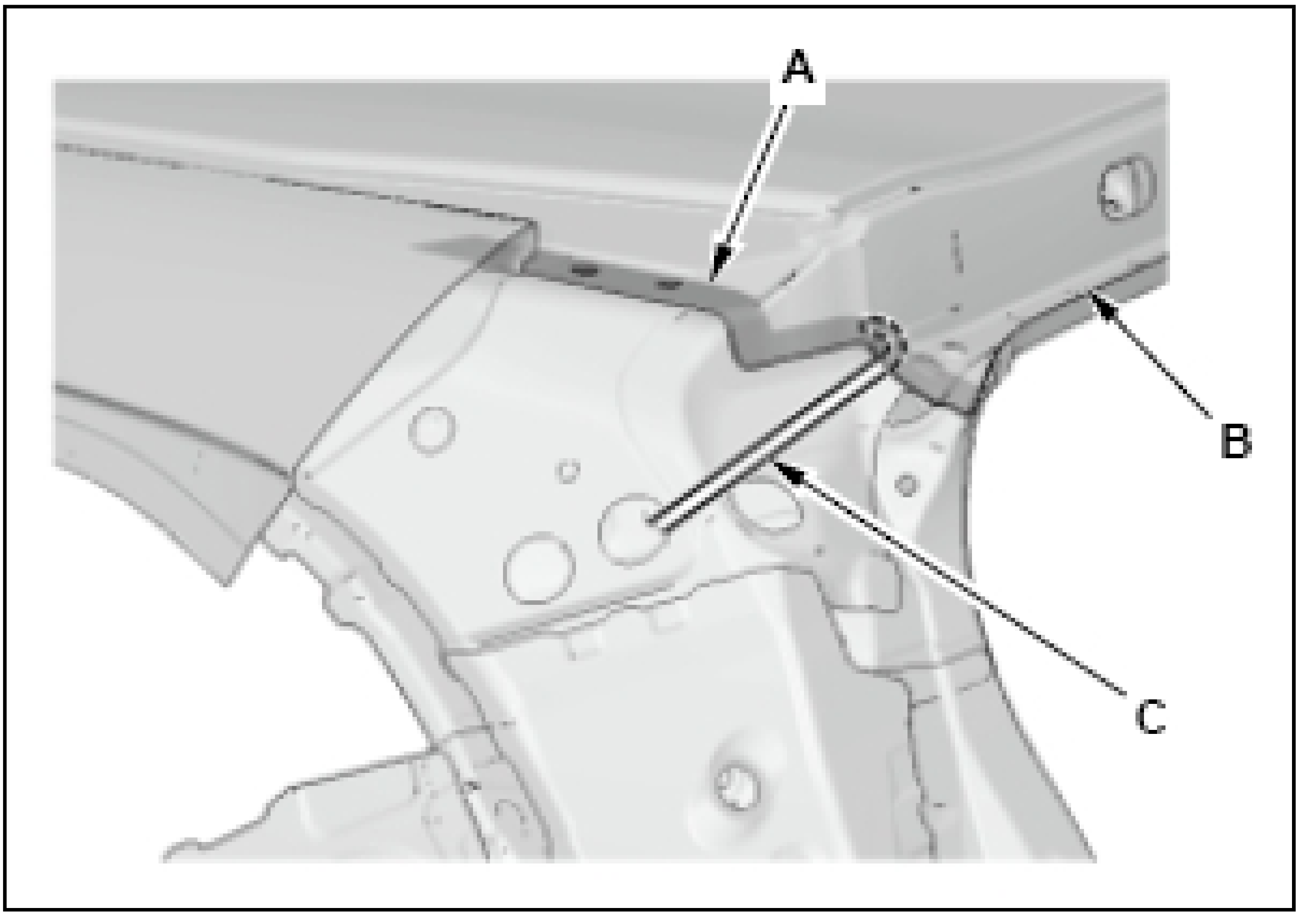
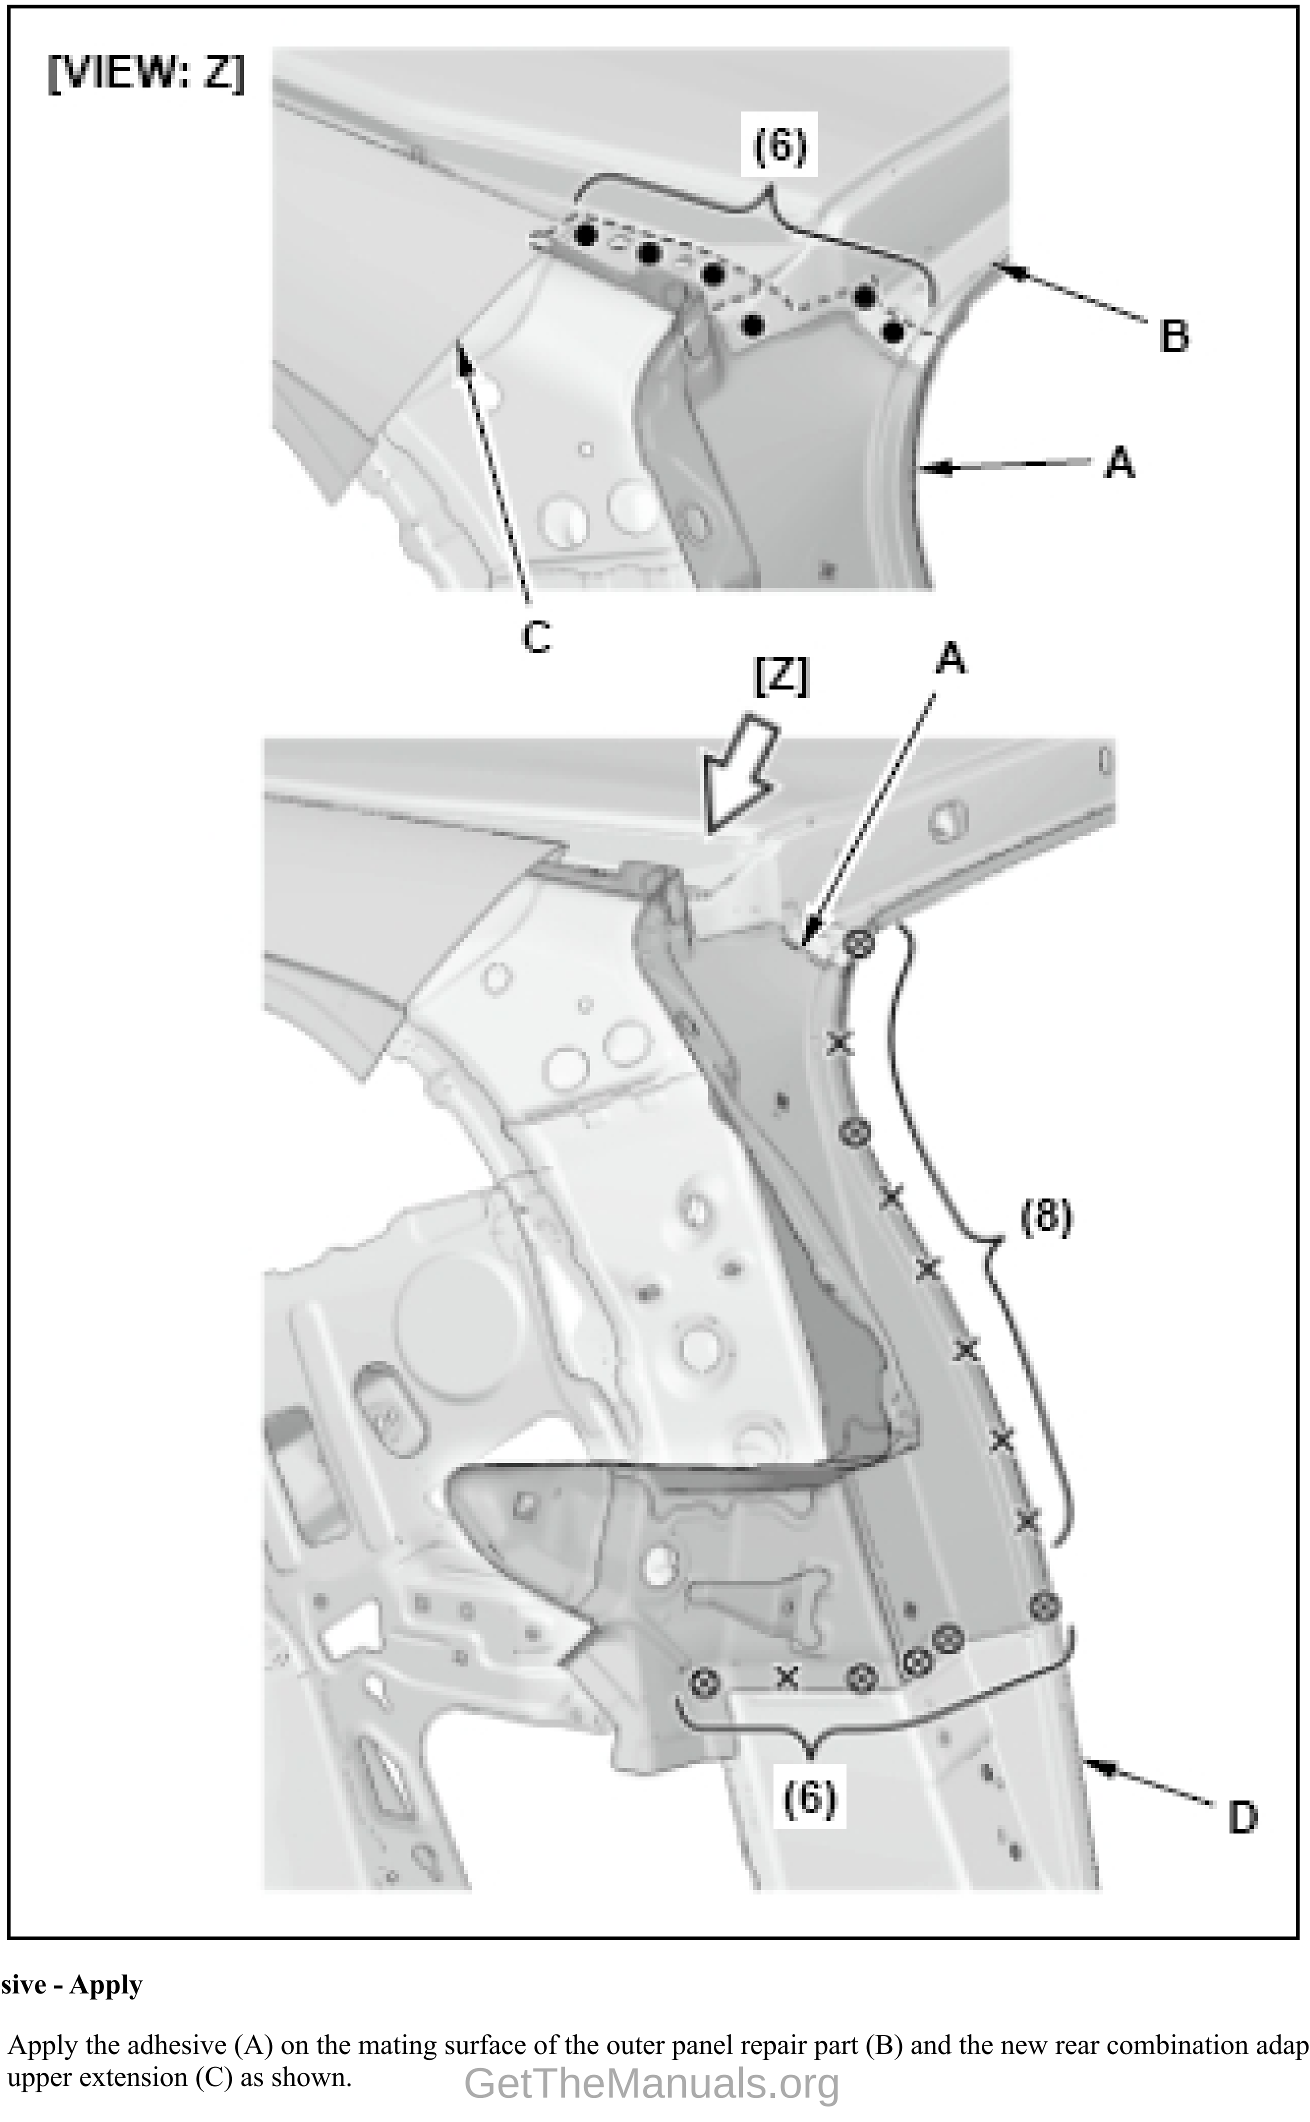
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear Pillar Gutter Complete - Weld

1. Because the original adhesive (A) may burn when welding the rear pillar upper gutter, scrape out the adhesive from the underside of the roof panel (B) with a pick tool (C).



2. Weld the rear pillar gutter complete (A) to the roof panel (B), the outer panel (C), and the rear inner pillar complete (D).

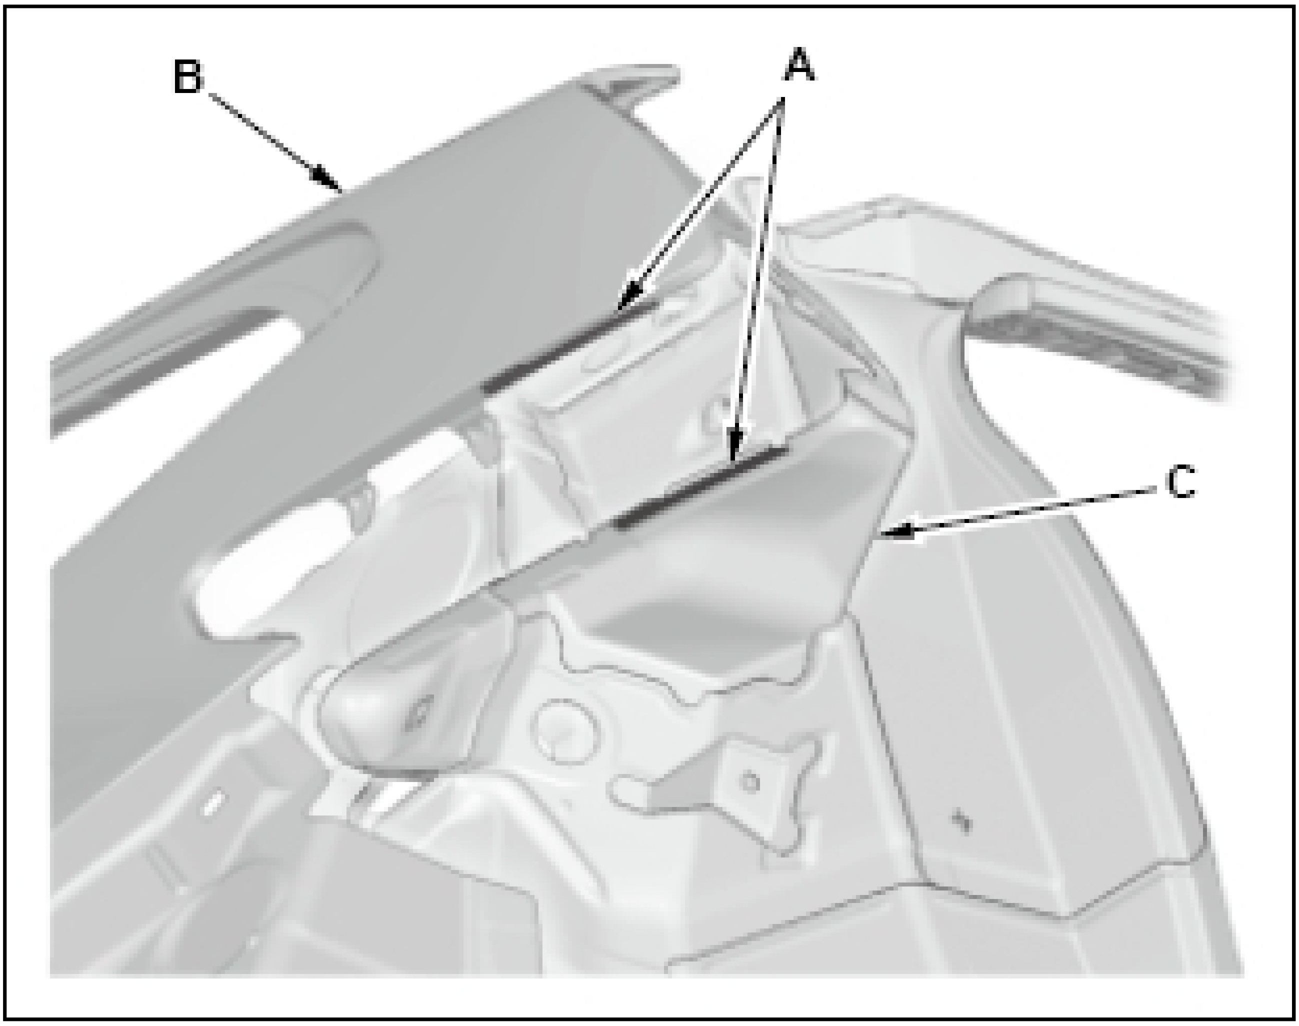


Adhesive - Apply

1. Apply the adhesive (A) on the mating surface of the outer panel repair part (B) and the new rear combination adapter upper extension (C) as shown.

NOTE: **Make sure the adhesive is not applied in areas that will be MAG welded when the outer panel is installed.**

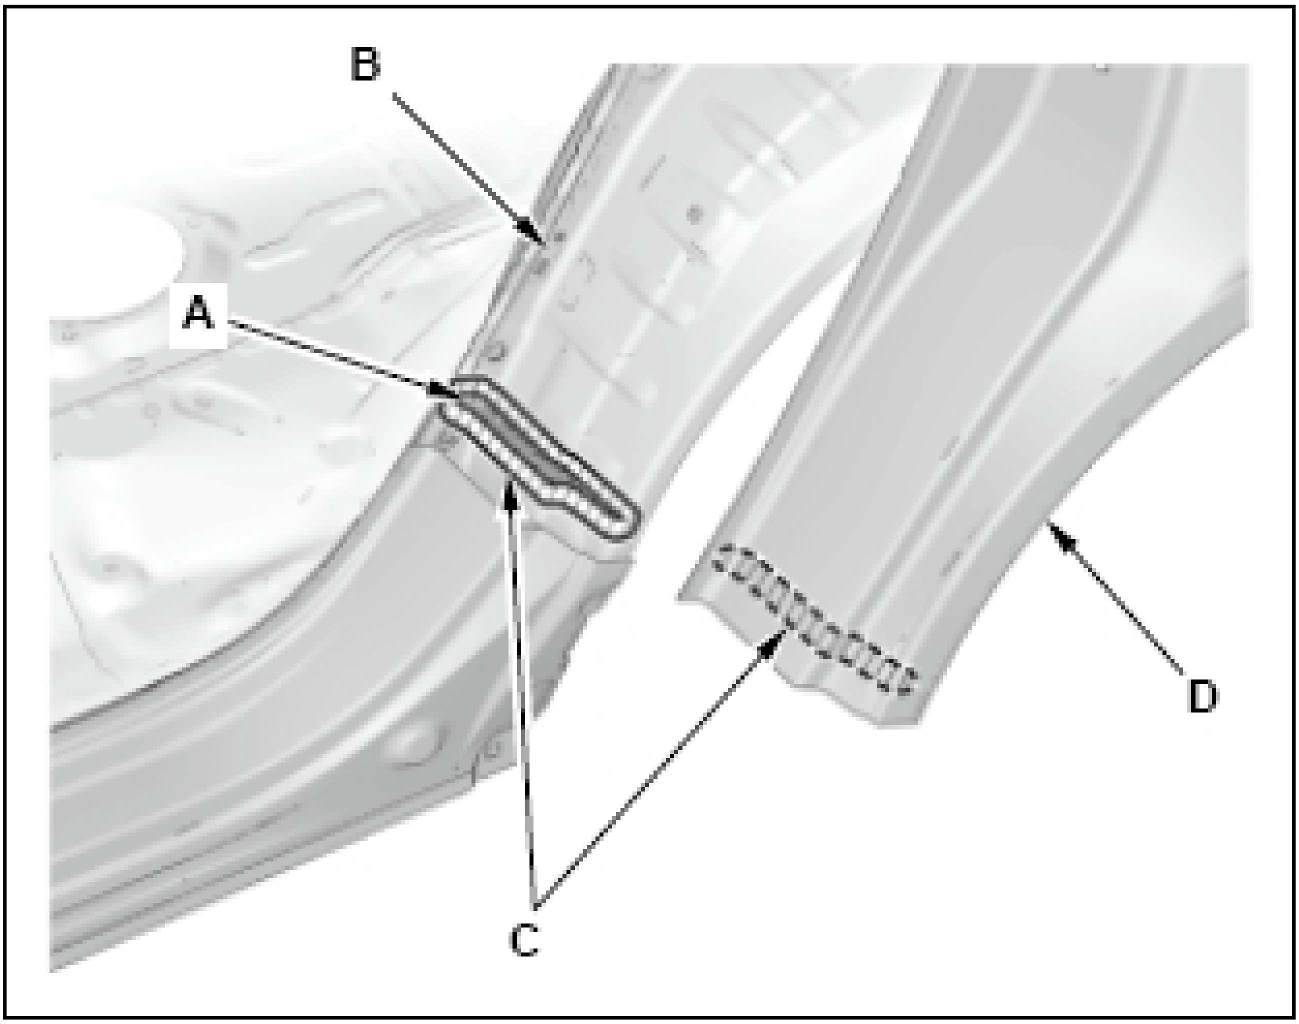
Adhesive: 3M 07333 or a commercially available equivalent



NOTE: **Refer to the manufacturers instructions for details.**

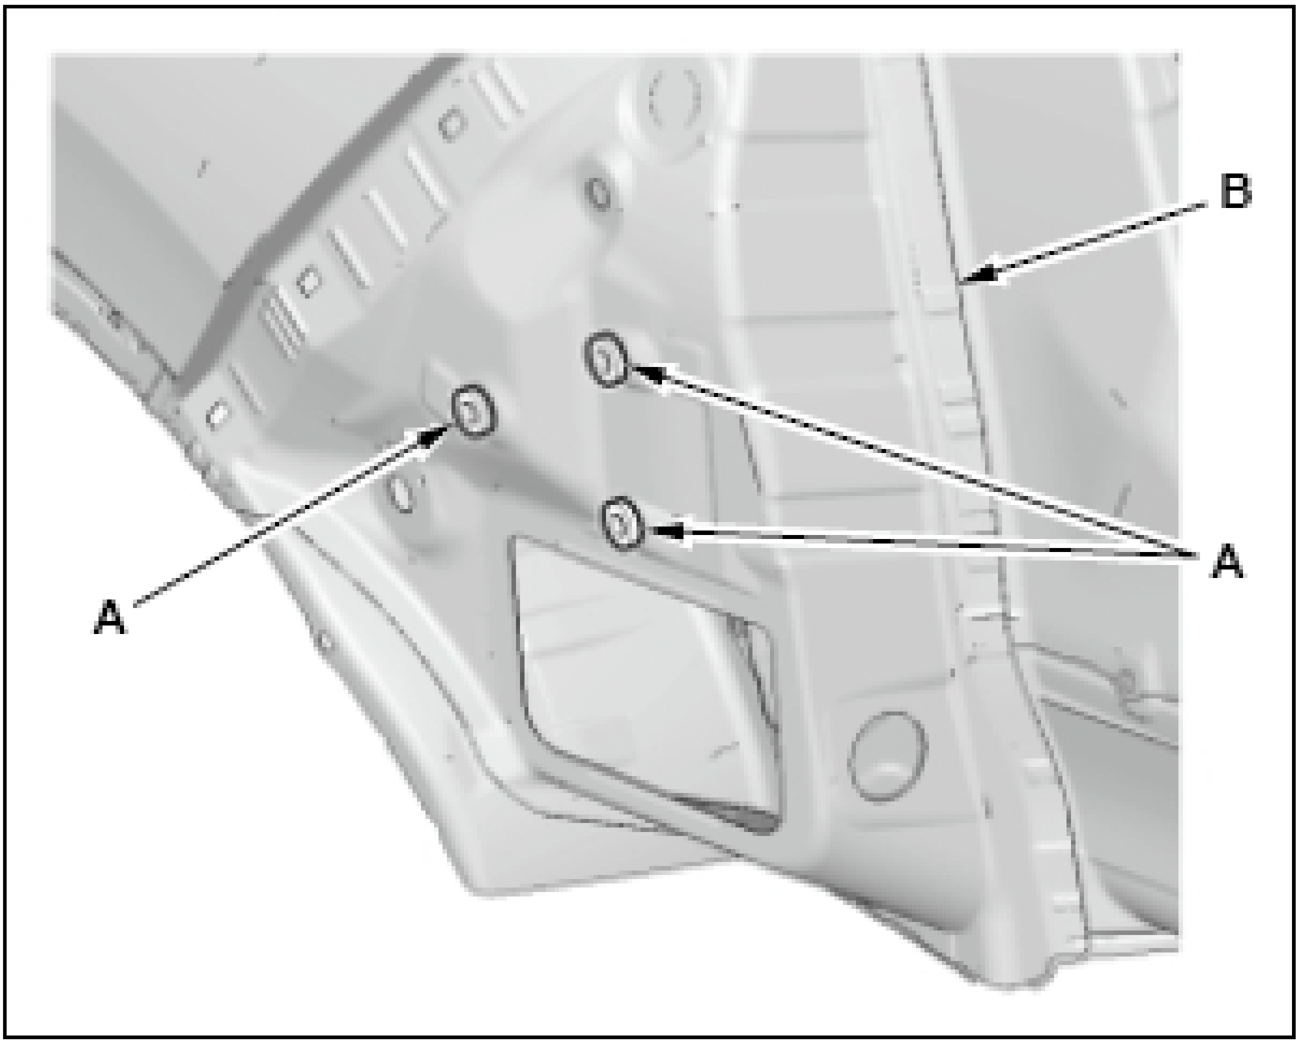
Wheel Arch Separator - Install

1. Install the new wheel arch separator (A) on the rear inner panel (B). Apply the sealer (C) without gaps all the way around the separator and inside the outer panel repair part (D).



BSI Radar Unit Mounting Area - Check (With BSI radar unit)

1. With Blind Spot Information (BSI) radar unit: Install the new rivnuts (A) to the outer panel repair part (B) with a rivnut tool.
2. **Check the Blind Spot Information (BSI) radar unit mounting positions.**



Outer Panel Repair Part - Weld

1. Weld the outer panel repair part (A).

- **Temporarily install the related parts, then check for differences in level and clearance. Check the external parts fitting positions. Make sure the body lines flow smoothly. See EXTERNAL PARTS FITTING POSITIONS .**
- **Confirm the sheet thickness, tensile strength, and existence of the zinc treatment on both sides, and set the welder to conform to the welding conditions by according to the Roof and Side Panel Construction and Floor and Rear Body Construction. (See ROOF AND SIDE PANEL CONSTRUCTION And FLOOR AND REAR BODY CONSTRUCTION).**
- **Welding symbols (The welding symbols with dashed lines have a meaning of the spot welding of the part which is not visible). See SYMBOLS DEFINITION .**
- **() and ()*: Any numerical value in between these parentheses indicate the number of welds required.**

Rear Frame A, Rear Portion - Weld

1. Weld the rear portion of new rear frame A and the body side rear frame A (B).

   L*: Welding positions with high-strength steel parts. **Confirm the butt welding conditions.** See MAG WELDING CONDITIONS FOR HIGH-STRENGTH STEEL PARTS (EXCEPT 1500 MPA) .

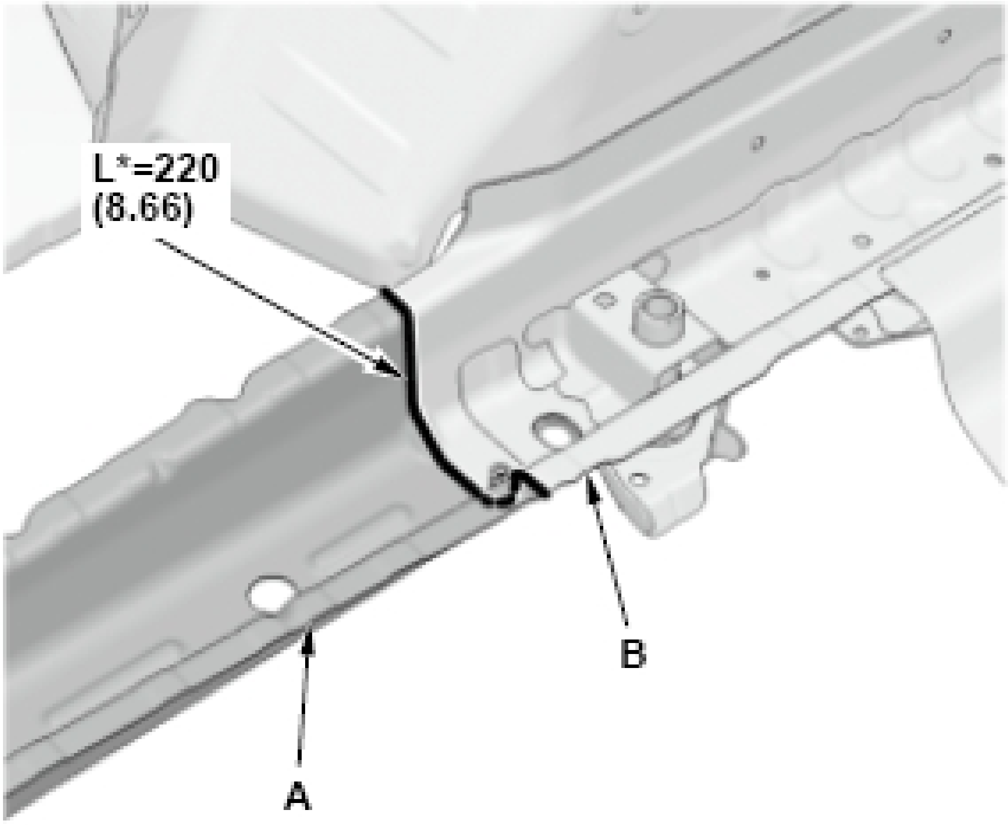

Fig. 43: Body Side Rear Frame Installation Weld Measurements And Locations
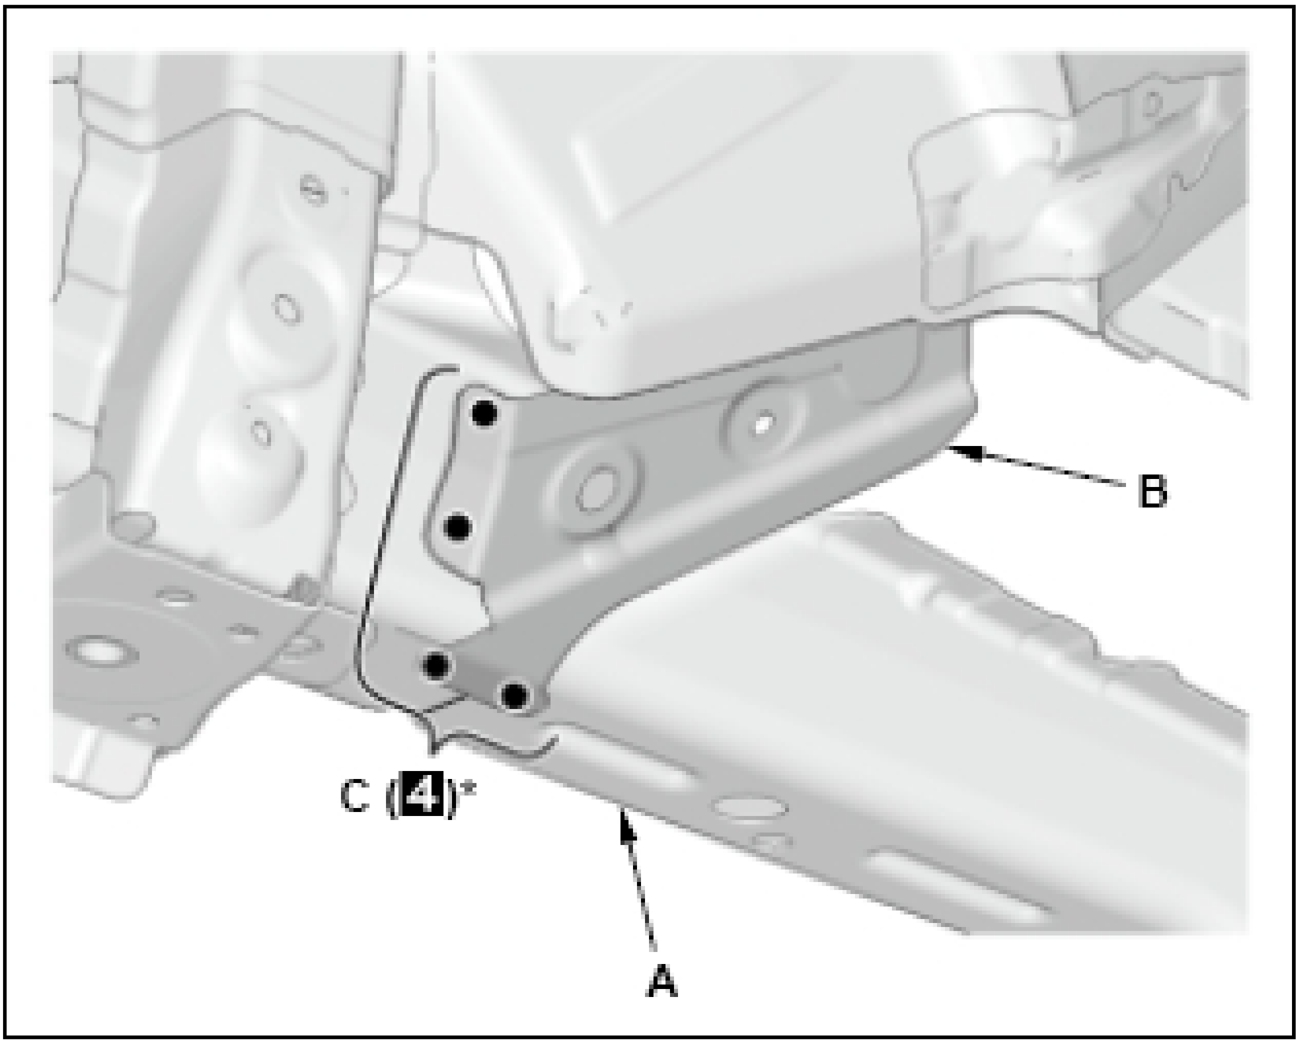
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Weld the rear frame side outrigger (B) to rear frame A.

(■)*: Welding positions with rear frame A, include ultra high-strength steel (1500 MPa) parts.

NOTE: **Welding positions (C): Must be welded according to the following conditions.**

Plug hole diameter: φ 10 mm (0.39 in) Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).



Rear Floor Side Panel - Weld

1. Weld the rear floor side panel (C) to rear frame A, the rear frame side outrigger (B), the rear wheelhouse (D), the wheelhouse upper patch (E), and the outer panel (F).

   (■)*: Welding positions with rear frame A, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 12 in the table shown below.** (See SPOT WELDING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

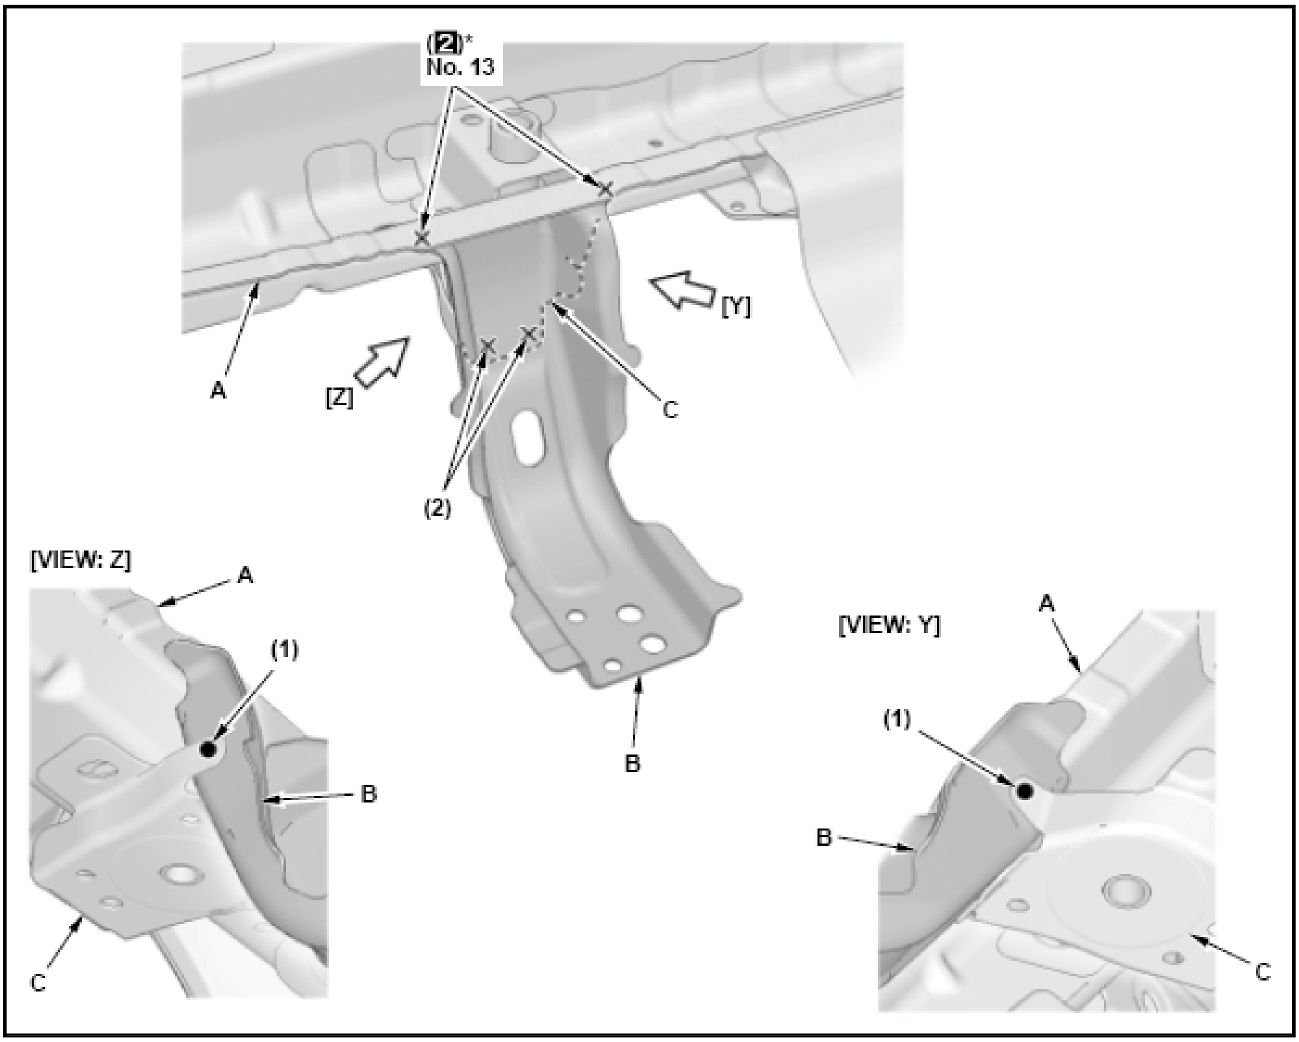
Spare Tire Pan Crossmember - Weld

1. Weld the spare tire pan crossmembers (B) to rear frames A and the spare tire pan lower crossmembers (C) on both sides.

   (■)*: Welding positions with rear frame A, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 13 in the table shown below.**

   SPOT WELDING CONDITION DESCRIPTION

No. 13	8000 A	600 ms	3432 N (350 kgf)



Spare Tire Pan Complete - Weld

1. Weld the new spare tire pan complete (B) to both rear frames A, rear frame upper stiffener A/B (C) (one side), the rear floor panel (D), and both of the spare tire pan crossmembers (E). Weld the rear frame flange (F) to rear frame A.

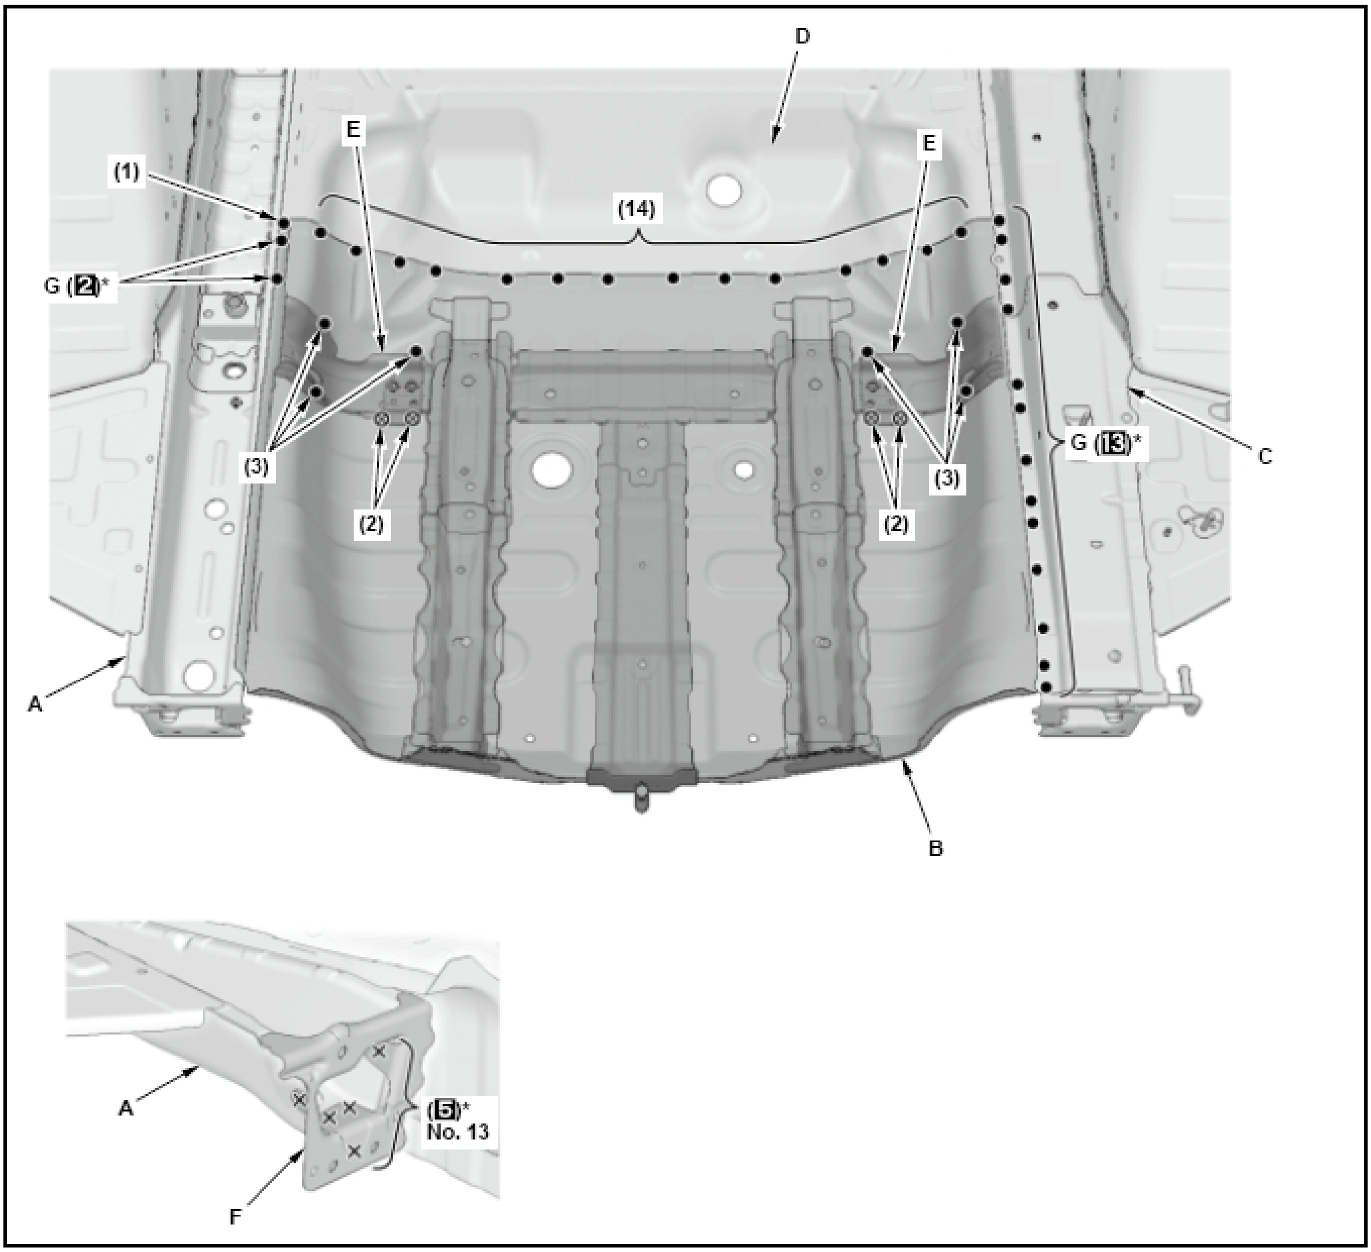
   (■)*: Welding positions with rear frame A, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 13 in the table shown below.** (See SPOT WELDING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

SPOT WELDING CONDITION DESCRIPTION

No. 13	8000 A	600 ms	3432 N (350 kgf)

NOTE: **Welding positions (G): Must be welded according to the following conditions.**

Plug hole diameter: φ 10 mm (0.39 in)
Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).



Rear Frame Upper Stiffener A/B (One Side) and Rear Floor Upper Crossmember - Weld

1. In case of sectioning rear frame upper stiffener B: Weld the rear portion of new rear frame upper stiffener B and reused rear frame upper stiffener B (A).

   L*: Welding positions with high-strength steel parts. **Confirm the butt welding conditions.** See MAG WELDING CONDITIONS FOR HIGH-STRENGTH STEEL PARTS (EXCEPT 1500 MPA) .

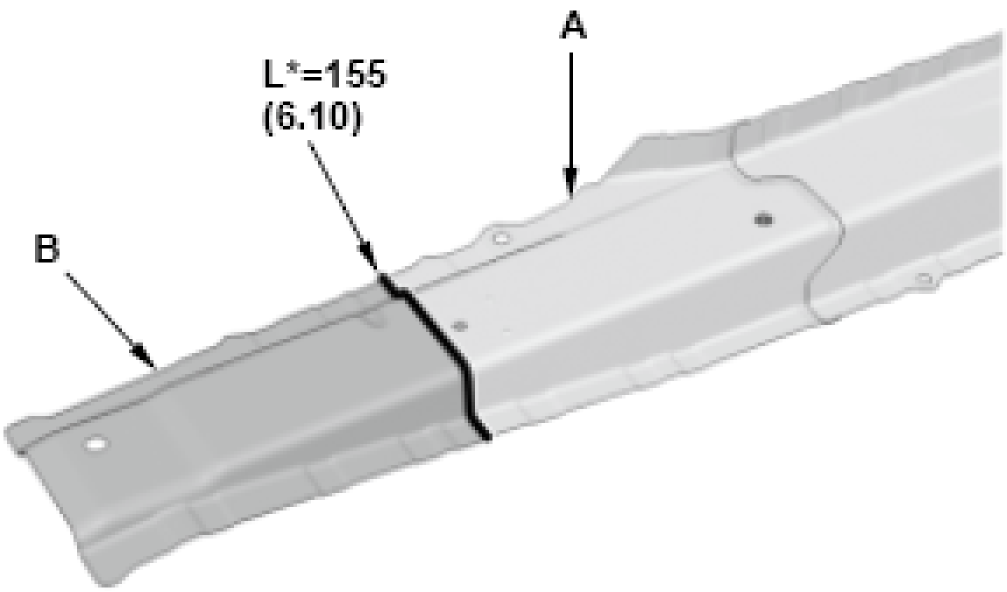


Fig. 44: Rear Frame Upper Stiffener Installation Weld Measurements And Locations
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Weld the rear portion of rear frame upper stiffener A and rear frame upper stiffener B to rear frame A (C), the rear floor side panel (D), the rear frame flange (E), the rear wheelhouse (F), the spare tire pan (G), and the rear floor panel (H).

   (■)*: Welding positions with rear frame upper stiffener A/B and rear frame A, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 13 and 14 in the table shown below.** (See SPOT WELDING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

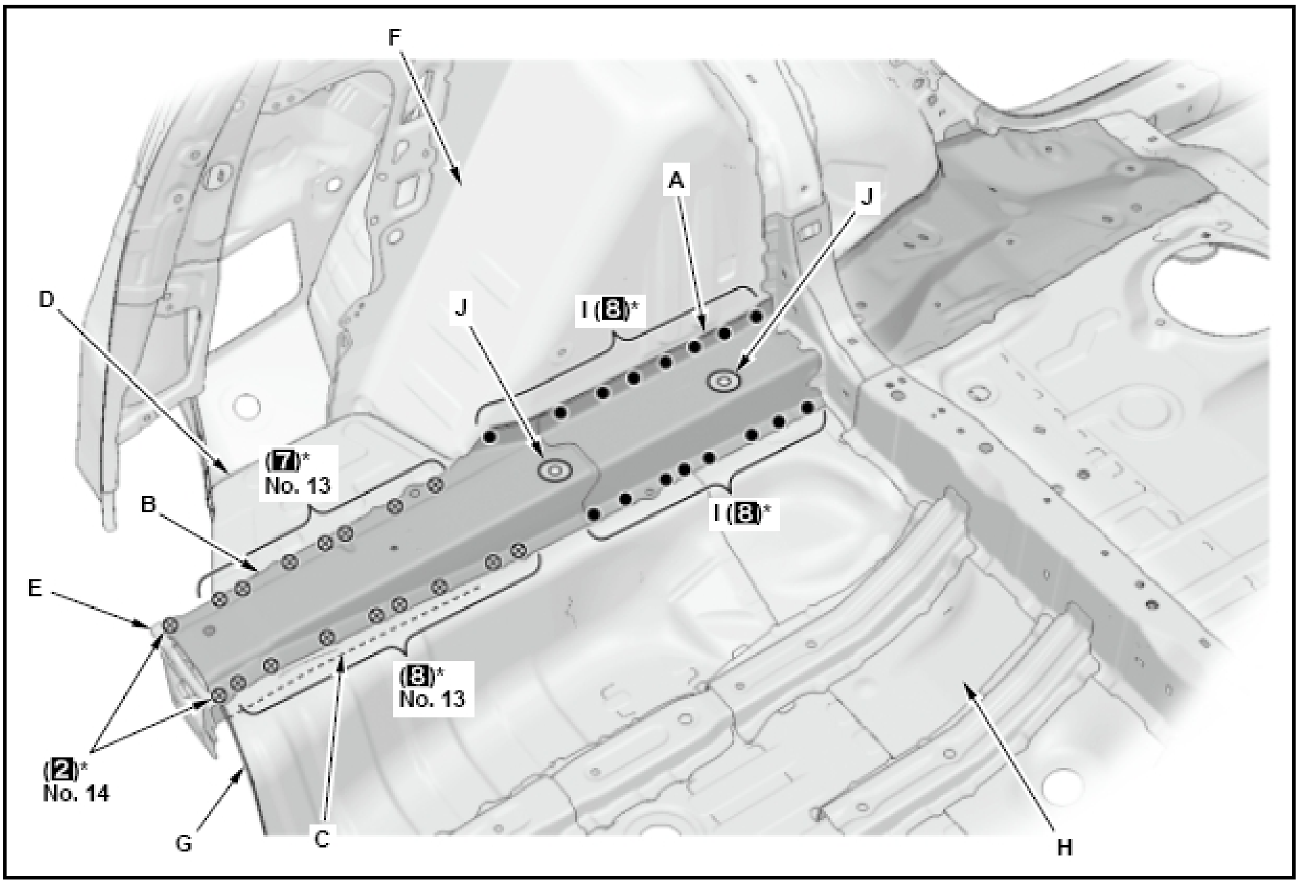
   SPOT WELDING CONDITION DESCRIPTION

No. 13	8000 A	600 ms	3432 N (350 kgf)
No. 14	8500 A	600 ms	3432 N (350 kgf)

NOTE: **Welding positions (I): Must be welded according to the following conditions.**

Plug hole diameter: φ 10 mm (0.39 in)
Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

NOTE: **The indicated areas (J) are ground locations. Prior to installation of the IPU (high-voltage battery), make sure that these areas are not painted or have any corrosion.**



3. Weld the front portion of rear frame upper stiffener A to rear frame A (B), the side sill extension (C), the rear wheelhouse (D), the middle floor crossmember stiffener (E), and the rear floor panel (F).

   If rear frame upper stiffener A is to be reused, plug weld it.

   (■)*: Welding positions with rear frame upper stiffener A and rear frame A, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 14 in the table shown below. Confirm the MIG brazing conditions.** (See SPOT WELDING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA) And MIG BRAZING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

Installation

NOTE:

- **Position the replacement parts.**

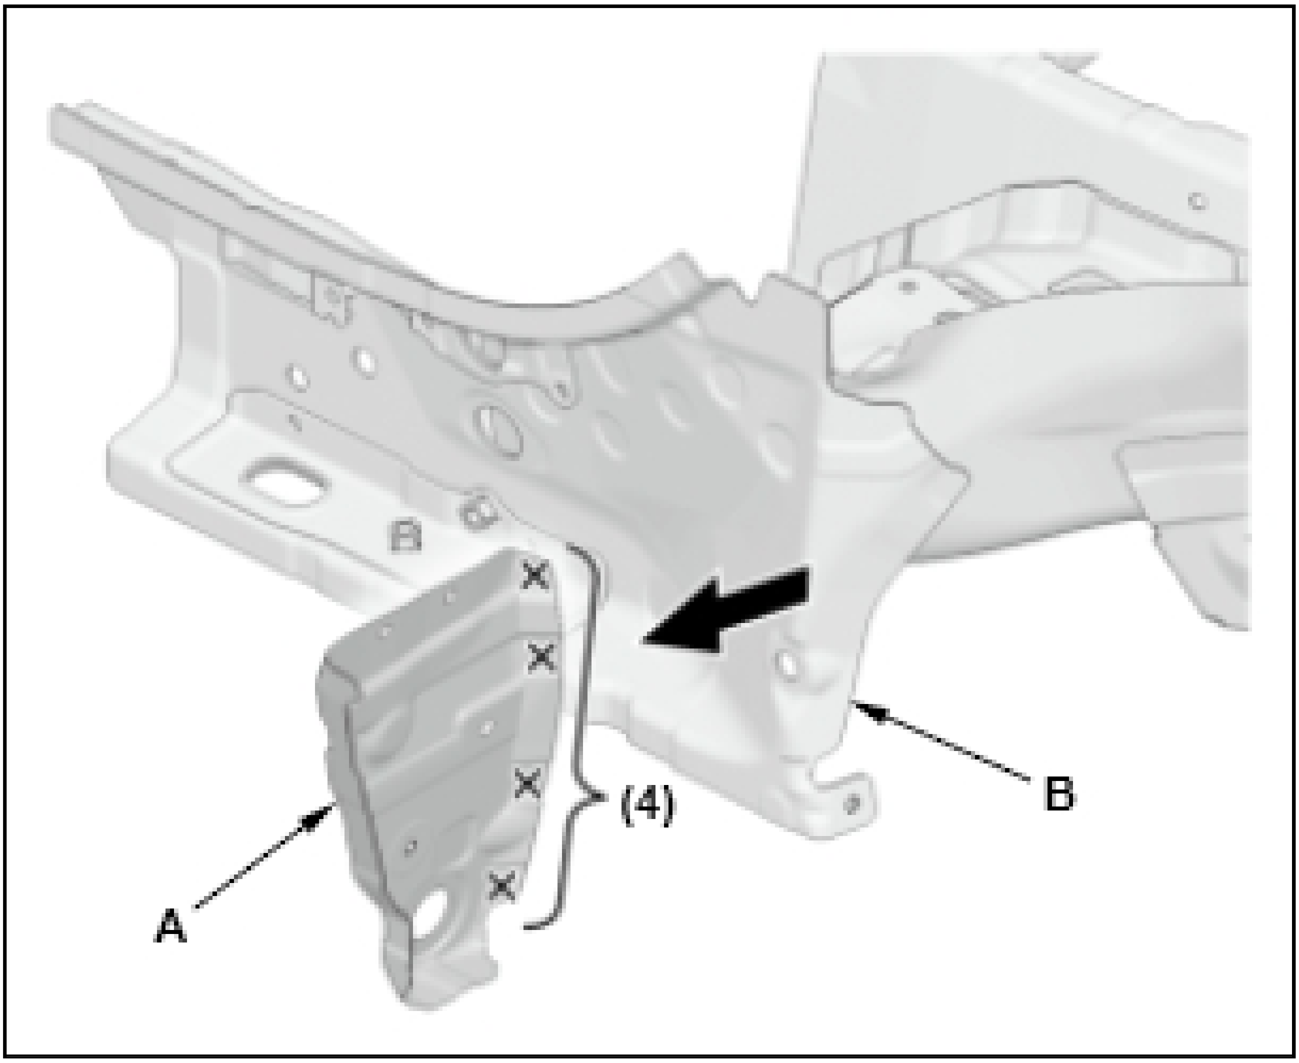
  Before doing the main welding, check the body dimensions:

  - **Rear pillar gutter and rear panel positions See REAR PILLAR GUTTER AND REAR PANEL POSITIONS DIMENSION .**
  - **Tailgate opening See TAILGATE OPENING DIMENSION .**
  - **Front floor and rear floor, under view See FRONT FLOOR AND REAR FLOOR, UNDER VIEW DIMENSION .**
  - **Frame repair chart See FRAME REPAIR CHART .**

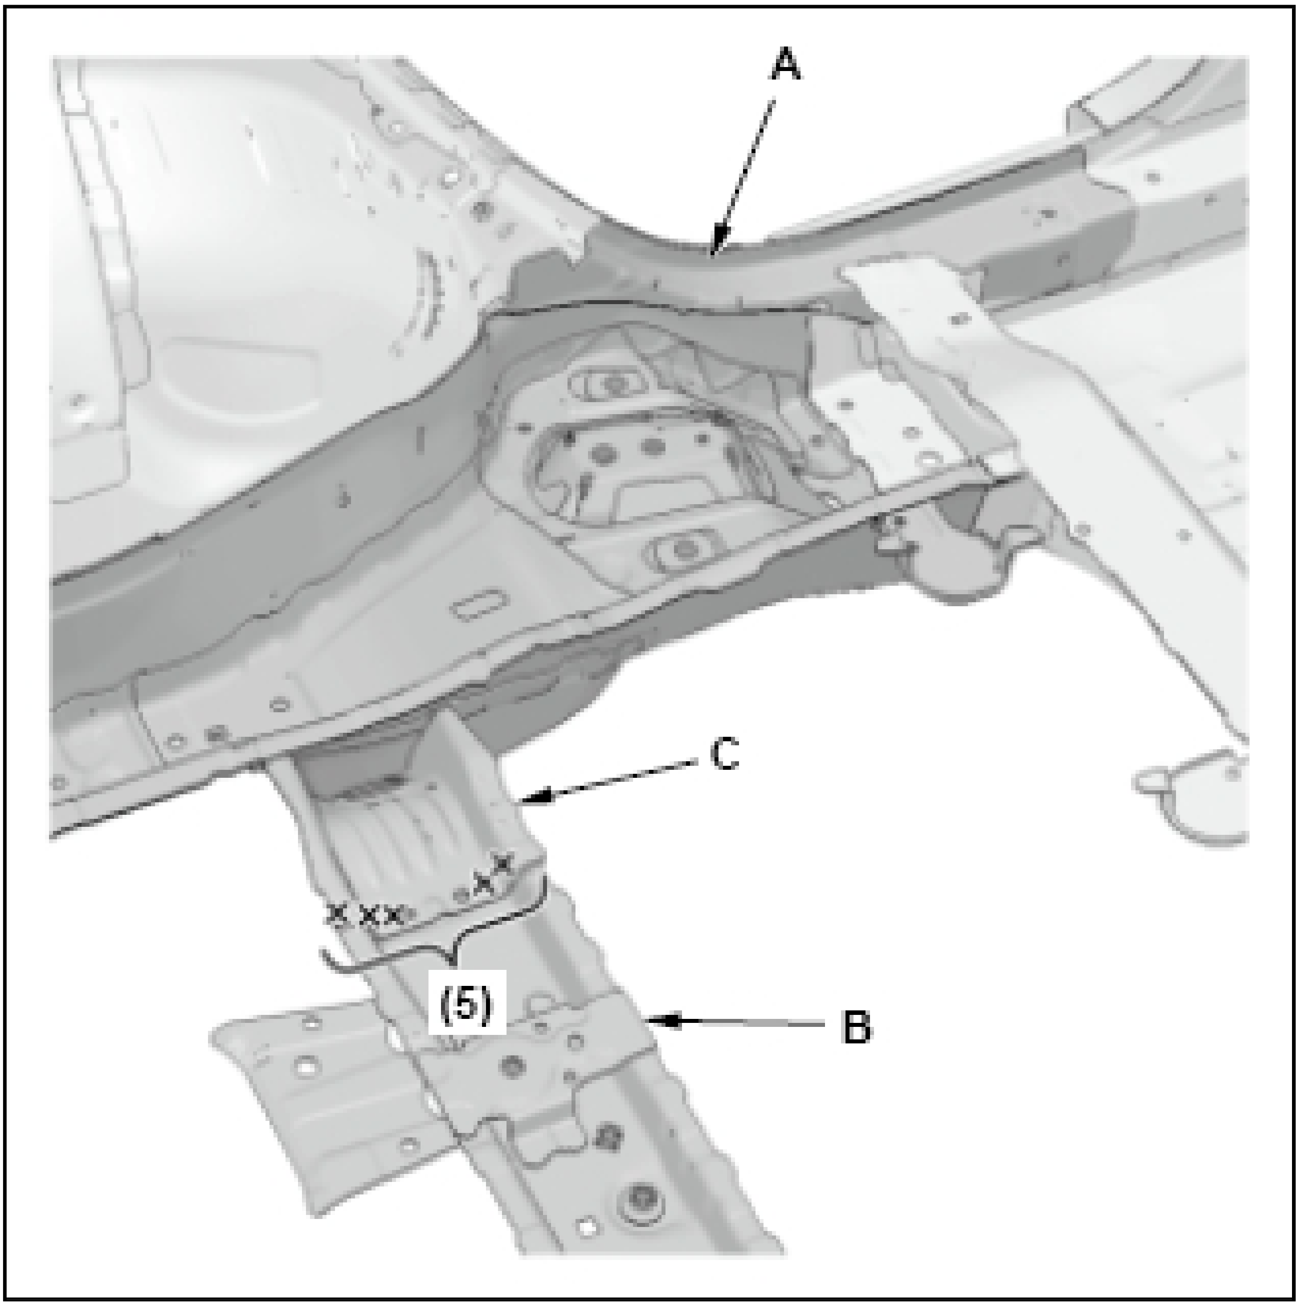
- **Temporarily install the related parts, then check for differences in level and clearance. Check the external parts fitting positions. Make sure the body lines flow smoothly. See EXTERNAL PARTS FITTING POSITIONS .**
- **Confirm the sheet thickness, tensile strength, and existence of the zinc treatment on both sides, and set the welder to conform to the welding conditions by according to the Roof and Side Panel Construction and Floor and Rear Body Construction. (See ROOF AND SIDE PANEL CONSTRUCTION And FLOOR AND REAR BODY CONSTRUCTION).**
- **Welding symbols (The welding symbols with dashed lines have a meaning of the spot welding of the part which is not visible). See SYMBOLS DEFINITION .**
- **() and ()*: Any numerical value in between these parentheses indicate the number of welds required.**

Rear Frame Complete - Weld

1. Remove the side sill extension end flange (A) from the new rear frame complete (B).

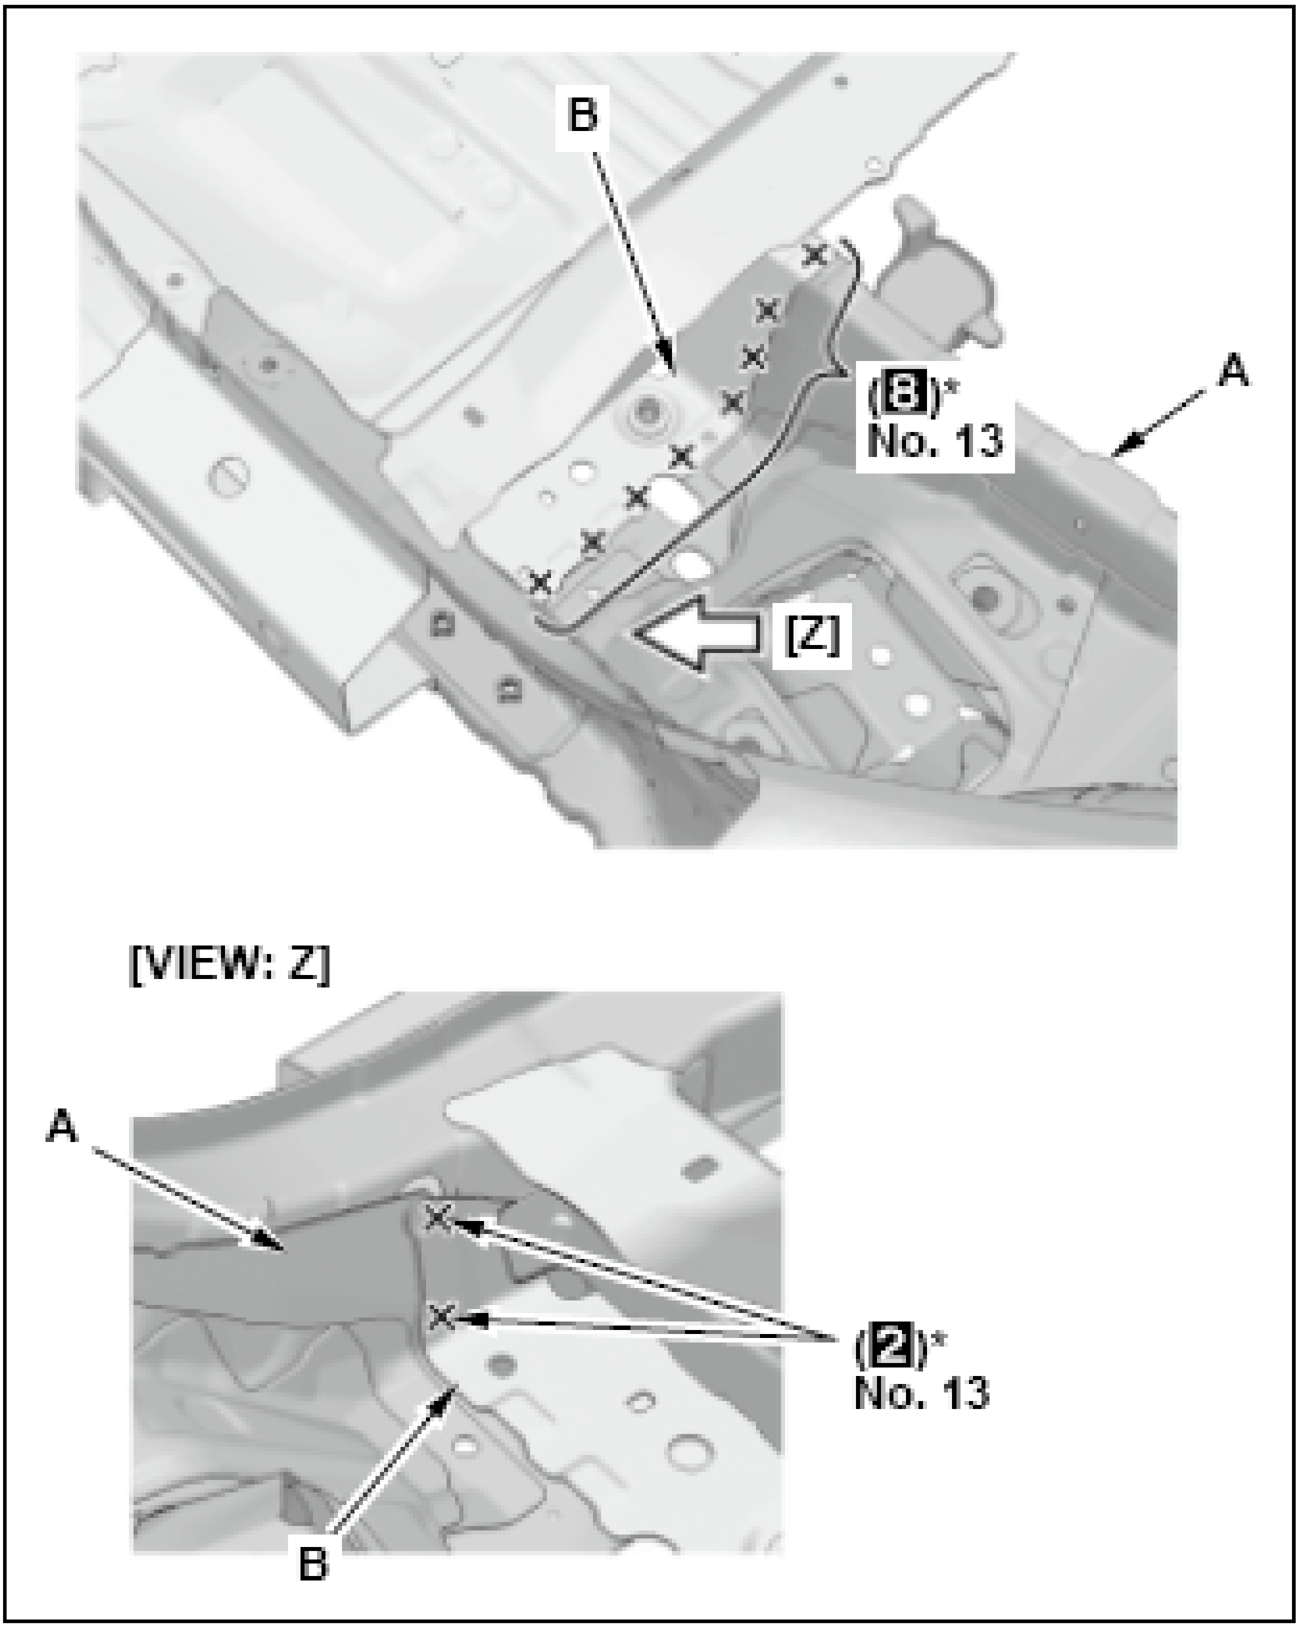


2. Clamp the new rear frame complete (A) to the body, and check it into position. Weld the rear floor crossmember complete (B) and the rear crossmember extension (C).



3. Weld rear frame A to the rear frame extension (B).

   (■)*: Welding positions with rear frame A, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 13 in the table shown below.** (See SPOT WELDING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

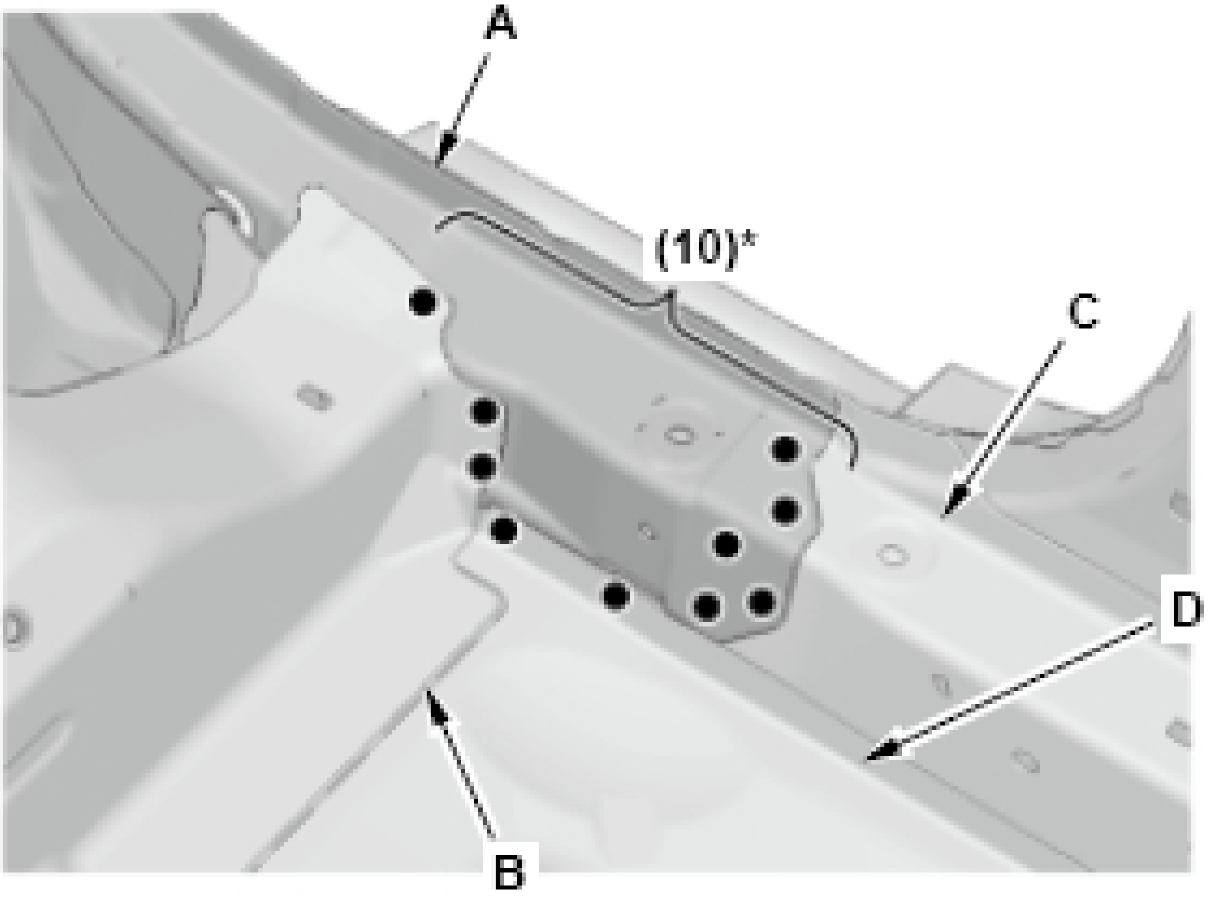


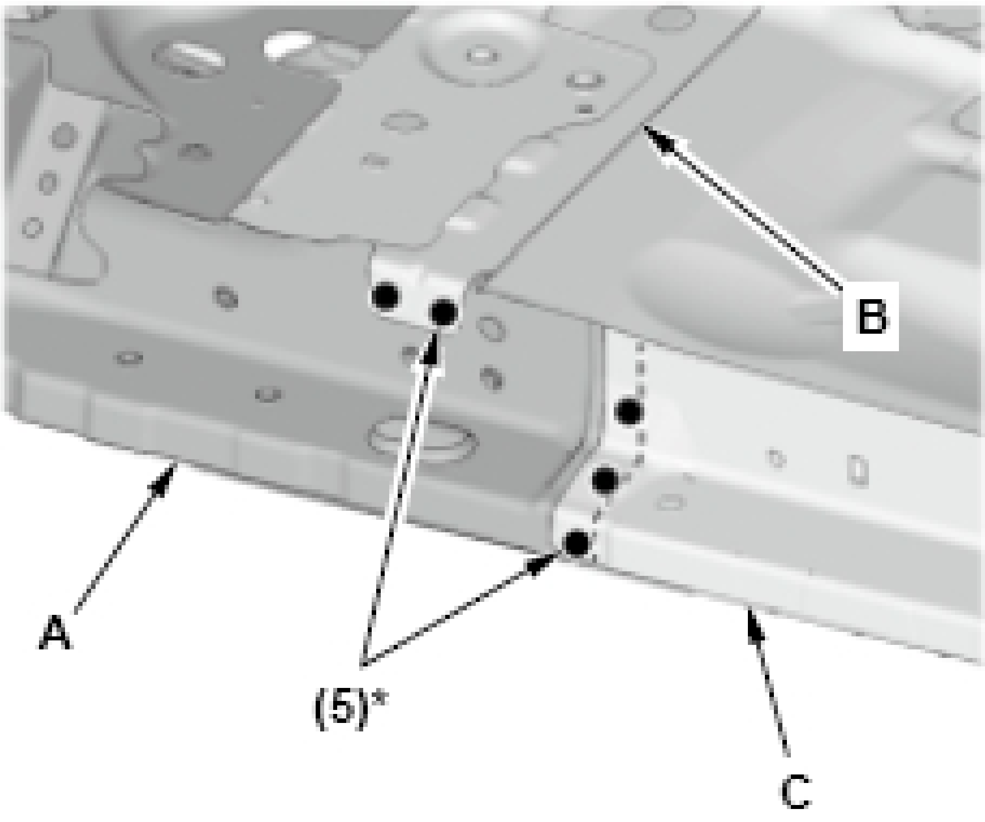
SPOT WELDING CONDITION DESCRIPTION

No. 13	8000 A	600 ms	3432 N (350 kgf)

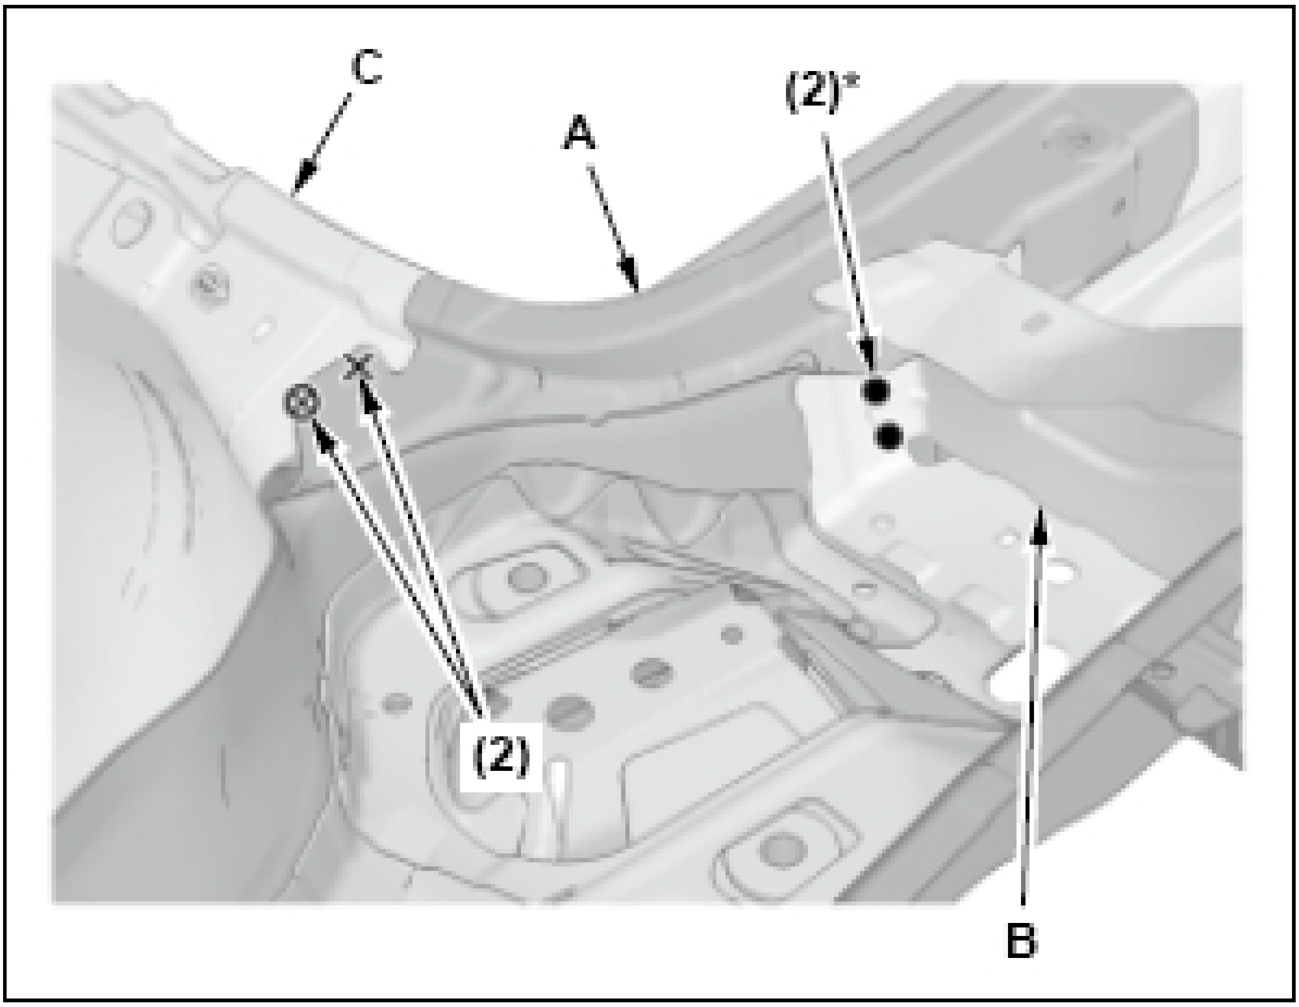
4. Weld the side sill extension (A) to the middle floor crossmember (B), the inside sill (C), and the front floor (D).

   ()*: Welding positions with high-strength steel parts. **Confirm the plug welding conditions.** (See **MAG WELDING CONDITIONS FOR HIGH-STRENGTH STEEL PARTS (EXCEPT 1500 MPA)** .)





5. Weld the side sill extension (A) to the middle floor crossmember (B) and the rear wheelhouse (C).



()*: Welding positions with high-strength steel parts. **Confirm the plug welding conditions.** (See MAG WELDING CONDITIONS FOR HIGH-STRENGTH STEEL PARTS (EXCEPT 1500 MPA) .)

6. Weld the spare tire pan upper crossmember (B) to the rear wheelhouse stiffener (C). Weld rear frame A and the rear wheelhouse (D).

   (■)*: Welding positions with rear frame A, include ultra high-strength steel (1500 MPa) parts. **Confirm the MIG brazing conditions.** (See MIG BRAZING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

NOTE: **Welding positions (E): Must be welded according to the following conditions.**

Plug hole diameter: φ 10 mm (0.39 in)
Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

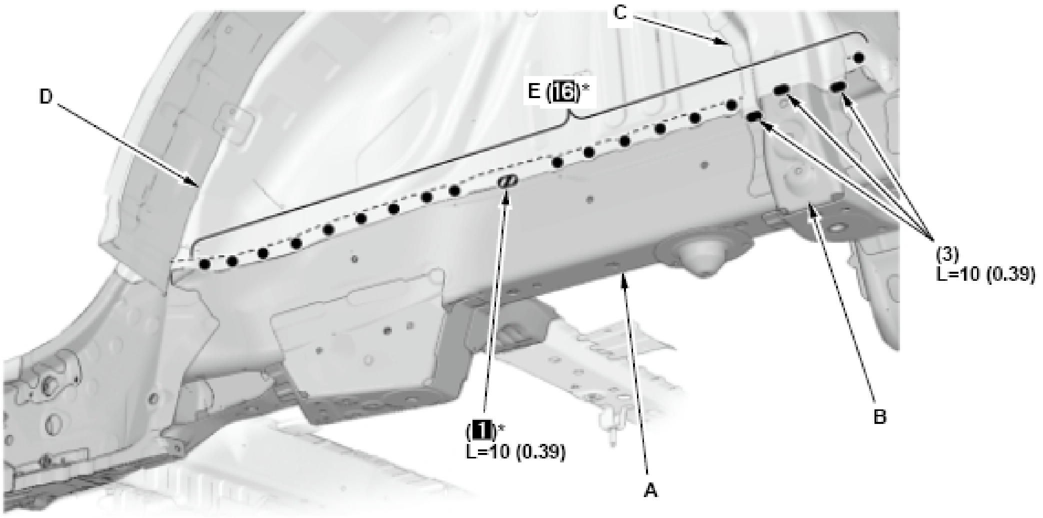


Fig. 51: Rear Frame Installation Weld Measurements And Locations
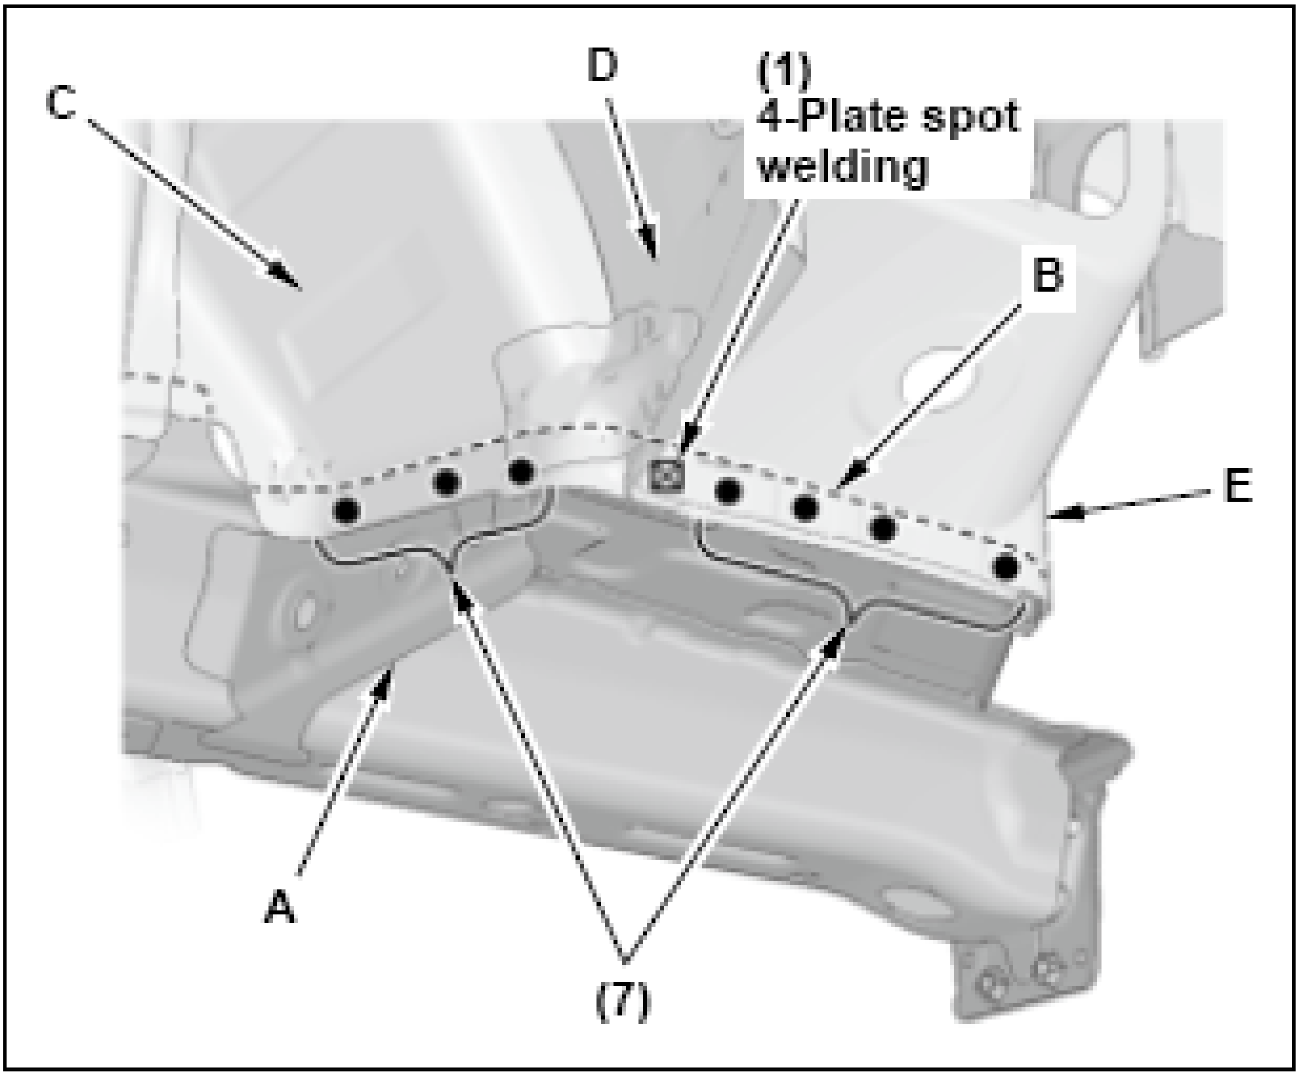
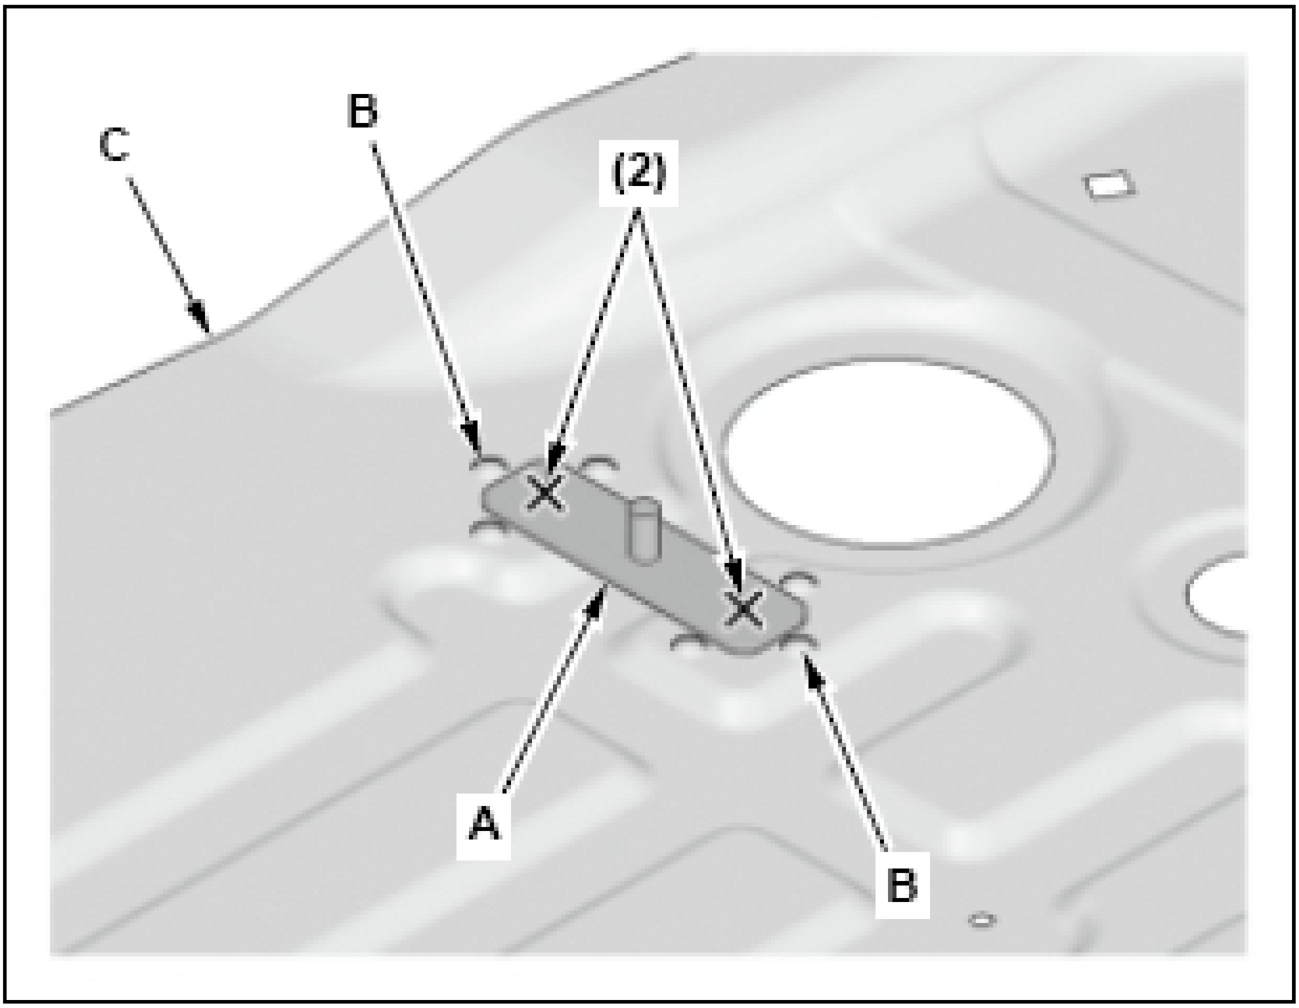
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Weld the rear frame side outrigger (A) and the rear floor side panel (B) to the rear wheelhouse (C), the inner panel (D), and the outer panel (E).



Rear Floor Panel - Weld

1. Place the new DC cable guard bracket (A) within alignment dots (B) of the new rear floor panel (C), and then weld them.



2. Weld the new rear floor panel (B) to rear floor A, rear frame upper stiffener A (C), the middle floor crossmember (D), and the rear floor crossmember (E).

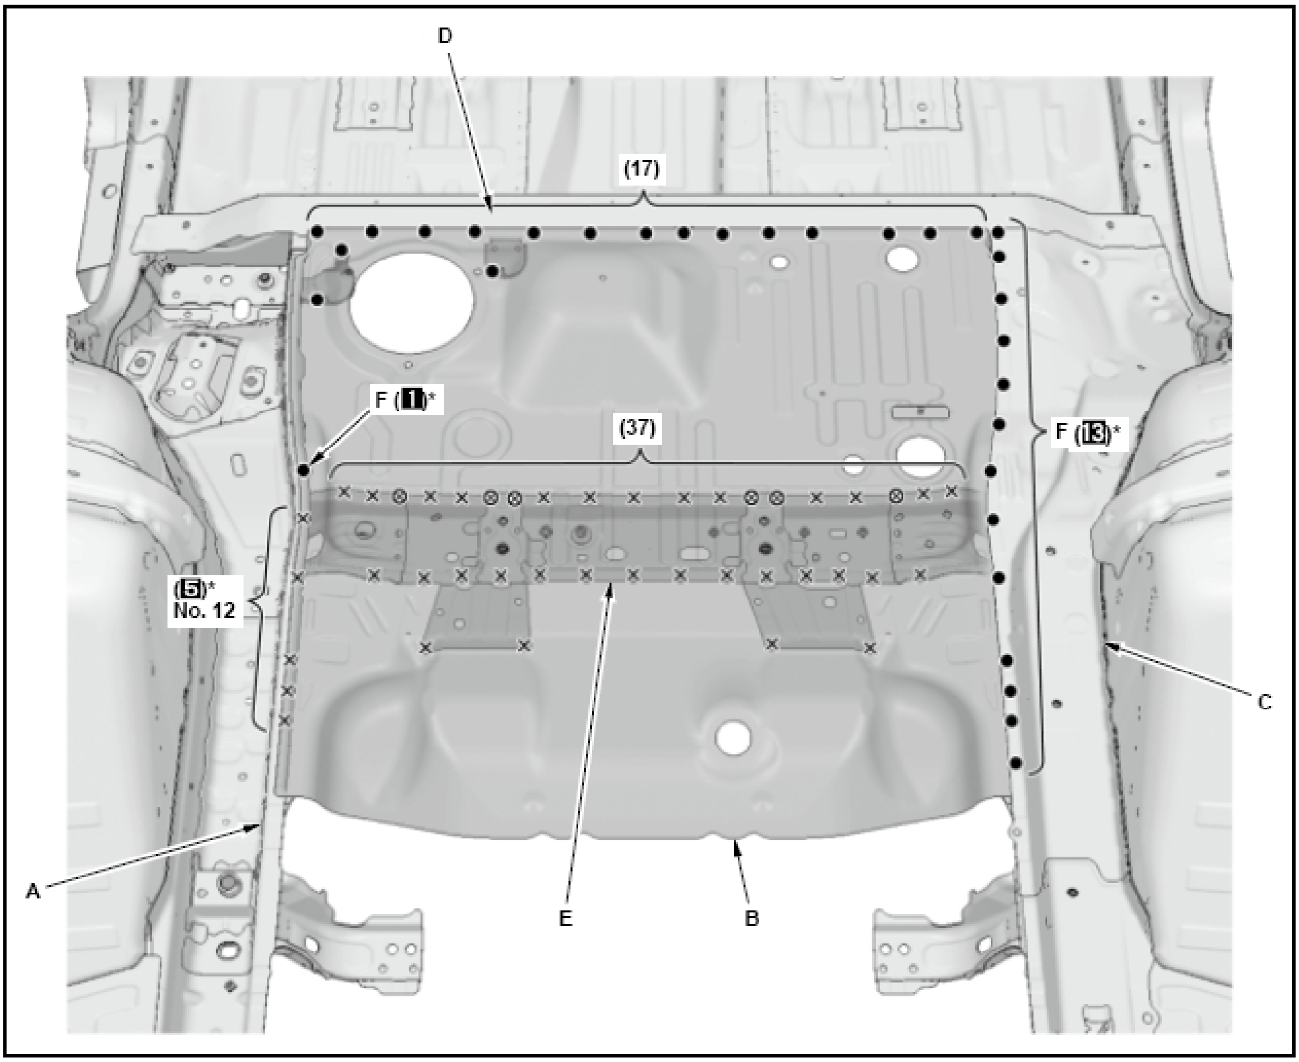
   (■)*: Welding positions with rear frame upper stiffener A, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 12 in the table shown below.** (See SPOT WELDING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

   SPOT WELDING CONDITION DESCRIPTION

No. 12	7500 A	600 ms	3432 N (350 kgf)

NOTE: **Welding positions (F): Must be welded according to the following conditions.**

Plug hole diameter: φ 10 mm (0.39 in)
Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).



Spare Tire Pan Complete - Weld

See REAR FLOOR/REAR FRAME REPLACEMENT.

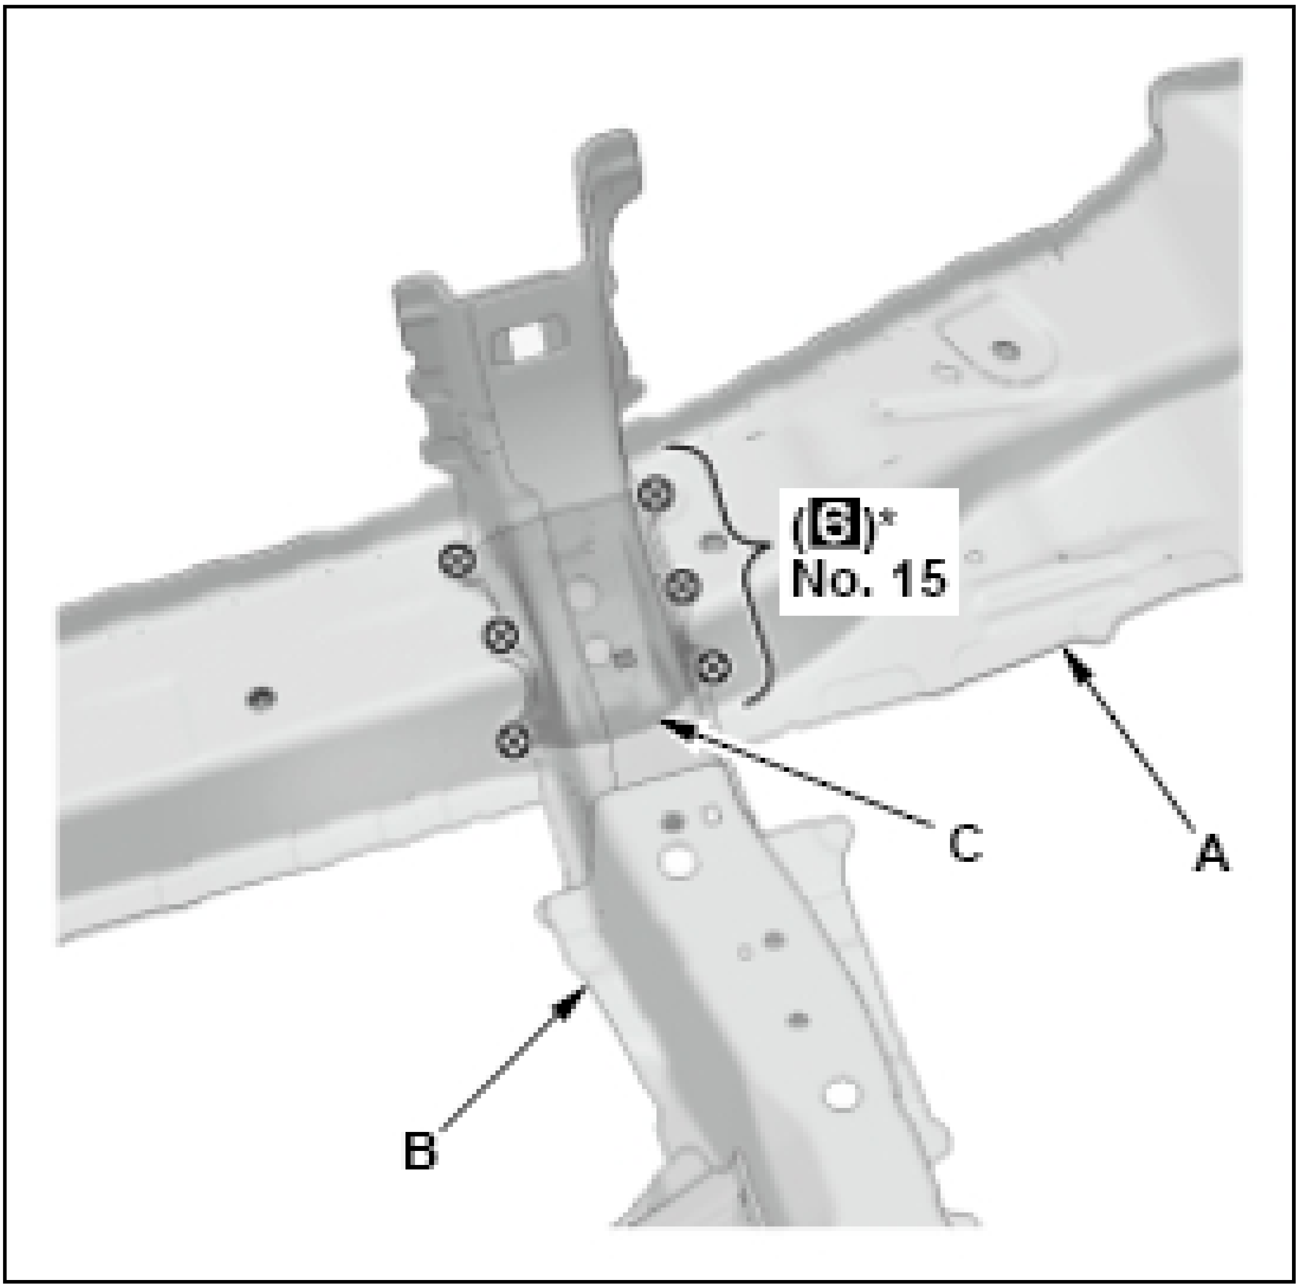
Rear Frame Upper Stiffener A/B (One Side) - Weld

1. Weld the new rear floor upper crossmember (B) to rear frame upper stiffener A and the upper stiffener bulkhead (C).

   (■)*: Welding positions with rear frame upper stiffener A, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 15 in the table shown below.** (See SPOT WELDING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

   SPOT WELDING CONDITION DESCRIPTION

No. 15	9000 A	600 ms	3432 N (350 kgf)



2. Weld the rear portion of rear frame upper stiffener A and rear frame upper stiffener B to rear frame A (C), the rear floor side panel (D), the rear frame flange (E), the rear wheelhouse (F), the spare tire pan (G), and the rear floor panel (H).

(■)*: Welding positions with rear frame upper stiffener A/B and rear frame A, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 13 and 14 in the table shown below.** (See SPOT WELDING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

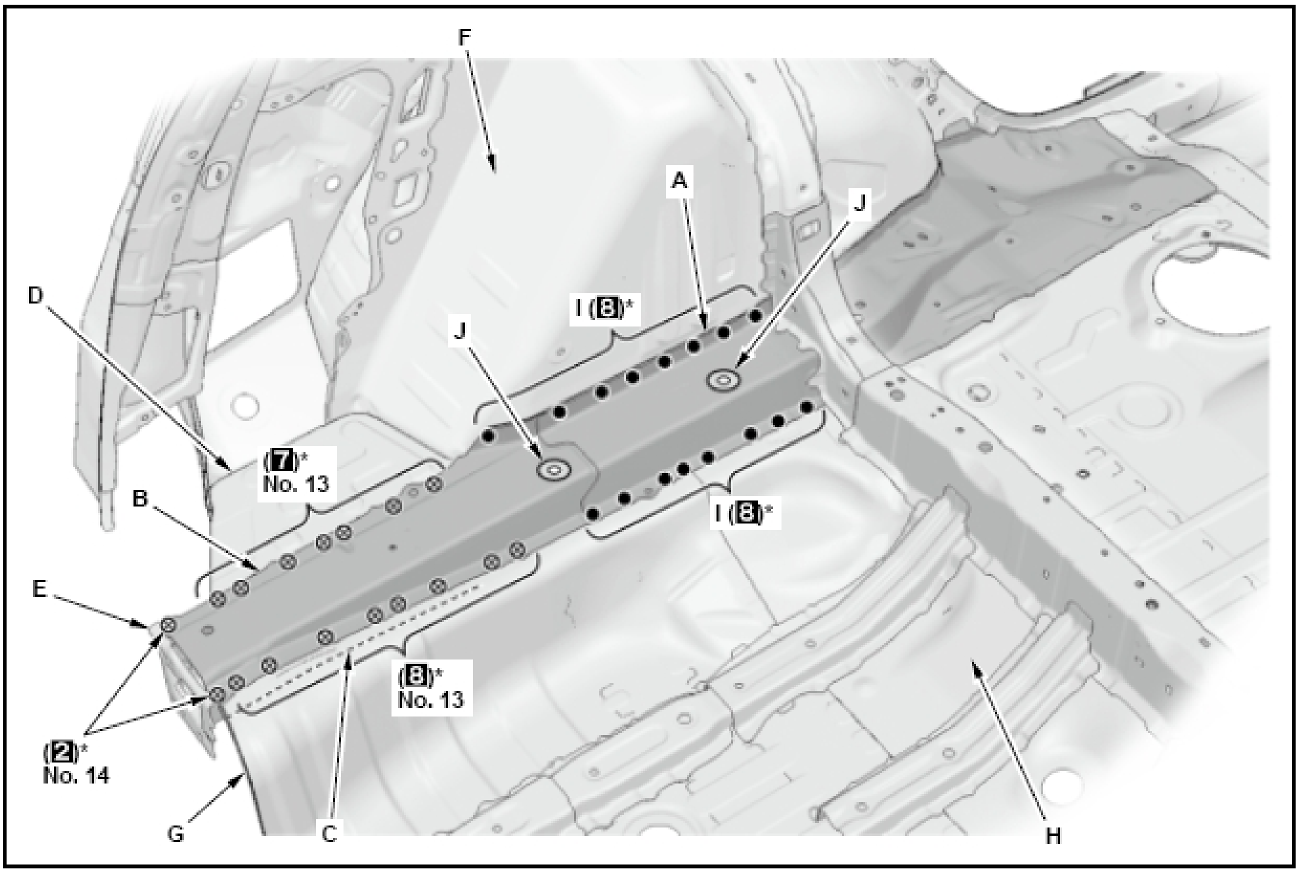
SPOT WELDING CONDITION DESCRIPTION

No. 13	8000 A	600 ms	3432 N (350 kgf)
No. 14	8500 A	600 ms	3432 N (350 kgf)

NOTE: **Welding positions (I): Must be welded according to the following conditions.**

Plug hole diameter: φ 10 mm (0.39 in)
Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

NOTE: **The indicated areas (J) are ground locations. Prior to installation of the IPU (high-voltage battery), make sure that these areas are not painted or have any corrosion.**



3. Weld the front portion of rear frame upper stiffener A to rear frame A (B), the side sill extension (C), the rear wheelhouse (D), the middle floor crossmember stiffener (E), and the rear floor panel (F).

(■)*: Welding positions with rear frame upper stiffener A and rear frame A, include ultra high-strength steel (1500 MPa) parts. **Perform the spot welding on the conditions of No. 13 and 14 in the table shown below. Confirm the MIG brazing conditions.** (See SPOT WELDING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA) And MIG BRAZING CONDITIONS FOR ULTRA HIGH-STRENGTH STEEL PARTS (1180 AND 1500 MPA)).

SPOT WELDING CONDITION DESCRIPTION

No. 13	8000 A	600 ms	3432 N (350 kgf)
No. 14	8500 A	600 ms	3432 N (350 kgf)

Side Sill Reinforcement - Weld

1. From the passenger's compartment, weld the side sill reinforcement (A) to the inner lower pillar extension (B) and the inside sill (C).

(■)*: Welding positions with the side sill reinforcement, include ultra high-strength steel (1500 MPa) parts. Confirm the MIG brazing conditions; refer to MIG Brazing Conditions For Ultra High-Strength Steel Parts (1180 And 1500 MPa) .

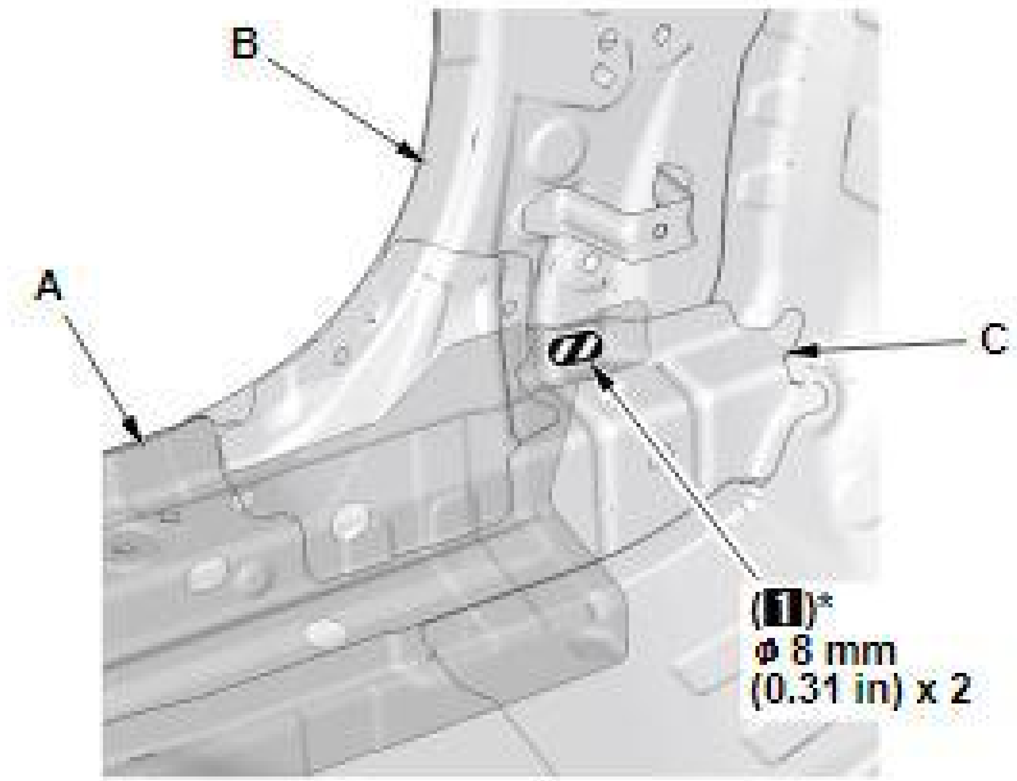

Fig. 8: Side Sill Reinforcement Installation Weld Counts, Measurement And Locations (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Weld the side sill reinforcement (A) to the front pillar lower stiffener (B) and the jack-up base (C).

(■)*: Welding positions with the side sill reinforcement, include ultra high-strength steel (1500 MPa) parts. Perform the spot welding on the conditions of No. 13 and 15 in the table shown below; refer to Spot Welding Conditions For Ultra High-Strength Steel Parts (1180 And 1500 MPa) . Confirm the MIG brazing conditions; refer to MIG Brazing Conditions For Ultra High-Strength Steel Parts (1180 And 1500 MPa) .

No. 13	8000 A	600 ms	3432 N (350 kgf)
No. 15	9000 A	600 ms	3432 N (350 kgf)

NOTE: **Welding positions (D): Must be welded according to the following conditions.**

Plug hole diameter: Γ□10 mm (0.39 in) Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

Center Pillar Stiffener - Weld

1. Install the new center pillar inner separator (A) to the center pillar lower stiffener (B). Apply the sealer (C) without gaps all the way around the separator and the center inner pillar (D).

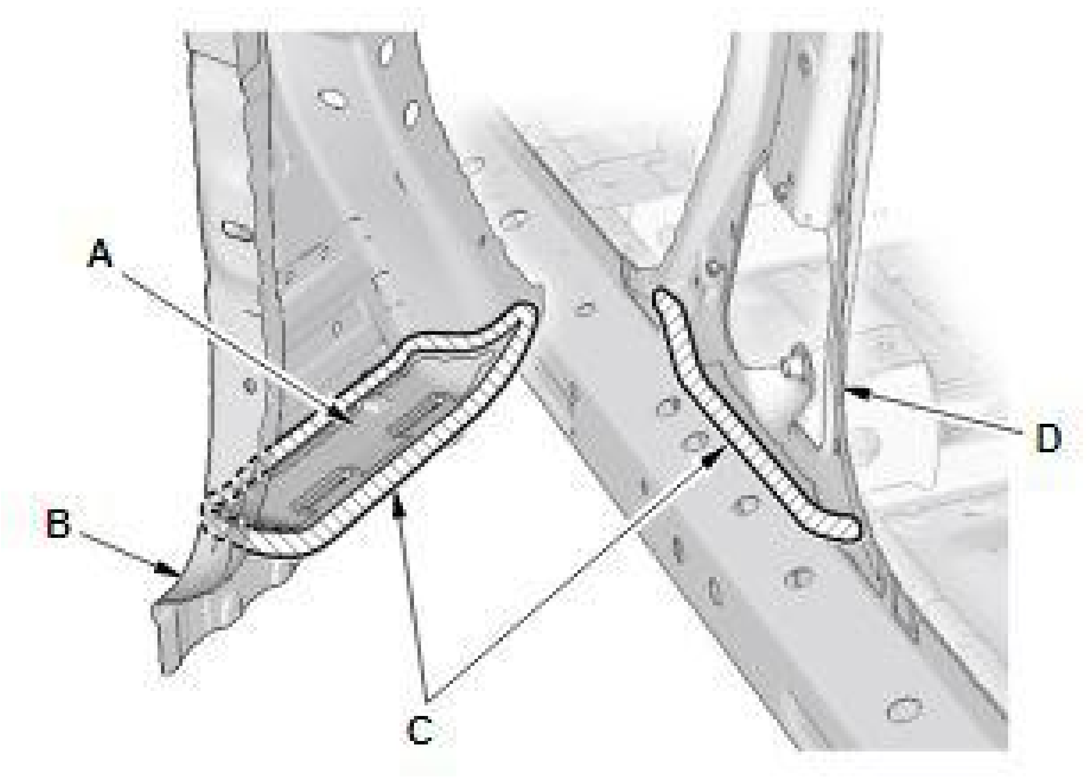

Fig. 11: Center Pillar Stiffener Separator And Body Sealer Installation Areas
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. **In case of side sill reinforcement replacement with center pillar upper stiffener left on body**

   Weld the center pillar lower stiffener (A) to the center pillar upper stiffener (B) and the side sill reinforcement (C).

   (■)*: Welding positions with the side sill reinforcement, include ultra high-strength steel (1500 MPa) parts. Confirm the MIG brazing conditions; refer to **MIG Brazing Conditions For Ultra High-Strength Steel Parts (1180 And 1500 MPa)** .

NOTE: **Welding positions (D): Must be welded according to the following conditions.**

Plug hole diameter: Γ□10 mm (0.39 in) Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

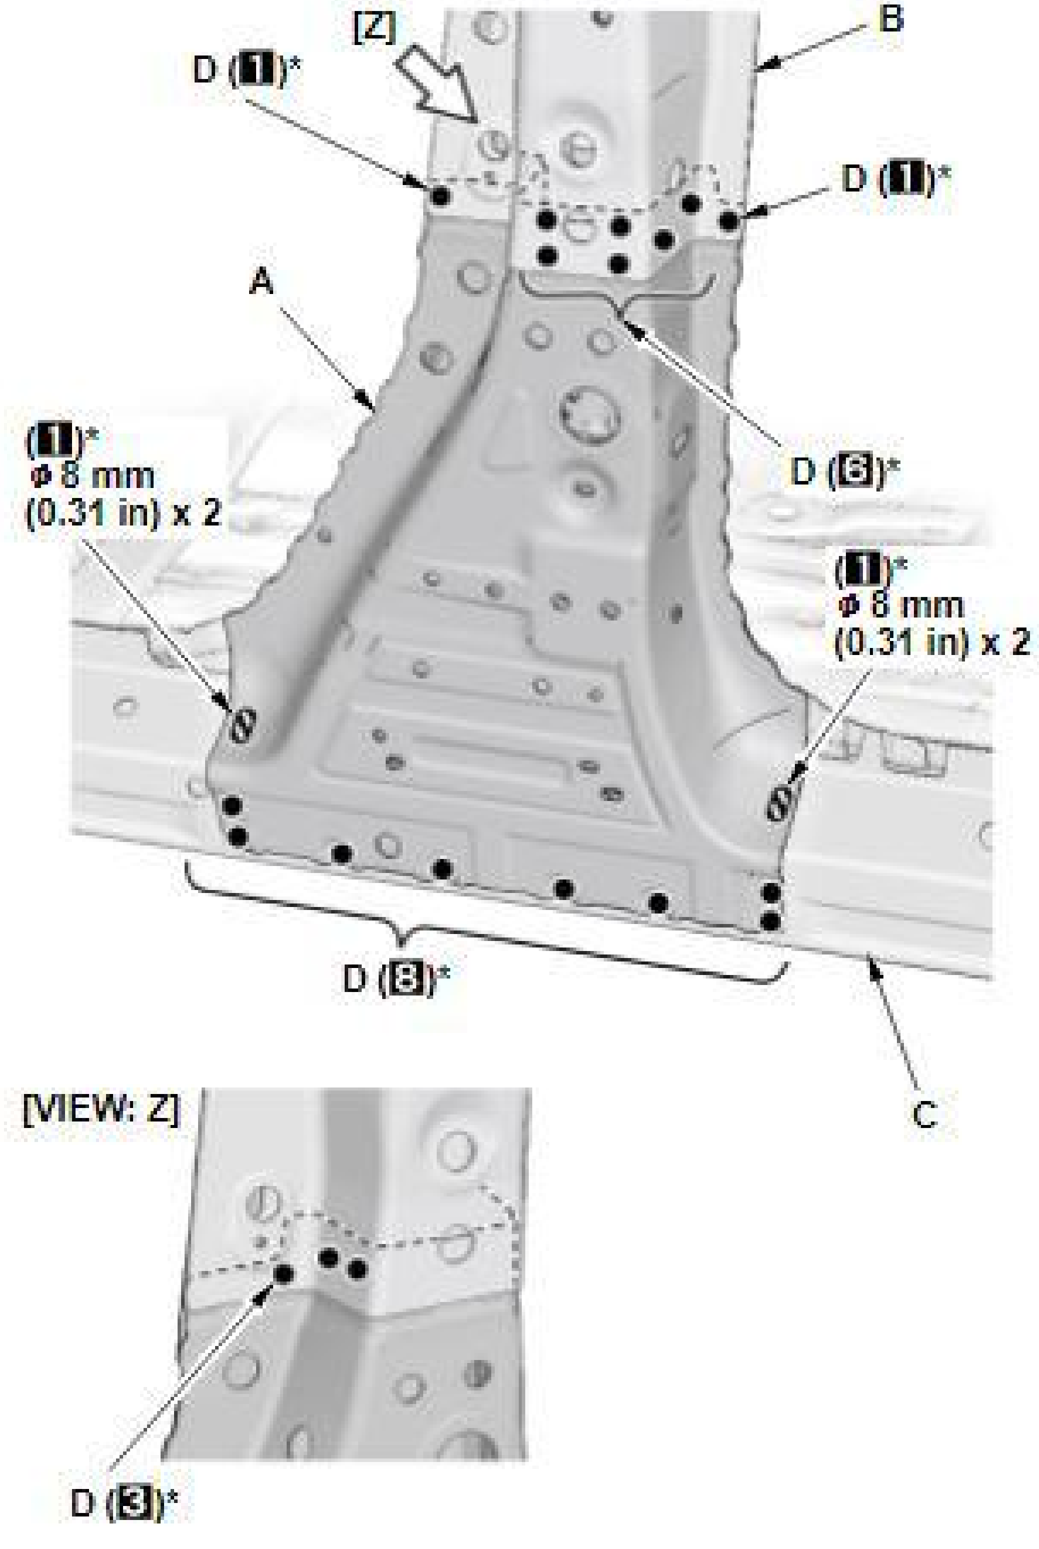

Fig. 12: Center Pillar Lower Stiffener Installation Weld Counts And Locations
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. **In case of center pillar stiffener complete replacement**

Weld the center pillar upper stiffener (A) to the front pillar upper stiffener (B) and the roof side stiffener (C).

(■)*: Welding positions with the center pillar upper stiffener and the front pillar upper stiffener, include ultra high-strength steel (1500 MPa) parts.

NOTE: **Welding positions (D): Must be welded according to the following conditions.**

Plug hole diameter: Γ□10 mm (0.39 in) Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

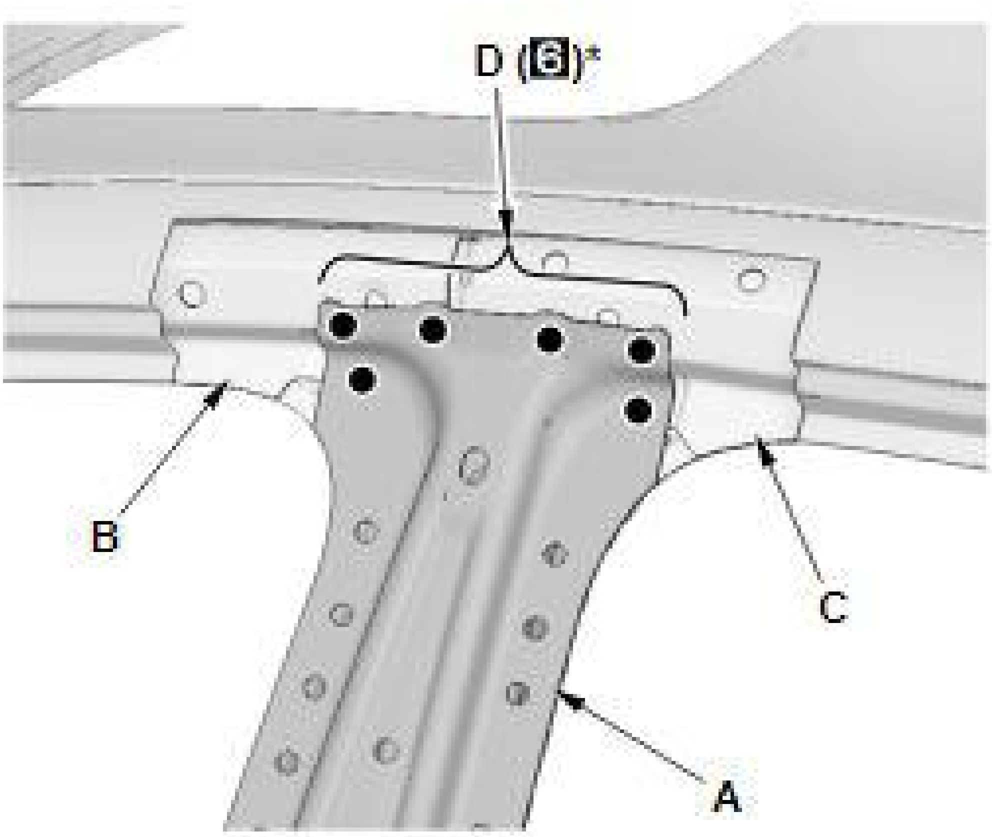

Fig. 13: Center Pillar Upper Stiffener Installation Weld Counts And Locations
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Weld the center pillar lower stiffener (A) to the side sill reinforcement (B).

(■)*: Welding positions with the side sill reinforcement, include ultra high-strength steel (1500 MPa) parts. Confirm the MIG brazing conditions; refer to MIG Brazing Conditions For Ultra High-Strength Steel Parts (1180 And 1500 MPa) .

NOTE: **Welding positions (C): Must be welded according to the following conditions.**

Plug hole diameter: Γ□10 mm (0.39 in) Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

Outer Panel Repair Part - Weld

1. **In case of part of outer panel repair part (front outer panel set) replacement**

   Weld the outer panel repair part (A).

   (■)*: Welding positions with the front pillar upper stiffener (B), the center pillar upper stiffener (C), and the side sill reinforcement (D), include ultra high-strength steel (1500 MPa) parts. Perform the spot welding on the conditions of No. 26 and 30 in the table shown below. Refer to Spot Welding Conditions For Ultra High-Strength Steel Parts (1180 And 1500 MPa) .

REMOVAL

NOTE:

- **High-strength steel is defined as any steel with a tensile strength of 340 MPa or higher. If a part is constructed of, or includes high-strength steel observe the important guidelines. Refer to Repair Guidelines For High-Strength Steel Parts .**
- **Welding symbols (The welding symbols with dashed lines have a meaning of the spot welding of the part which is not visible) ; refer to Symbols Definition**
- **(): The number of welds**

Rear frame A and rear frame upper stiffener B are made from ultra high-strength steel (UHSS) (1500 MPa). However, at the [X] and [Y] areas which are shown in the illustrations, each part is made from high-strength steel (except 1500 MPa). For this reason, sectioning is possible at areas [X] and [Y]. Do not cut except the [X] and [Y] areas.

INSTALLATION

NOTE:

- **Position the replacement parts. Before doing the main welding, check the body dimensions:**
  - **Refer to Rear Pillar Gutter And Rear Panel Positions Dimension .**
  - **Refer to TAILGATE OPENING .**
  - **Refer to Front Floor And Rear Floor, Under View Dimension .**
  - **Refer to Frame Repair Chart .**
- **Temporarily install the related parts, then check for differences in level and clearance. Check the External Parts Fitting Positions; refer to External Parts Fitting Positions . Make sure the body lines flow smoothly.**
- **Confirm the sheet thickness, tensile strength, and existence of the zinc treatment of both sides, and set the welder to conform to the welding conditions by referring to Roof And Side Panel Construction , and FLOOR AND REAR BODY CONSTRUCTION .**
- **Welding symbols (The welding symbols with dashed lines have a meaning of the spot welding of the part which is not visible) ; refer to Symbols Definition .**
- **() and ()*: The number of welds**

Rear Frame A, Rear Portion - Weld

1. Weld the rear portion of new rear frame A and the body side rear frame A (B).

   L*: Welding positions with high-strength steel parts. Confirm the butt welding conditions; refer to MAG Welding Conditions For High-Strength Steel (Except 1500 MPa) Parts .

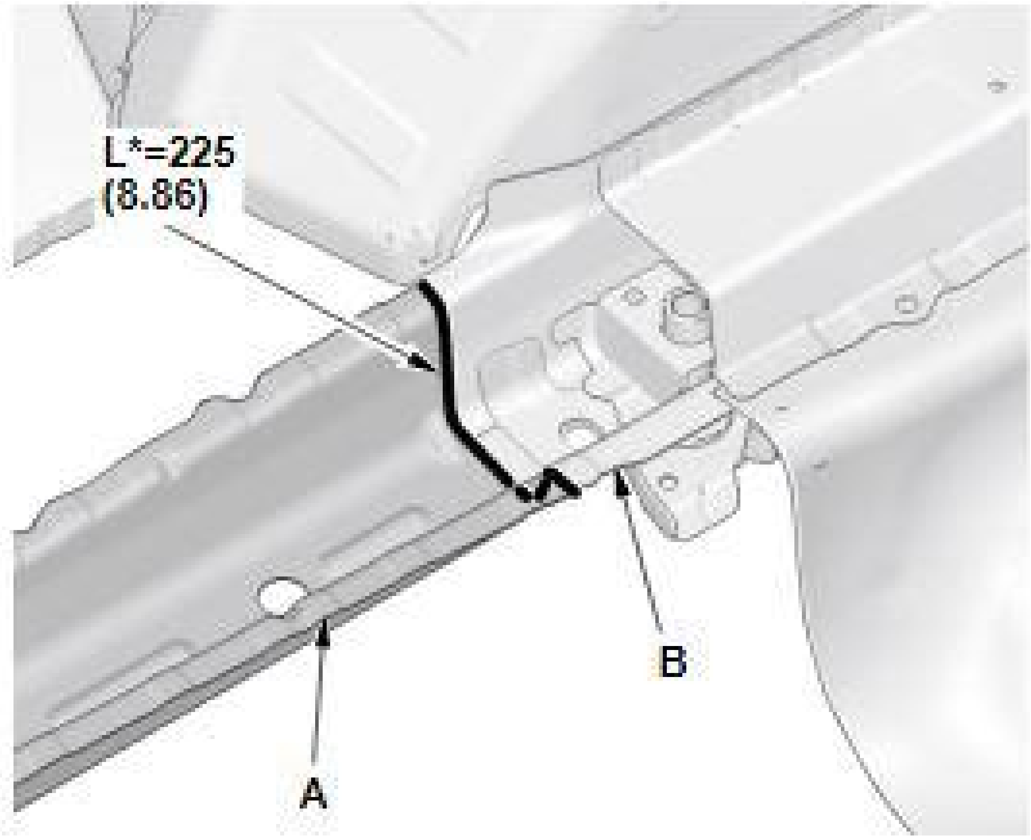

Fig. 55: Rear Frame A Installation Weld Measurements And Locations
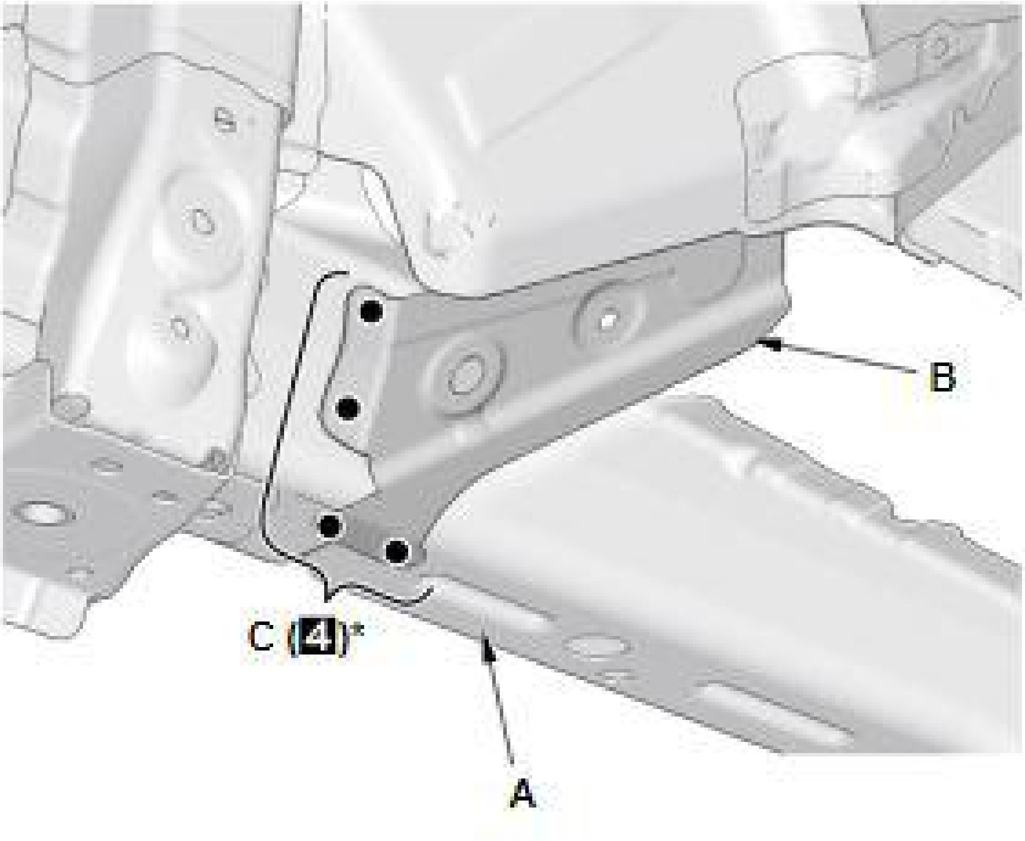
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Weld the rear frame side outrigger (B) to rear frame A.

(■)*: Welding positions with rear frame A, include ultra high-strength steel (1500 MPa) parts.

NOTE: **Welding positions (C): Must be welded according to the following conditions.**

Plug hole diameter: Γ□10 mm (0.39 in) Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).



[Fig. 56: Rear Frame Side Outrigger Installation Weld Counts And Locations](#)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear Floor Side Panel - Weld

1. Weld the rear floor side panel (C) to rear frame A, the rear frame side outrigger (B), the rear wheelhouse (D), the wheelhouse upper patch (E), and the outer panel (F).

   (■)*: Welding positions with rear frame A, include ultra high-strength steel (1500 MPa) parts. Perform the spot welding on the conditions of No. 12 in the table shown below. Refer to **Spot Welding Conditions For Ultra High-Strength Steel Parts (1180 And 1500 MPa)** .

No. 14	8500 A	600 ms	3432 N (350 kgf)

NOTE: **Welding positions (C): Must be welded according to the following conditions.**

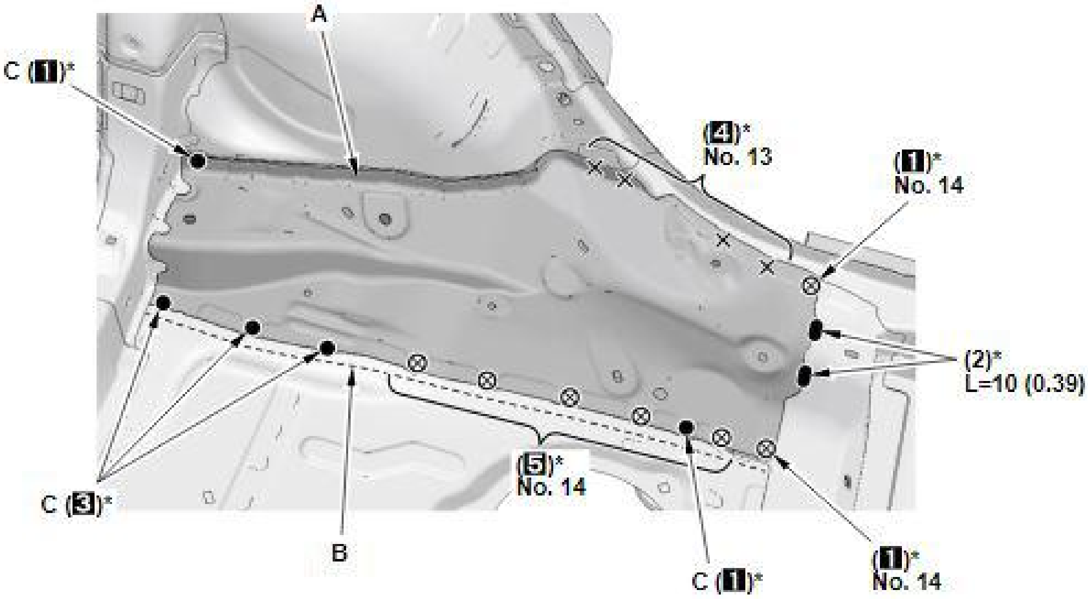
Plug hole diameter: Г□10 mm (0.39 in) Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

()*: Welding position with high-strength steel parts. Confirm the plug welding conditions; refer to MAG Welding Conditions For High-Strength Steel (Except 1500 MPa) Parts .



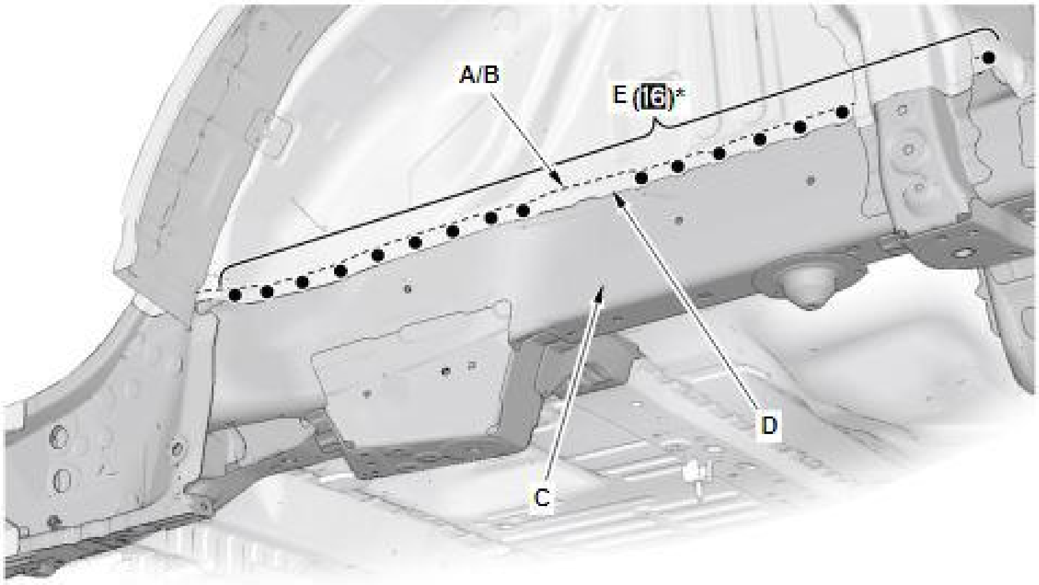
[Fig. 83: Rear Frame Upper Stiffener Installation Weld Counts, Measurements And Locations (2 Of 3)]
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Weld rear frame upper stiffener A/B to rear frame A (C) and the rear wheelhouse (D).

   (■)*: Welding positions with rear frame upper stiffener A/B and rear frame A, include ultra high-strength steel (1500 MPa) parts.

   NOTE: **Welding positions (E) : Must be welded according to the following conditions.**

   Plug hole diameter: Γ□10 mm (0.39 in) Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).



[Fig. 84: Rear Frame Upper Stiffener Installation Weld Counts And Locations (3 Of 3)]
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Weld the rear floor upper crossmember complete (B) to the rear floor panel (C), the rear floor crossmember (D), rear frame upper stiffener A, and the rear wheelhouse stiffener upper (E).

   (■)*: Welding positions with rear frame upper stiffener A, include ultra high-strength steel (1500 MPa) parts.

   NOTE: **Welding positions (F) : Must be welded according to the following conditions.**

   Plug hole diameter: Γ□10 mm (0.39 in) Welding wire: Must use wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

INTRODUCTION

This service information explains the basic guidelines to repair automotive sheet metal damaged by a collision or other situation. This service information includes basic body repair information, basic sheet metal repair, and common body repair guidelines.

Please refer to the specific body repair and/or service information for each model when replacing parts, clarifying model specific dimensions, or other situations requiring specific repair information.

Model-specific service information includes the specific and unique repair information for each model, but do not include the general information provided in this service information.

Please note that some models may require particular maintenance even for the items included in this basic service information.

Please refer to the service information for the specific model in such cases:

- All information is based on the latest product information available at the time of publishing. We reserve the right to make changes without notice.
- Honda service and body repair information is edited for those with basic knowledge and skills about Honda and Acura vehicles. Therefore, those without such skills or knowledge may not be able to successfully maintain the vehicle even following the information provided in this service information.

SYMBOLS DEFINITION

Replacement

NOTE: **Welding symbols (The welding symbols with dashed lines have a meaning of the spot welding of the part which is not visible).**

✕ and ⁘	2-Plate spot welding
⊗ and ⊗	3-Plate spot welding
⊠ and ⊠	4-Plate spot welding
●	MAG plug welding
⬬	MAG welding
(■)*	Double Hole MIG brazing (1500 MPa to HSS/UHSS)
( )*	Single Hole MIG brazing (270 MPa to 1500 MPa)
L and L* =	Welding length unit: mm (in)
() and ()*	The number of welds

Body Dimensional Drawings

Body measuring dimensions show the distance between the forward or upper edge of positioning bosses and/or holes shown in the detail illustration. However, the measuring points in the frame repair chart are always the centers of the holes.

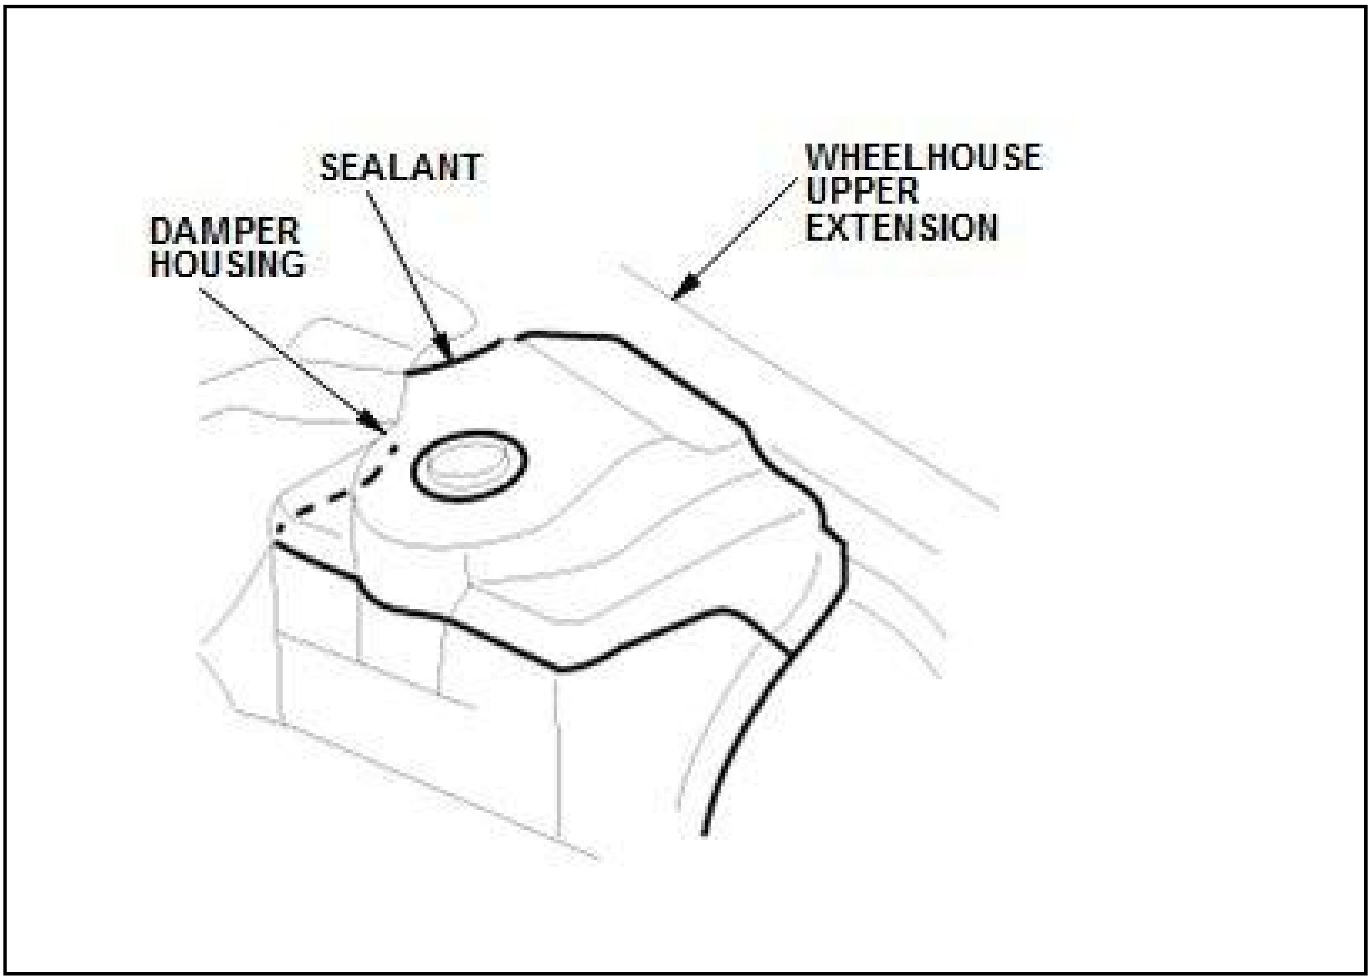
Rust Prevention

The following type of illustration shows the areas where sealant is to be applied.

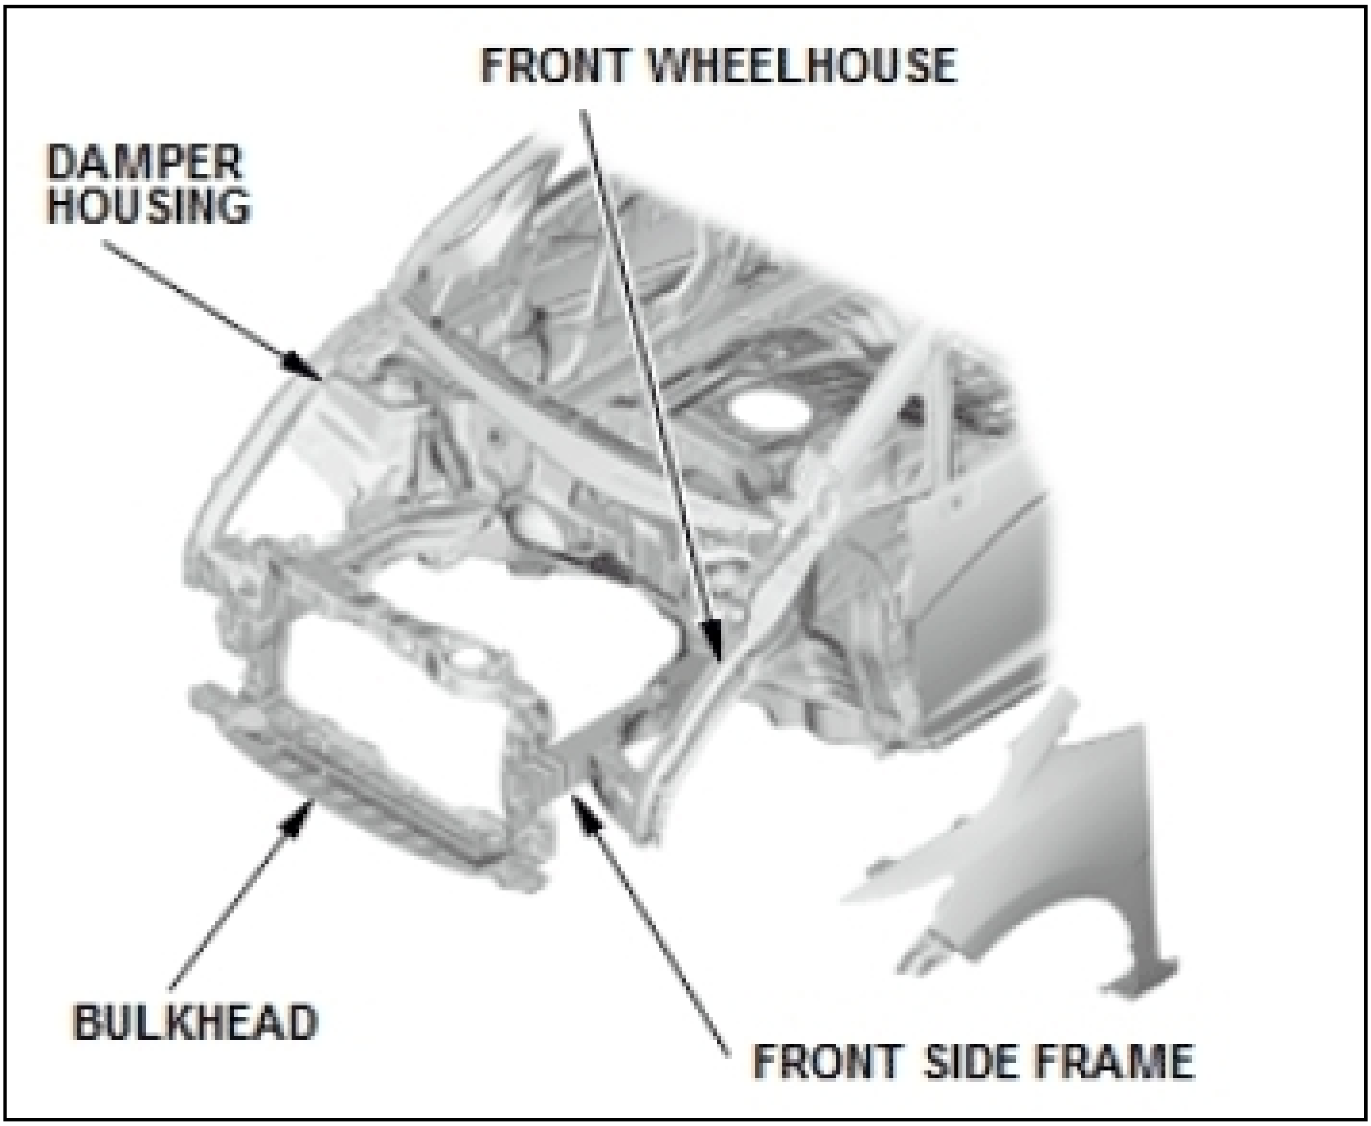


BODY STRUCTURE

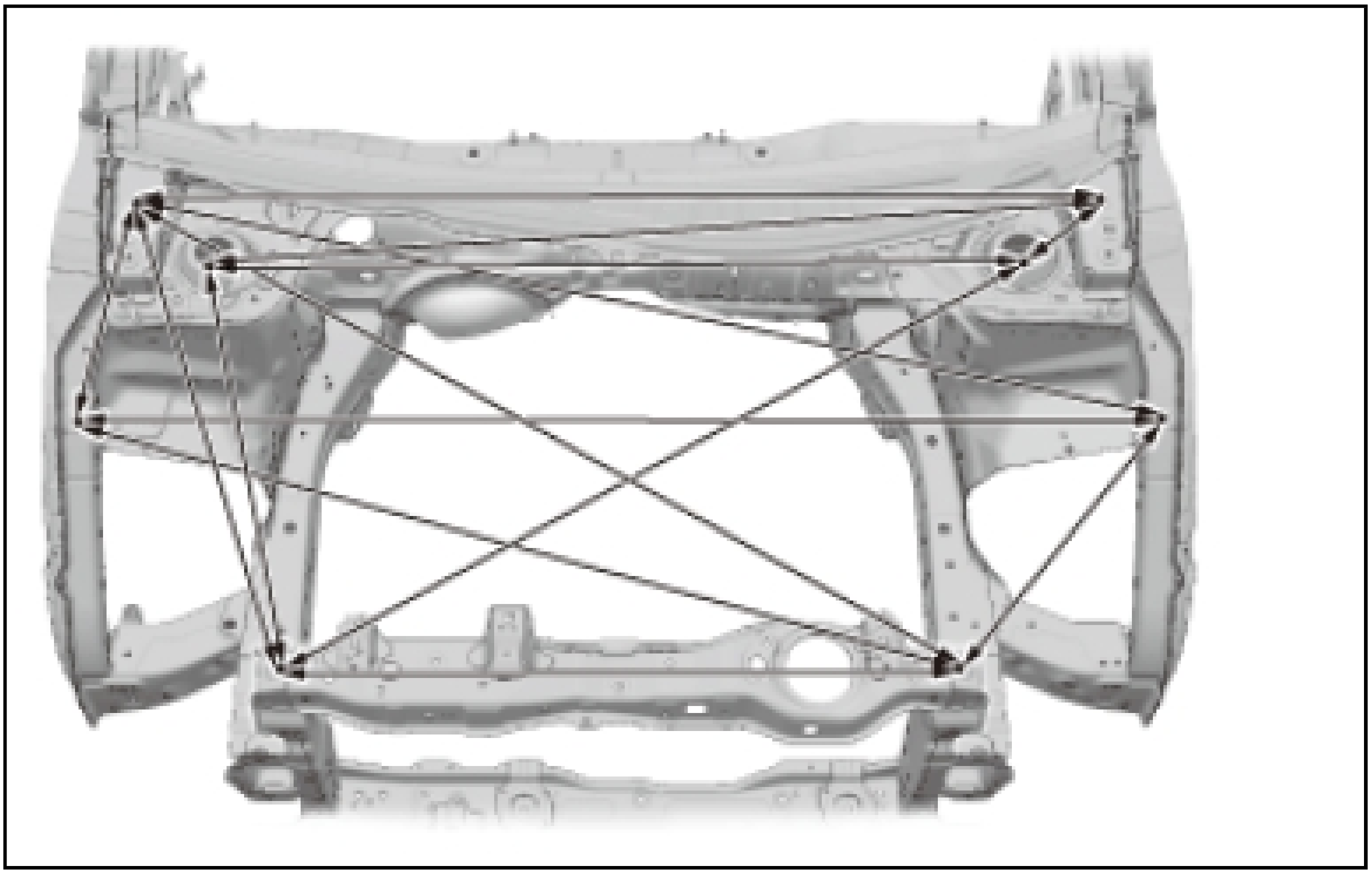
BODY DAMAGE INSPECTION

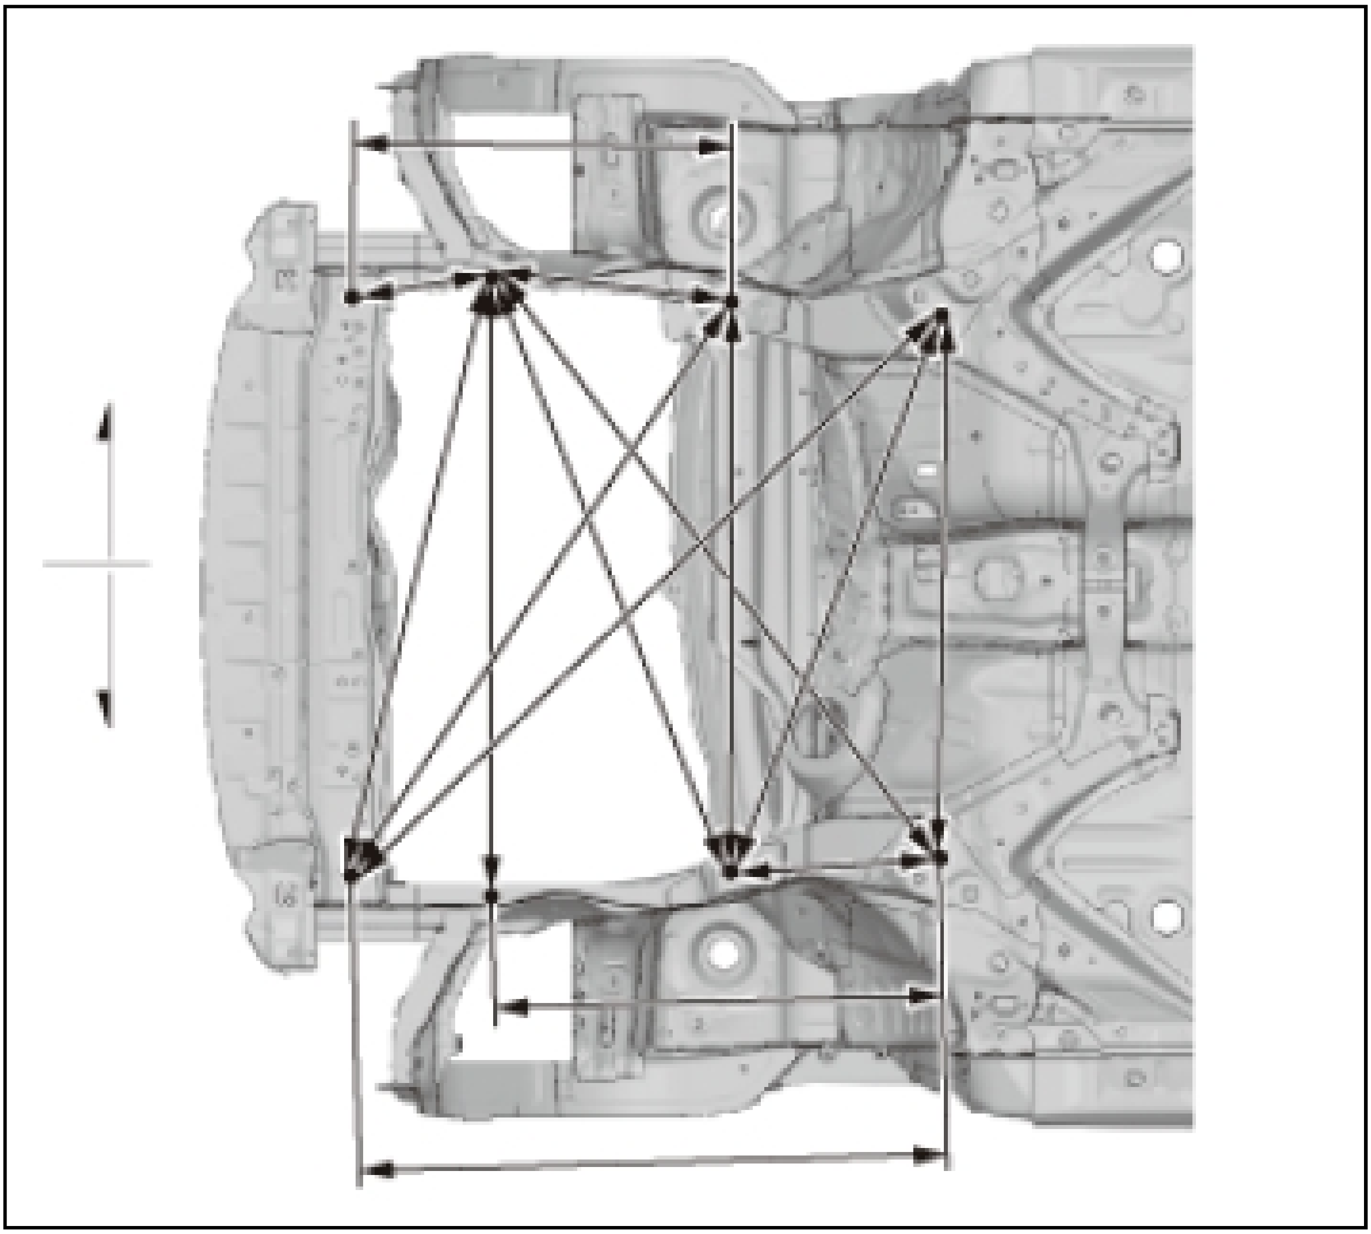
Front Body Damage

- The framework of the front body is composed of the bulkhead, front side frame, wheelhouse and damper housing. In order to evaluate the damage correctly it is important to check not only for the deformation and cracks of the component parts but also to check thoroughly for the deformation of the dashboard and the front pillar.
- Reliance on visual checks alone will overlook some serious damage. Therefore, it is strongly recommended to measure the body using an appropriate gauge. In particular, it is vital to use a gauge to measure the damper housing and side frame positions because both of them greatly influence wheel alignment. The gauge must be used based on the datum point placed on a non-damaged part.
- It is possible to check the damage with the outer panel assembled, but pay attention to the following points:
    - Deformation of front bulkhead
    - Deformation of right/left front wheelhouses/damper housings
    - Deformation of right/left front side frames at frame rear end
    - Deformation of dashboard upper/lower panels



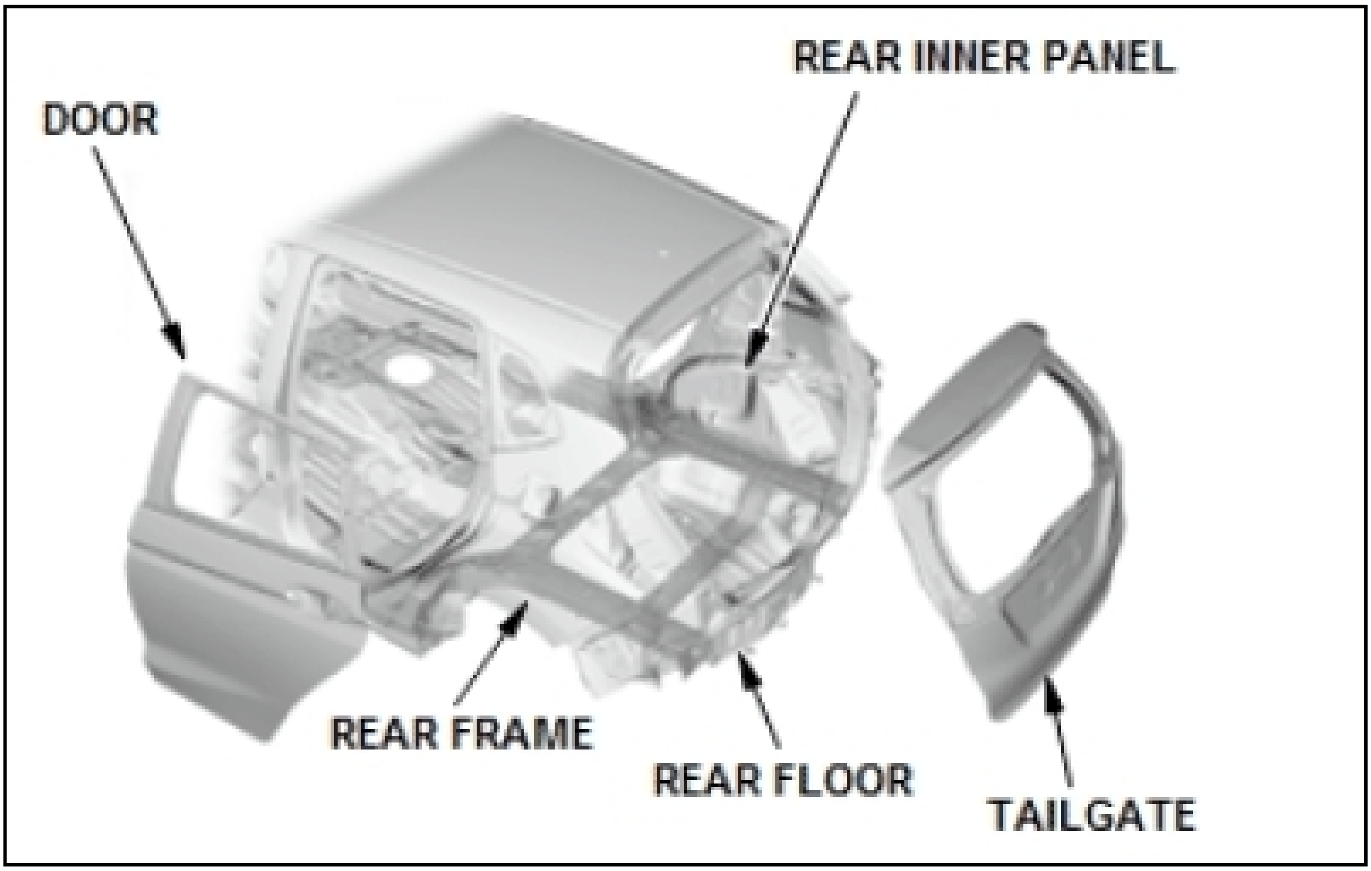
FRONT WHEELHOUSE
DAMPER HOUSING
BULKHEAD
FRONT SIDE FRAME



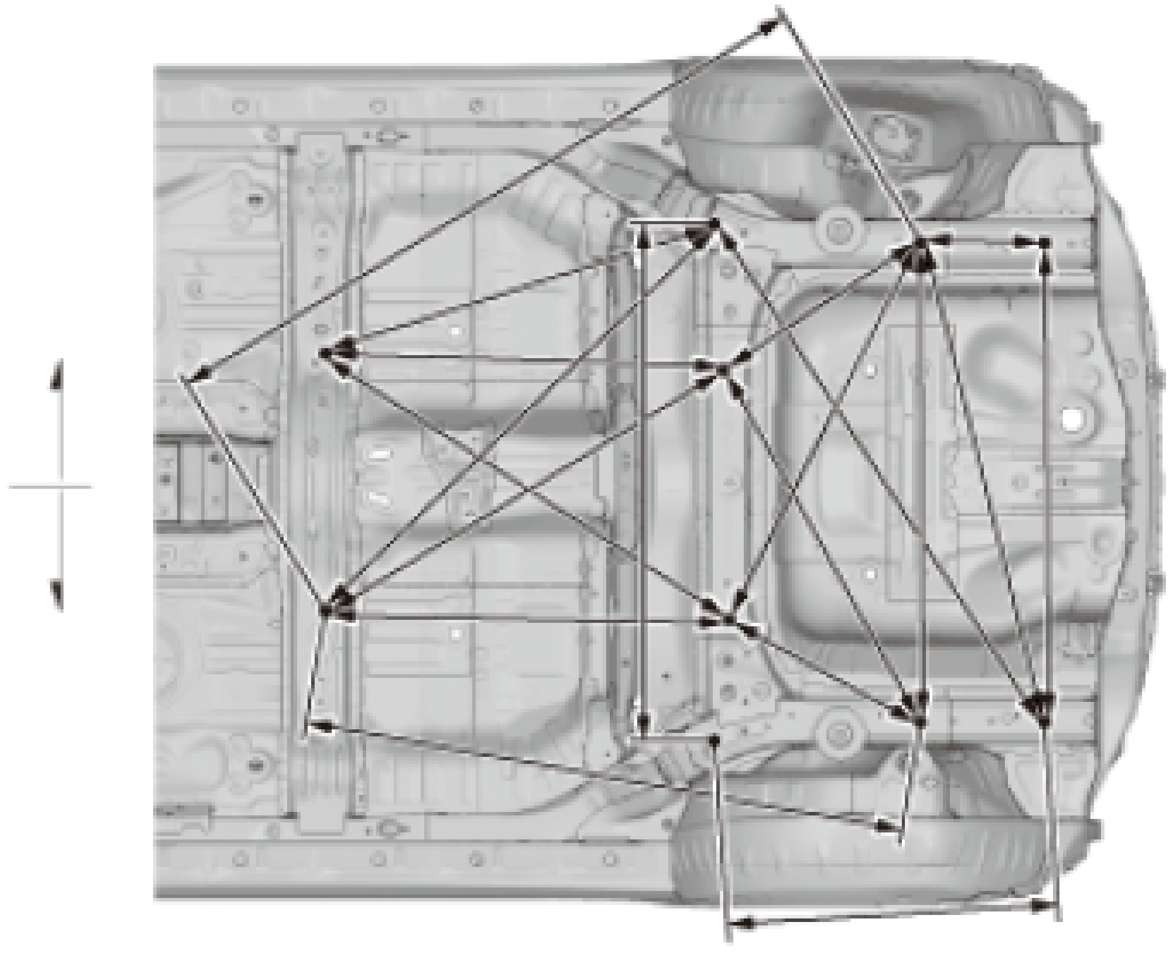


Rear Body Damage

- In addition to inspection of external appearance such as fit and finish of the attached parts, also check for lateral, horizontal, and vertical deformation.
- When measuring damaged parts, place a datum point on a non-damaged part:
  - Deformation of rear panels
  - Deformation of rear side outer panels
  - Fit and finish of trunk/rear inner panels/rear doors
  - Deformation of rear floor and rear frame



REAR INNER PANEL
DOOR
REAR FRAME
REAR FLOOR
TAILGATE



Side Body Damage

In addition to inspection of the external appearance such as fit and finish of the doors, use a gauge to measure the level of damages accurately by placing a datum point on a non-damaged part:

- Deformation of side sills
- Deformation of front/center/rear pillars
- Deformation of roof panel
- Deformation of floor panel

FUNDAMENTALS OF UNIBODY CONSTRUCTION

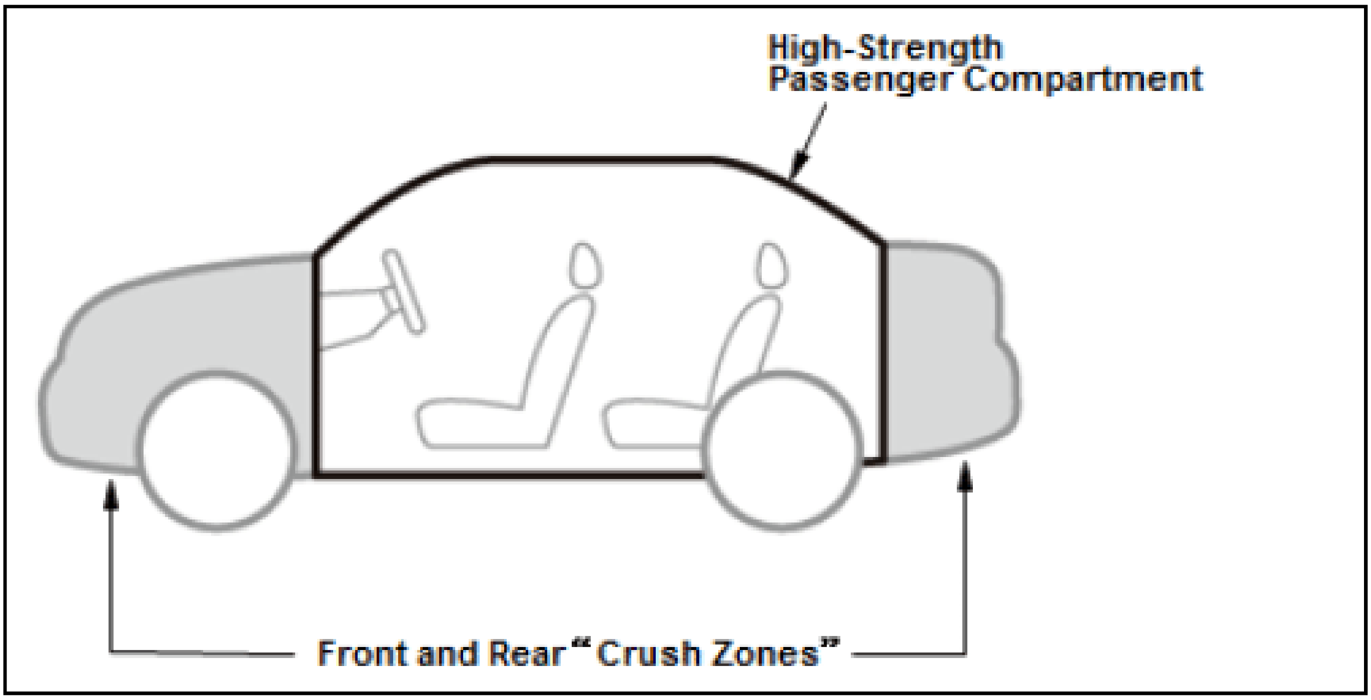
Basic Body Structure

An automobile body consists of many different component parts, each of which is stamped from a thin steel. Most parts are united into a complete unitized body using electric resistance spot welding. In this fashion, a unitized body or "unibody, structure has no independent frame. Stamped parts are assembled as part of the body Components such as an engine, suspension, and steering system are directly installed to the body structure. Unibody construction is the most common vehicle construction method in the automotive industry.

A unibody is structured by a wide variety of stamped steel parts in different shapes and dimensions, joined by welding into one complete body In order to meet all of the requirements of the body as a whole, each of those parts share the responsibility of meeting the necessary criteria on strength and rigidity as well as weight reduction, accuracy, durability performance etc.

In addition, to protect the passengers in case of collision, the body structure must allow a certain amount of deformation if a front or rear crash impact occurs. By effectively absorbing the impact energy through "crush zones" in the body structure, a "survival space" is maintained in the passenger compartment. Effects of the impact on the vehicle's passengers are also mitigated.

The image below shows typical body crush zones. The passenger compartment is reinforced by structural members to dissipate front and rear impacts. The side frame is similar in strength to the front and rear body receives impact forces. This will cause ripple effects and secondary damage, but the side frame is designed to minimize deformation in the passenger compartment area.



- Floor Is the Core of a Unibody Structure

  The floor is the core part of unibody construction. The floor gets formed by a deep-draw. The floor's strength comes from the drawn floor tunnel and reinforcements installed in lateral, horizontal and angled directions.

  The strength (rigidity) of this floor panel is further increased by joining the front side frame, side sills and crossmembers through spot welding.

- Passenger Compartment (Cabin) Structure

  The passenger compartment is very important because it protects the passengers. On more recent models, passenger compartment has been made much stronger to provide better crash protection in a much wider range of impacts.

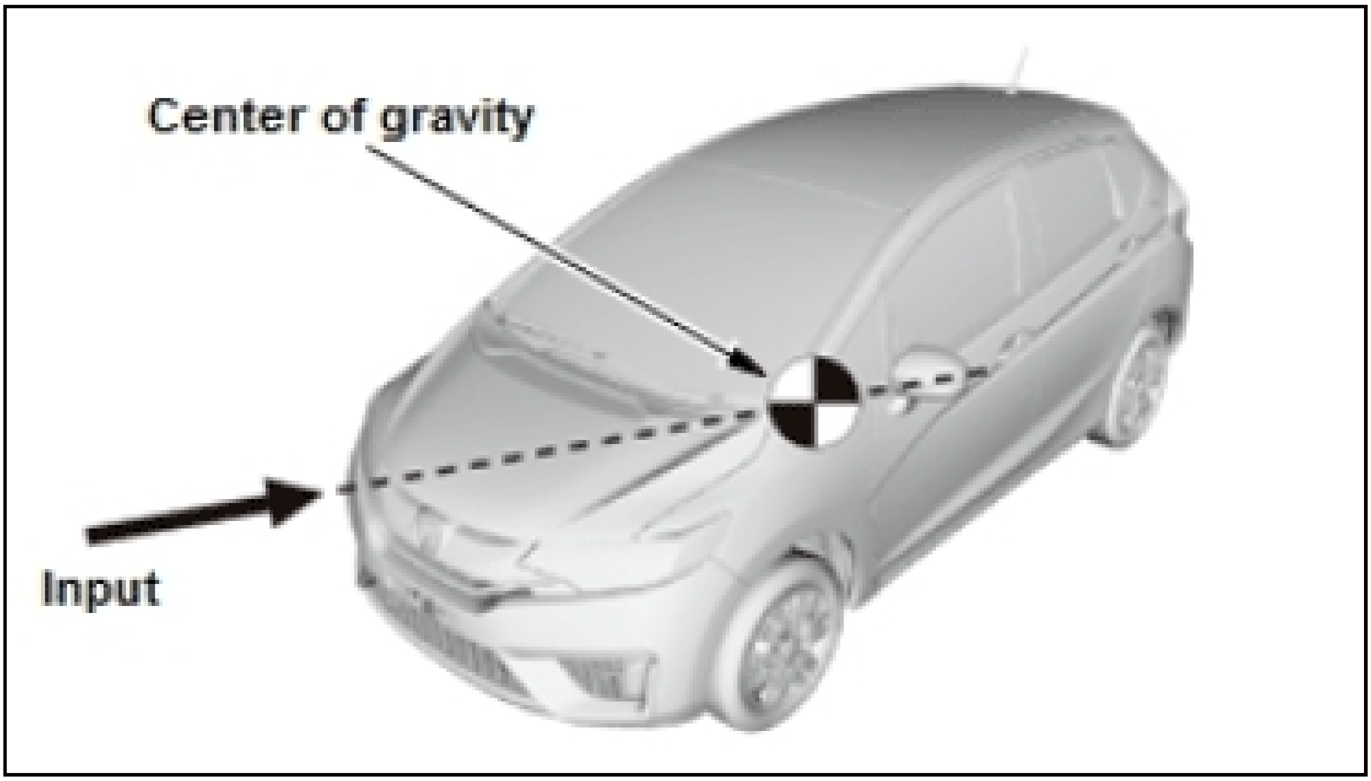
  Passenger compartment strength is attained by the combined strength of its individual parts, such as: the floor panel, front pillars, center pillar, rear pillars, dash board, rear body roof side rails and roof panel. The cabin is capable of withstanding a certain level of impact.

Collision Angle And Damage

Collisions can be categorized into two types depending on direction of impact. One is the centripetal-force, or a collision toward the vehicle's center of gravity The other is a tangential-force collision directed off the center of gravity. They result in different degrees of damage.

Centripetal Collision

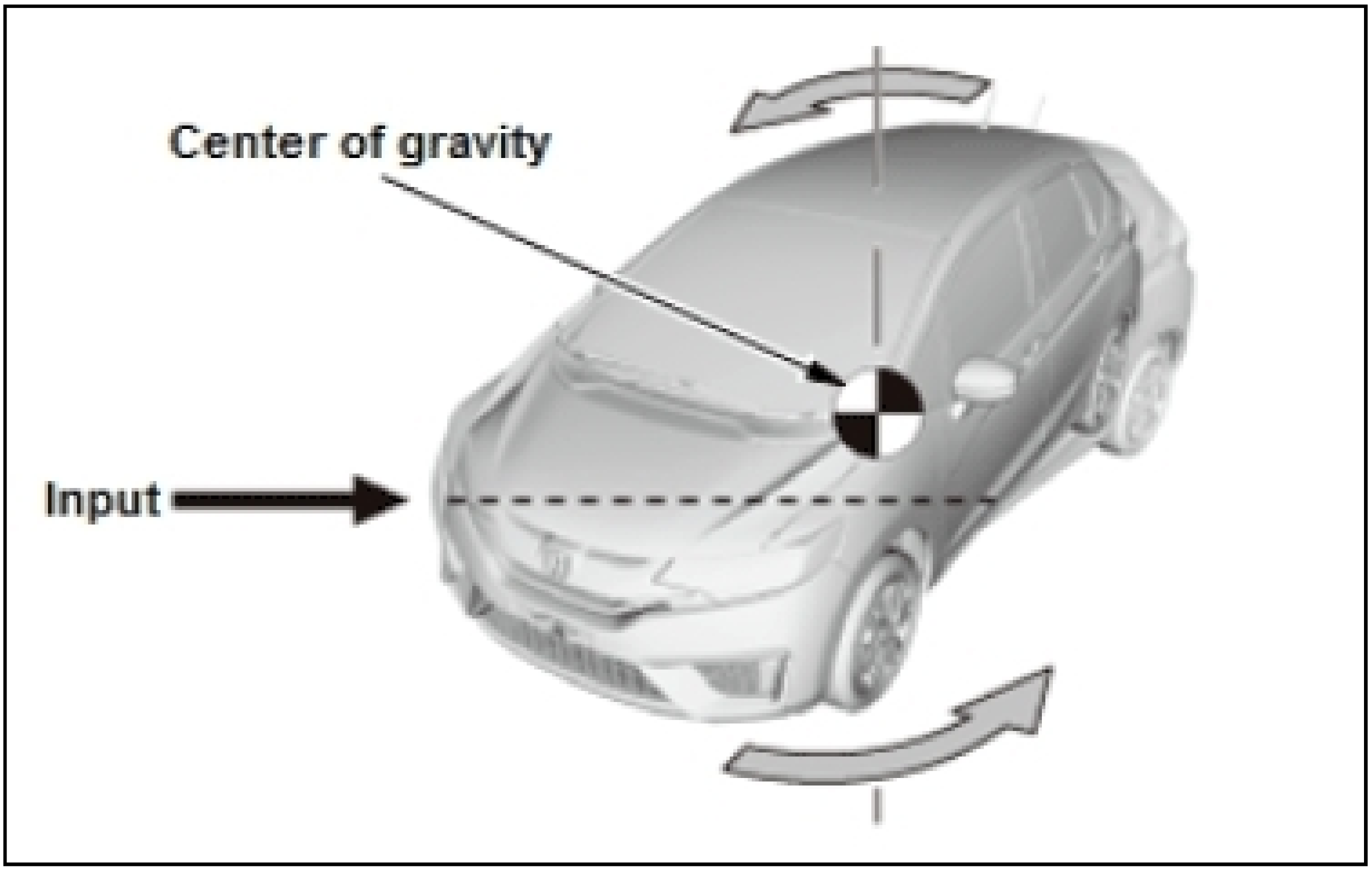
Causes serious damage because the horizontal movement of the vehicle is constrained during the collision.



Center of gravity
Input

Tangential Collision

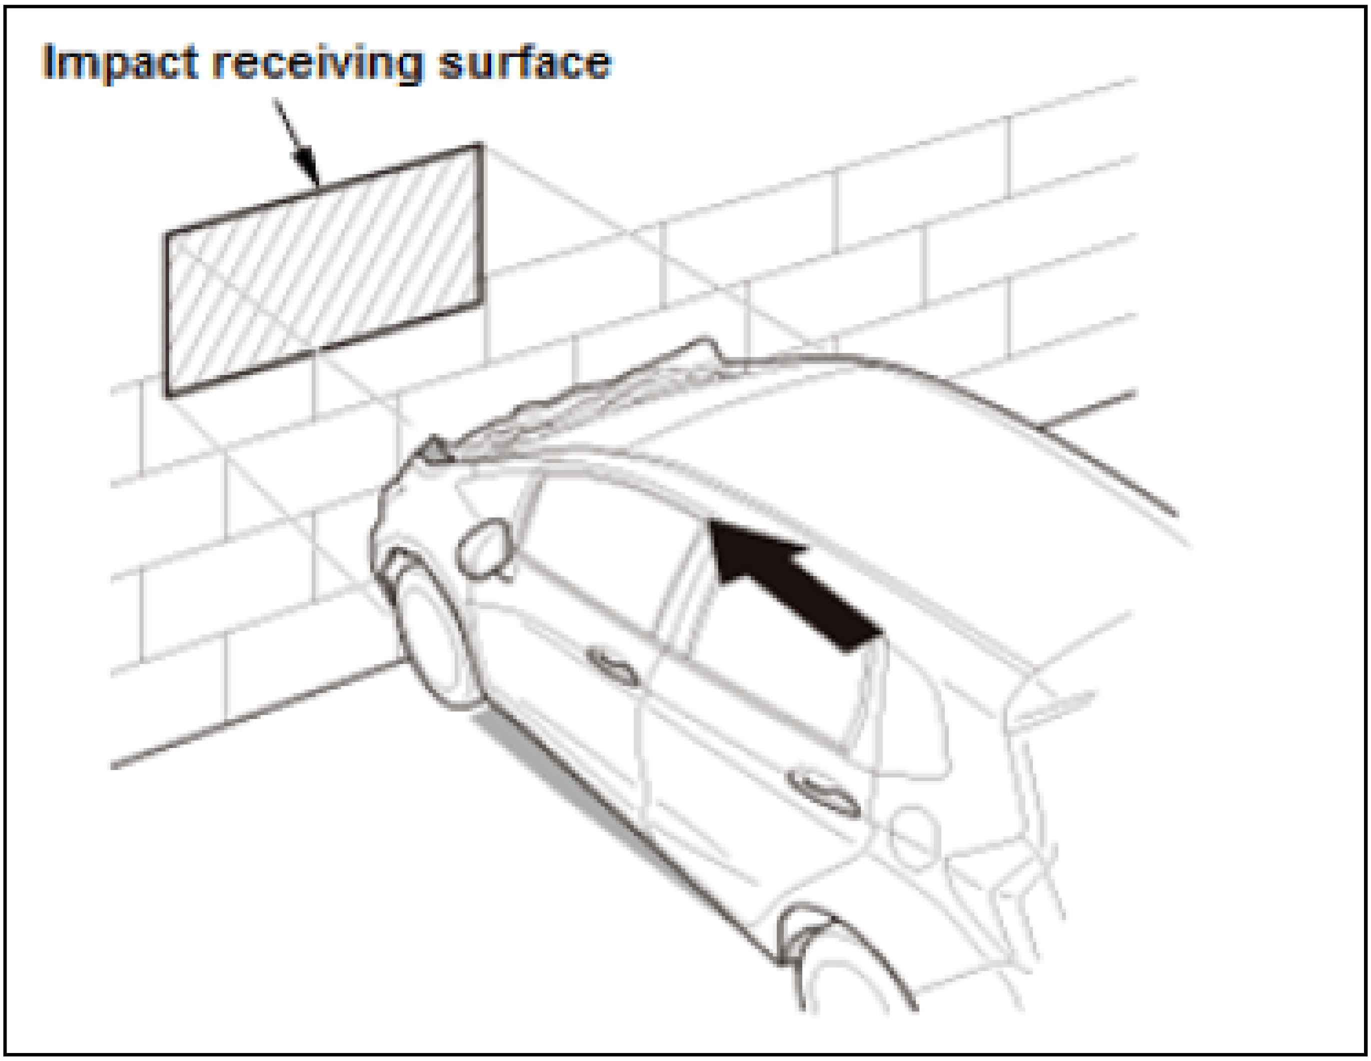
Causes relatively light damage because the vehicles move when impacted and each absorbs some of the energy.



Center of gravity
Input

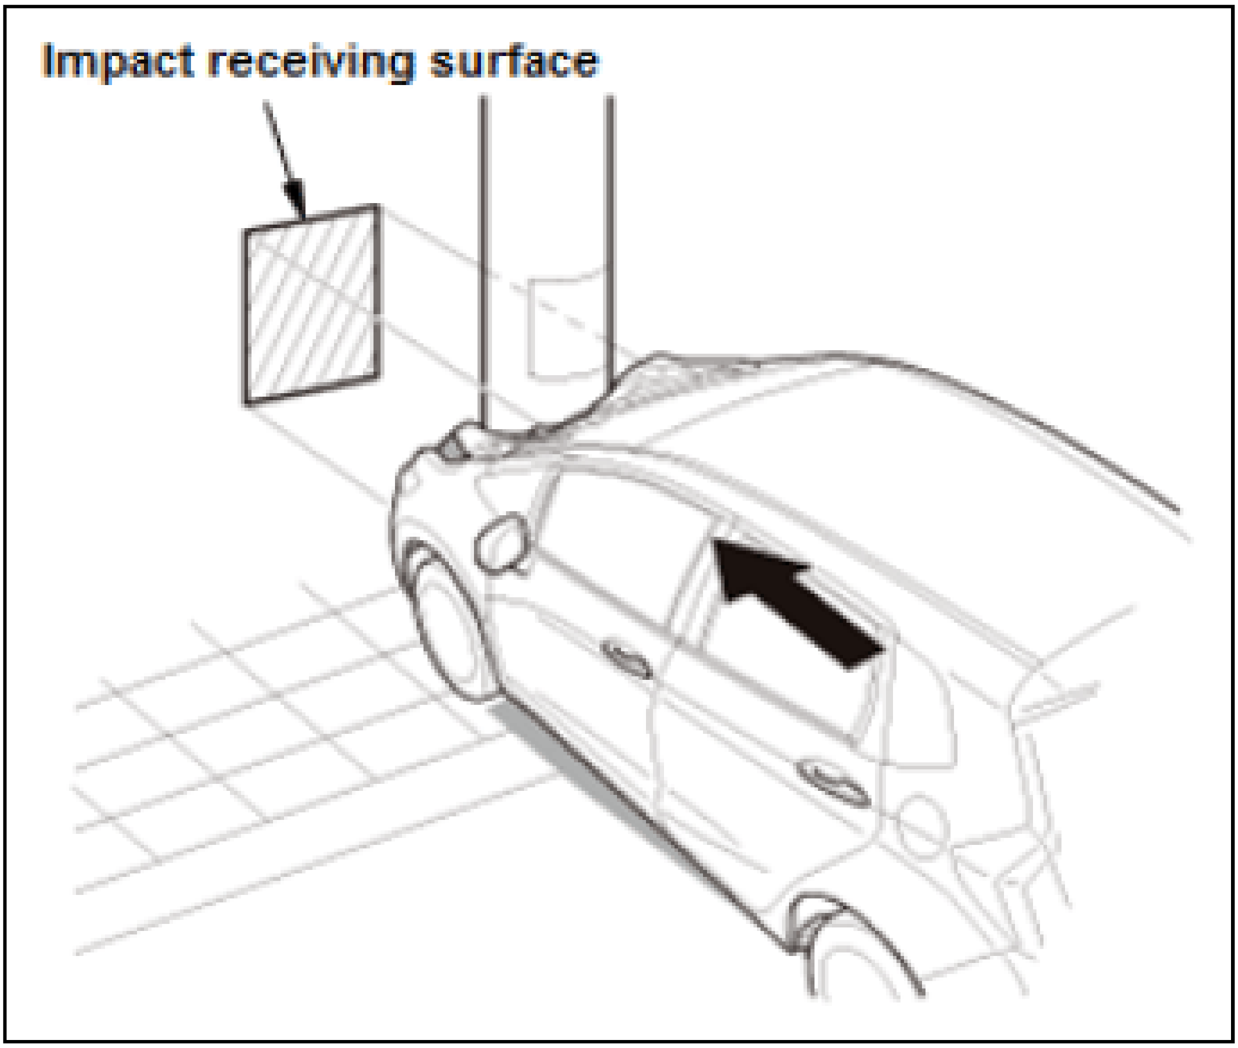
Collision Target And Damage

Even if the car weight and speed are the same between the two cases at the time of a crash, the degree of the damage will be significantly different depending upon the object that the car crashes into.



$$\text{Impact force per unit area} = \frac{\text{Input}}{\text{Impact Area}}$$

- When the impact area is wider, such as a wall, the impact force per unit area is smaller. Therefore, the degree of deformation is smaller and the area of damage is larger.
- When the impact area is smaller, such as an electric pole, the impact force per unit area on the car is greater. Therefore, the degree of deformation is also greater.



Direction Of Impact

The impact (outer force) consists of three variables:

- Input point
- Angle
- Magnitude

When impact (input) is applied to a vehicle, the force is divided into two or more directions. The divided forces become a dispersed impact onto the body Here is an example:

When the specified force "F1-O" (magnitude) is applied at input point "O" (input point) with angle "a" (direction), F1-O for an actual vehicle is divided into the horizontal forces, F2 and F3 and the vertical force F4.

- F2: Pushes the wheelhouse member towards the rear side
- F3: Pushes the bulkhead upper frame to the center
- F4: Pushes the bulkhead downward

Honda/Acura Collision Safety Technology (G-CON)

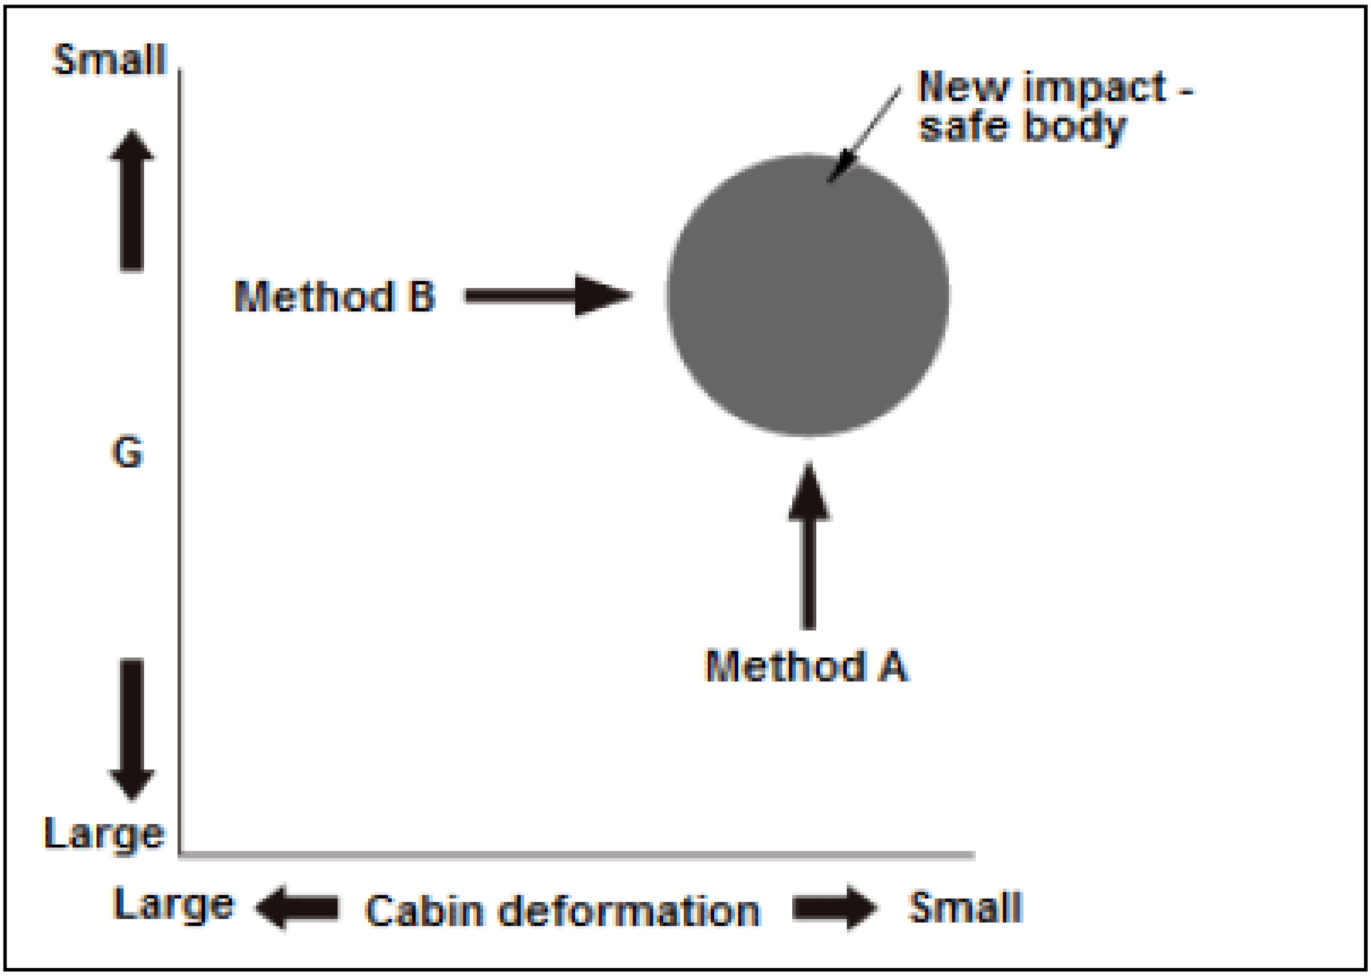
Managing both collision absorption and securing maximum cabin survival space at a high level

When considering collision safety during automobile body design, the coexistence of "energy absorption" and "securing maximum cabin survival space" are the keys to improving body safety. Although those two concepts contradict each other, balancing them is essential to mitigation of passenger injuries. Honda and Acura have developed a technology, called G-CON (Gravity Control). In a full-lap collision, G-CON maximizes "survival space". In an offset collision, it maximizes "energy absorption". G-CON technique has been incorporated into the new collision resistant body for small size vehicles. This reduces passenger compartment deformation and degree of injury to the driver and passengers in both collision types.

Achieving high performance by Honda/Acura unique ideas

When cabin survival space is prioritized, the usual approach is a highly rigid frame to minimize the degree of passenger compartment deformation. However, in this also transfers more impact force to the passengers, generally causing greater injuries (Method A in the figure below).

When passenger safety is prioritized, the impact absorption structure is designed with a comparably low-rigidity frame. This reduces the injury rate, while increasing passenger compartment deformation. (Method B in the figure below). A new collision resistant frame designed by Honda and Acura controls the G-forces applied to the body. This minimizes both passenger compartment deformation and passenger injury rate, balancing the two contradictory concepts at a high level.



Achieving the world's highest collision safety standard for small size vehicles

Traditionally achieving "impact absorption" while "securing maximum survival space" has been viewed as difficult for small cars. While considering this proposition, Honda and Acura found the solution with a new technique called "G-CON", which produced the world's highest standard of collision safety for small size vehicles.

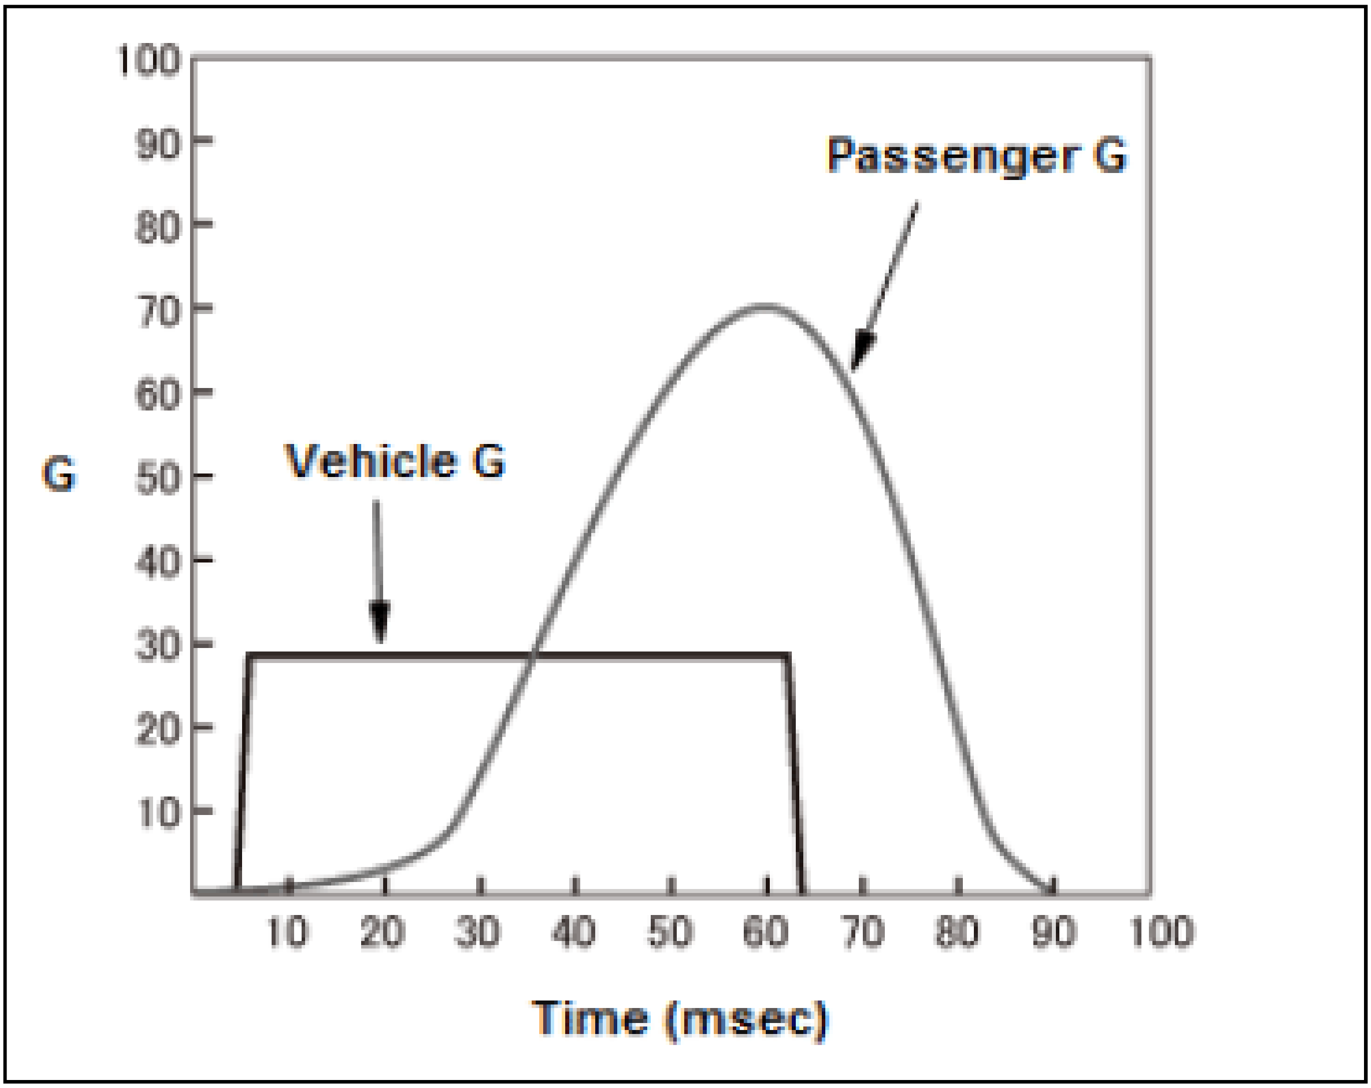
Wave-form for the frame and for the passengers under the "G" force of a full-lap collision

When the same level of impact is applied, the total surface of G-wave will be the same regardless of the approach/passage. To mitigate the G-force to passengers, it is critical to design the body based on the optimal timing and wave dispersion path of G-force.

Approach A - Prioritize passenger compartment survival space

In order to secure passenger compartment survival space, the frame is of rigid design. However, passengers would receive high collision G-forces:

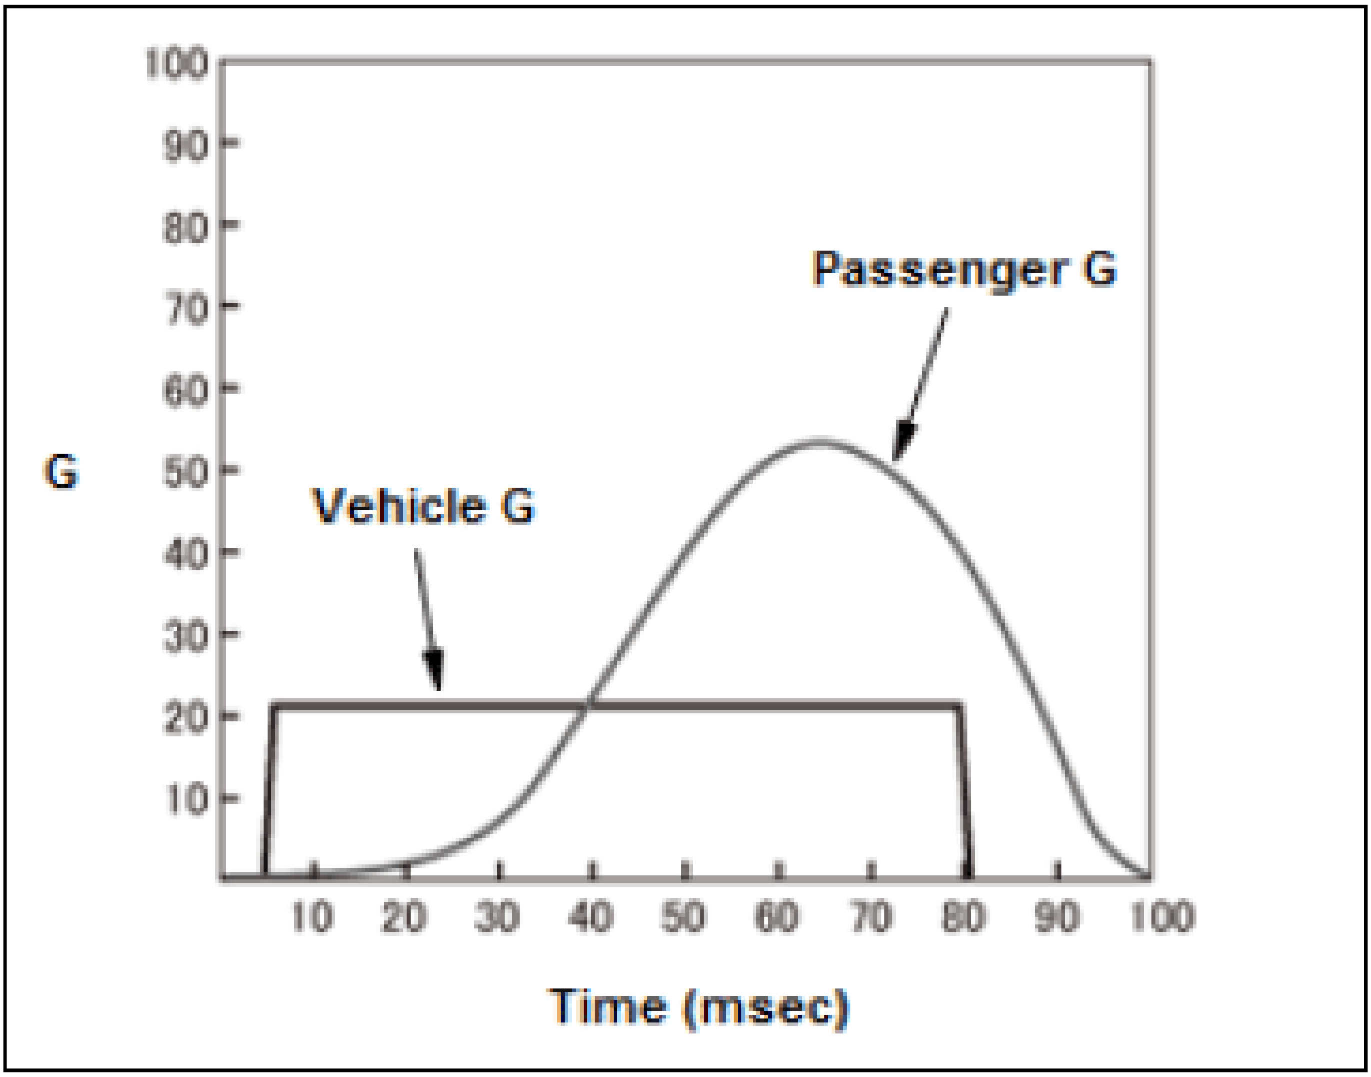
- Highly rigid frame with small deformation.
- Sufficient survival space is secured, but injury rate is high.



Approach B - Prioritize reduction of passenger injury rate

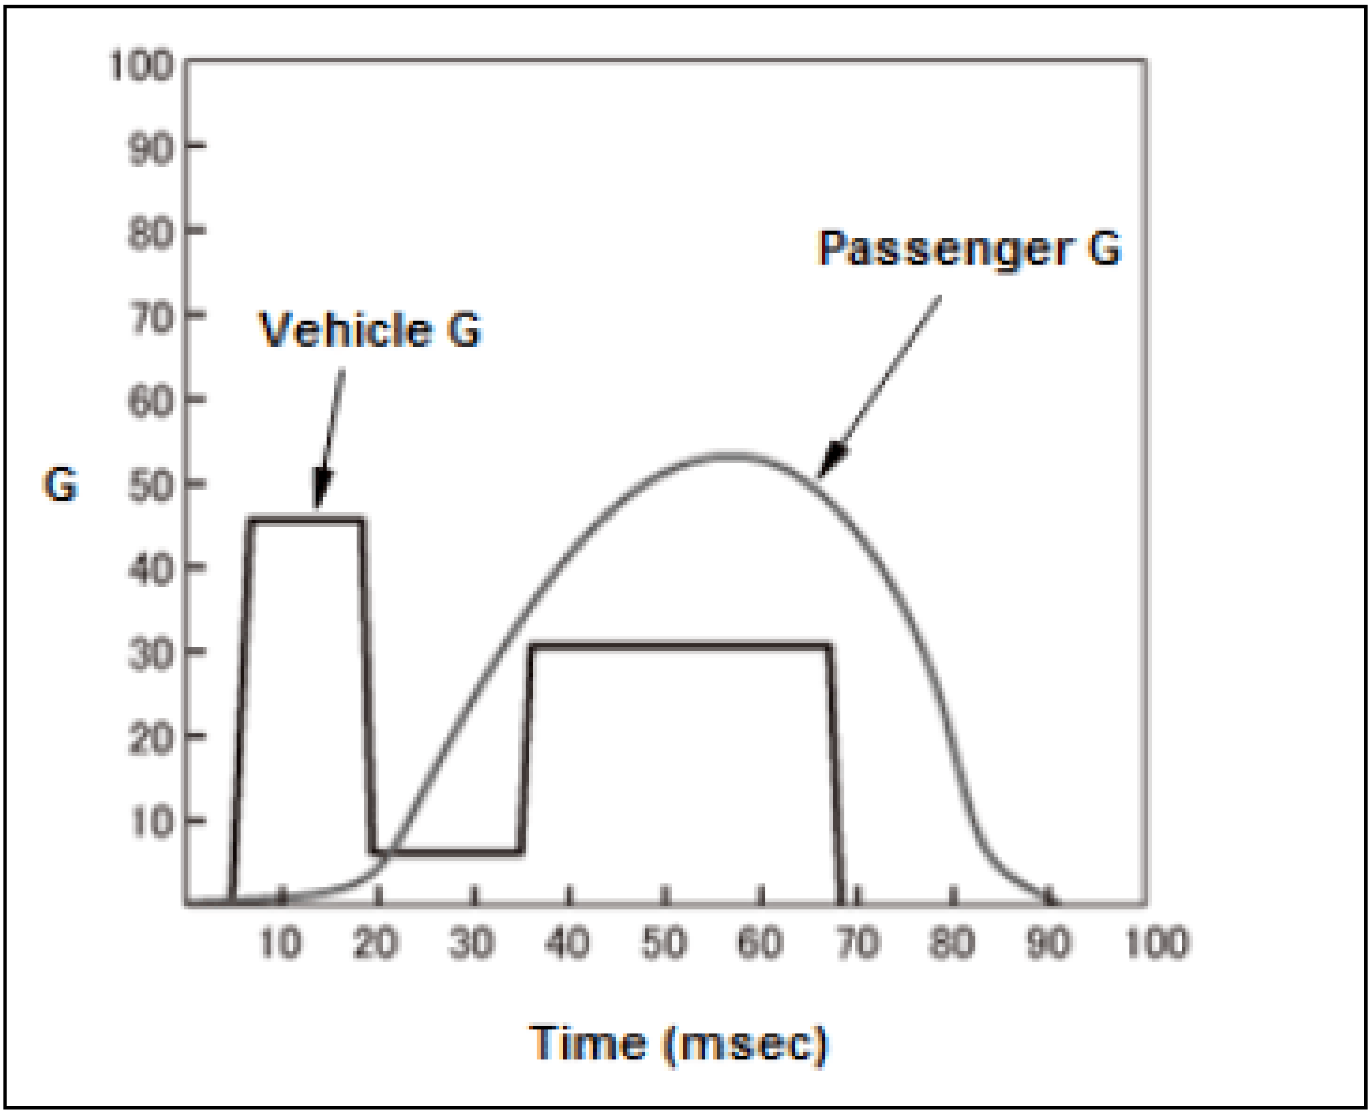
In order to reduce collision G-forces on passengers, frame rigidity is reduced, and its deformation rate will increase. Therefore, the frame size needs to be expanded:

- Reduce injuries by reducing frame rigidity.
- Larger frame size is required to secure survival space.



New collision safety frame for small size vehicles

By controlling G-forces to the frame, passenger G-forces are reduced, while maintaining almost the same level of frame deformation. Small size vehicles can secure a survival space and mitigate the injury rate at the same time, by balancing the cabin deformation rate and passenger injury rate at a high level.



G Control with 3 Stages: Crash, Bend and Withstand

The crash safety frame is a structure which controls impact G in three stages:

- In the first stage, focus is placed on the timing difference between body G generation and passenger G generation. Front Side

  The body is designed so that a high body G is generated through compressed collapse of the front side frame's front portion (compressed collapse: a cylindrical can is collapsed in an axial direction like a bellows or an accordion). By doing so, the passenger G generation timing will be accelerated. In the early stages of the crash where the passenger G is still in a lower state, the passenger G is intentionally forced to occur so that most of it can be evenly absorbed.

- In the second stage, the body G that was increased during the first stage is reduced when the narrow high-offset rear portion of the front side frame deforms quickly This constrains the increase in passenger G and makes it possible to reduce the peak of the passenger G.
- In the third stage, while controlling the passenger G constrained during the second stage, the rigid passenger compartment absorbs impact energy while reducing body deformation as much as possible.

  With these steps, the collision performance of body helps protect the passengers.

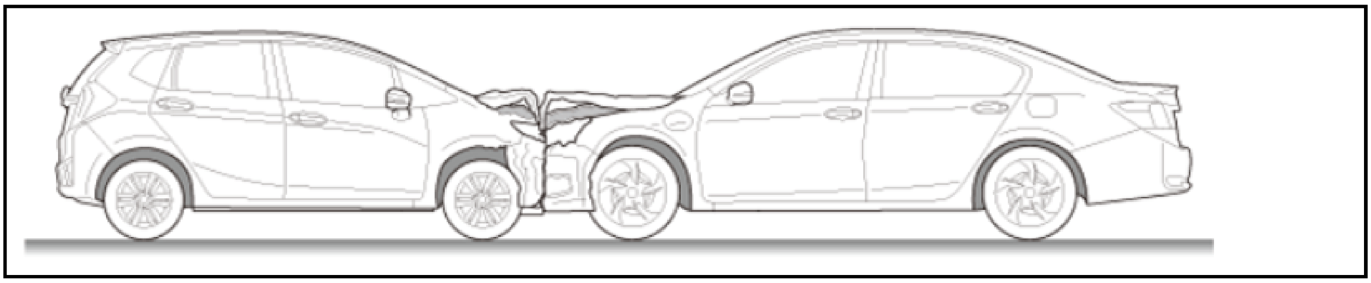
(2):	2nd stage damage
(3):	3rd sage damage

Honda/Acura Collision Safety Technology Compatible (ACE™) Body

Compatible Body

Through an advancement of the G Control technology it became possible to improve safety in the impacted vehicle ("self-protection performance"), while also protecting the impacting vehicle in a collision ("damage reduction to other vehicles").



Characteristics of Compatible Body

The frame structure is modified from the traditional structure so that impact energy is received through a wider surface area and energy is more easily dispersed.

For frontal collisions, impact forces will disperse and be absorbed through the bulk head, wheelhouse member and side frames. The forces are then further transmitted to the front pillars, floor frame and side sills. The lower frame member prevents the off-set positioning against the impact absorber of the counter vehicle, and receive the impact on a wide surface area along with the bulk head and upper frame. This achieves significantly higher impact energy absorption performance. This approach not only reduces the forces to the passenger compartment, improving one's own protection safety, but also minimizes damage to the other vehicle in a collision. By also increasing the section of the floor frame as well as making it straight, body rigidity can be further enhanced. Passenger compartment deformation will be limited, increasing self-protection ability.

Honda/Acura Collision Safety Technology Compatible (ACE™) Body Features

Features Of Collision Safety Technology Compatible Body

1. Increase contact with impact absorption structure of the other vehicle.

   The vehicle body is a multi-skeletal structure and is designed with the wheelhouse member positioned outside of front side frame, but joined with large gussets. This mitigates impact with other vehicles in a crash by increasing the area of contact with the other vehicle's impact absorption structure.

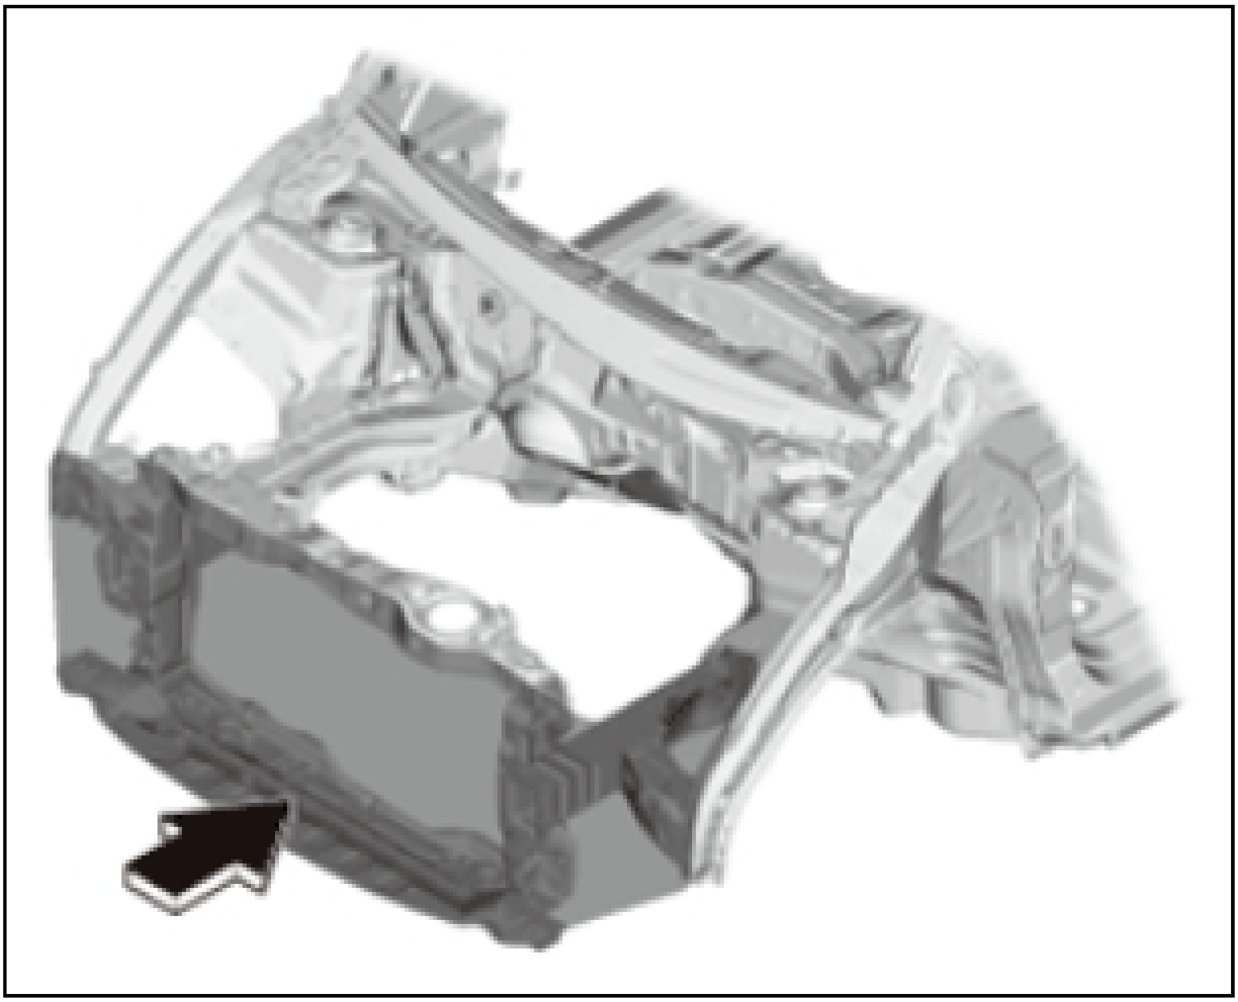
      WHEELHOUSE MEMBER
FRONT SIDE FRAME
GUSSET

2. Dissipation of impact load.

By receiving an impact on a wider surface area including the:

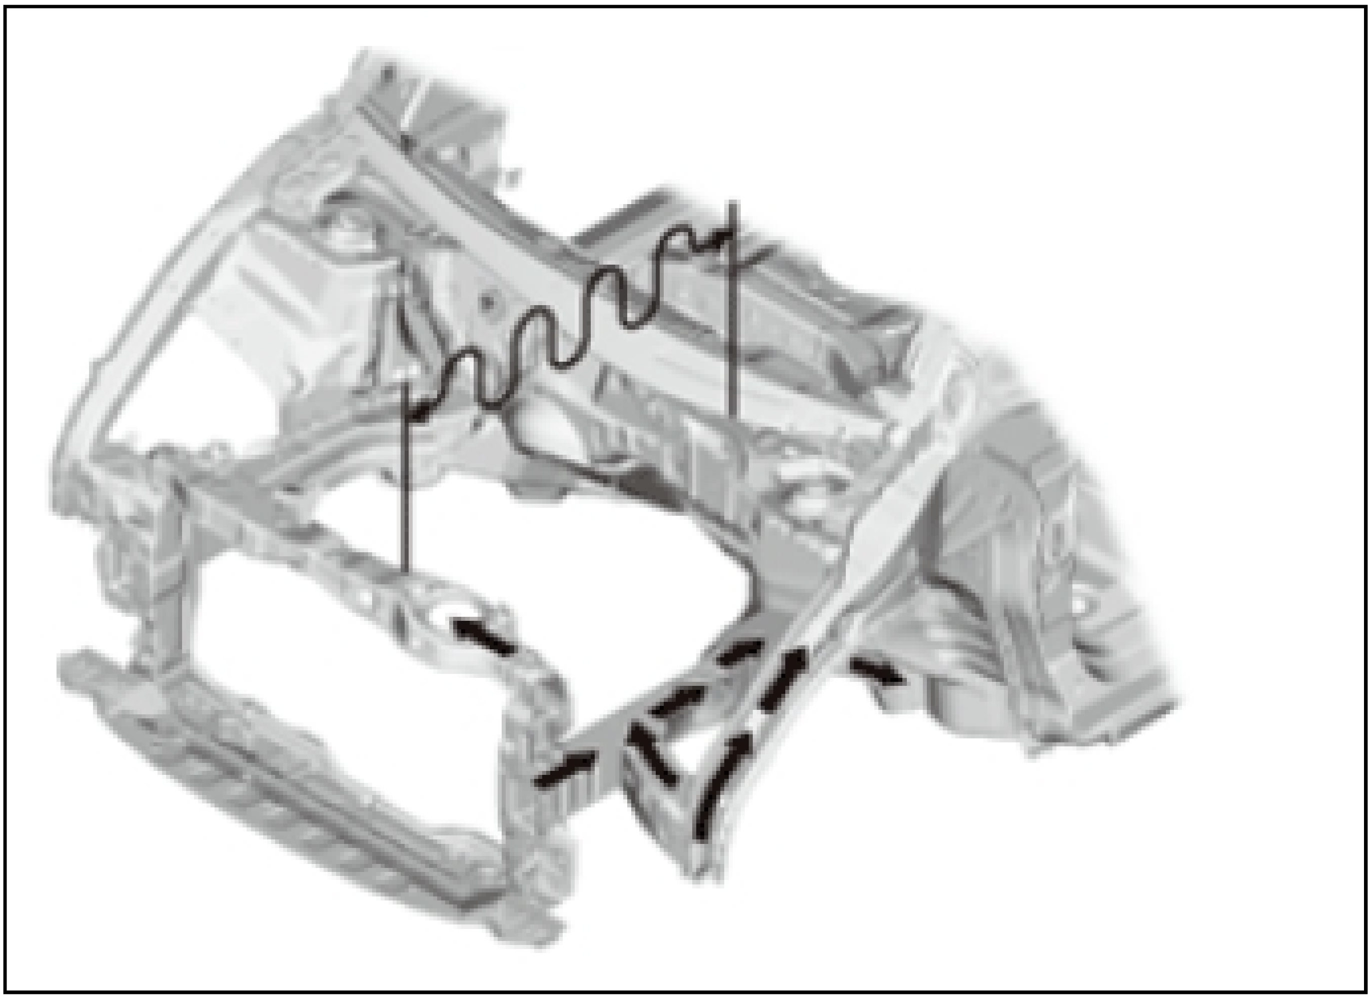
- Bulkhead upper frame
- Wheelhouse member
- Front side frame

The impact forces received are more efficiently dissipated through the structure.



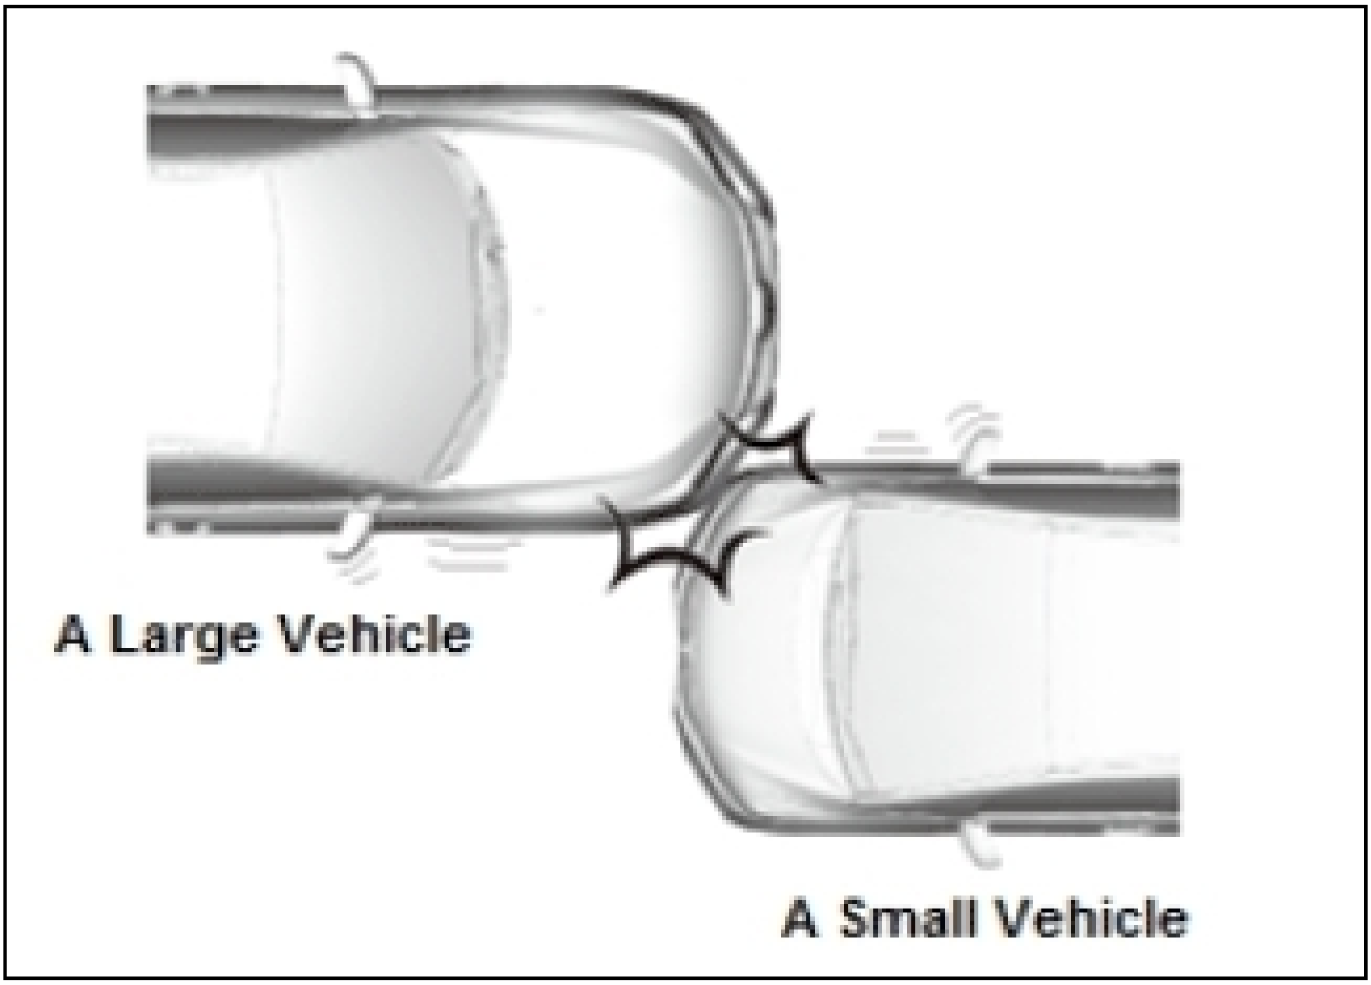
3. Highly efficient absorption of energy.

The optimization of impact absorption parts significantly reduces the load applied to the passenger compartment by improving energy absorption efficiently of the engine compartment.



Effectiveness Of Crash-Compatible Body

In case of a collision between a large-and-small-vehicle, the impact absorption structure allows energy to dissipate in a similar way between those two vehicles. Safety is improved for both of the vehicles.



A Large Vehicle
A Small Vehicle

The frame member will be crushed by the impact through the wheelhouse member and gusset in an offset impact. This mechanism helps decrease the impact against a smaller vehicle.

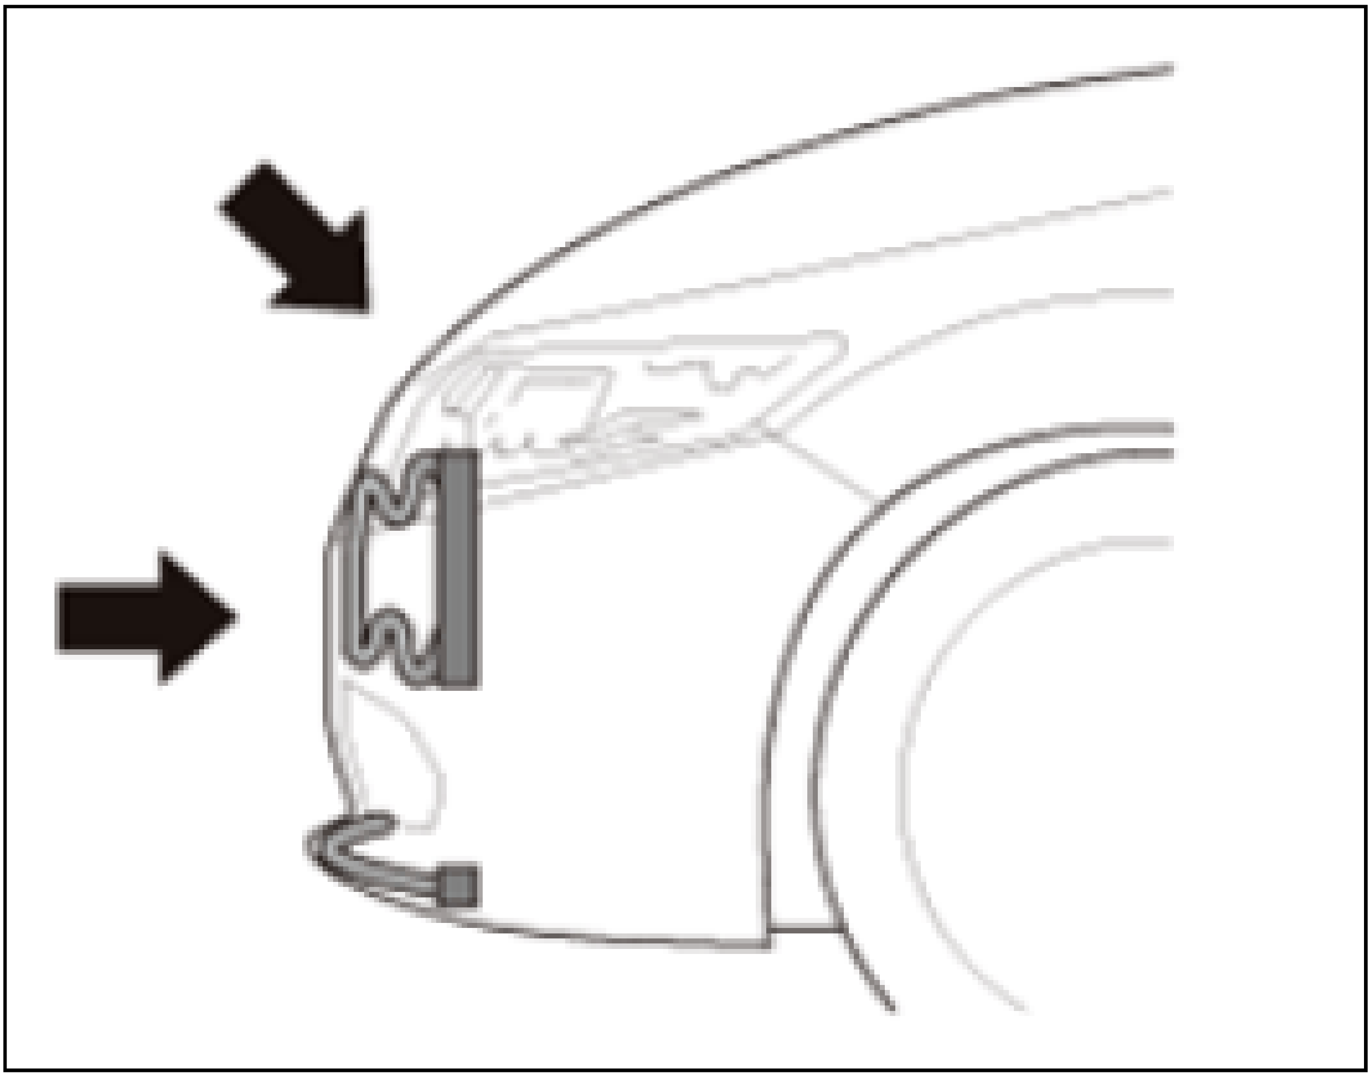
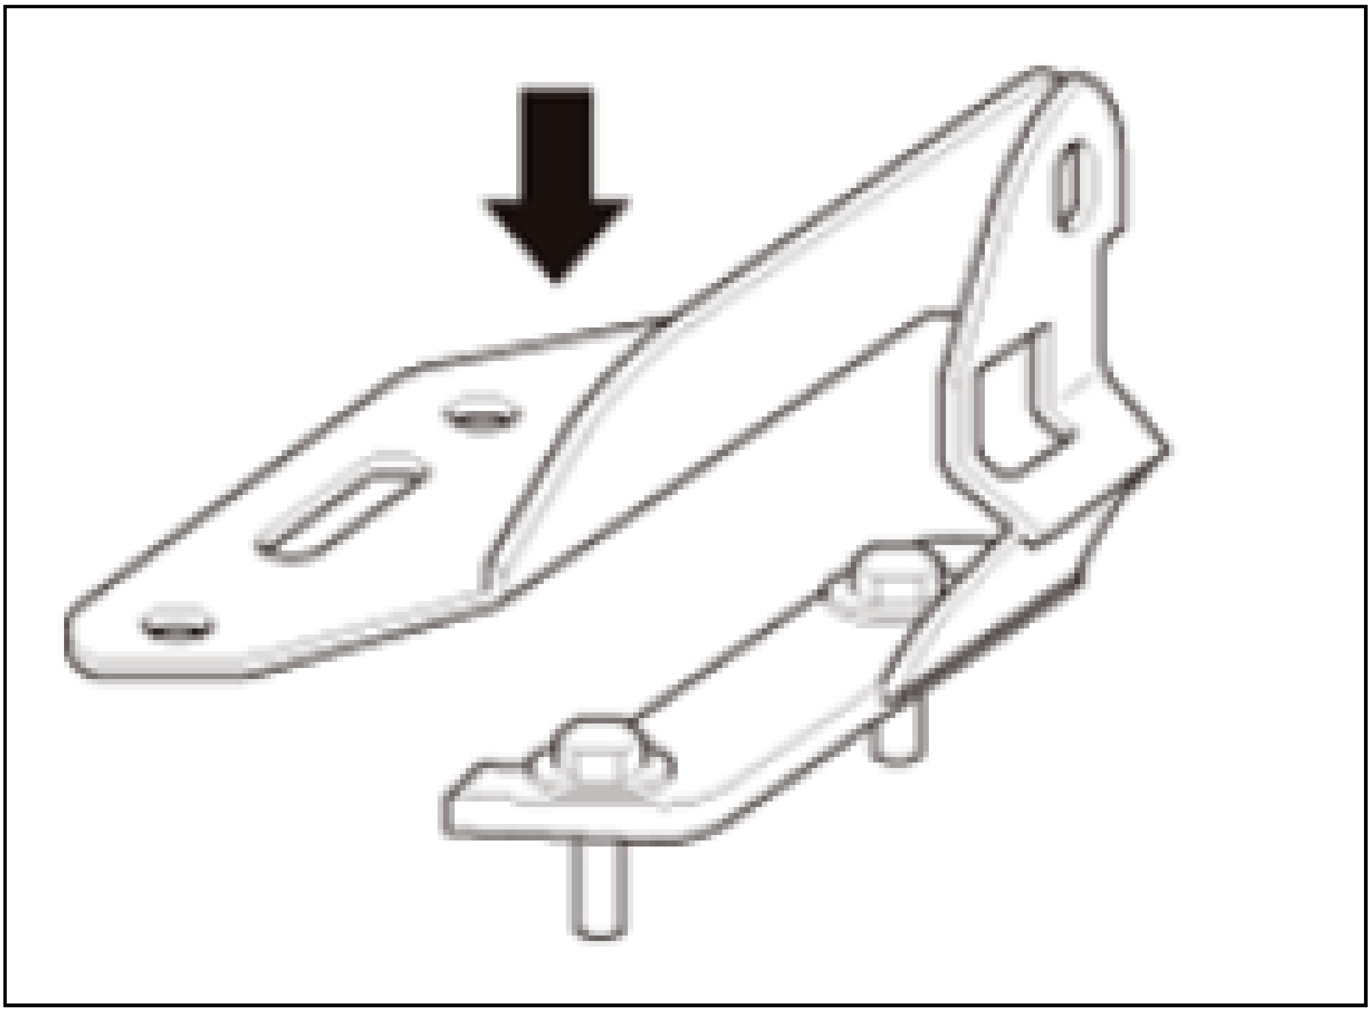
Honda/Acura Pedestrian Injury Mitigation Body

The hood, hood hinge, front fender, front bumper, wiper pivot and or brackets are constructed to absorb impacts to minimize pedestrian injuries in a car-to-pedestrian crash.

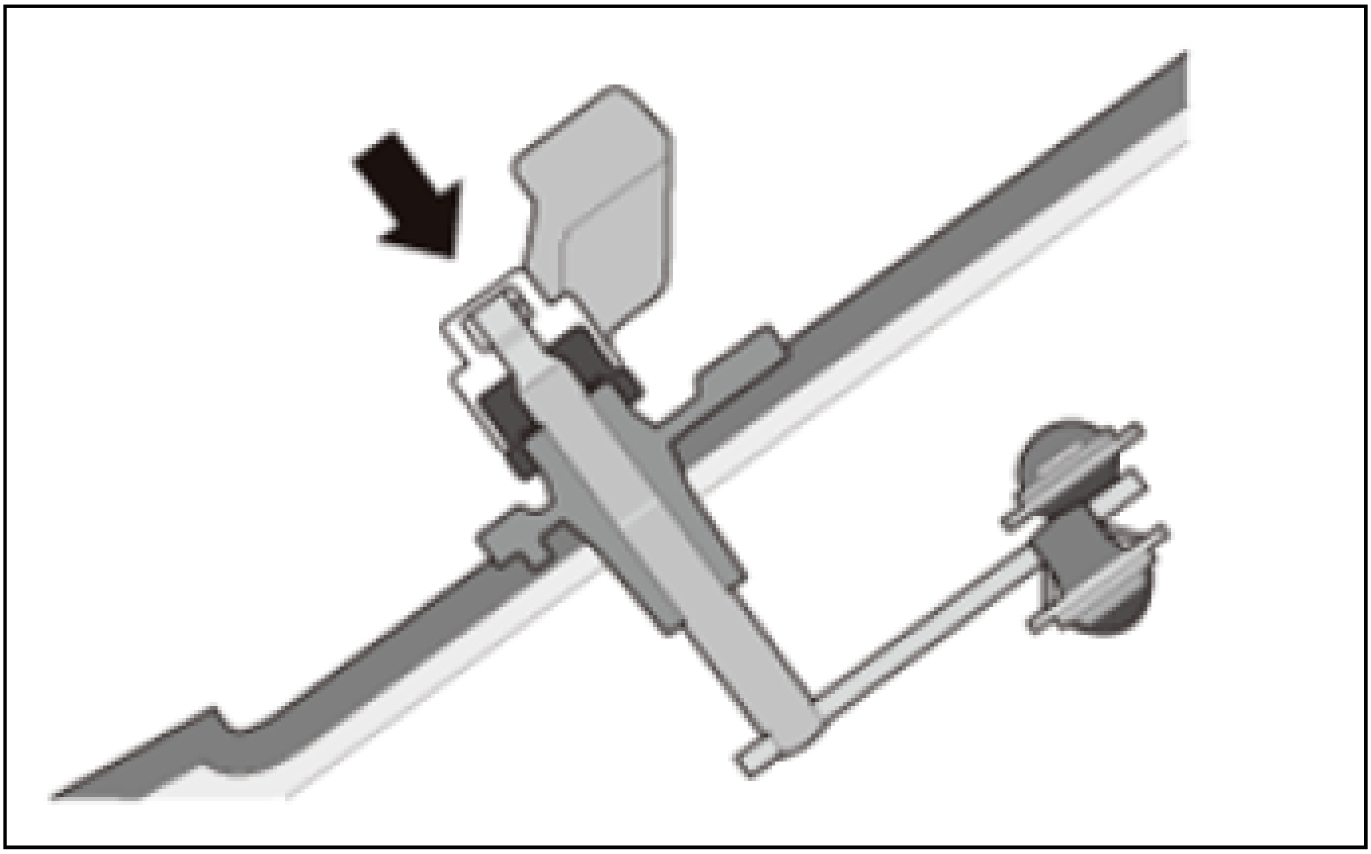
Clearance secured beneath bumper absorbs passenger impact



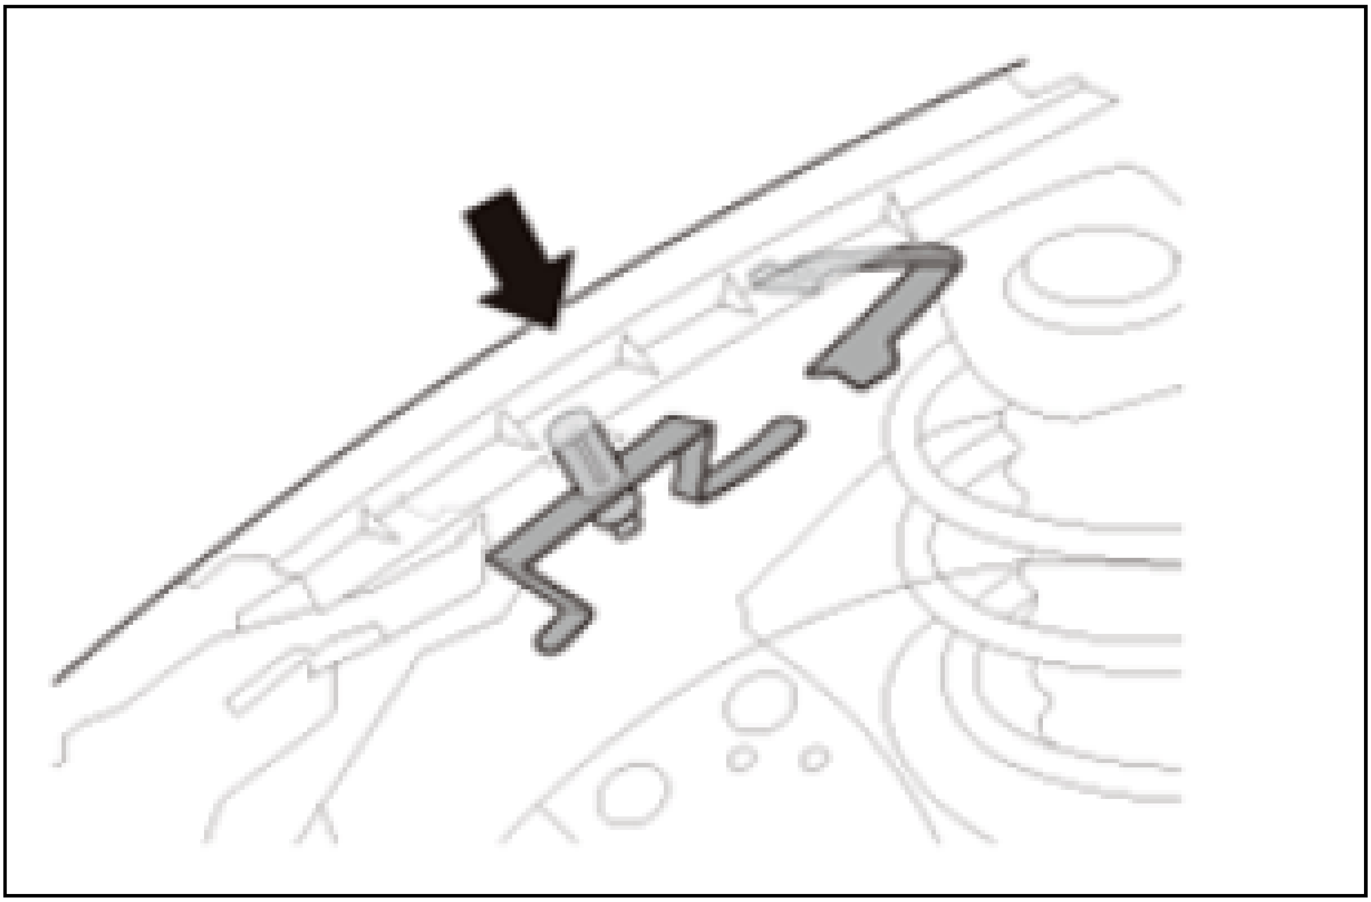
Collapsible hood hinges bend to absorb impact



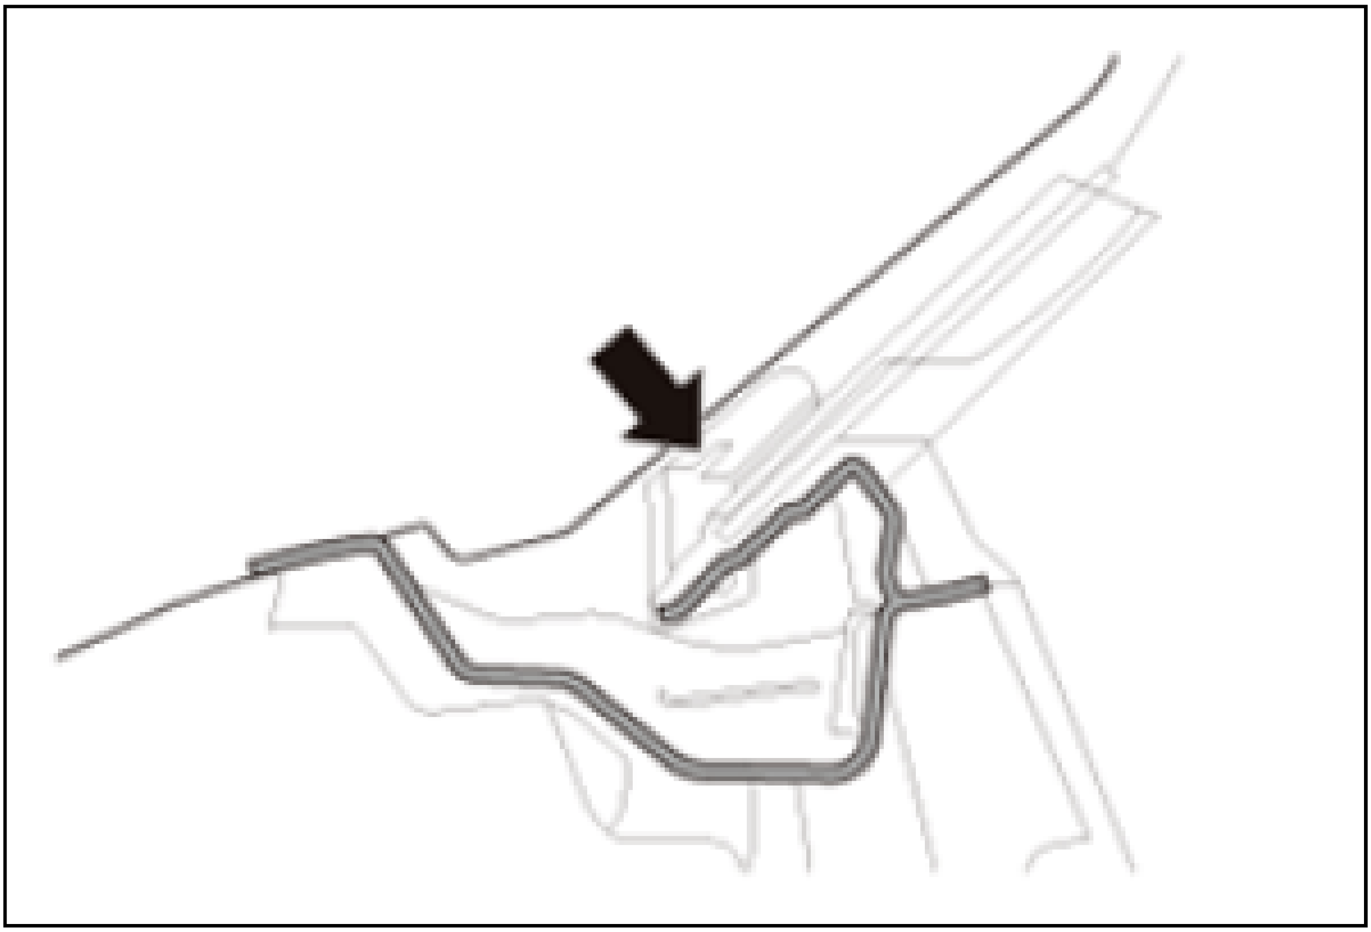
Shaft movement at the base of the wiper pivots absorbs impact



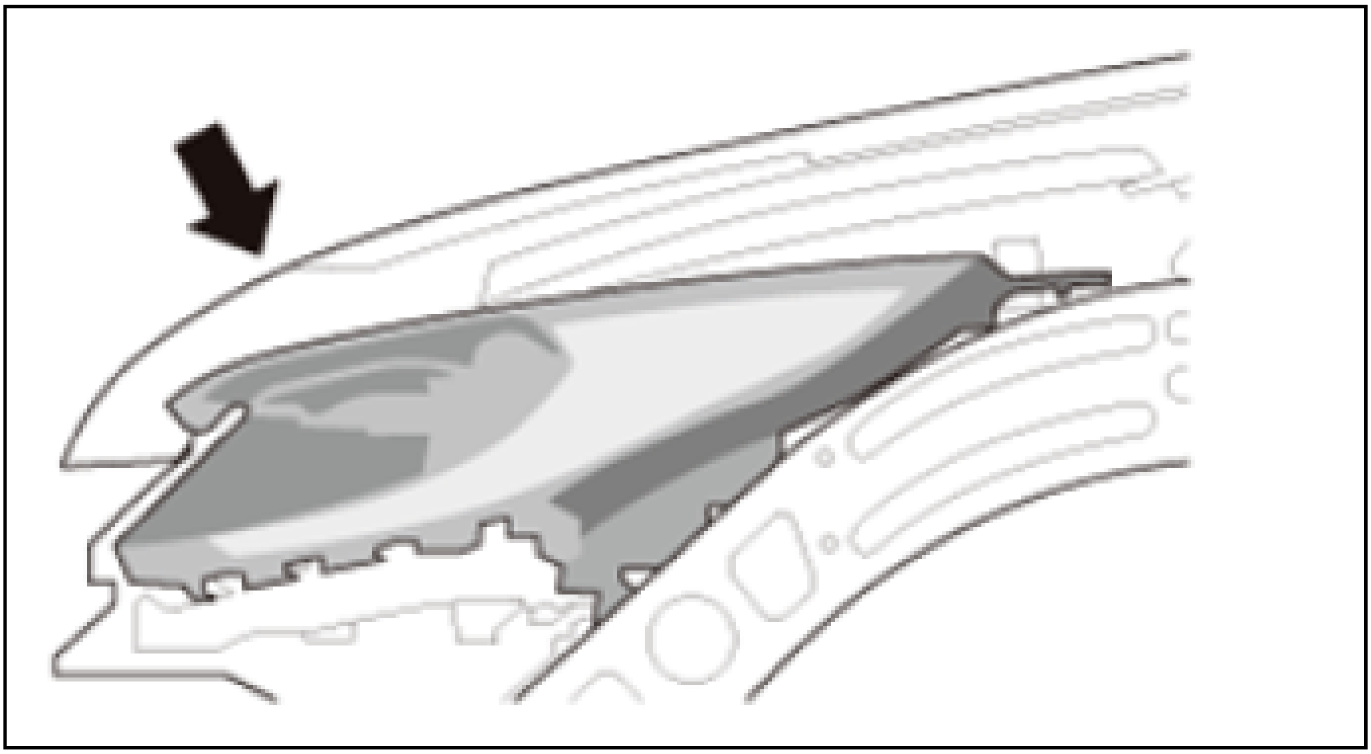
Collapsible fender brackets absorb impact by allowing the fenders to deform



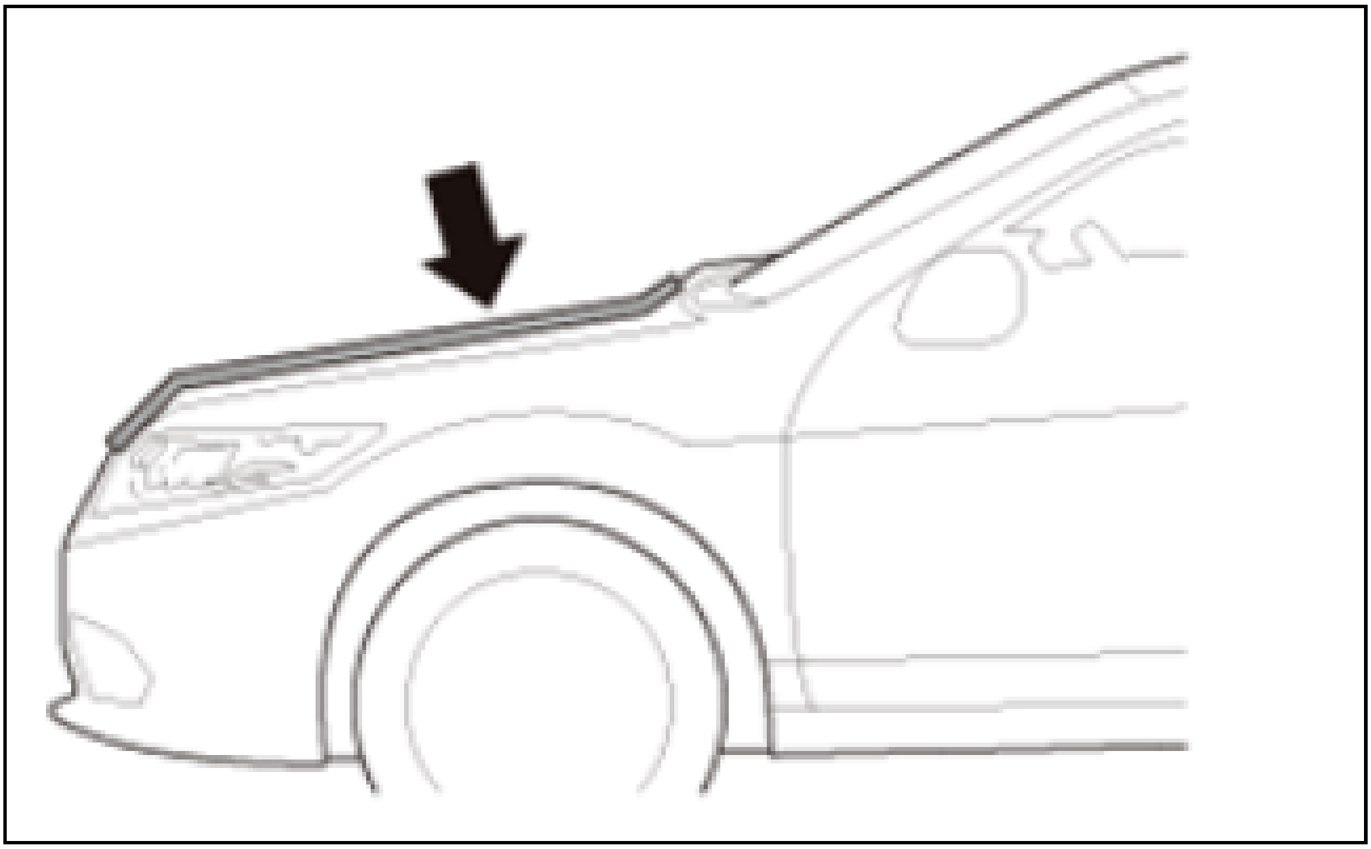
Clearance secured beneath the windshield allows deformation to absorb impact



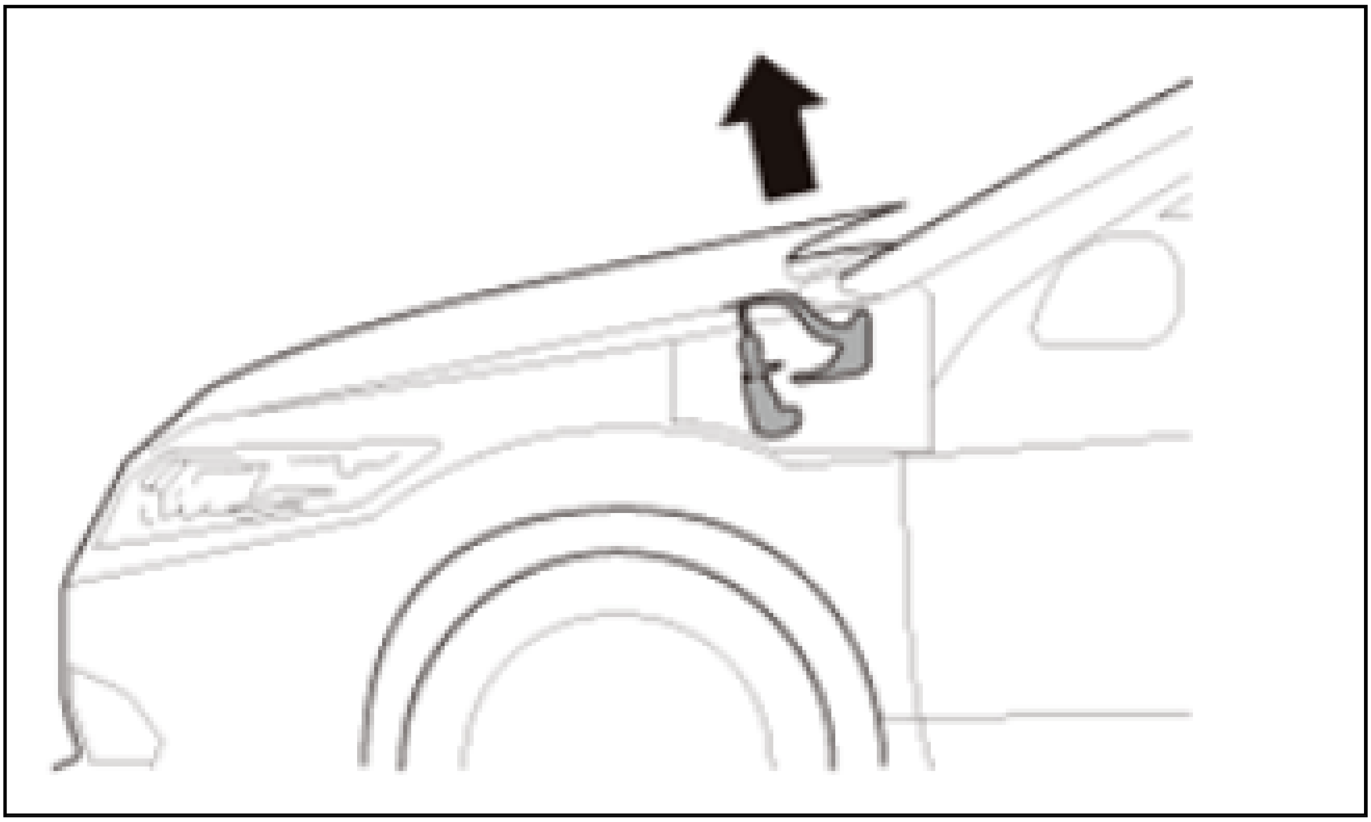
Clearance secured beneath the headlight absorbs impact by the allowing this area to deform easily



Clearance secured beneath the hood absorbs impact by allowing hood area to deform easily

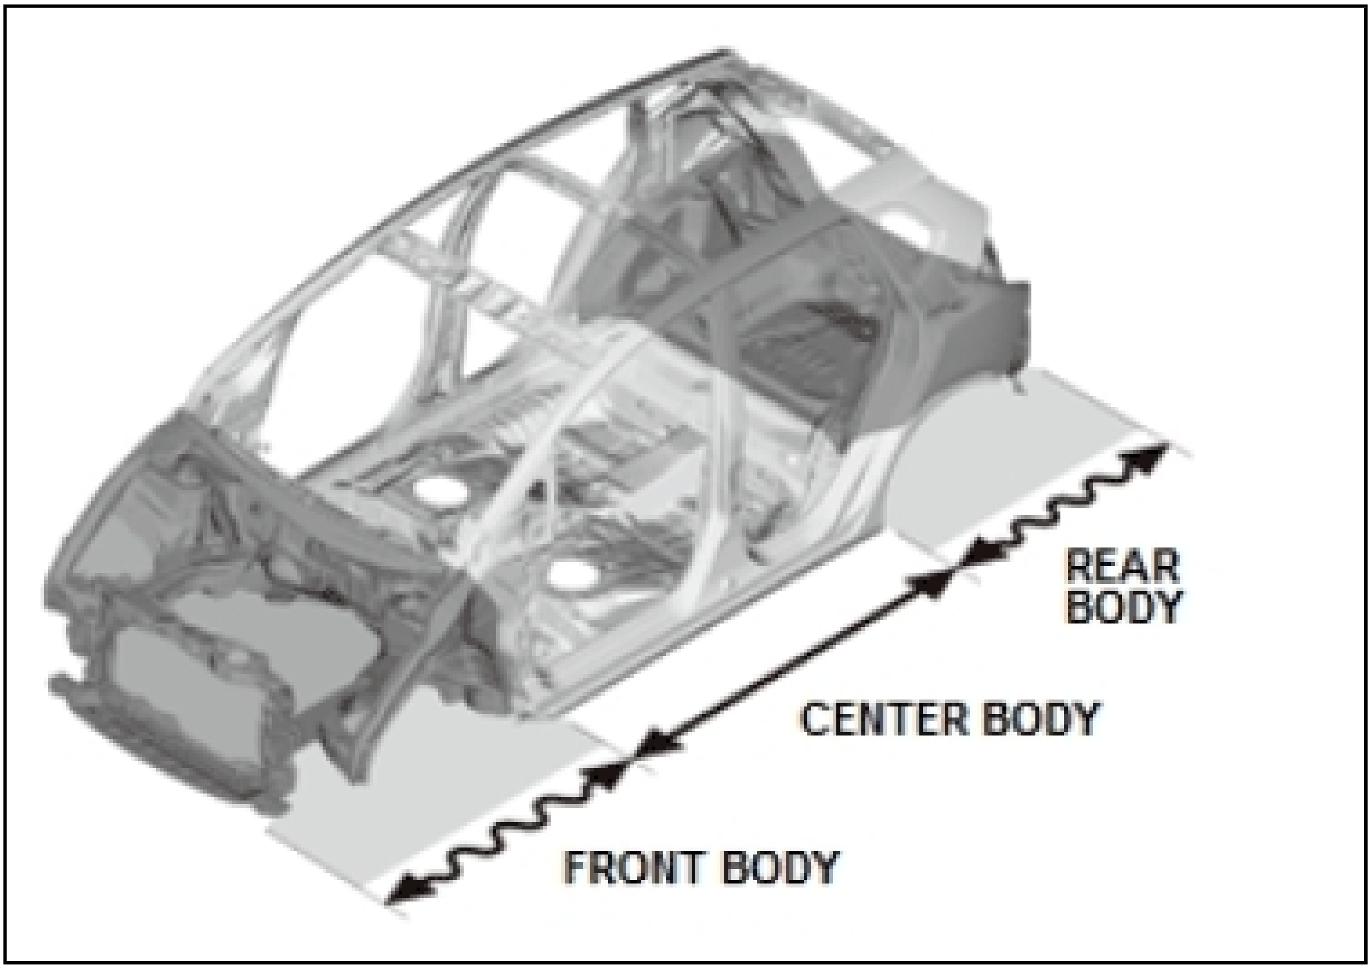


Pop-up hood hinges (some markets) absorb impact by lifting up the rear side of the hood, providing extra deformation space



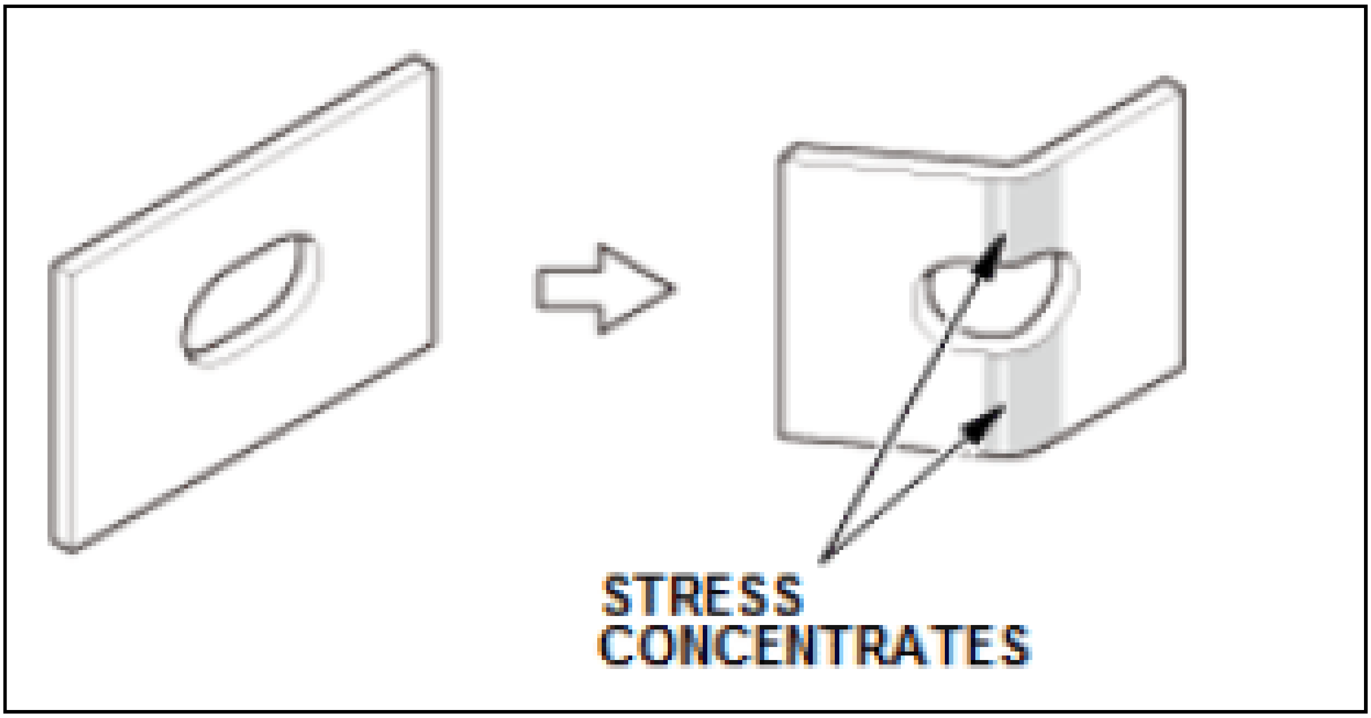
Impact Absorption Structure

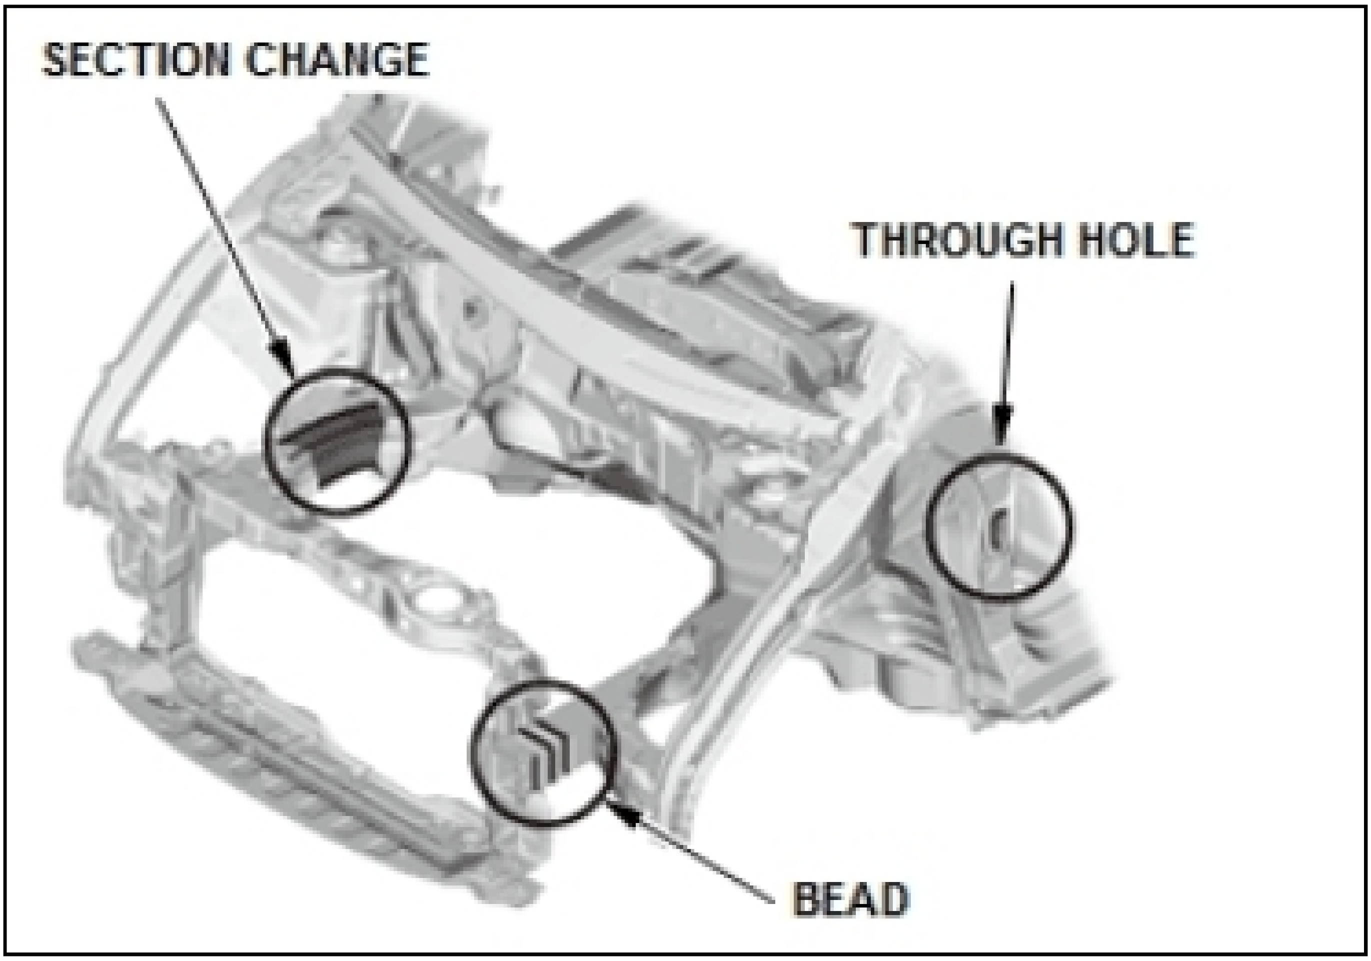
The unibody has a crushable structure to absorb collision impact energy through deformation of its body structure. The front and rear compartments are constructed as impact absorbing structures. The center body (passenger compartment) has a rigid structure to disperse collision energy.



Stress Concentration

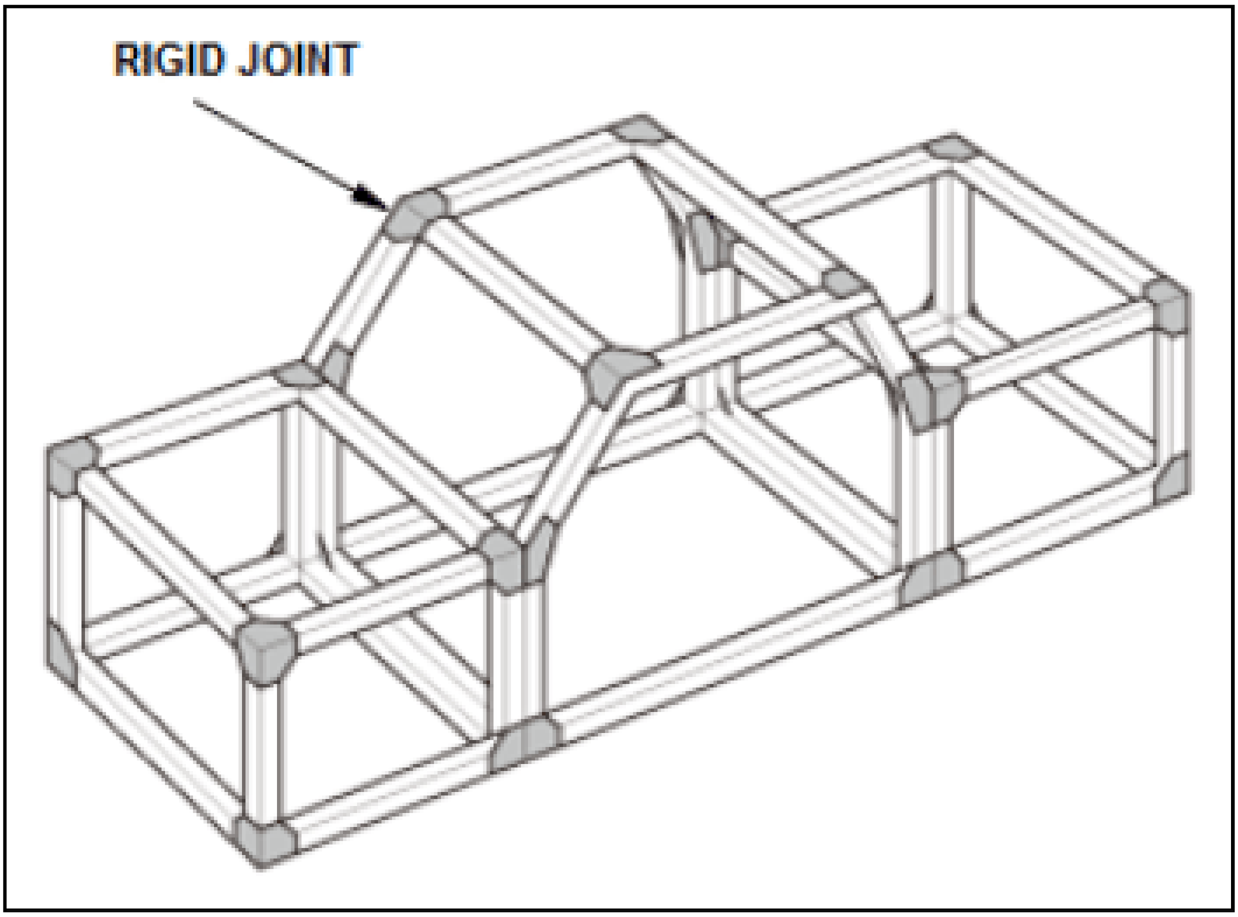
- During impact, stress is concentrated where the part shape and surface has been altered. For example, to bend a metal plate, first open a hole at the bending position. When the plate is bent, the stress is concentrated around the hole, and the plate is easily bent there.
- Unibodies have different size side frame sections, plus stamped channels and holes applied to front wheelhouse upper members. These help absorb impact energy by concentrating stress at those locations.





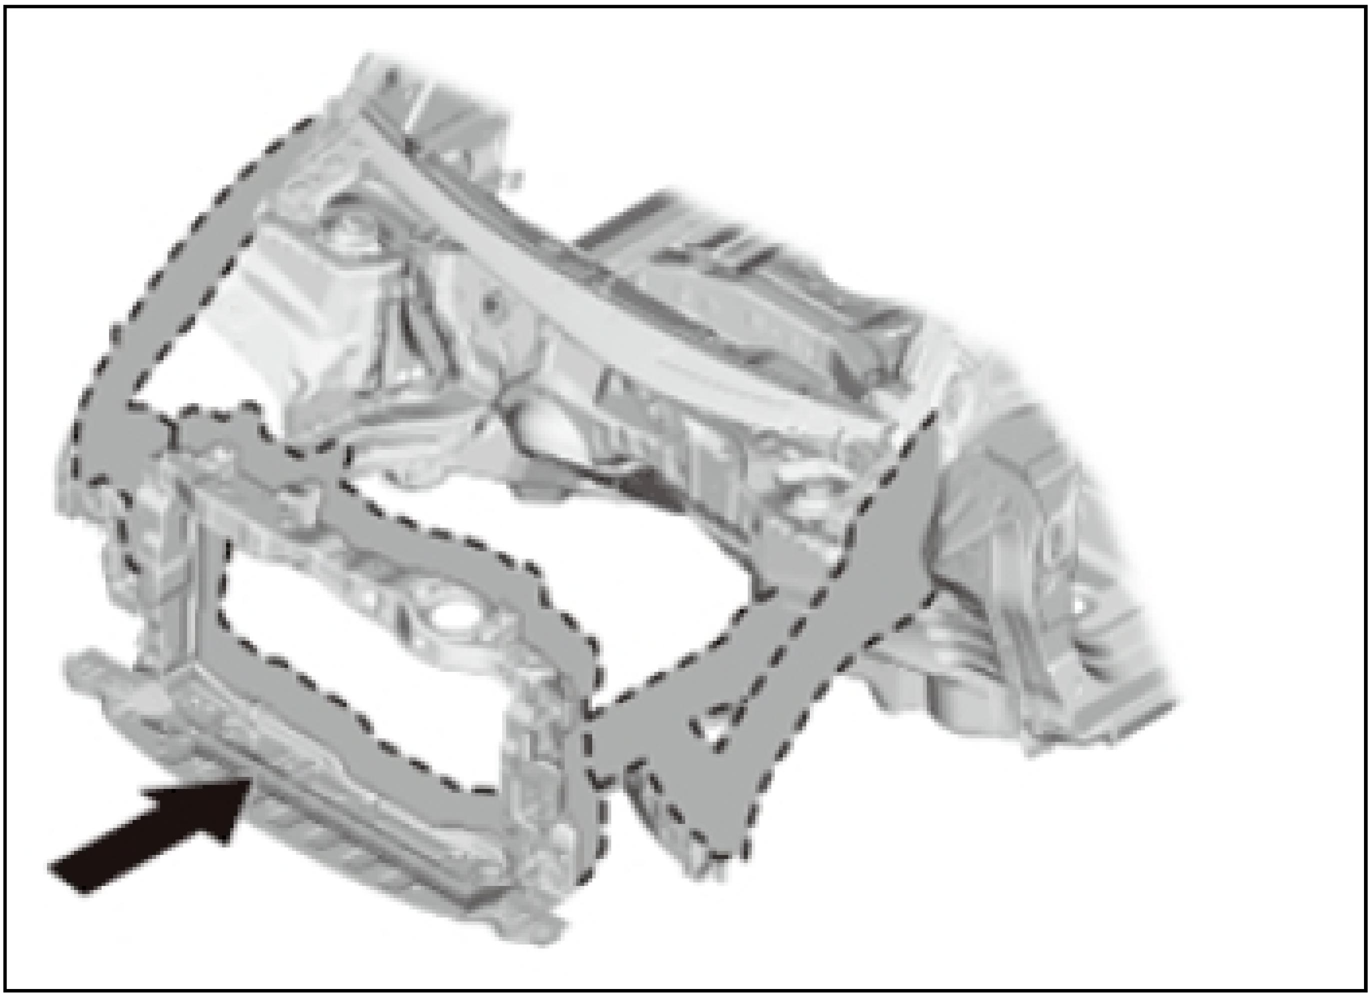
Rahmen Structure

- Rahmen structure is a framework structure constructed by the individual parts assembled together with rigid fixed points (rigid joints). When the body takes external forces, it resists them as one unit because the component members are rigidly joined. A unibody is made up of a series of connected rahmen structures.



- A unibody is a combination of a number of rahmen structures that are assembled into one with spot welding (rigid points) connecting their component parts. It is designed and manufactured so that, when the body takes forces such as load intruded by:
    - Starting, acceleration and braking
    - Impact from the road surface
    - Bending and twisting (body deformation) during cornering

    The unibody resists those external forces by dispersing across the entire body structure.
- The unibody ensures sufficient strength and rigidity by:
    - Carefully designed structural members such as frames and crossmembers.
    - Thin sheet parts such as skins and panels and reinforcement parts.
- During unibody body repairs, it is important to fully understand the characteristics of Rahmen structure. These characteristics determine how far impact damage traveled through the vehicle's body It is likely that damage may even exist opposite the actual impact area.



Unibody Characteristics

- Impact Absorption Efficiency and Safety

  A unibody uses the stamped floor pane l and other parts joined using spot welds to manage impact forces.

- Reduced Weight and Improved Fuel Efficiency/Driveability

  By stamping thin steel sheet and spot welding multiple panels, it is possible to reduce vehicle weight while strengthening the structure. Consequently, engine displacement can be reduced resulting in improved fuel efficiency In addition, brake and chassis parts wear is reduced.

- Manufacturing Efficiency

  Unibodies are manufactured using automated systems such as welding robots, saving labor and resulting in significantly higher production efficiency.

- Freedom of Design

  Recently it became possible to stamp a high quality steel sheet for body outer panels. Because of this, the steel sheets can be bent and formed into a wide variety of shapes and combined together. Also, it enhances design freedom. For an example, by shaping the floor panel in an optimal way by drawing (stamping), it is possible to lift the floor surface to provide more legroom. This design provides maximum passenger compartment space even in smaller vehicles.

Unibody Parts Structure

Each automobile part may be called by a different name depending on the supplier and/or auto manufacturer. Body parts are no exception. Keep this in mind when ordering or installing parts. Refer to the specific parts list of each model for more details.

WHEEL ALIGNMENT

Caster Angle/Toe/Steering Axis Inclination (SAI)

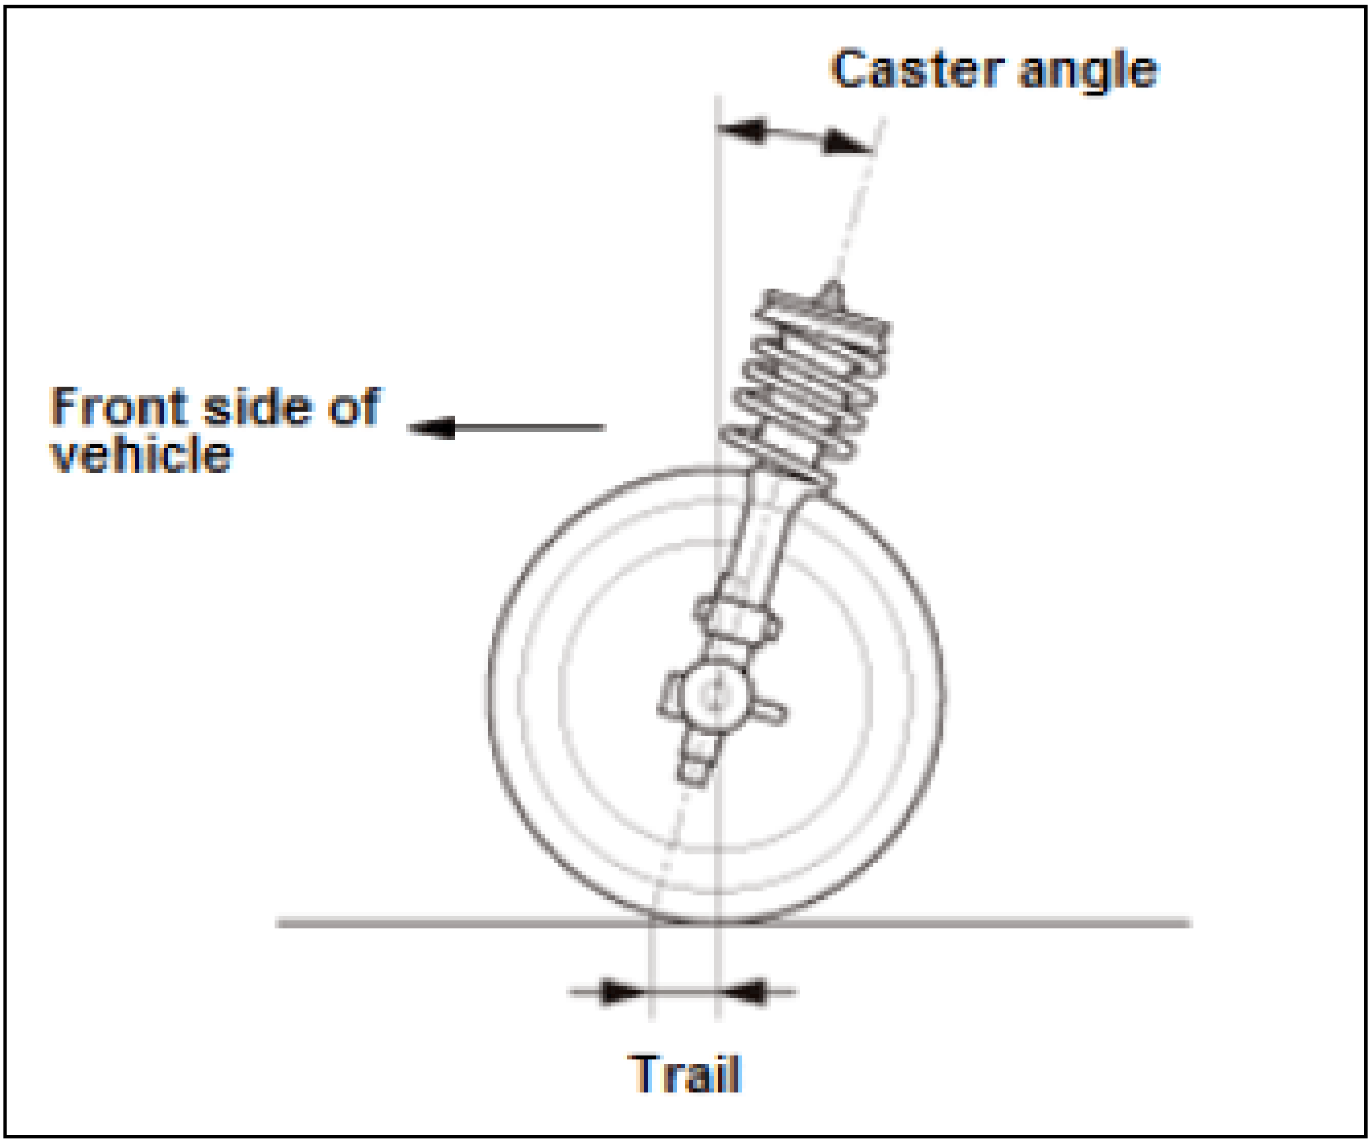
Caster Angle

Caster is the forward or rearward angle of the steering axis compared to true vertical as seen from the side. Caster is measured as the number of degrees that the steering axis varies from true vertical.

- If the top of the steering axis is in front of true vertical, the caster is negative.
- If the steering axis is parallel with true vertical, it has zero caster.
- If it is behind true vertical, the caster is positive.

Caster affects vehicle steering effort, steering wheel returnability, and handling.

Steering wheel returnability refers to the vehicles ability to straighten out and the steering wheel return to center after the vehicle leaves a corner.

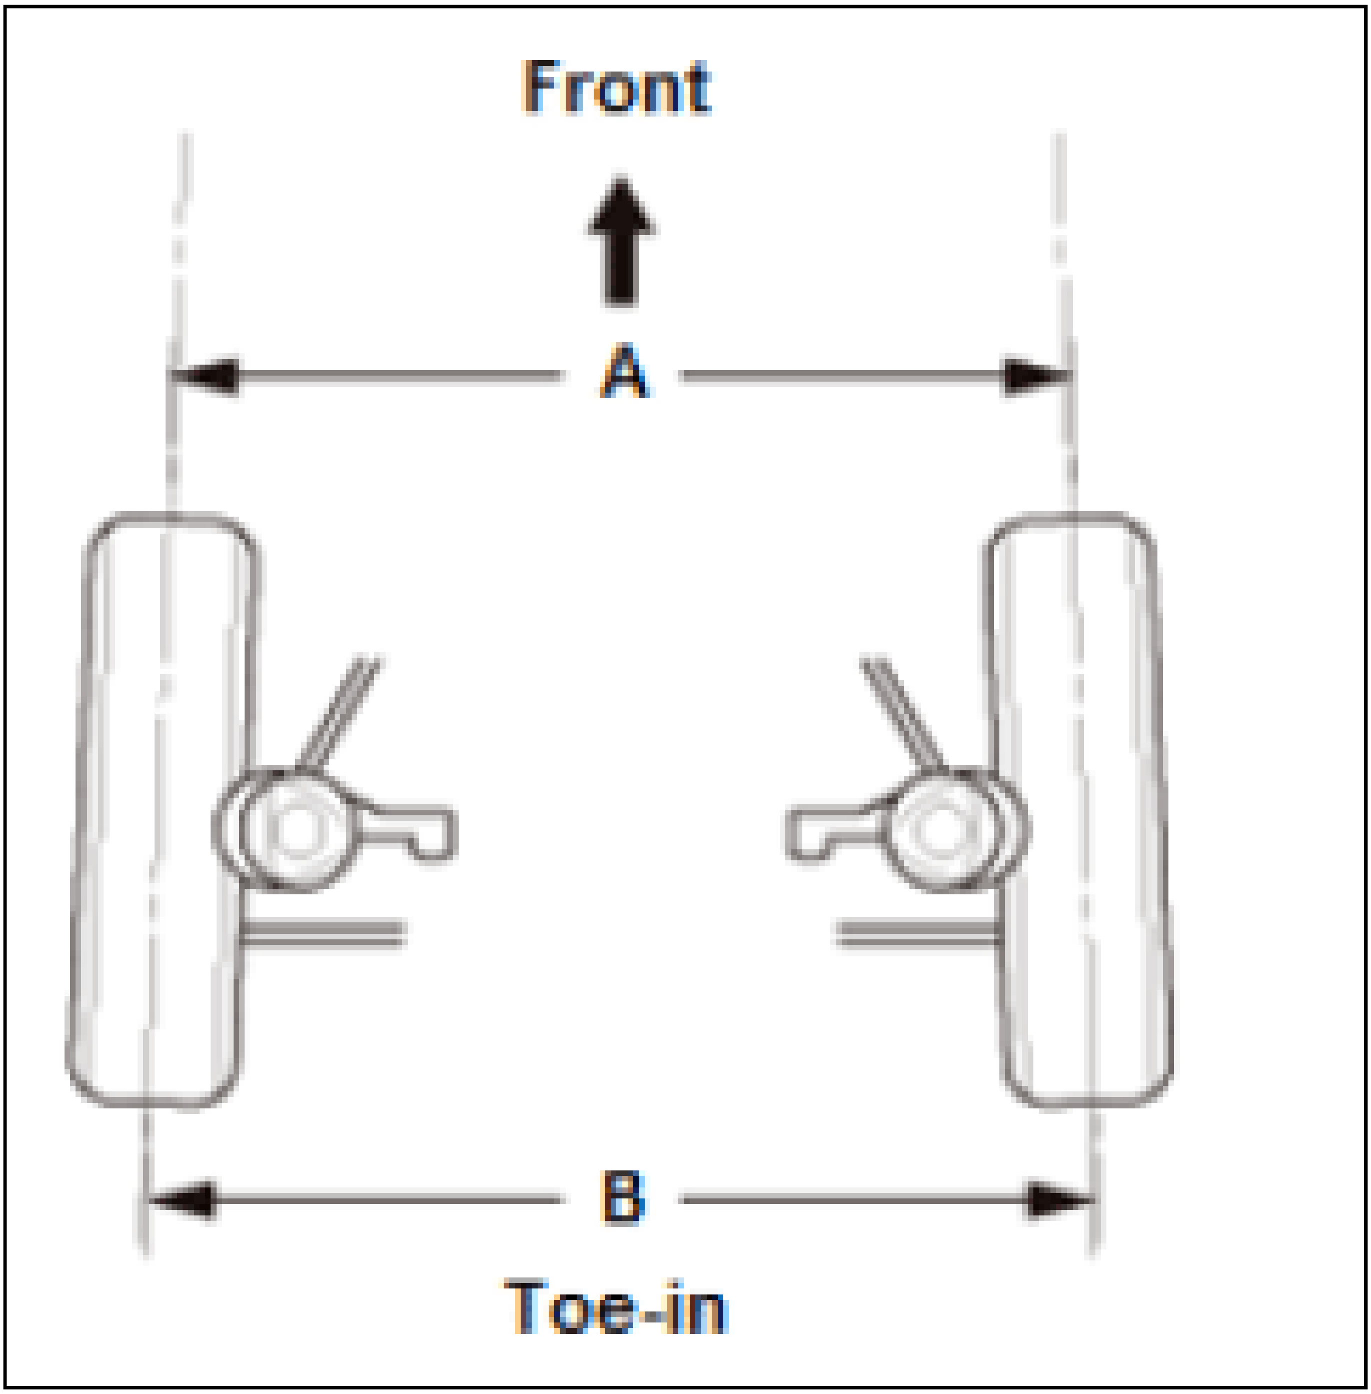


Toe

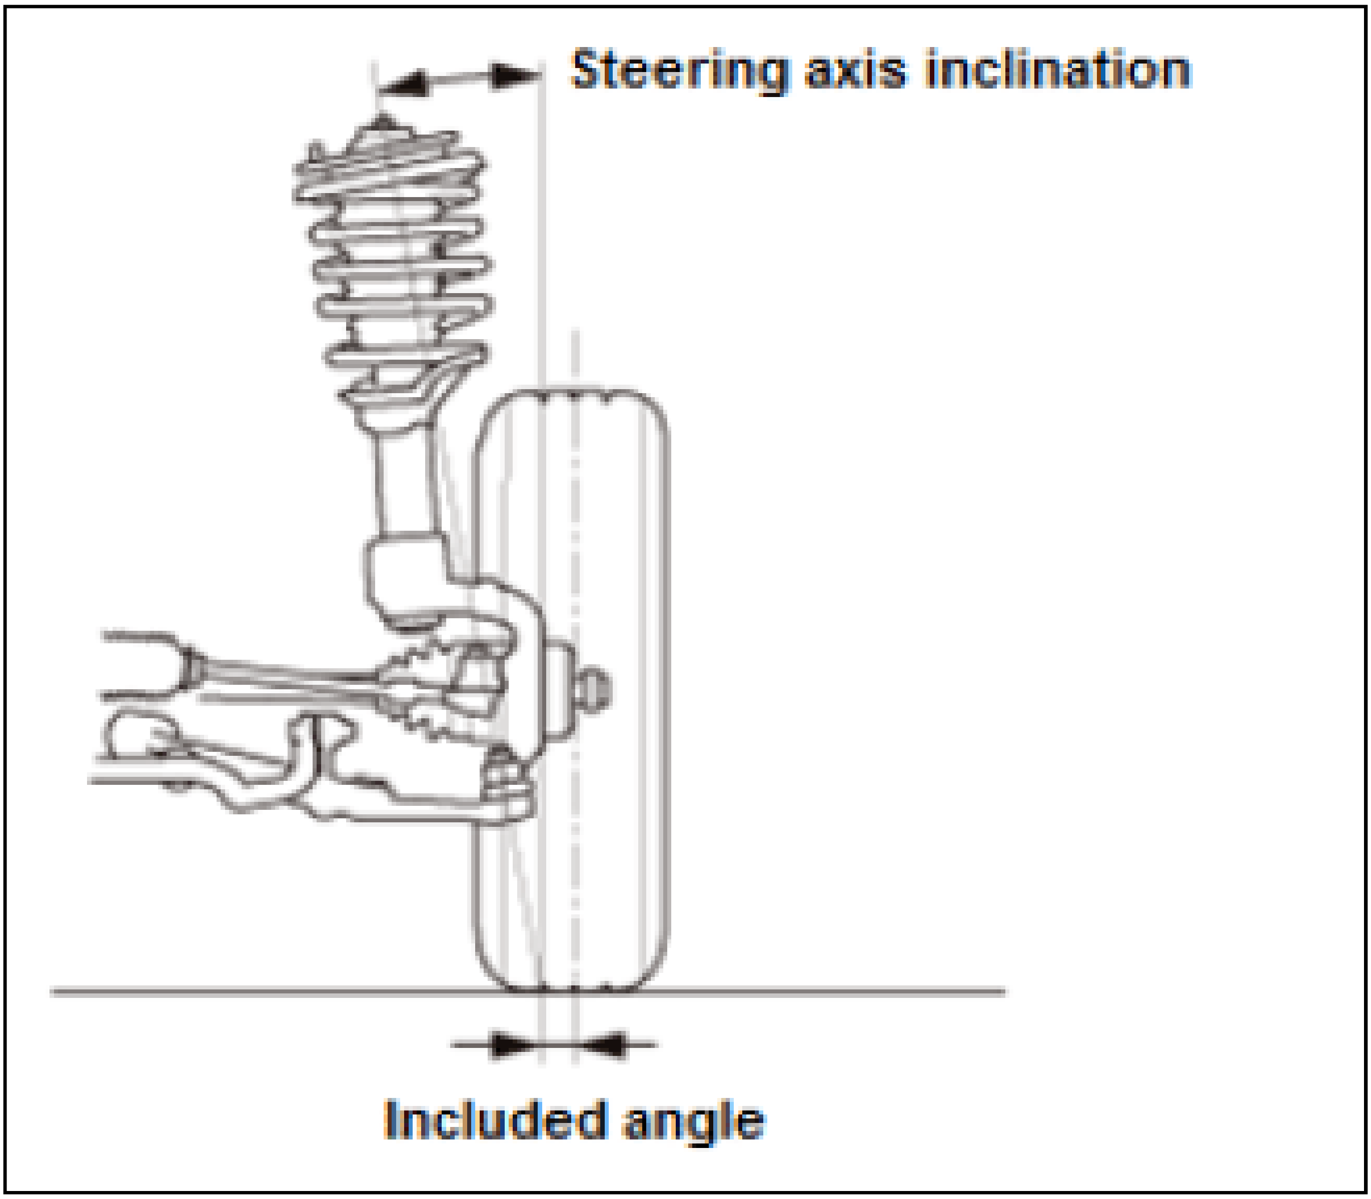
Toe is the comparison of the distance measured between the front and rear of the tires on the same axle.

Toe affects tire wear, handling and steering wheel alignment. Toe is represented by a measurement in either millimeters or inches calculated by taking the distance between the rear of the tires and subtracting the distance between the front of the tires. This measurement is called total toe:

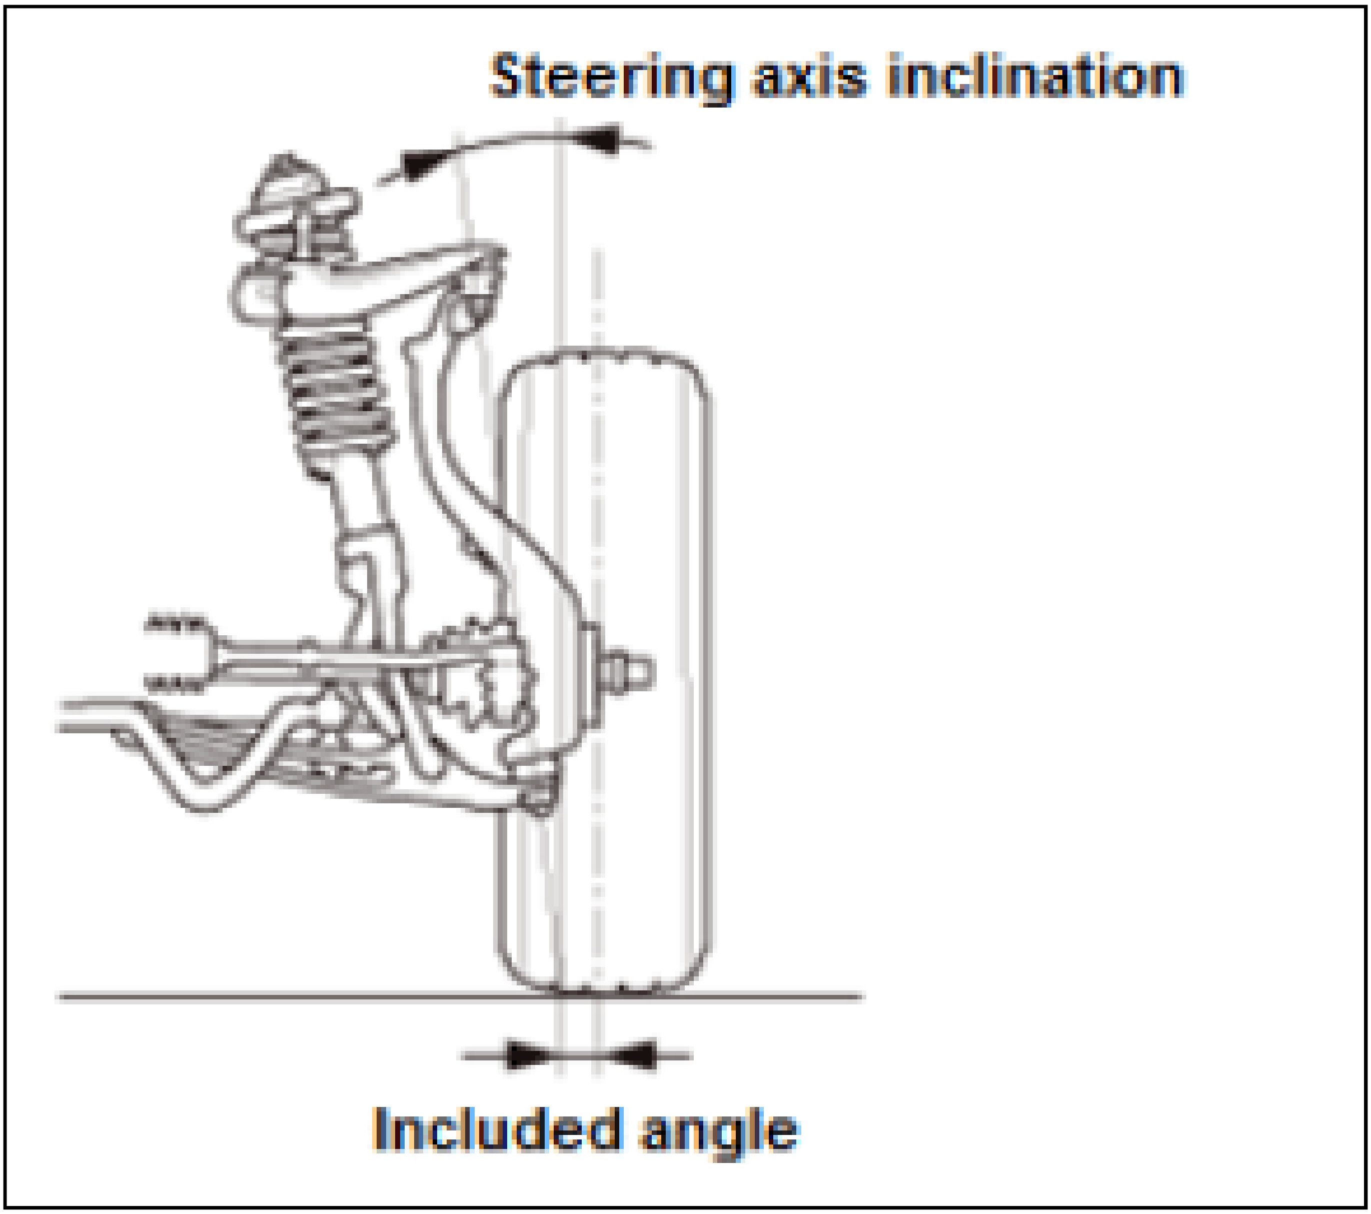
- If the front of the tires were closer together than the rear, the vehicle would have positive toe, also called toe in.
- If the rear of the tire were closer together than the front, the vehicle would have negative toe, also called toe out.



Front
A
B
Toe-in



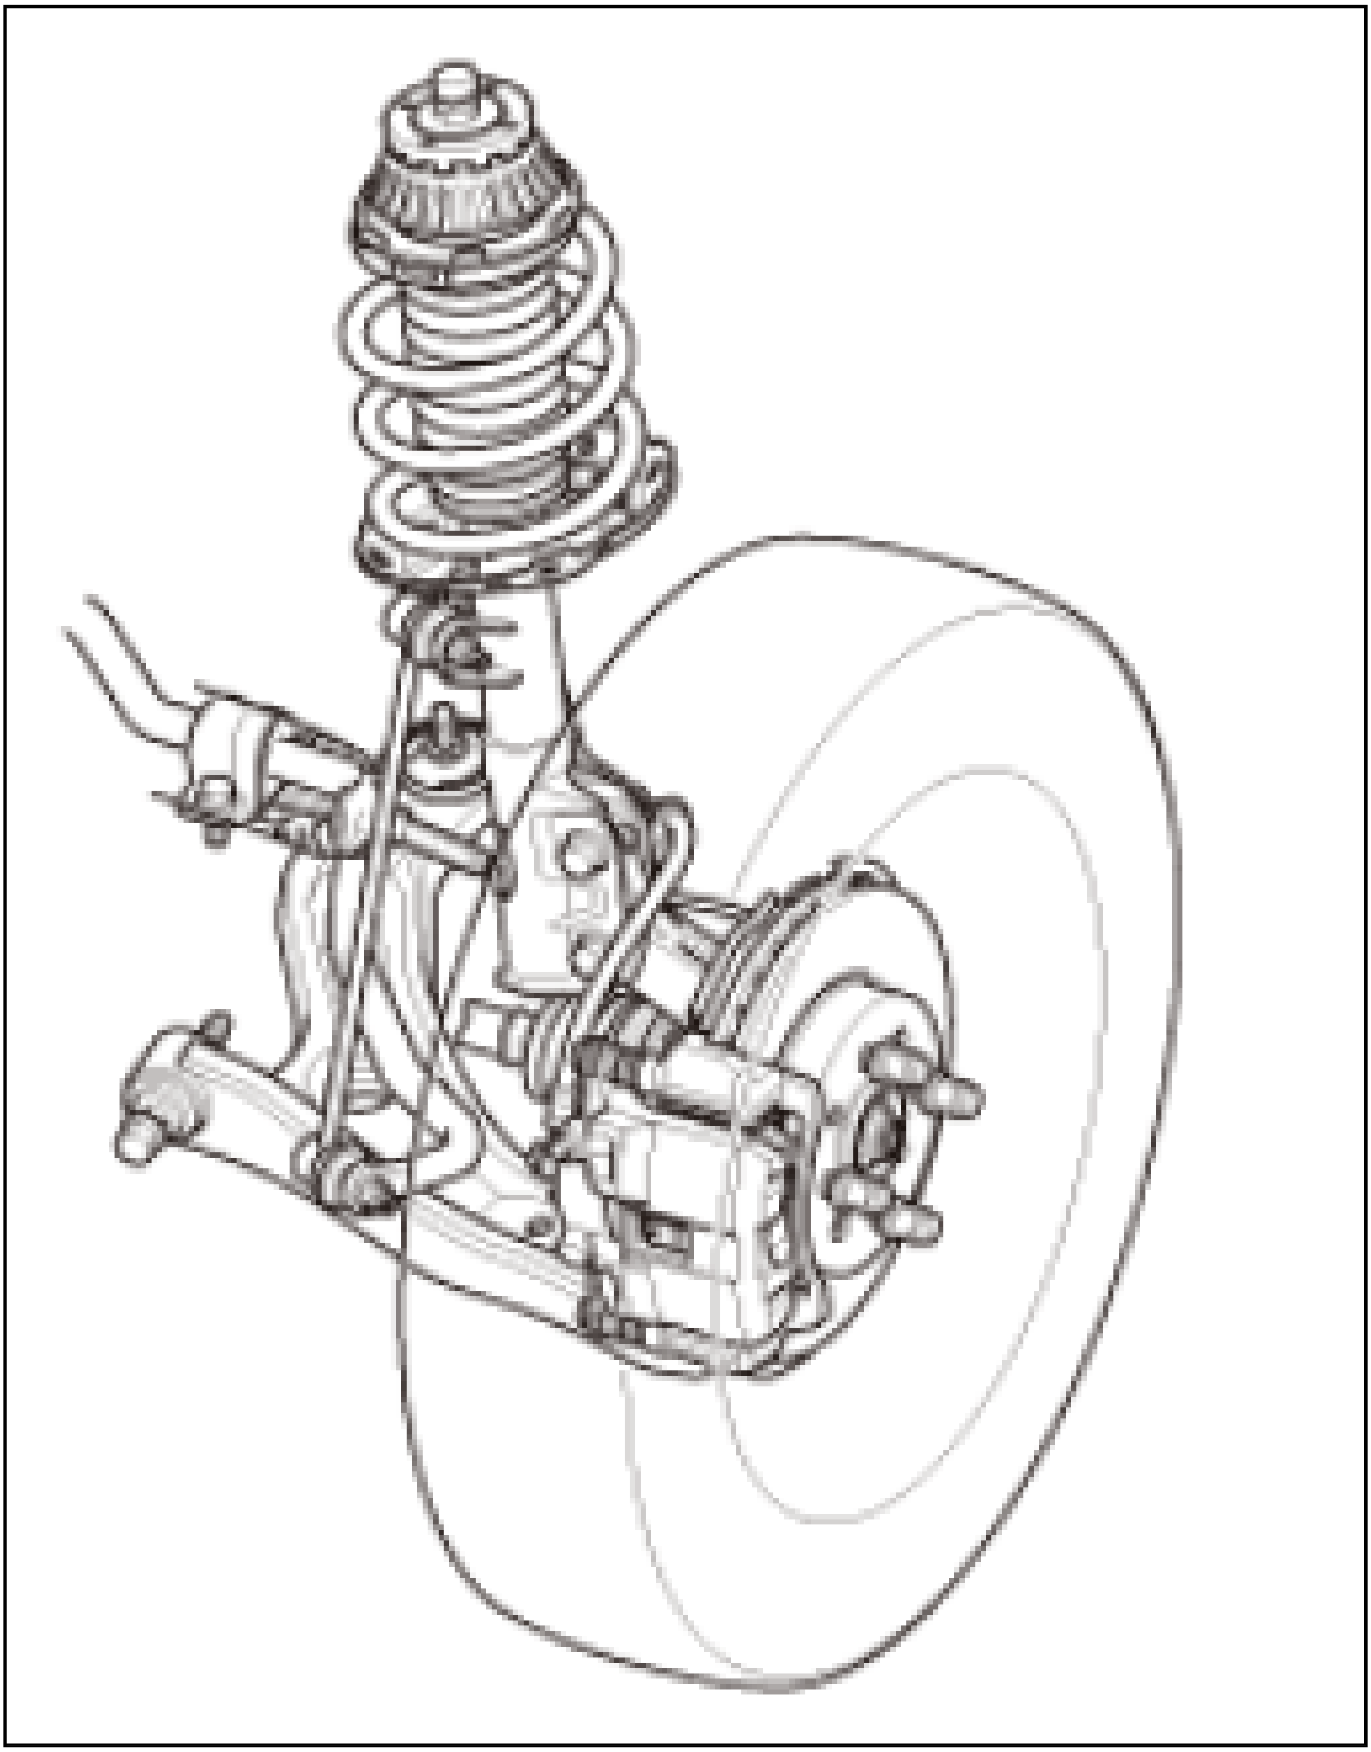
Steering axis inclination
Included angle

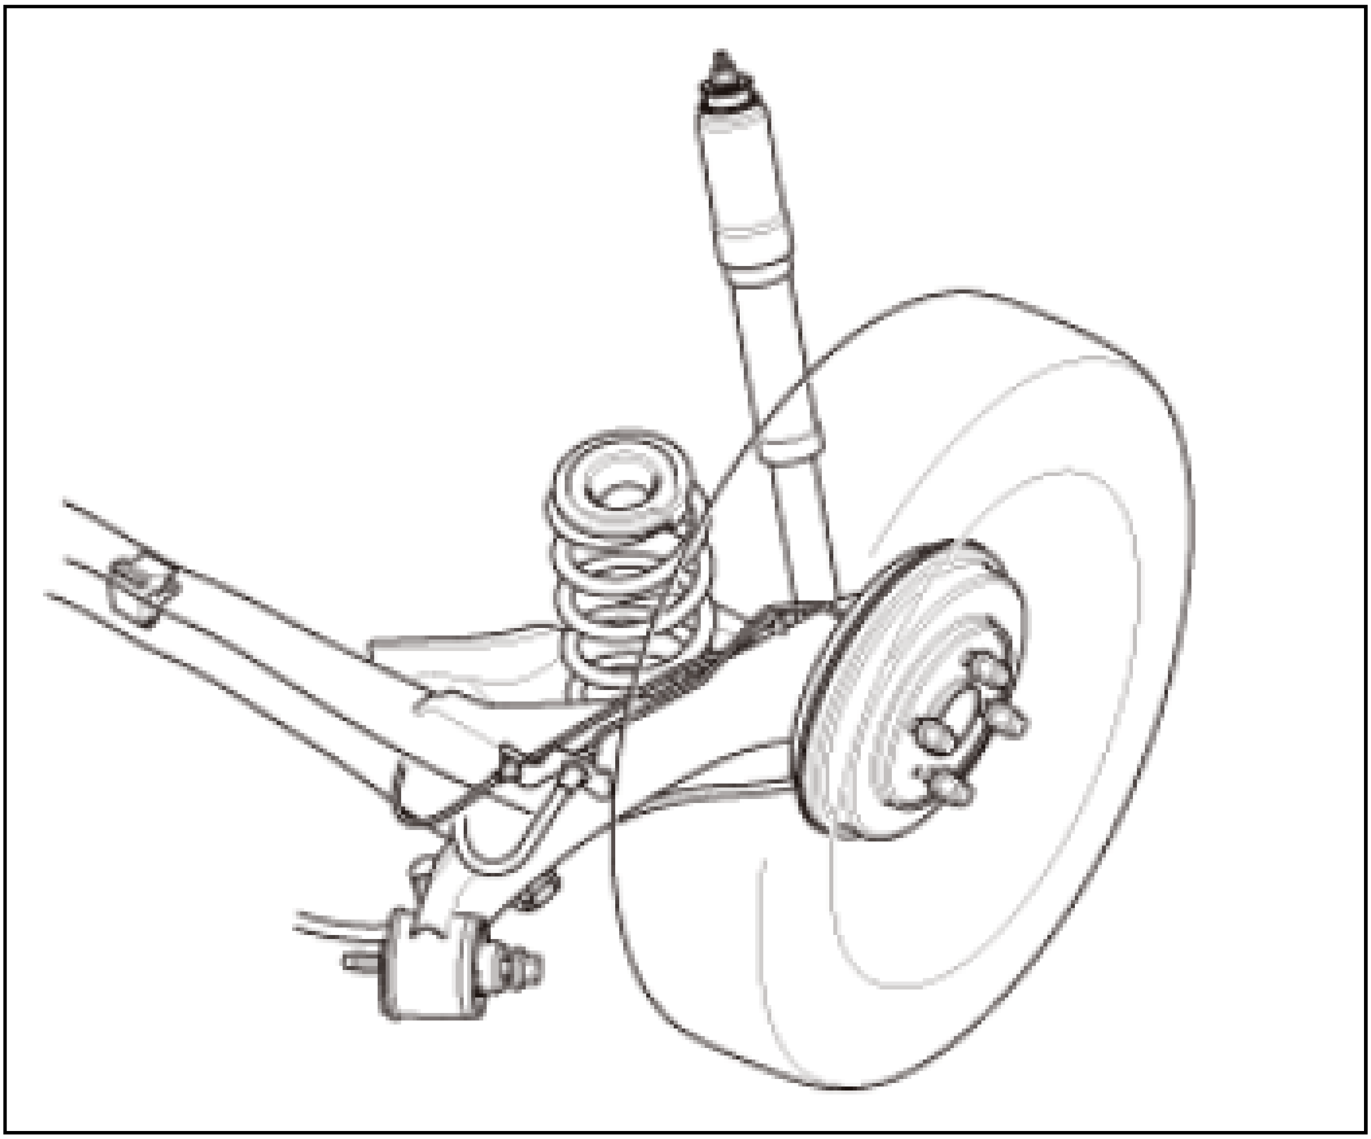


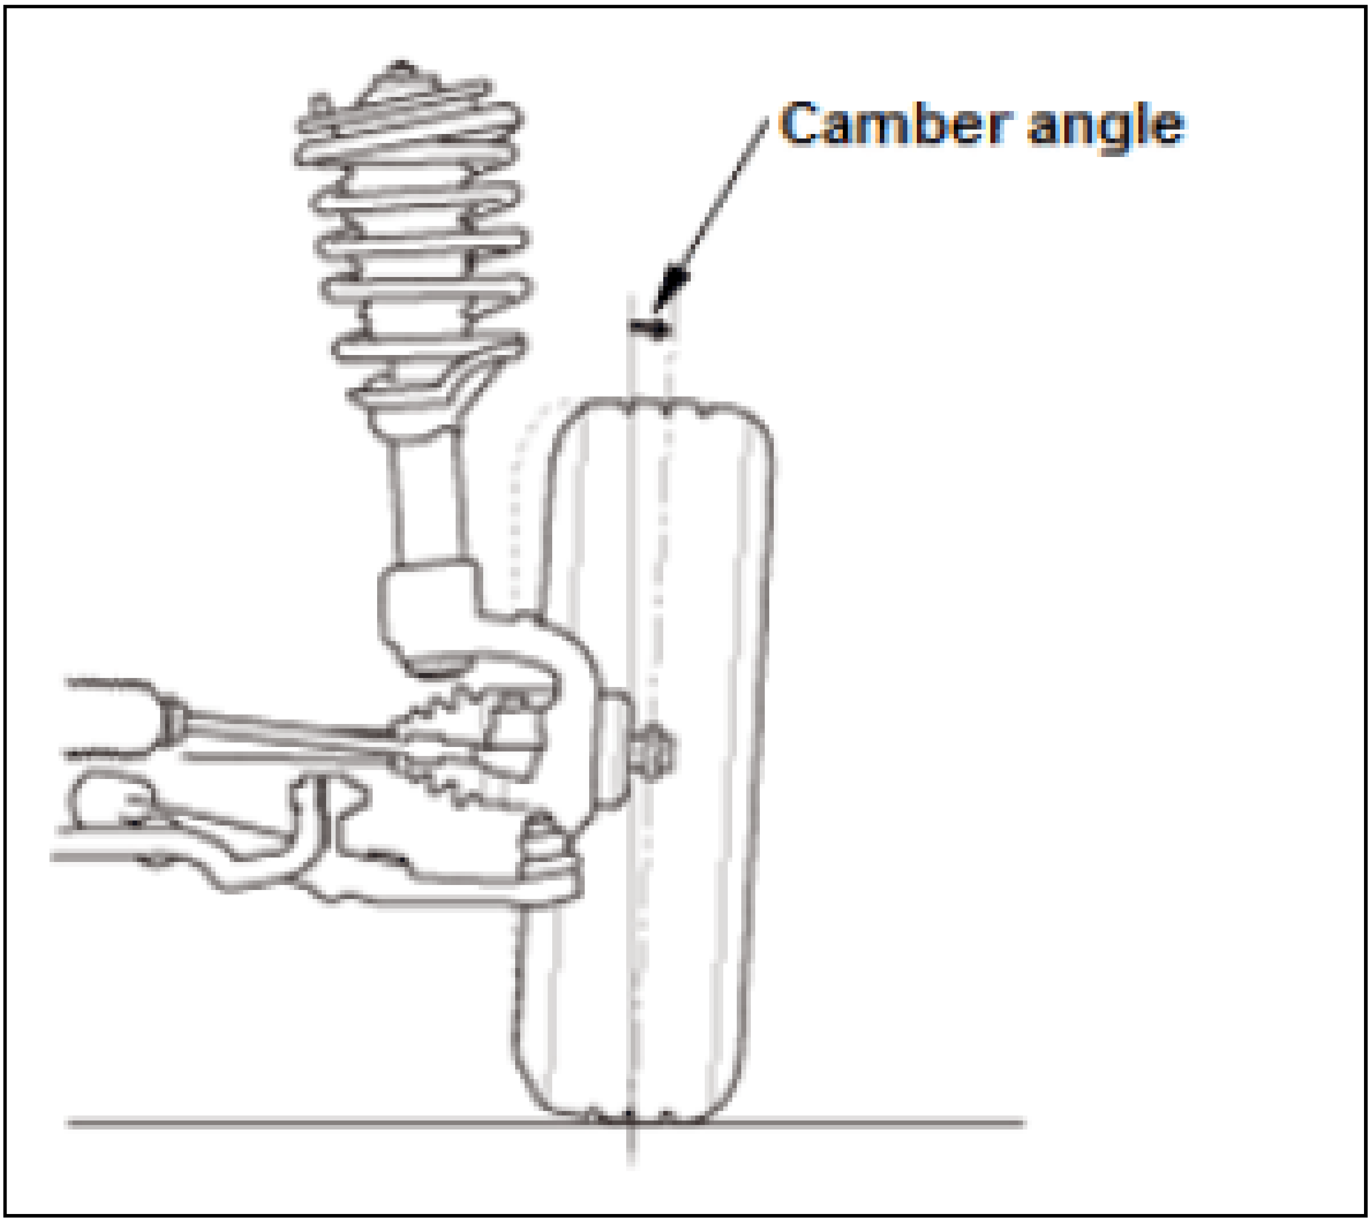
Steering axis inclination, or SAI., is the angle created by drawing a line through the upper and lower pivot points of the knuckle when looking from the front of the vehicle and comparing it to true vertical. Included angle, or I.A., is the combination of SAI. and Camber. If the side to side difference in SAI. or included angle differ 1.5 degrees or more, it may be an indication that the vehicle has damaged components.

Suspension/Camber Angle

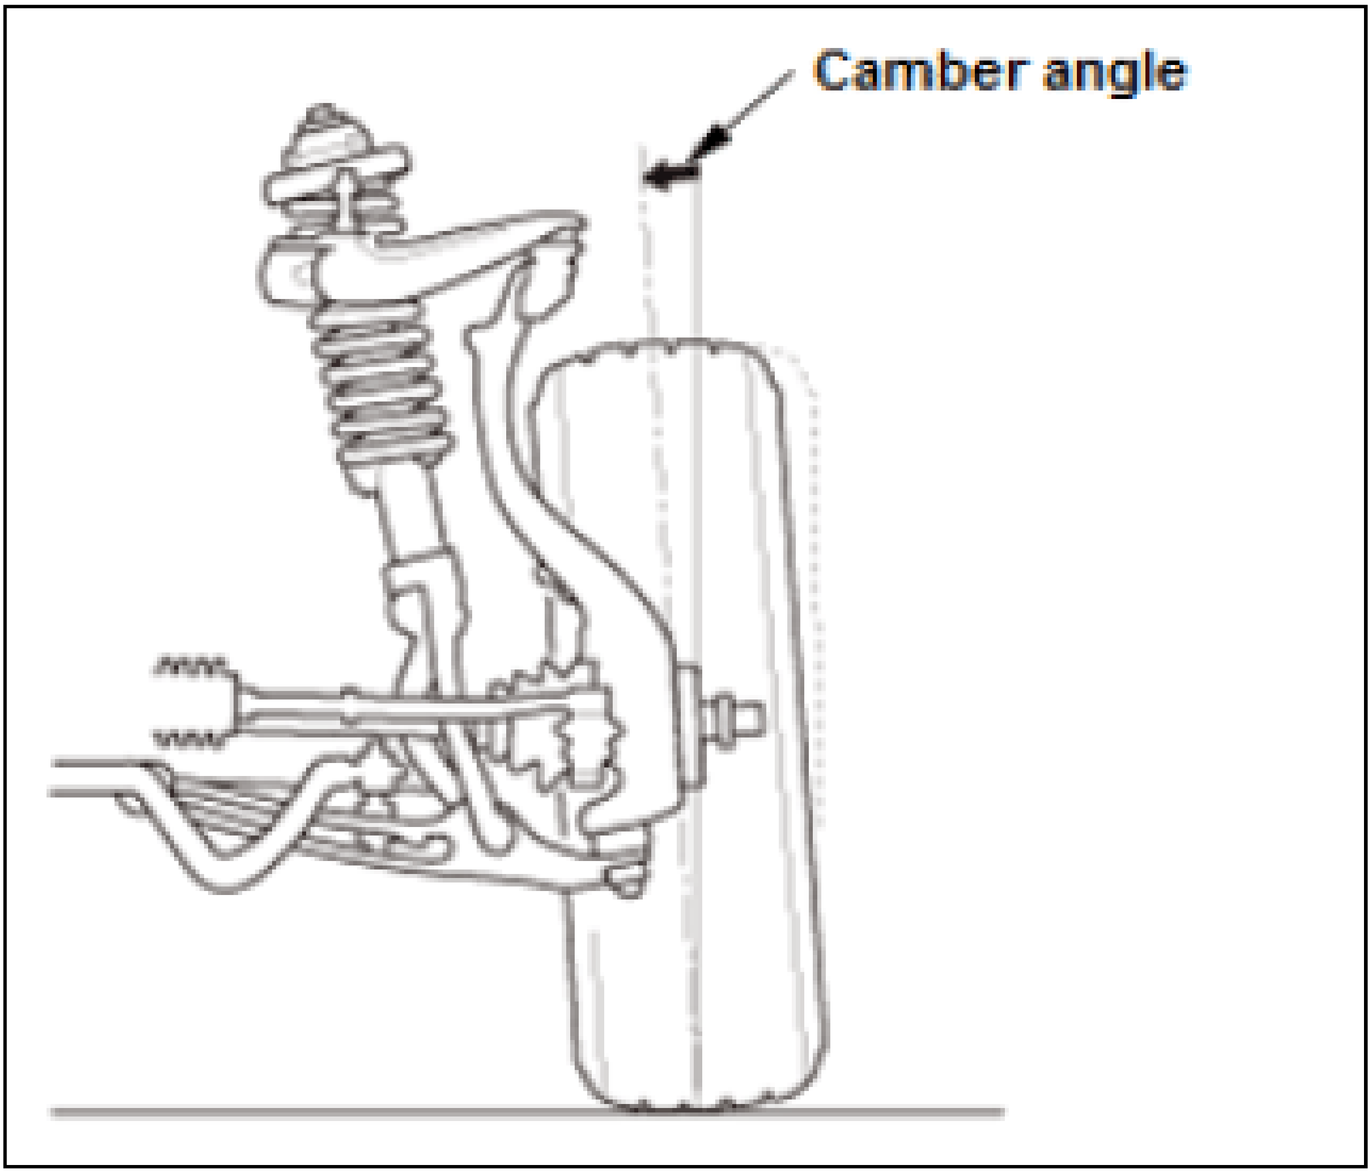
The suspension system holds the wheels and axles in position and absorbs road vibrations. It also allows steering, directional stability and recoverability, while minimizing tire wear. In order to achieve all those requirements, the wheels have a steering axis inclination angle, a camber angle, caster angle and toe-in angle. Wheel alignment is the combination of these angles relevant to the wheel.







Camber angle



Camber Angle

Camber is the side to side tilt of the tire compared to true vertical as seen from the front of the vehicle. This angle is measured for both the front and rear tires. Camber affects vehicle ride quality, handling and tire wear. Camber is measured as the number of degrees that the tire varies from true vertical:

- If the top of the tire is leaning away from the vehicle, camber is positive.
- If the top of the tire is leaning towards the vehicle, camber is negative.
- If the tire is parallel to true vertical, it has zero camber.

MATERIAL INFORMATION

ALUMINUM

Characteristics Of Aluminum Alloy

1. **Advantages of Aluminum Alloy**

Light	The specific weight of aluminum is 2.7, 1/3 of weight compared to iron (7.8) and copper (8.9)
Strong	The alloy can offer tensile strength ranging from 7 to 60 kg/mm^2 depending on its type and through thermal refining. In addition, it increases strength under a super low temperature environment.
High corrosion resistance	The aluminum easily be oxidized in the air and form a layer of aluminum oxide on the surface. The aluminum oxide layer is superb in corrosion resistance and prevents its own corrosion.
High conductivity	The electrical conductivity is 60% of that of copper, at the same time, the weight is only 1/3 of that of copper. Thus twice of the conductivity is achieved with aluminum alloy compared against the copper when they are the same weight.
High processability	Aluminum has high plastic forming capability and allows to form a variety of shapes. By utilizing a special extrusion method, it is possible to make very complicated shapes easily.

No toxic property	Aluminum is a non hazardous material with no smell. High in sanitation. Thus often used for kettles and other kitchen/food related products.
Easy to recycle	It does not produce industrial waste. It can be recycled with only 3% of energy used for creating a new virgin metal.

2. **Corrosion of Aluminum Alloy**

   After a thin layer of aluminum oxide forms, aluminum alloy has high anti-corrosion performance. However, under some conditions, the corrosion types below can occur:

   - Contact Corrosion (Electric or Galvanic Corrosion)

     When aluminum alloy is placed in conditions where a conductive solution while in contact with different types of metals with lower potential, the electrical potential difference causes galvanic corrosion of the aluminum alloy It is also called electric or galvanic corrosion. The contact corrosion rarely occurs in dry air, however it could happen locally under the environment with presence of water content. It requires a special attention.

     NOTE: **In order to avoid contact corrosion, always refer to the parts catalogue to choose the appropriate bolts, screws and nuts to be used together with aluminum alloy body parts and replace them where specified.**

   - General Corrosion

     Occurs when the protective natural aluminum oxide layer is destroyed by a chemical agent. Aluminum alloy will be corroded by both acid and alkali solutions.

3. **Oxide Layer**

   The melting point of the oxide layer is very high, at 4532Â°F (2500Â°C). The hardness and specific weight of oxide layer is higher than the aluminum alloy itself. The melting point of aluminum alloy is approximately 1182Â°F (640Â°C).

Precautions On Aluminum Alloy Panel Repair

- When aluminum and metal oxide (iron oxide) powders are mixed and ignited for some reasons, a strong redox reaction occurs. This is called thermite reaction and can generates heat up to 5, 432 Â°F (3, 000 Â°C).

  WARNING: **Separate and ventilate aluminum work areas to avoid mixing the aluminum power with other metal powders.**

- Aluminum is non toxic, however due to its light weight, its particles can easily be dissipated into the air. Always use protective equipment to prevent dust from entering the lungs and eyes.
- When aluminum is in contact with other types of metals (especially iron), it will cause galvanic (contact) corrosion on aluminum.

  Because of this characteristic, if the tools used for steel panel repair are then used on aluminum parts, the iron power will adhere to the aluminum surface causing corrosion. Maintain a separate set of tools and work area used only for aluminum repair.

- When aluminum alloy is exposed to the air, an aluminum oxide layer will be generated in a short period of time. This oxide layer can negatively impact putty and paint work, therefore base coat treatment must take place immediately after sanding and degreasing the surface.
- Aluminum is brittle and tends to crack and work harden easily. By heating, workability improves when restoring the deformed areas and work hardening and crack can be prevented. Heating is very effective during repair, however the temperature must be tightly controlled as the workability becomes the best only within a tight optimal temperature range. When the temperature exceeds this range, the aluminum's durability is reduced.

- **Aluminum Sanding Precautions:**
  - Use separate sanding tools and coated abrasives for aluminum repair.
  - Use lower sanding tool speeds to reduce heat tool and avoid continuous heating work.
  - Do not use clogged sanding tools or coated abrasives.
  - Use only stainless wire brushes, never use a regular steel wire brush.
- **Aluminum Welding Precautions:**
  - Clean the repair area before welding.
  - Confirm welding conditions using a test piece before making actual welds. Do not start the welding arc on the joint surface.
  - Do not use a welding wire without referring to the information in the model specific body repair information.

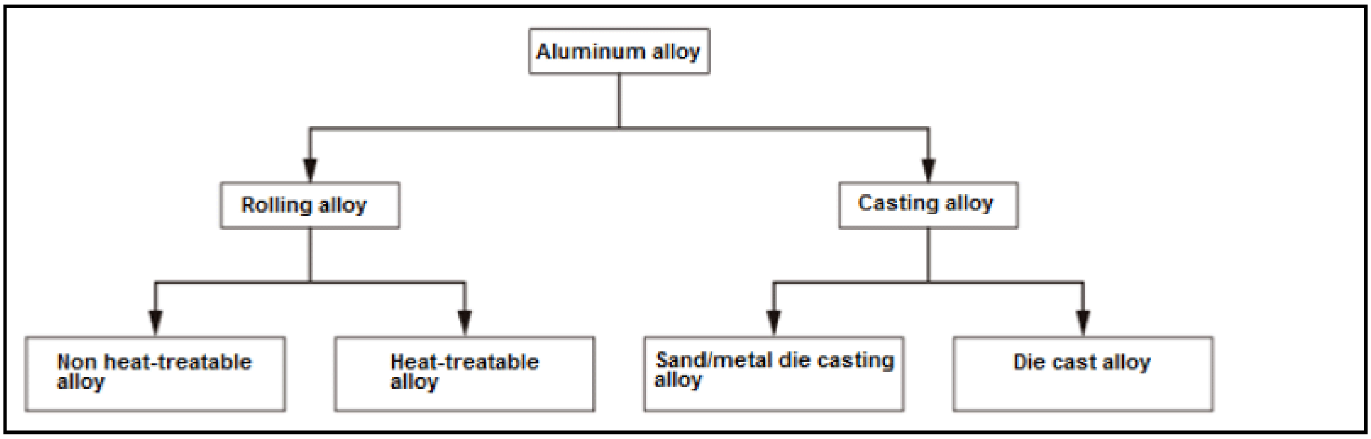
  - Use only 100% argon shielding gas.
  - Welding wire must be stored in a dry, temperature-controlled area inside a closed container. Do not use wire that has been stored for a long time.
  - Do not use an oxyacetylene gas torch for welding or soldering.
- **Aluminum Metal Work Precautions:**
  - If cracking is observed in the buckled area of structural components, replace the parts. Do not attempt repair.
  - The buckled area of 5000 grade aluminum parts must be straightened using heat within a tight temperature range. Do not cold straighten this type of aluminum. Do not repair damaged aluminum castings.
  - Do not clamp tools directly to the aluminum.
  - Do not use a file-faced hammer.
  - Do not solder aluminum parts to repair them.
  - Always apply epoxy based primer before putty application.
- **Aluminum Assembly Work Precautions:**
  - Only use specified screws and bolts.
- Aluminum Inspection Precautions:
  - After straightening and welding work on the structural parts is completed, make sure to check for cracks.

Types Of Aluminum Alloy

Aluminum with a purity of 99.00% or higher is called pure aluminum. Aluminum alloy is the combination of aluminum and various different types of elements in order to improve the strength and other characteristics.

Aluminum alloy can be categorized into two major types of rolled alloy and cast alloy the type chosen depends on the application requirements. Rolled alloy is mainly used in a form of plates, pipes, sticks, wires, and some casting parts. Cast alloy is mainly used for casting parts and die cast. They are also subcategorized into non heat-treatable and heat-treatable alloys.

Non heat-treatable alloy can achieve the specified strength by a cold work including rolling process, meanwhile heat-treatable alloy can achieve the specified strength by heat treatment including hardening and normalizing processes.



Non heat-treatable alloy		Heat-treatable alloy	
Types	**Characteristics**	**Types**	**Characteristics**
1000 type (pure aluminum)	Good in processability corrosion resistance, electro/thermal conductivity. Poor in strength.	2000 type Al-Cu-Mg type alloy	Equivalent strength as steel panels. Known as duralumin.
3000 type Al-Mn type alloy	Good in processability, corrosion resistance and strength.	6000 type Al-Mg-Si type alloy	Good in strength and corrosion resistance. Suitable for extrusion processes.
4000 type Al-Si type alloy	Good in heat and wear resistance.	7000 type Al-Zn-Mg type alloy	The strongest alloy of all aluminum alloy.
5000 type Al-Mg type alloy	Good in corrosion resistance and welding capability A wide variety of types are available offering wide range of application.	Â	Â

BODY PANEL TECHNICAL REQUIREMENTS

Overview

- Steel sheets used for automobile bodies are mostly carbon steels (carbon-ferrous alloy) because of the stamping requirements and resistance to severe usage conditions that vehicles must endure.

- Depending upon the steel's carbon content, technical properties of the metal are changed. Higher the carbon content increases impact resistance, but the formability and weldability are reduced. Even panel repair would be difficult. For these reasons most body parts are made from low carbon steels, with a carbon content of 0.1 to 0.4% or less.
- Recently more high-strength steel has been used. Though much thinner than conventional soft steel, it provides the same level of strength. High-strength steel sheet has a higher tensile strength, 340 MPa or higher, and a higher yield point. This makes it possible to reduce the total weight of a body while maintaining collision safety
- Where required, zinc-plated sheets are used to improve corrosion resistance.
- Body component parts have different section requirements. Because most are press formed from a thin steel sheet, different rigidities are specified, depending upon where strength is needed, by adding different thicknesses or reinforcements.

Example: Main parts using high-strength steel and zinc-plated sheets

CHARACTERISTICS OF STEEL SHEET

Bending And Strength

While considering design and strength, automotive body panels are press-formed in various shapes. By giving a steel panel its own designed shape, strength is increased. By assembling that panel with other parts, body rigidity is enhanced.

Steel Sheet Bending

- Automotive body panels are press formed with sharp bent areas where higher strength is necessary. Those sharply bent areas are called a crowns and have the following categories:

  <Low Crown>

  The bend radius of the curve is great or the edge is very gently sloping.

  <High Crown>

  The bend radius is very small or the edge is very sharp.

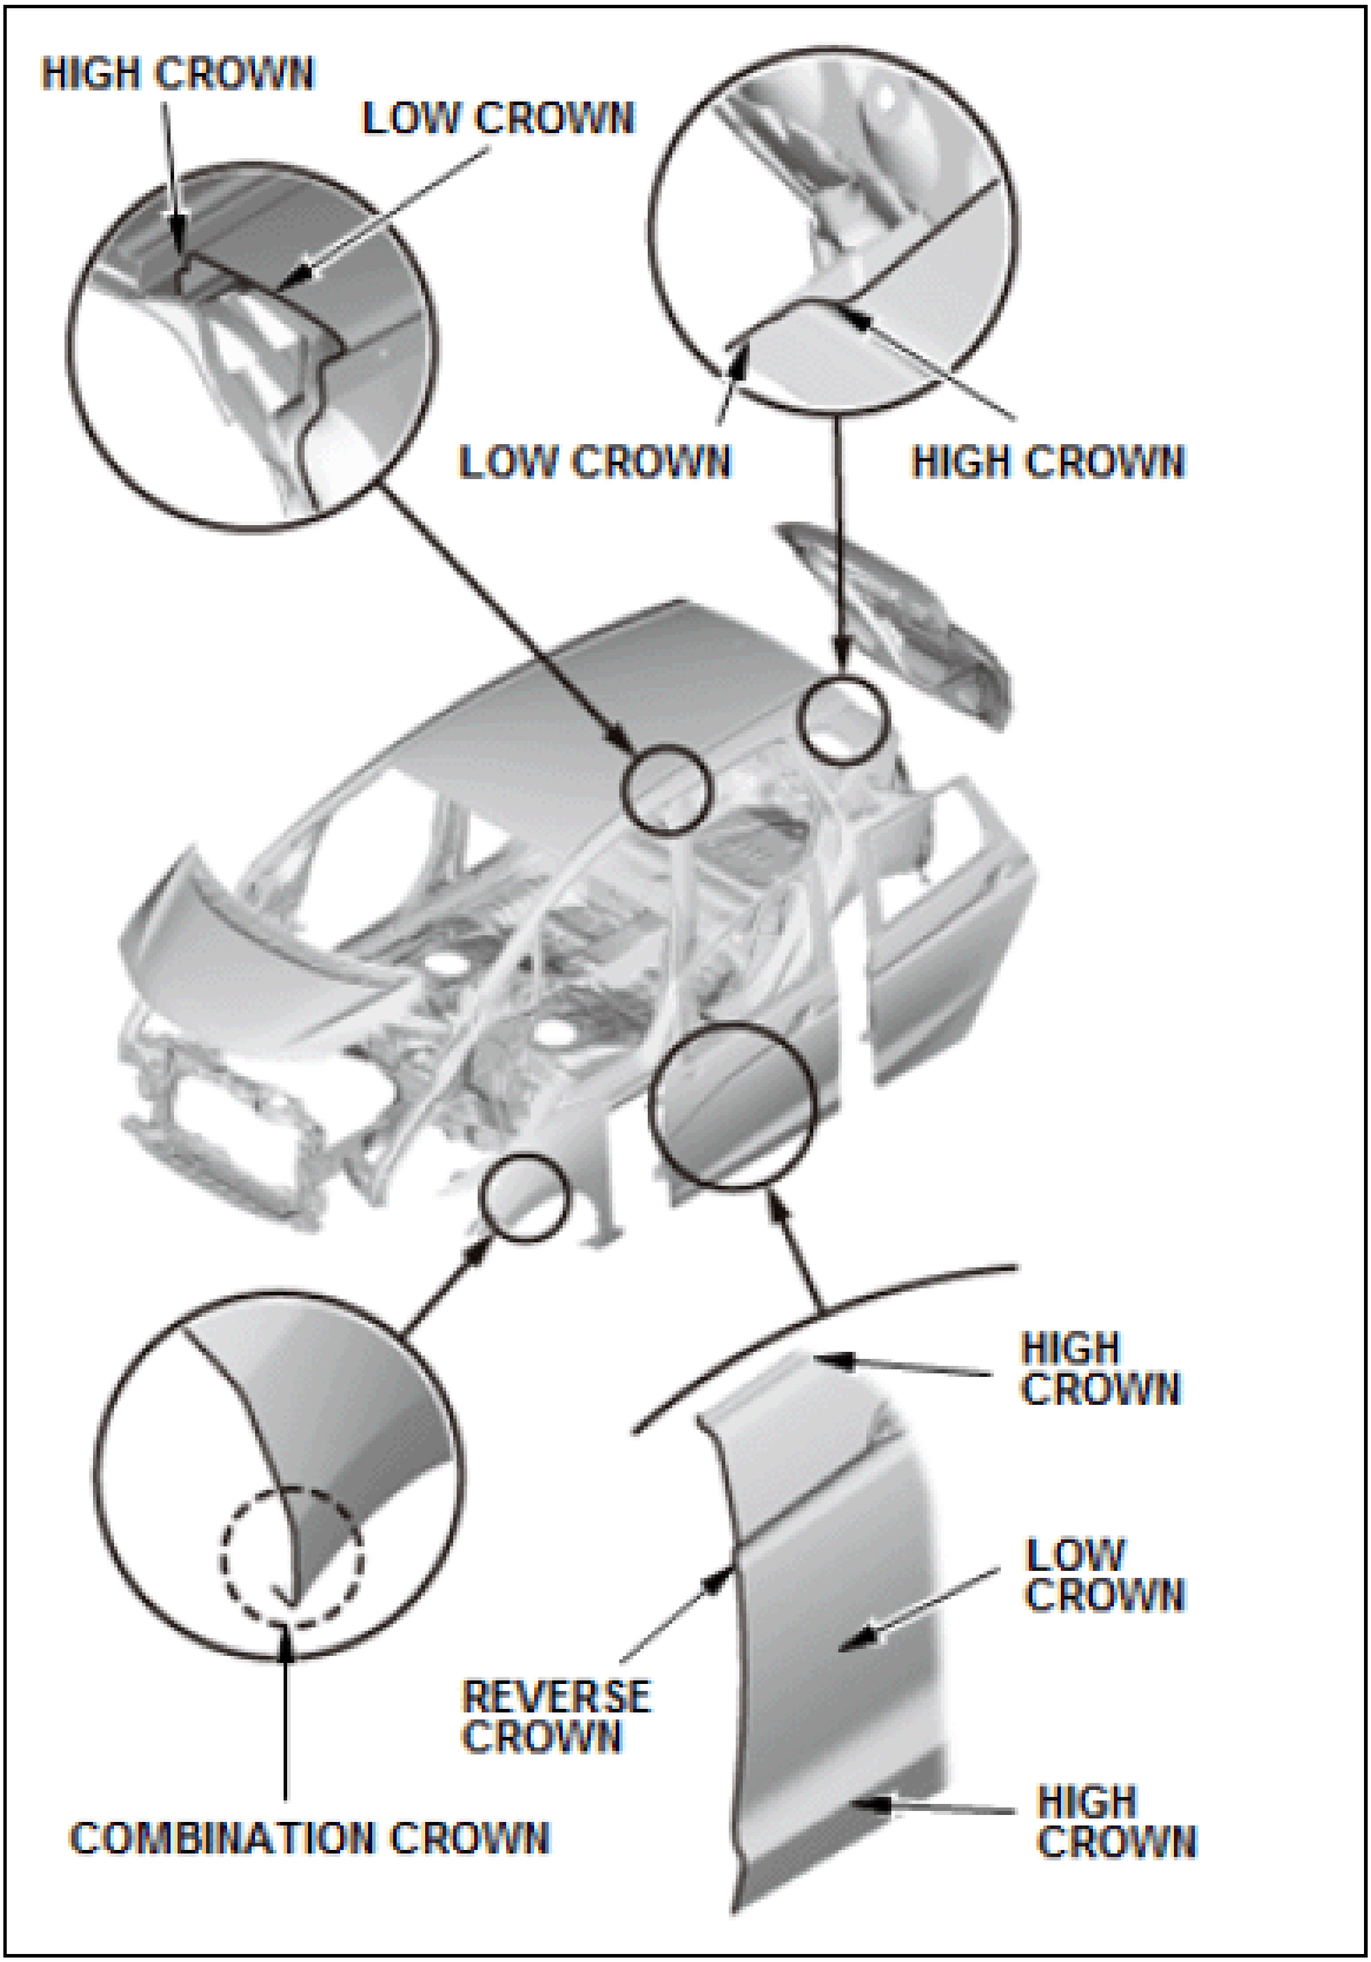
  <Combination Crown>

  A low crown and high crown are combined on one panel.

<Reverse Crown>

An edge sharply curved inward toward the panel.

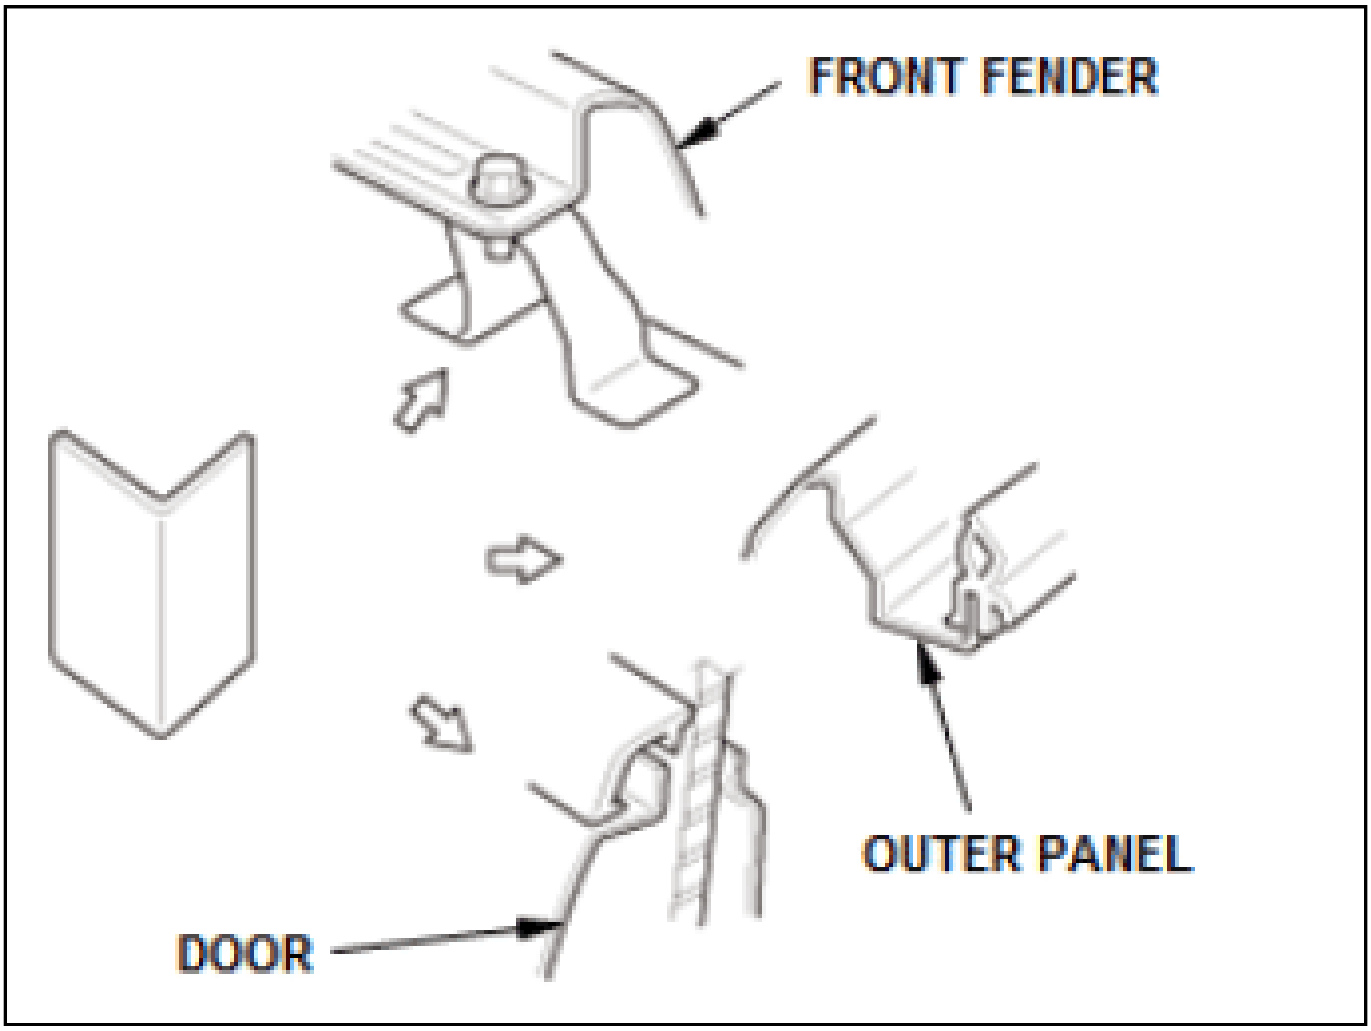
- When repairing a damaged body or panel, smaller loads are required for a low crowned panel because it has a large radius. A high crowned panel for deep-draw has a small radius and requires a certain level of pulling force against the deformation area. A reverse crown is incorporated in a panel that has a sharp inward curvature. Because of this, the strength is so concentrated that repair becomes difficult.



HIGH CROWN
LOW CROWN
LOW CROWN
HIGH CROWN
HIGH CROWN
LOW CROWN
REVERSE CROWN
HIGH CROWN
COMBINATION CROWN

Angle Bending

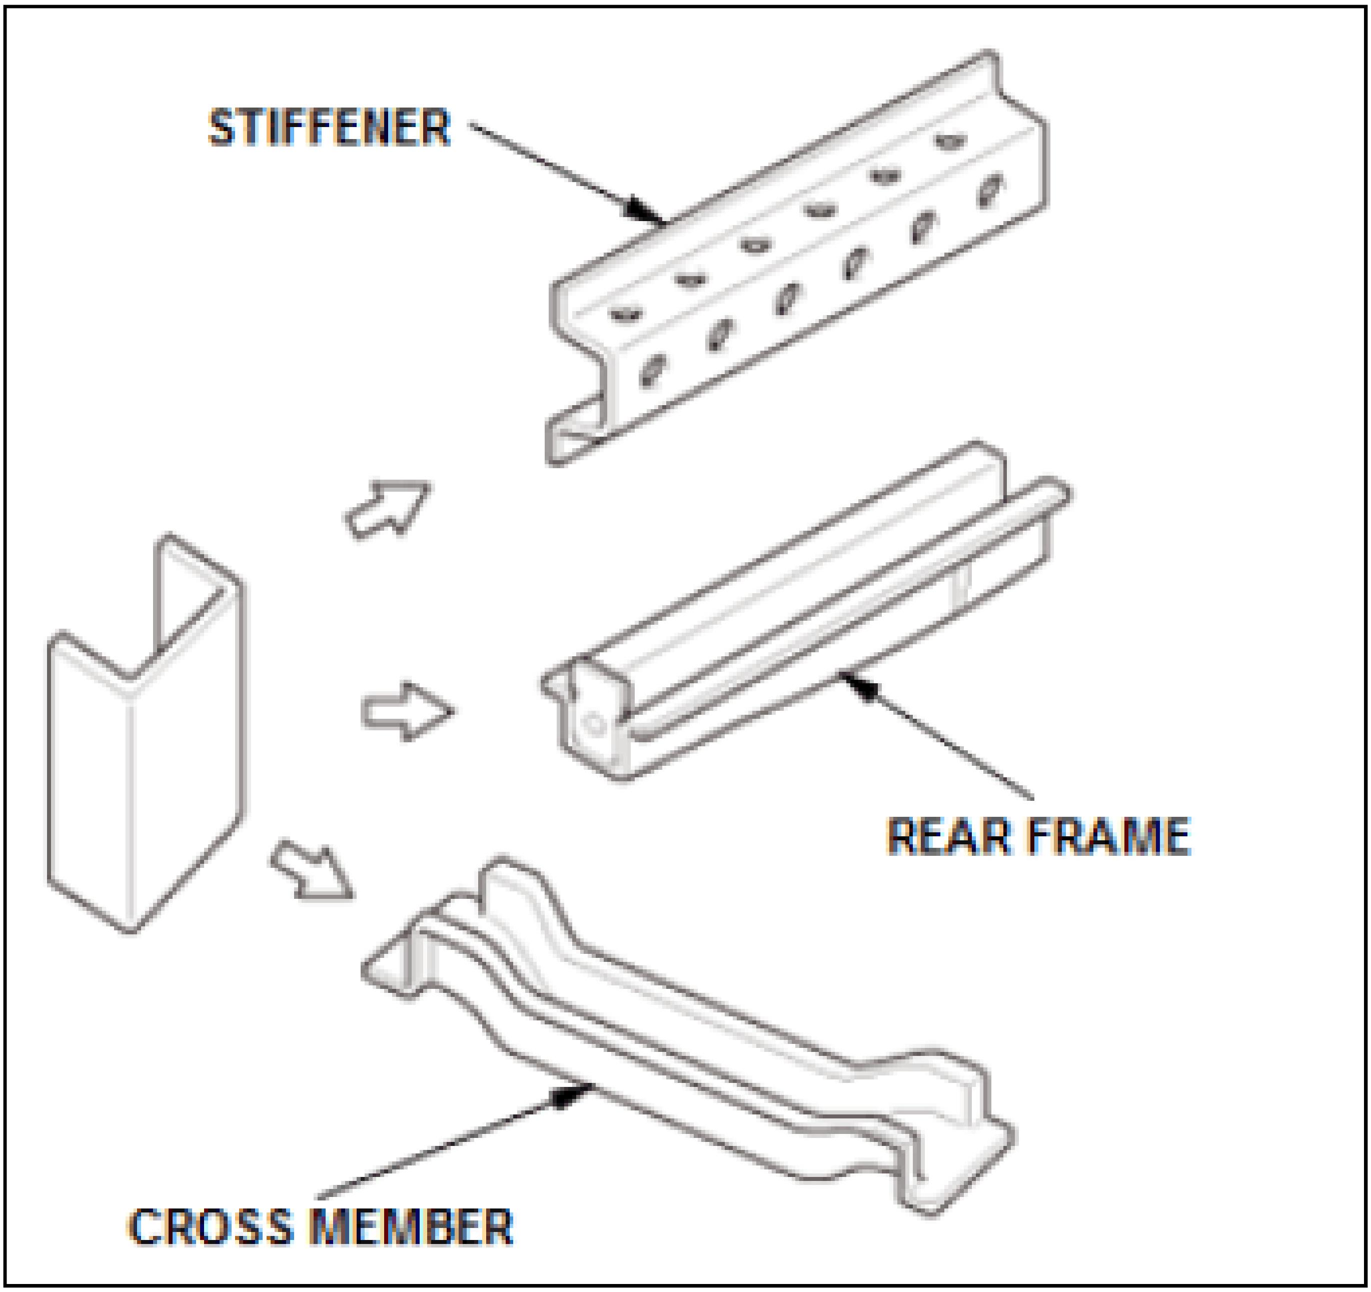
Panel is bent at a right angle. This is mainly used for doors, fenders and some outer panels.



FRONT FENDER
OUTER PANEL
DOOR

Channel Bending

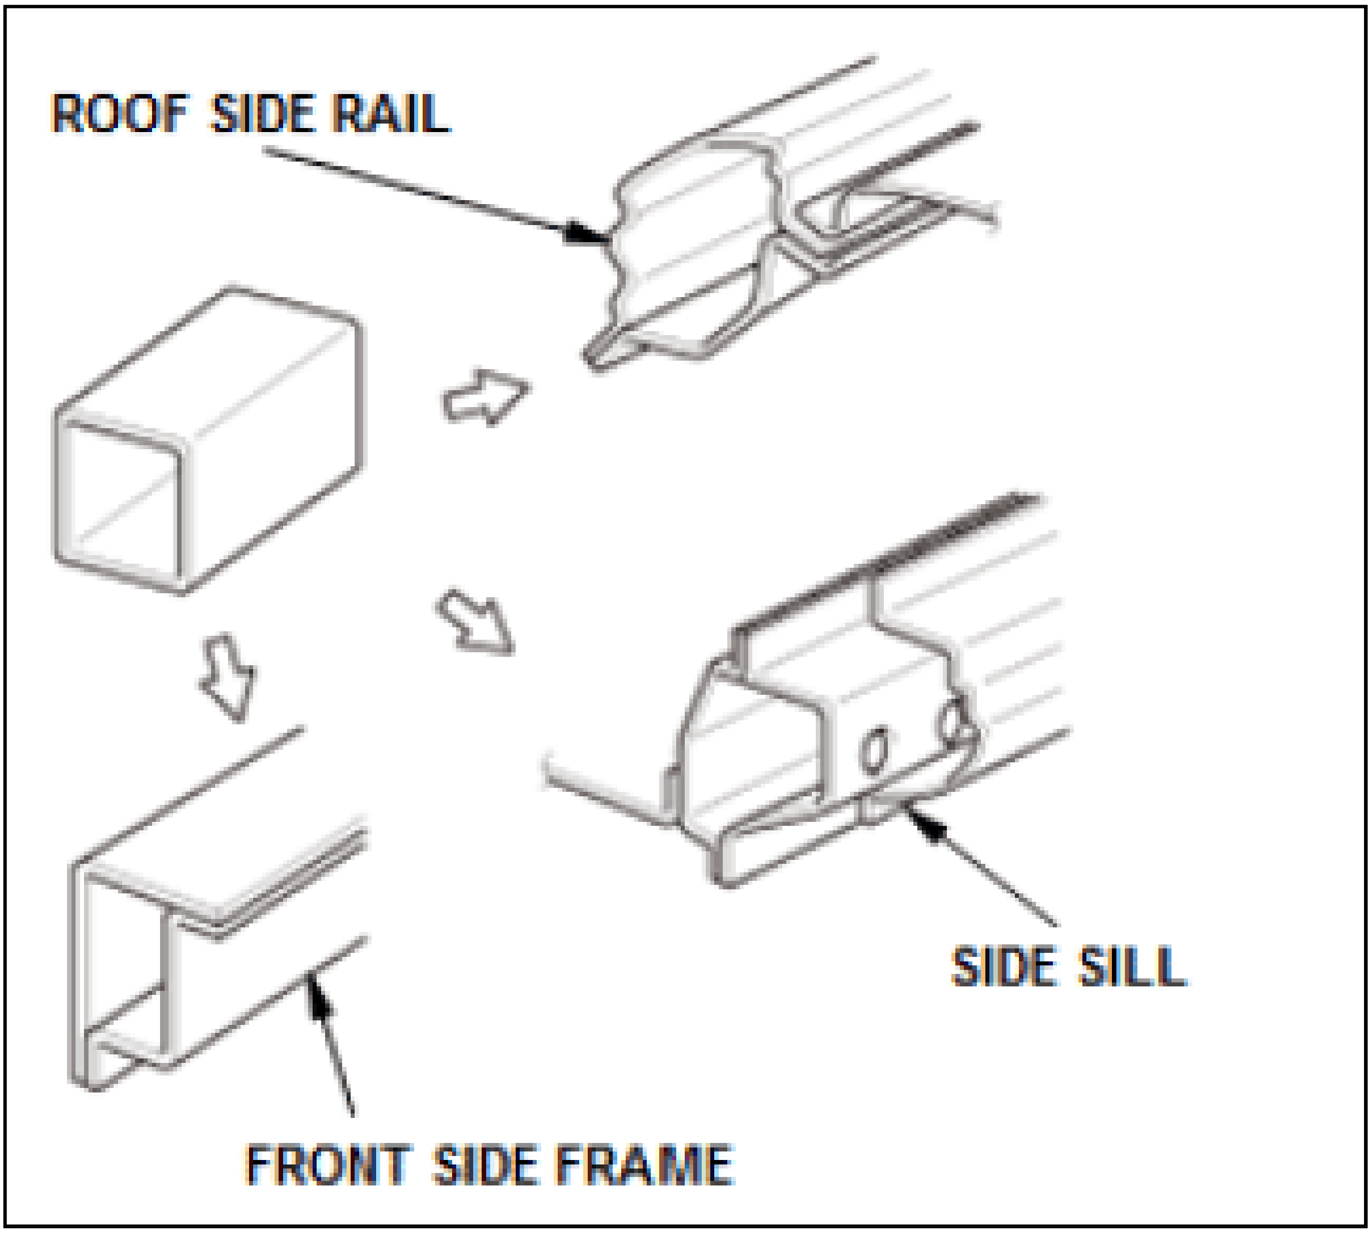
This steel sheet bending method has greater strength than angle bending. It is mainly used for under-body component parts such as stiffeners, rear frame, cross members or a floor frame.



STIFFENER
REAR FRAME
CROSS MEMBER

Box Gutter

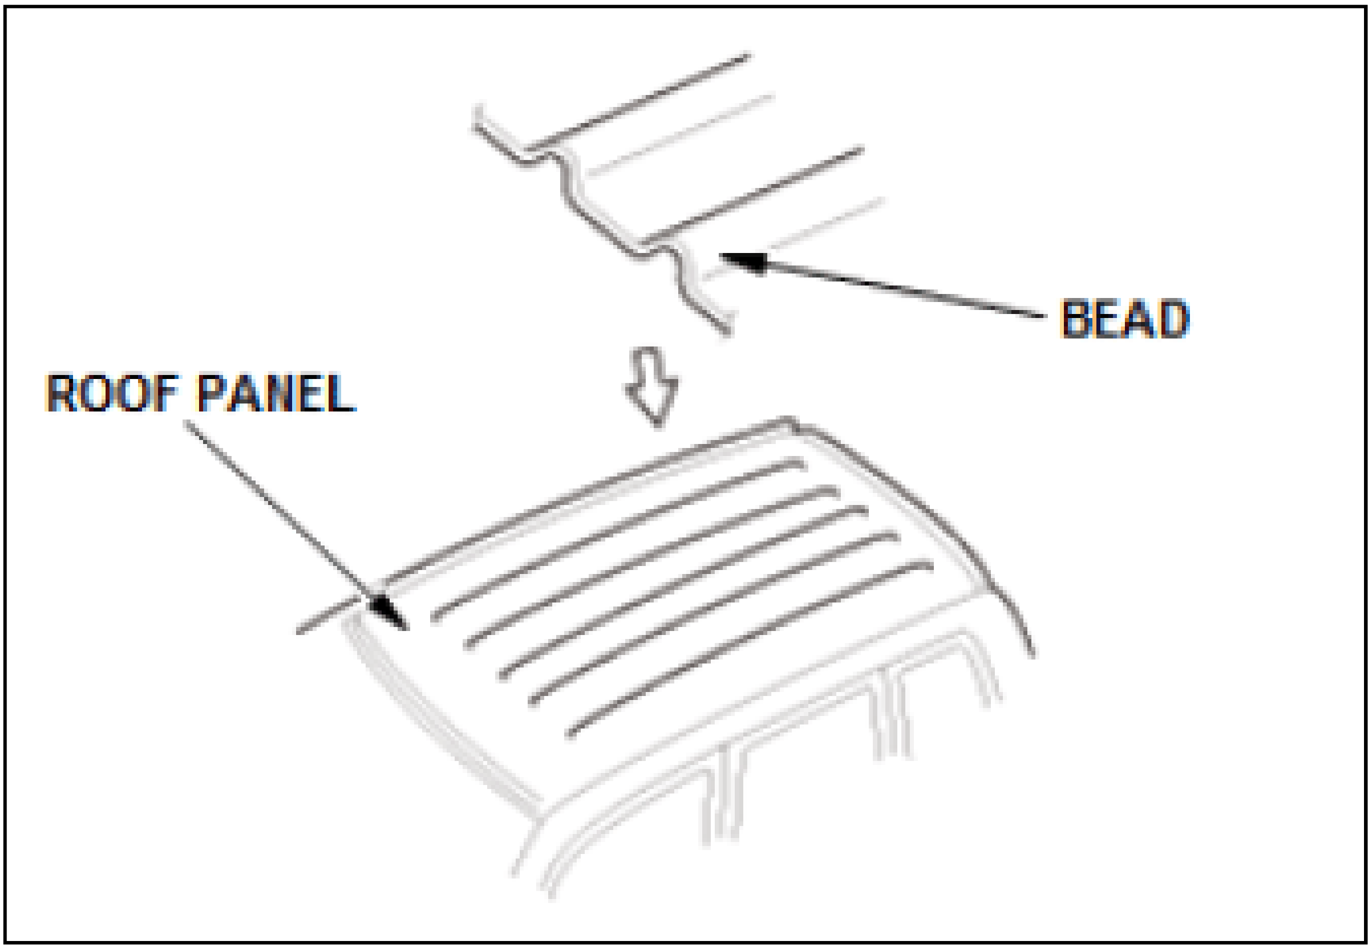
Used for parts that require higher strength such as side sills, pillars, roof side rail, and front side frame.



ROOF SIDE RAIL
SIDE SILL
FRONT SIDE FRAME

Beading

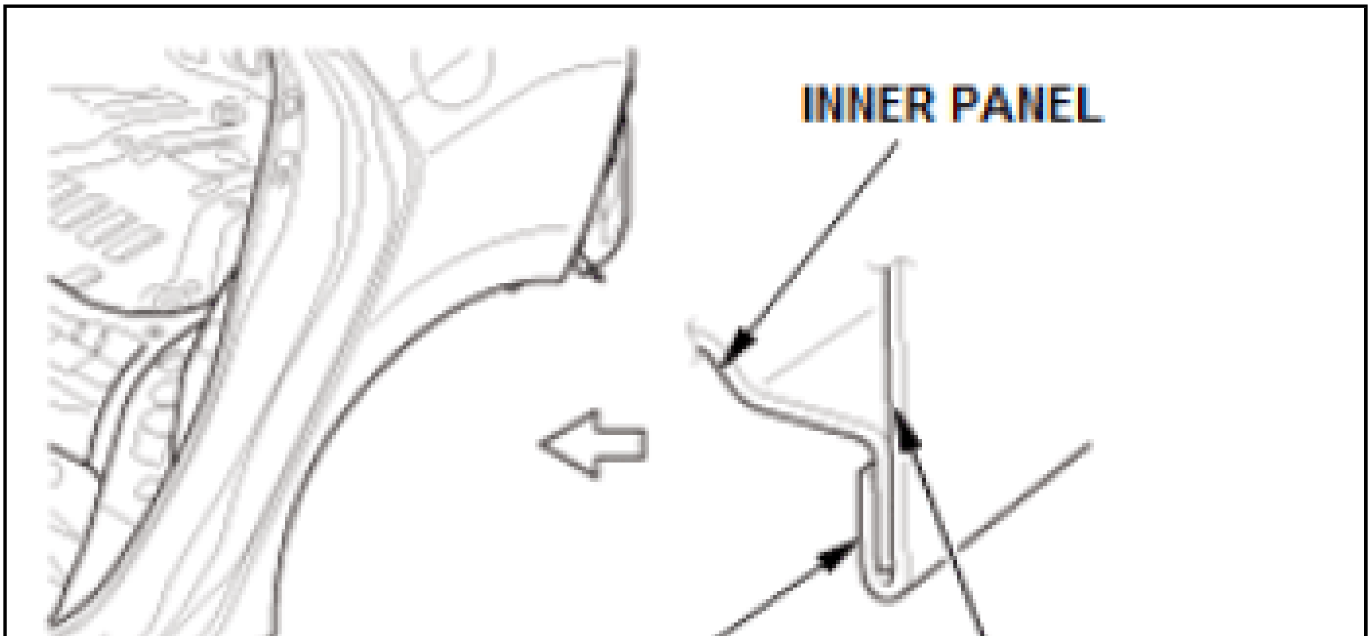
Used for large panels such as the floor and roof, where the grooves strengthen the entire panel.



BEAD
ROOF PANEL

Hemming

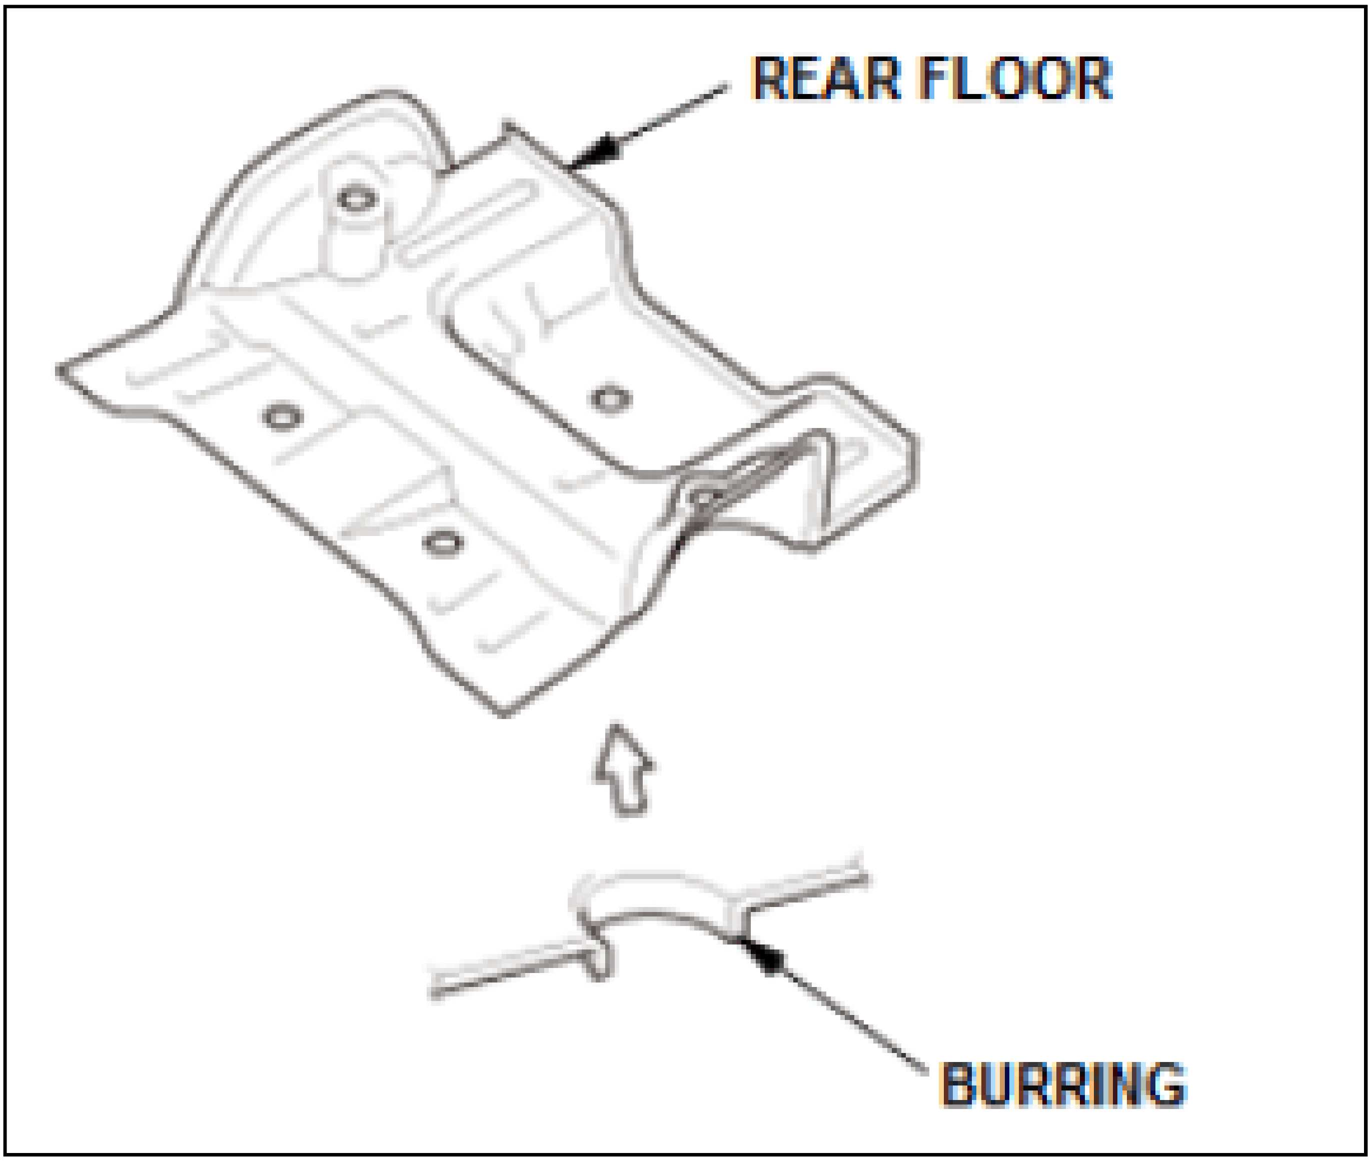
Used to joint skin panels such as hood, door and trunk to an inner frame or panel. It is also used in the rear wheel arch area of some models.



INNER PANEL
HEMMING
OUTER PANEL

Burring

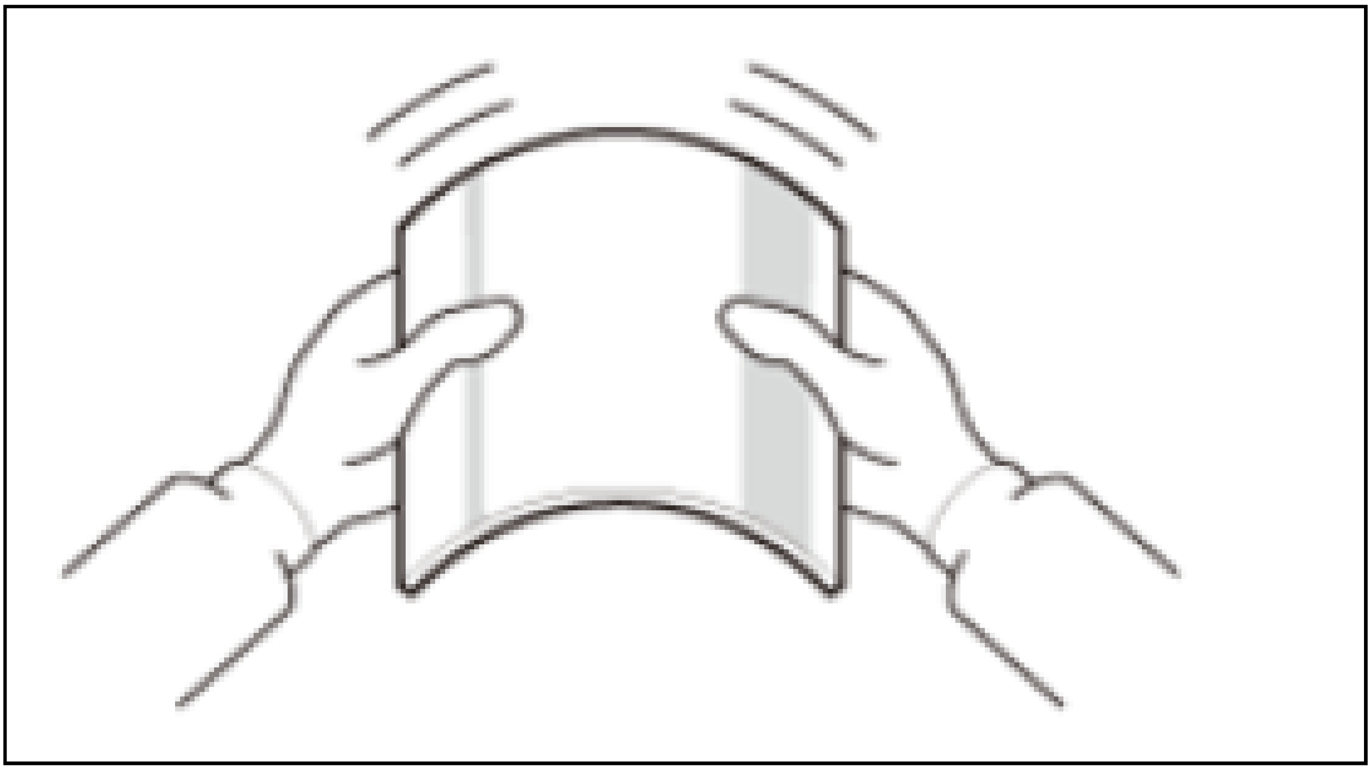
Used around the punched water drain holes in floor panels. The projected edge around the hole increases panel strength.

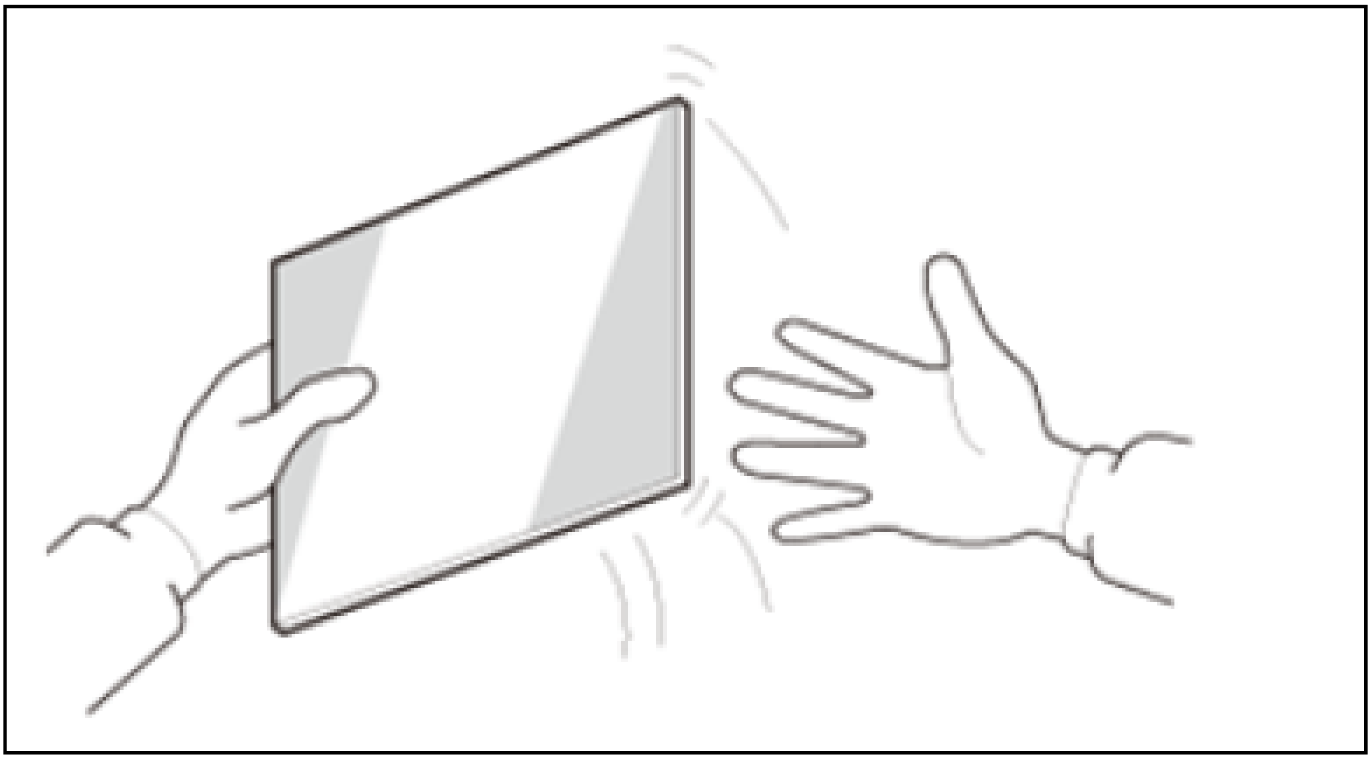


Elasticity

Elastic deformation

- Elasticity is a property of metal which allows the returns to its original shape when a deformation force is removed. Even if a steel plate is bent with your fingers it returns to the original shape when the force is removed from the plate without leaving any deformation. This returnable deformation is called an elastic deformation and this characteristic of metals is known as "elasticity".
- If more pressure is applied beyond the point of elasticity the deformation remains even after the pressure is removed and the metal does not return to its original shape. This occurs when the force exceeds the metal's elastic limit. The harder the steel, the greater the elasticity. Therefore, as the steel is hardened, elasticity is increased.





Heat Change

Changes in steel sheets due to heat application can be divided into the following types:

- Scale (iron scorch = Thin oxidized layer that appears on heated steel)
- Change to molecular structure
- Expansion and shrinkage

These changes to steel panels mainly occur through heating during body panel welding work, oxyacetylene torch heating, and friction heat from grinding or sanding.

As steel sheet is heated, the color changes until it starts to melt at 2132Â°F (1500Â°C).

Color	Temperature Range Â°F (Â°C)	Color	Temperature Range Â°F (Â°C)
Dark Red	1112 (600)	Yellow	1832 (1000)

Color	Temperature Range Â°F (Â°C)	Color	Temperature Range Â°F (Â°C)
Red	1292 (700)	Orange	2012 (1100)
Rose-pink	1562 (850)	White	2192 (1200)
Yellowish Red	1652 (900)	Bright White	2282 (1250) or higher

Heating Temperature And Material Change

As a steel sheet is heated, its plasticity increases. However, if the temperature of the sheet exceeds a certain point, it becomes hard and brittle. Therefore, it is important not to exceed 1333Â°F (723Â°C) during steel processing to prevent this structural change. At 392-482Â°F (200-250Â°C), blue heat brittleness happens to the sheet. If 1328Â°F (720Â°C) is exceed, red brittleness occurs. Further, if it goes to over 1652Â°F (900Â°C), the steel grains become large and rough causing oxidation and weakening of the material.

Brittleness

Generally the more heat applied to a metal, the softer it becomes and the easier it is to work with. But, where soft steel is concerned, hardness and tensile strength peak then elongation decreases at a certain temperature.

Heat Treatment

As temperature increases, structural change (transformation) takes place in the metal. If the cooling speed is quickened, the progress of the transformation is delayed and, as a result, a metal structure that is unusual at a normal temperature can be obtained. Heat treatment is a technical process to obtain metallic features to meet desired requirements through heating and cooling.

Hardening and Tempering

A kind of heat treatment used for cutting tools and blades that have to be harder than what they are cutting:

- Hardening is done by quickly heating up the material up to a high temperature 1472Â°F (800Â°C) and then submerging it in water or oil. As the result of this process, the steel becomes a few times harder. Hardened steel also becomes brittle.
- Tempering heats up the metal to around 1112Â°F (600Â°C) then gradually cools it. This process increases the toughness of steel.

Normalizing

This heat treatment process decreases metallic grain size after they are made large and rough during heating or casting. By removing eccentric crystallization and residual stress, the metal's properties are returned to normal. Usually the metal is heated up to 1472-1652Â°F (800-900Â°C) and then gradually cooled down.

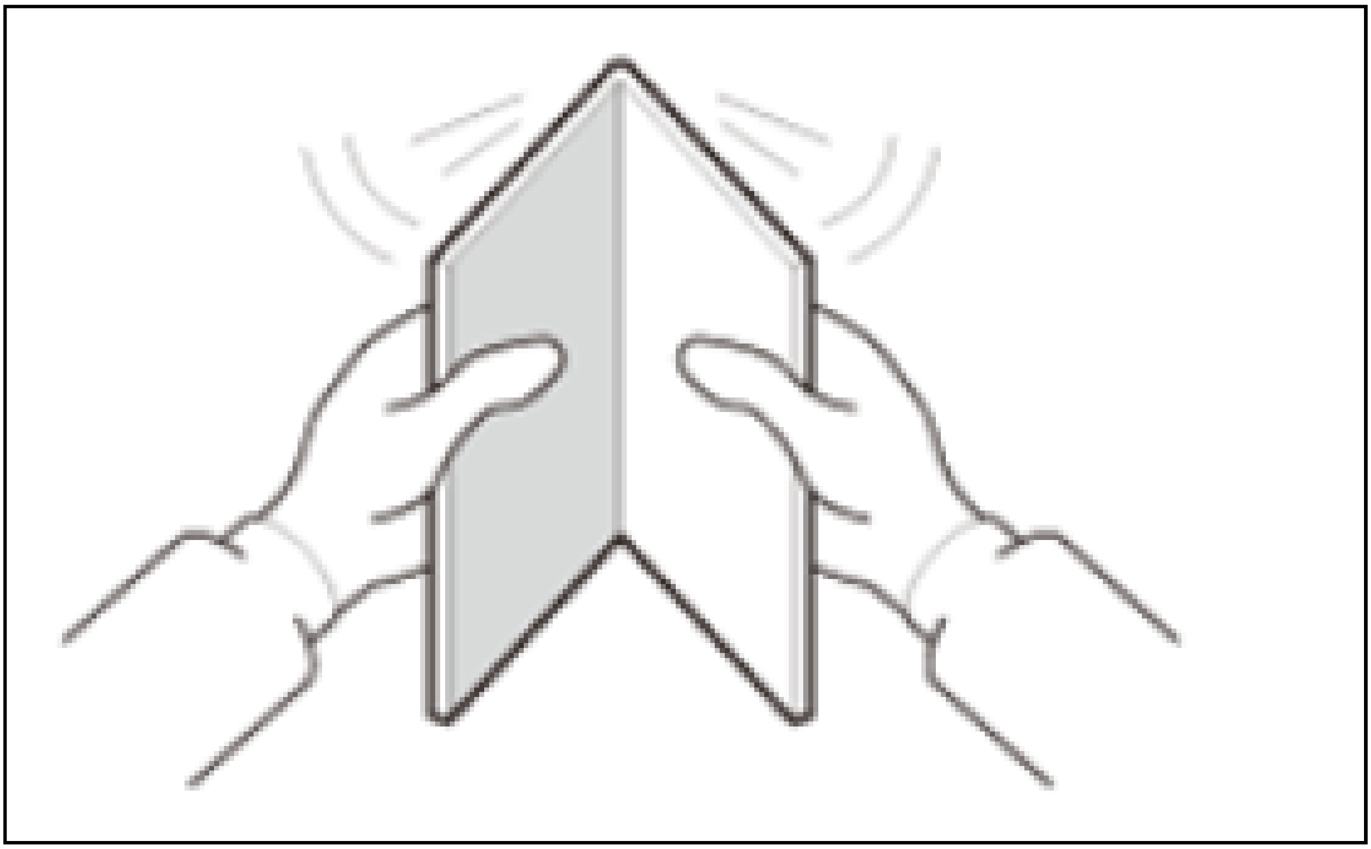
Annealing

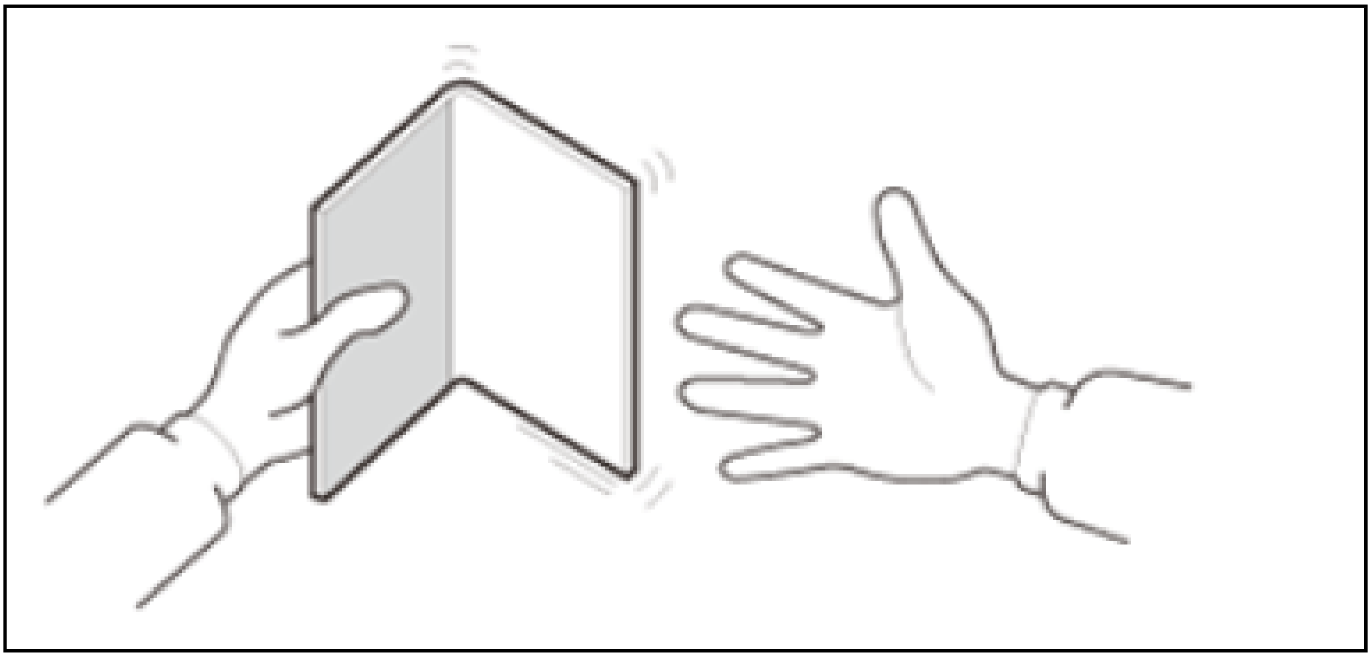
This heat treatment process alters the physical and sometimes chemical properties of a material to increase its ductility and to make it more workable. This may be required after a material has been work hardened by cold working or a hardened. Depending upon the kinds and use of materials, heating temperature, time duration of holding temperature, cooling temperature, and speed has to be adjusted.

Plasticity

Plastic deformation

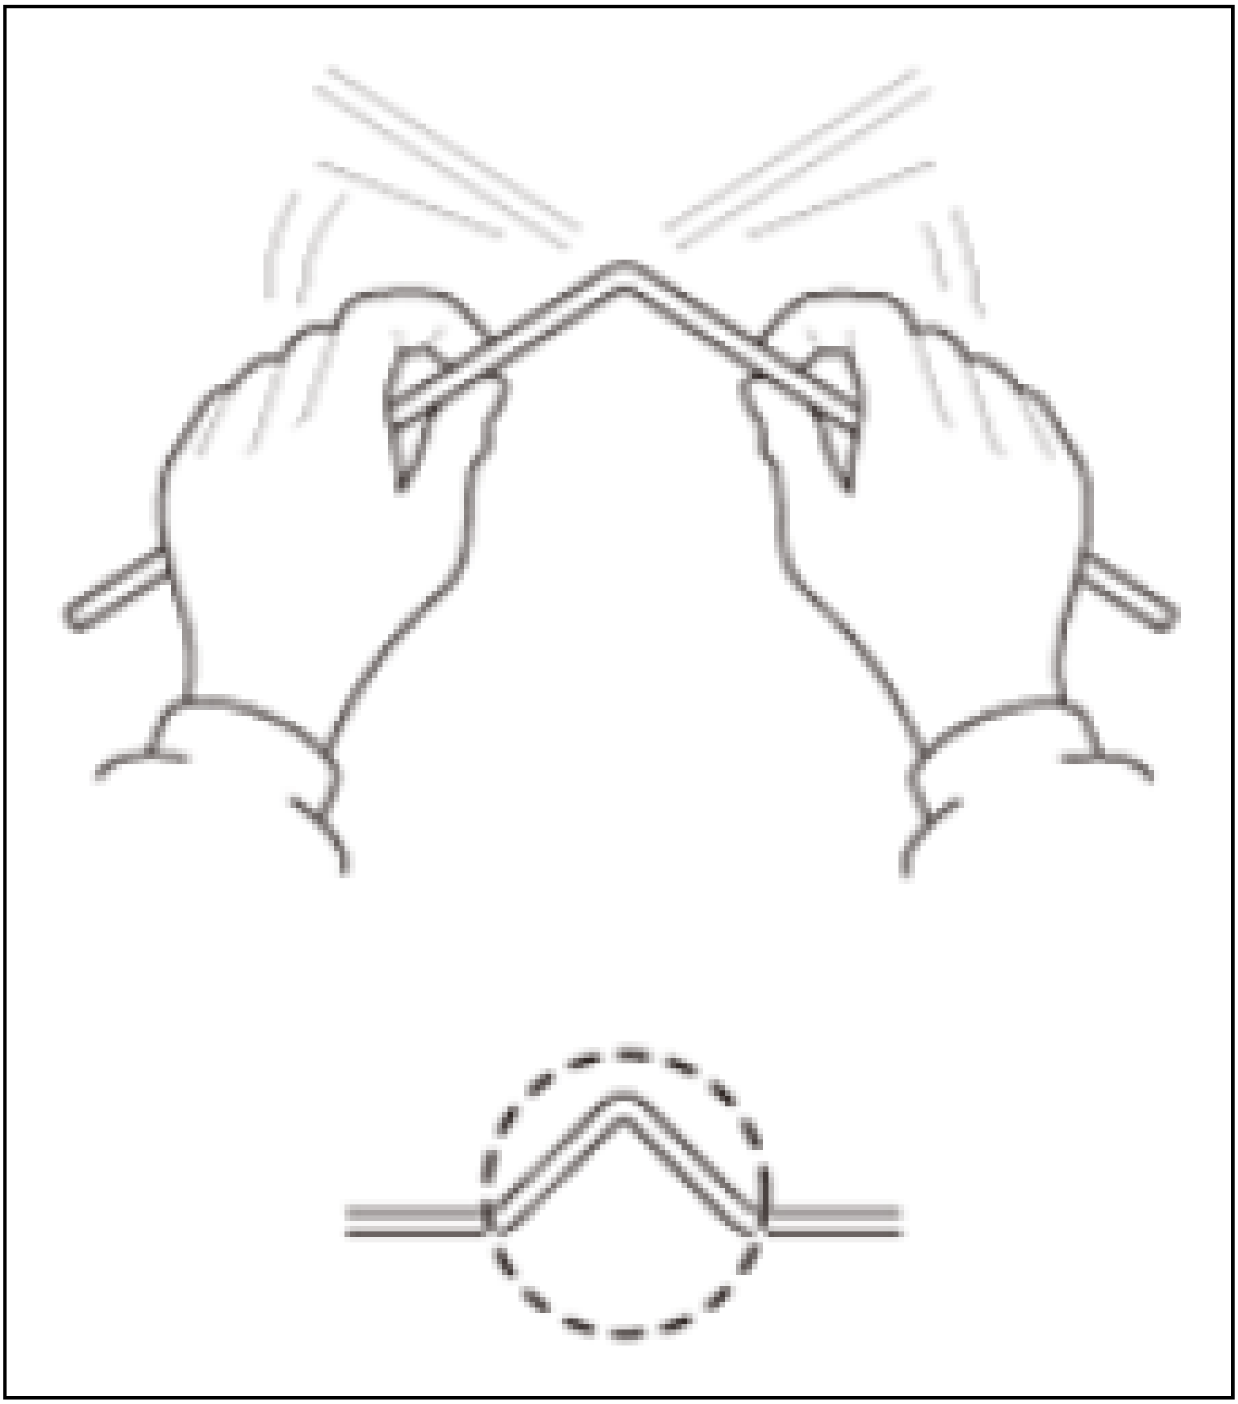
- When a steel plate is severely bent, it may partially return to its original shape, but it remains permanently bent. This is called "plastic deformation" and the characteristic of not returning to the original shape is called "plasticity".
- Automotive body panels such as fenders, hood, roof panel and others are press formed into each required shape from large steel sheets. In this way the characteristic that the shape of an object remains changed after a pressure is applied is plasticity It is also possible to change the shape of an object by pulling (tension strength) or pressing it. The deformation caused by pulling is called "ductility" and the one by pressing is called "malleability". The result of ductile deformation is an elongation and the one of pressing deformation is compression.



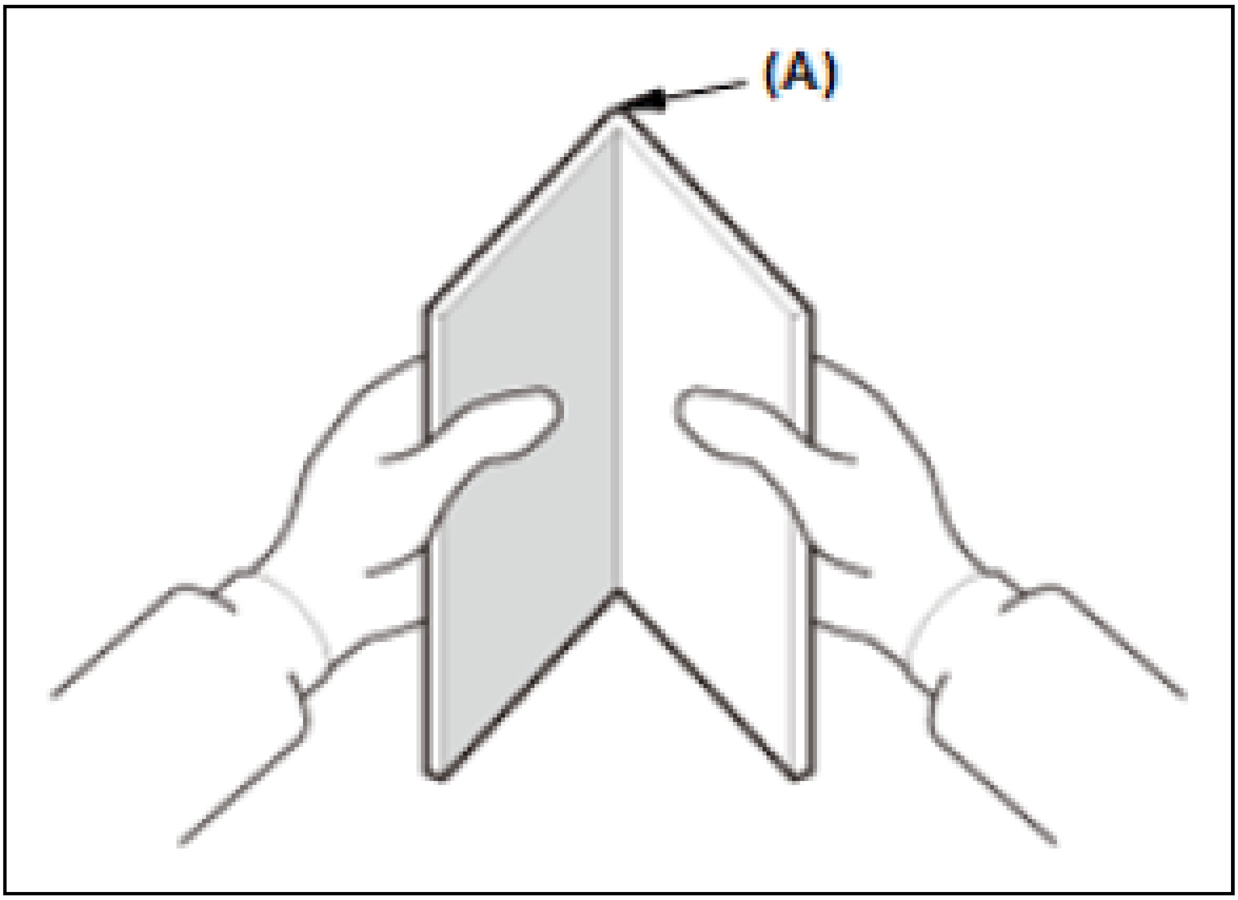


Work Hardening

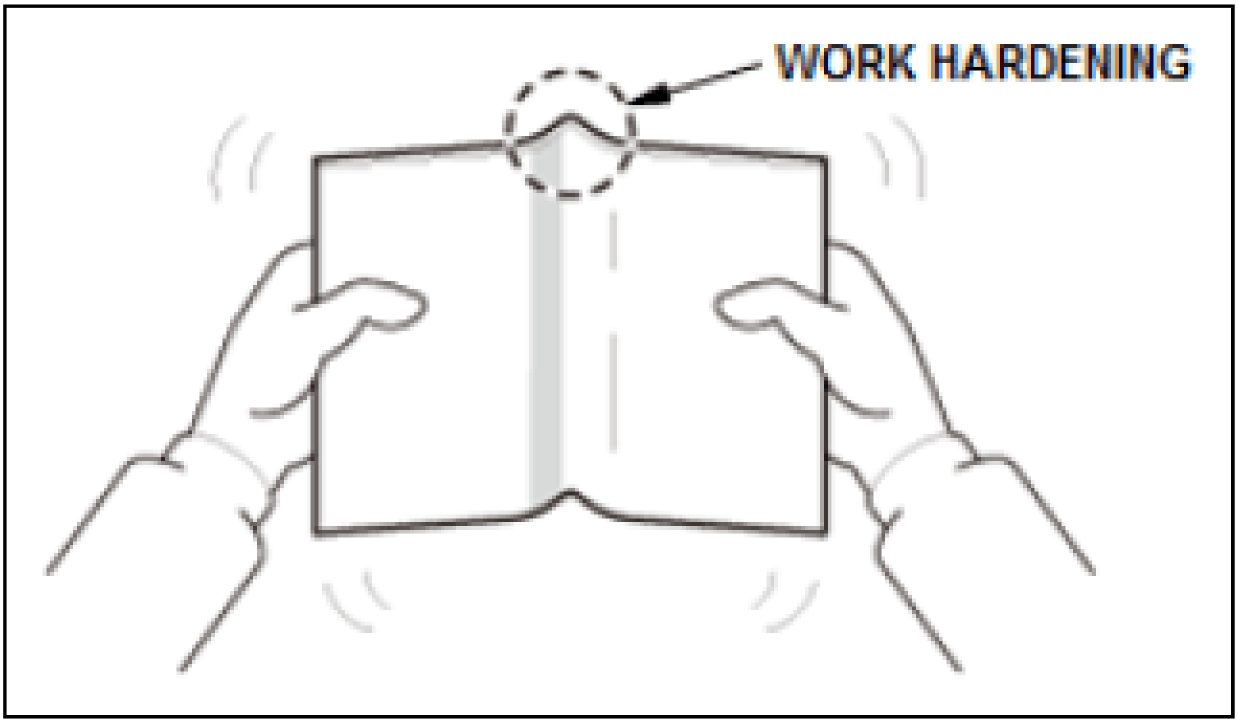
- When a metal wire is repeatedly bent and straightened, it is gradually hardened. In the same way a steel sheet becomes hardened and strong through work hardening (plastic deformation).



- When a flat steel sheet is bent and straightened, the first bent area (A) remains and the new bent areas are formed on both sides of the sheet. It happens because the first bent area becomes hardened and strong through work hardening. In the same way when a body panel is press-formed (plastic deformation), work hardening occurs.



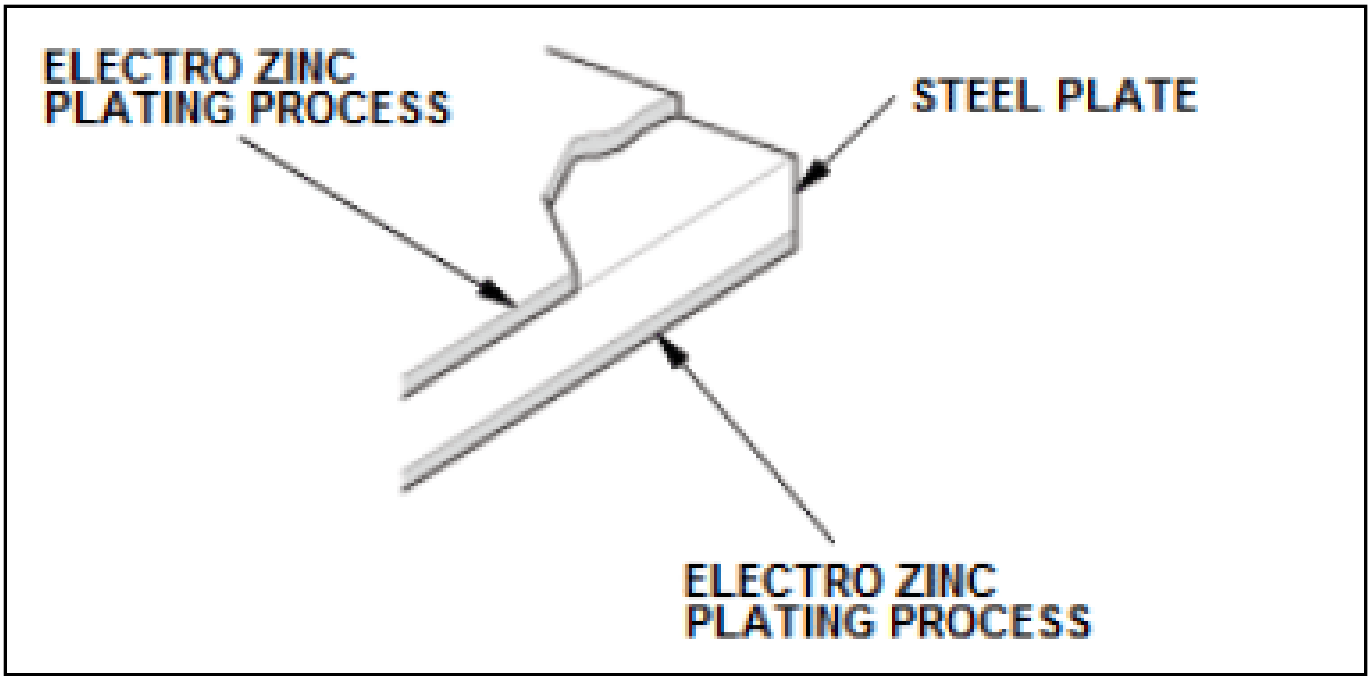
- On a collision damaged vehicle, the same work hardening occurs where parts were buckled (buckling) due to the external impact force. Work hardening also takes place when the parts are repaired.



FUNDAMENTALS OF AUTOMOTIVE STEEL SHEETS

Anti-Rust Steel Sheets

In order to increase corrosion resistance, some steel sheets are electro-plated with zinc, tin or aluminum on their surfaces. Zinc-plated steel sheets have the highest corrosion resistance, this type is the most widely used for automotive component parts requiring this protection. Some of the well-known zinc-plated steel sheets are an electro-zinc plated steel sheet, molten zinc plated steel sheet, and alloyed molten zinc plated steel sheet.



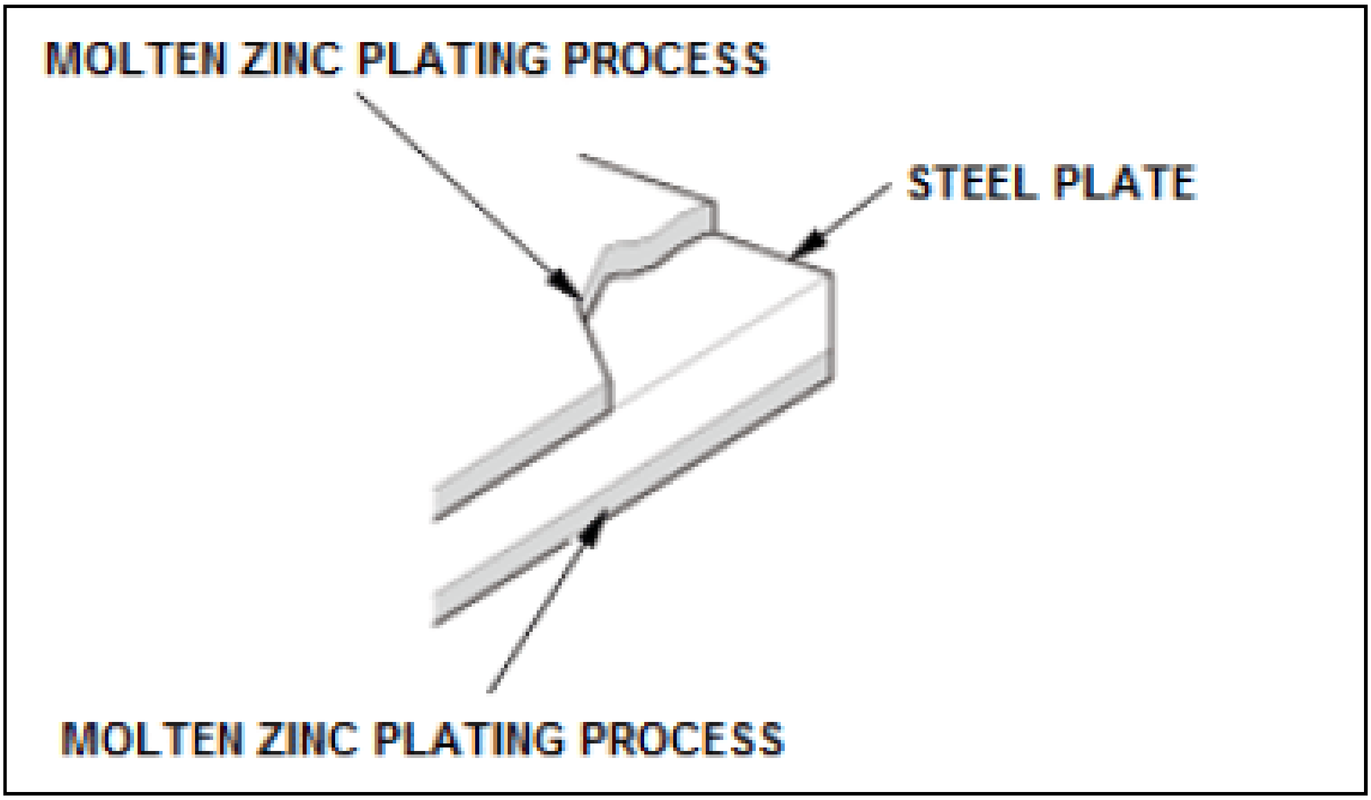
ELECTRO ZINC PLATING PROCESS
STEEL PLATE
ELECTRO ZINC PLATING PROCESS

Electro-Zinc Plated Steel Sheet

Corrosion resistant steel sheet with high purity zinc deposited on the sheet surface through electric plating process. Though its zinc-plated thickness is thinner than that of the molten plated steel sheet, the surface condition is even. Therefore it is superior in workability, welding and painting processes. But, it is inferior to the molten zinc plated steel sheet in corrosion protection as it cannot be thick-plated.

Molten Zinc Plated Steel Sheet (Dipping Method)

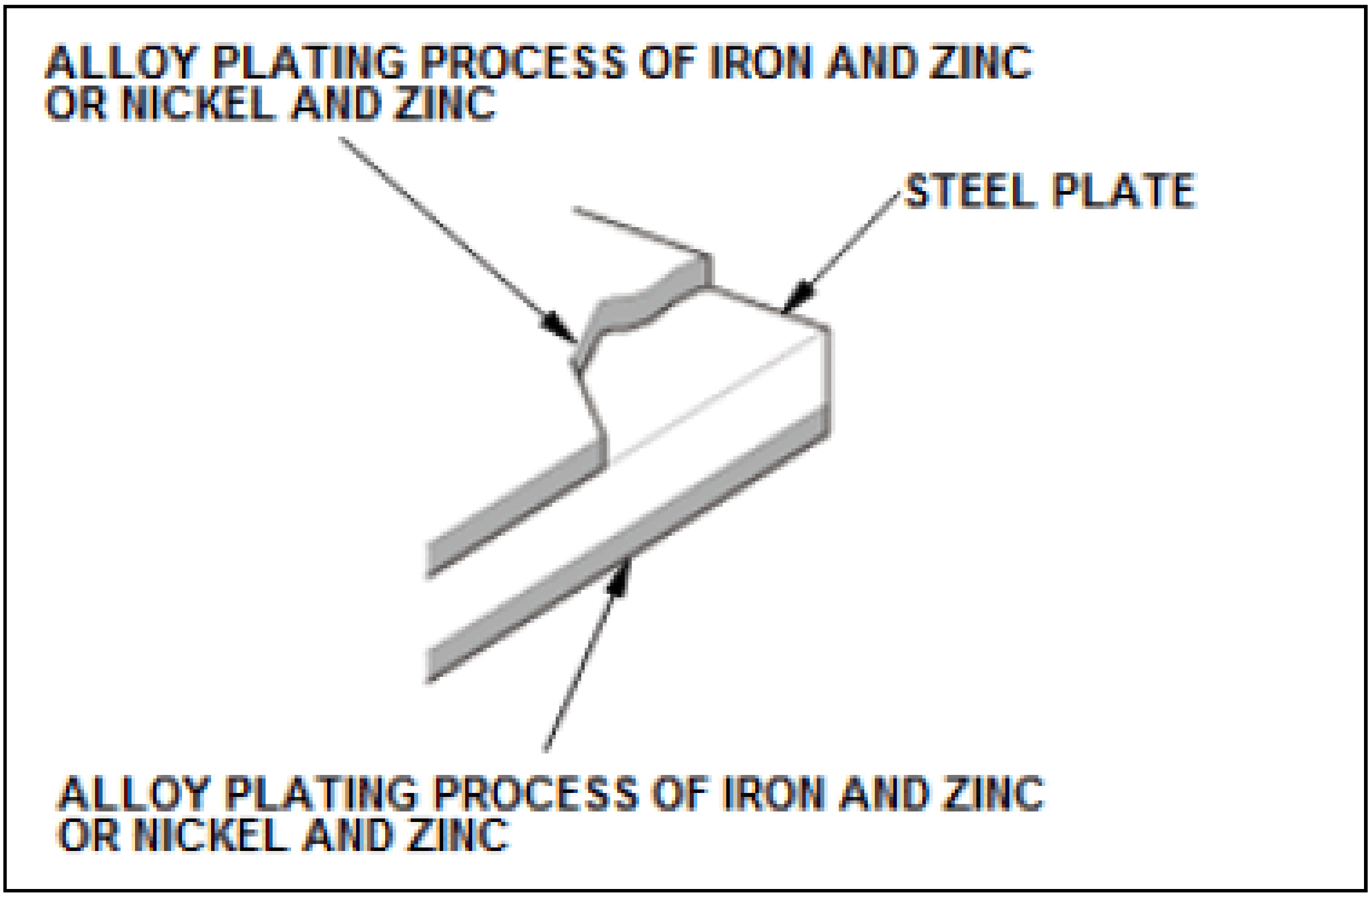
Corrosion resistant steel sheet is covered with molten zinc plating by immersing it. Although it is superior in corrosion protection performance as the plating layer is thick, is inferior to the electro-zinc plated steel sheet in welding and painting.



MOLTEN ZINC PLATING PROCESS
STEEL PLATE
MOLTEN ZINC PLATING PROCESS

Alloyed Molten Zinc Plated Steel Sheet

In order to compensate for imperfections of electro-zinc plated and molten zinc plated steel sheets, alloys of iron and zinc or nickel and zinc are plated on the surface to improve ease of welding and painting.



ALLOY PLATING PROCESS OF IRON AND ZINC OR NICKEL AND ZINC
STEEL PLATE
ALLOY PLATING PROCESS OF IRON AND ZINC OR NICKEL AND ZINC

Characteristics Of Steel Sheets

Steel sheets are of two types; hot rolled or cold rolled:

- Hot rolled steel sheet is rolled above re-crystallization temperature (normally 1472-1652Â°F (800-900Â°C)).
- Cold rolling occurs with the metal below its recrystallization temperature (usually at room temperature).

In automotive body components, hot rolled steel sheets are used for frames and other parts of vehicles that carry heavy loads such as trucks. Cold rolled steel sheets are mostly used for unibodies of passenger vehicles. Because corrosion resistance is required for such parts as outer panels, side frames and wheelhouses, zinc plated cold rolled steel sheets are widely used:

- Sheet thickness

  During the hot rolling process, slabs must be rolled while they are still hot. As they are cooled while being rolled, they cannot be rolled thin flat. Cold rolled steel sheets can be rolled at normal temperature, making it possible to manufacture thin steel sheets.

- Sheet surface

  As hot rolled steel sheets are rolled at a high temperature, black oxidation, or mill scale, appears on the sheet's surface. Sheets that have been washed with oxide (pickling washer) have gray surfaces. The surface of a cold rolling steel sheet is smooth and glossy often called polished sheet. It is subjected to the picking process, cold rolling, annealing, and temper rolling process after the hot rolling process.

- Workability

  Most of the body component parts are press formed. The workability on presswork is determined by technical specifications of materials. Those technical specifications are, in turn, determined by material contents as well as the extent of temper rolling.

  When the workability compared in terms of elongation rate obtained by an elongation test, hot rolled steel has about 35% while a cold rolled steel has about 43%, indicating that a cold rolled steel sheet has better workability.

High-Strength Steel Sheets

High-strength steel has higher tensile strength than normal, or "mild" steel. Generally, high strength steel is defined as steel with a 340 MPa or higher tensile strength. However, this definition may vary depending on vehicle manufacturer, suppliers, and countries. Steel with a tensile strength of 980 MPa and higher is called "Ultra High-Strength Steel" to differentiate it during repairs because the repair methods are restricted.

In addition, there are several types of high-strength steel sheets available. Solid solution strengthened and precipitation strengthened steel adding elements such as nickel (Ni), silicone (Si) manganese (Mn) etc. to increase strength. Composite structure strengthened steel is hardened after press forming.

Type		Strengthening Mechanism
Solid Solution Strengthened		The very basic method. To form a solid solution of the alloy elements to crystal lattice. There are two type of solution; one is called substitutional solid solution which forms solid solution by replacing with iron atoms such as silicone (Si), manganese (Mn) and phosphorus (P), another one is called interstitial solid solution which forms solid solution by intruding such as carbon and nitrogen.
Precipitation Strengthened		To interrupt the rearrangement by precipitate through precipitation of carbide or nitride such as titan (Ti) or niobium (Nb).
Composite Structure Strengthened	DP Steel (Dual Phase)	To change the internal composition through heat treatment (strengthened by martensite with a high hardness obtained by quickly cooled down austenite generated in heated steel at a high temperature).
	TRIP Steel (Transformation Induced Plasticity)	To change the internal composition through heat treatment (strengthened by bainite or residual austenite obtained by quickly cooled down austenite generated in heated steel at a high temperature).

Characteristics

- High tensile strength
- High yield point (the point where material changes from elastic to plastic)
- High yield rate (yield point/tensile strength)

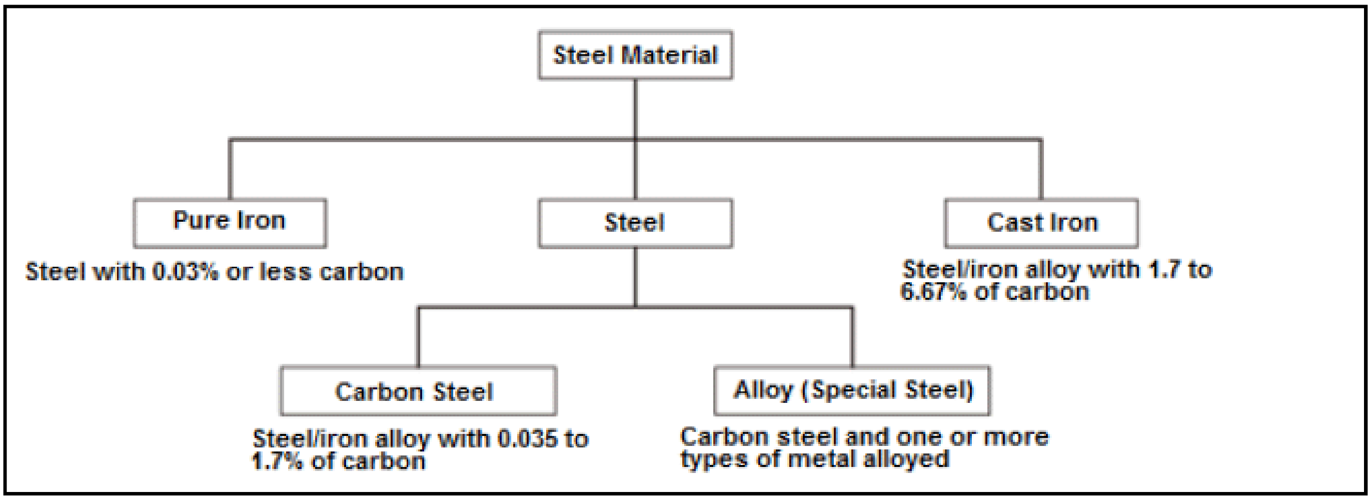
Other High-Strength Steel Sheets

- **Bake Hardened (BH) Steel Sheet:**
  - BH steel is originally soft, but increases its strength through the baking process after being work-hardened by the stamping process.
- **Cold Stamping:**
  - It is a stamping process to press form one of the high-strength steel types called high-tensile steel under a normal temperature. The steel sheets used for this process contains a small amount of precious metal to increase the strength by several times higher than the normal steel sheets. It is difficult to form the steel to the requirements through this process, but it is possible to produce light parts similar to hot stamping.

Steel Material

The carbon steel sheets used for most of the automobile body account for about 50% of the total weight of a general passenger vehicle. The main reasons steel sheet is used are: availability ease of manufacturing, and low cost. The ability to alloy steel with other elements allows adjustments to material strength, hardness, and toughness.

The carbon content in the steel greatly impacts its characteristics greatly with some categories based on the carbon content volume alone.



Steel Material
Pure Iron
Steel with 0.03% or less carbon
Steel
Cast Iron
Steel/iron alloy with 1.7 to 6.67% of carbon
Carbon Steel
Steel/iron alloy with 0.035 to 1.7% of carbon
Alloy (Special Steel)
Carbon steel and one or more types of metal alloyed

Pure iron contains almost no other elements other than iron (Fe) and is very soft, thus its use is very limited. One of the few examples of automotive uses is for electromagnets. Cast iron cannot be wrought, so it is mainly used for cast parts. Steel can be categorized into carbon steel and alloy steel (special steel). It can also be categorized by purpose of use its shape (stick, plate, pipe, etc.).

Carbon Steel

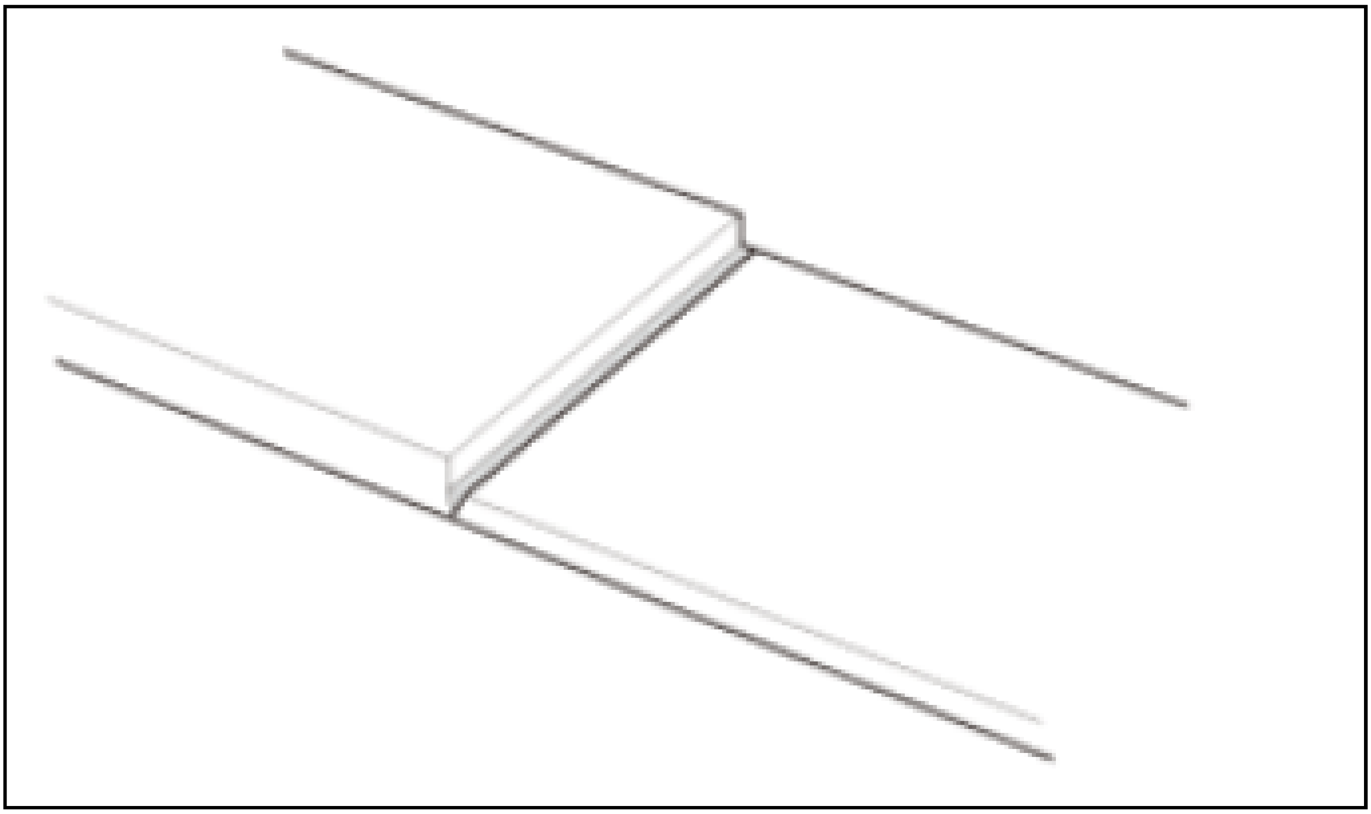
Most of the steel panels used for automotive bodies are made of carbon steel (alloy of iron and carbon) based on the design requirements of formability durability and endurance.

Carbon steel is an alloy with the main composition of iron (Fe) and 0.035 to 1.7% of carbon (C), and small amount of silicon (Si), manganese (Mn), phosphorus (P) and sulfur (S). Among those compositions, carbon has the most significant impact on the steel's characteristics.

In case of using high-carbon steel which contains a high amount of carbon, the body panels will have a very strong impact resistance but a poor formability and welding capability. Because of this, low-carbon steel is mainly used for body panels. It generally contains a lower amount of carbon (0.1 to 0.4% or less).

Tailored Blank Material

- Tailored blank materials are multiple stamped steel sheets jointed together by welding to meet different requirements and purposes.
- The original purpose of the tailored blanks was to make use of mill ends or various types of steel sheets combined together, increasing yield and reducing cost by welding before stamping. Today tailored blanks are being increasingly used for automobile body parts to reduce weight and enhance rigidity in certain areas of some parts.
- By welding tailored blank materials with different thickness and material features together, it becomes possible to optimize the parts to their use. Strong or thick materials can be used for where rigidity is required, while using thinner materials for other areas. It is now possible to layout parts with optimal characteristics exactly where needed.



Types Of Tailored Blank Welding

There are three types of tailored blank (TB) welding; laser, mushroom and plasma method. Details are as follows.

- **TB Laser Welding:**
  - A method of welding by concentrating a laser beam onto approximately a 0.5 mm (0.020 in) diameter spot to melt and join the two surfaces.

    The steel's appearance, quality and material characteristics are only slightly changed by the laser's heat.

    The width of the laser welding bead is less than 1 mm. Laser welded tailored blanks are most commonly used for automobile parts.
- **TB Mushroom Welding:**
  - A method of welding where two layers of steel panels are overlaid and pressure is applied to while the parts are eclectically welded. Mushroom welding is superb in formability but poor in appearance.

The width of the welding bead is roughly 5 mm (0.20 in).

- **TB Plasma Welding:**
  - A method of welding where a high temperature plasma current is applied to the butted area joining the parts using thermal conduction.

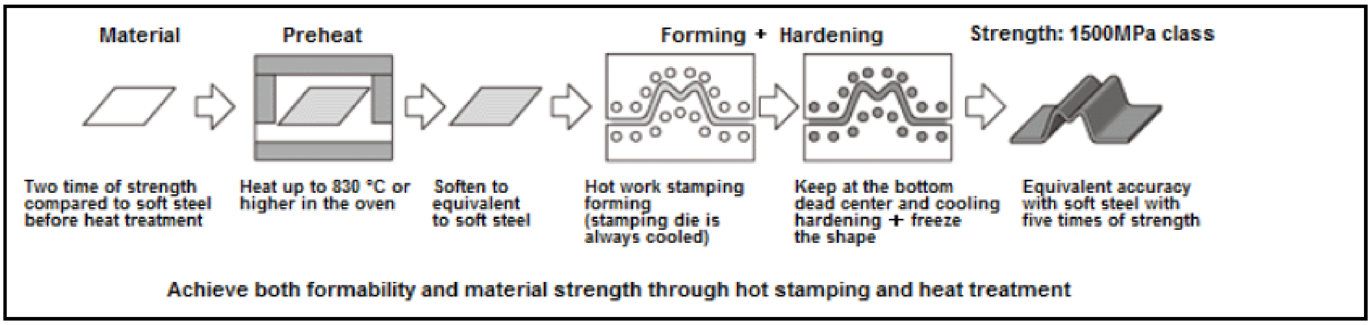
    It is suitable for automated processes with a low equipment cost.

    The width of the welding bead is 3-4 mm (0.12-0.16 in).

Ultra High-Strength Steel Sheets (1500 MPa Grade)

Stamping takes place when the steel sheet is heated to 1, 652 Â°F (900 Â°C) and softened. By cooling the steel part down to a normal temperature while still in the stamping die, the hardening process will be improved and a 1500 MPa grade tensile strength is achieved. This process is called hot stamping.

When compared to normal steel stamping processes, hot stamping is capable of producing parts with significantly higher strength. Therefore, the parts produced through this process can offer the same strength level with thinner material in comparison with parts made using normal stamping process. This contributes to vehicle weight reduction and improved fuel efficiency.



Material
Preheat
Forming + Hardening
Strength: 1500MPa class
Two time of strength compared to soft steel before heat treatment
Heat up to 830 °C or higher in the oven
Soften to equivalent to soft steel
Hot work stamping forming (stamping die is always cooled)
Keep at the bottom dead center and cooling hardening + freeze the shape
Equivalent accuracy with soft steel with five times of strength
Achieve both formability and material strength through hot stamping and heat treatment

Use Of Tailored Blank Material

Laser welded tailored blank materials are used for the front side frames, dashboard lower, and door inner panels.

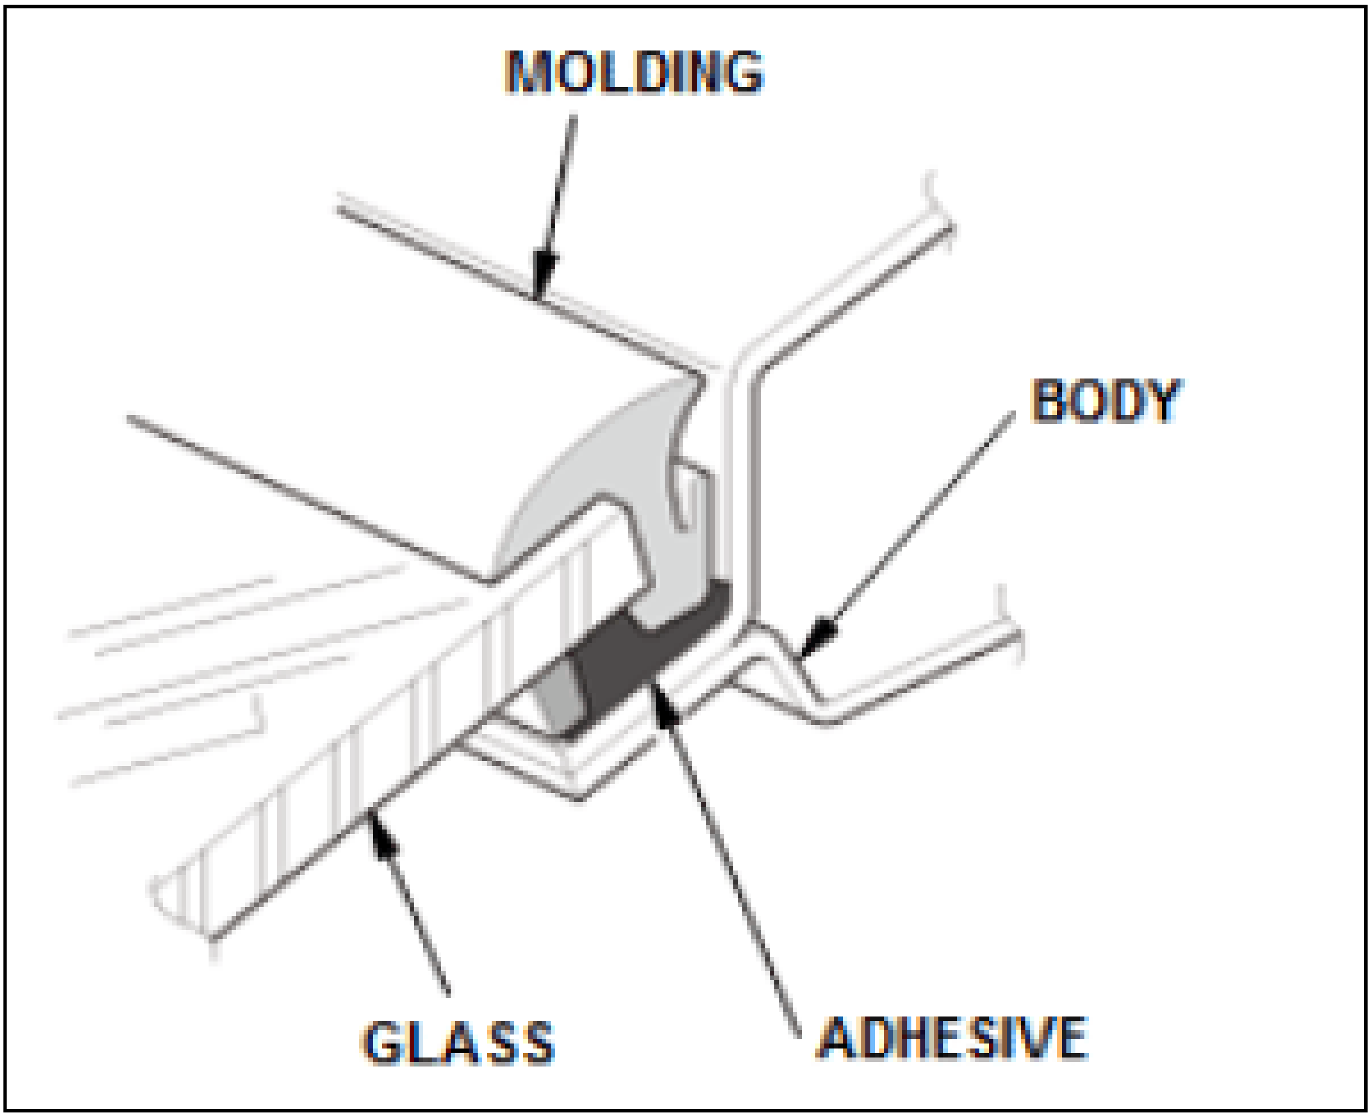
GLASS

Installation Of Glass

Front and rear window glass sealing has two basic functions:

- Prevent wind, rain, dust, noise, and outer air from entering the passenger compartment
- Hold the glass in position during a collision

Two sealing methods are used, adhesive and weatherstrip.

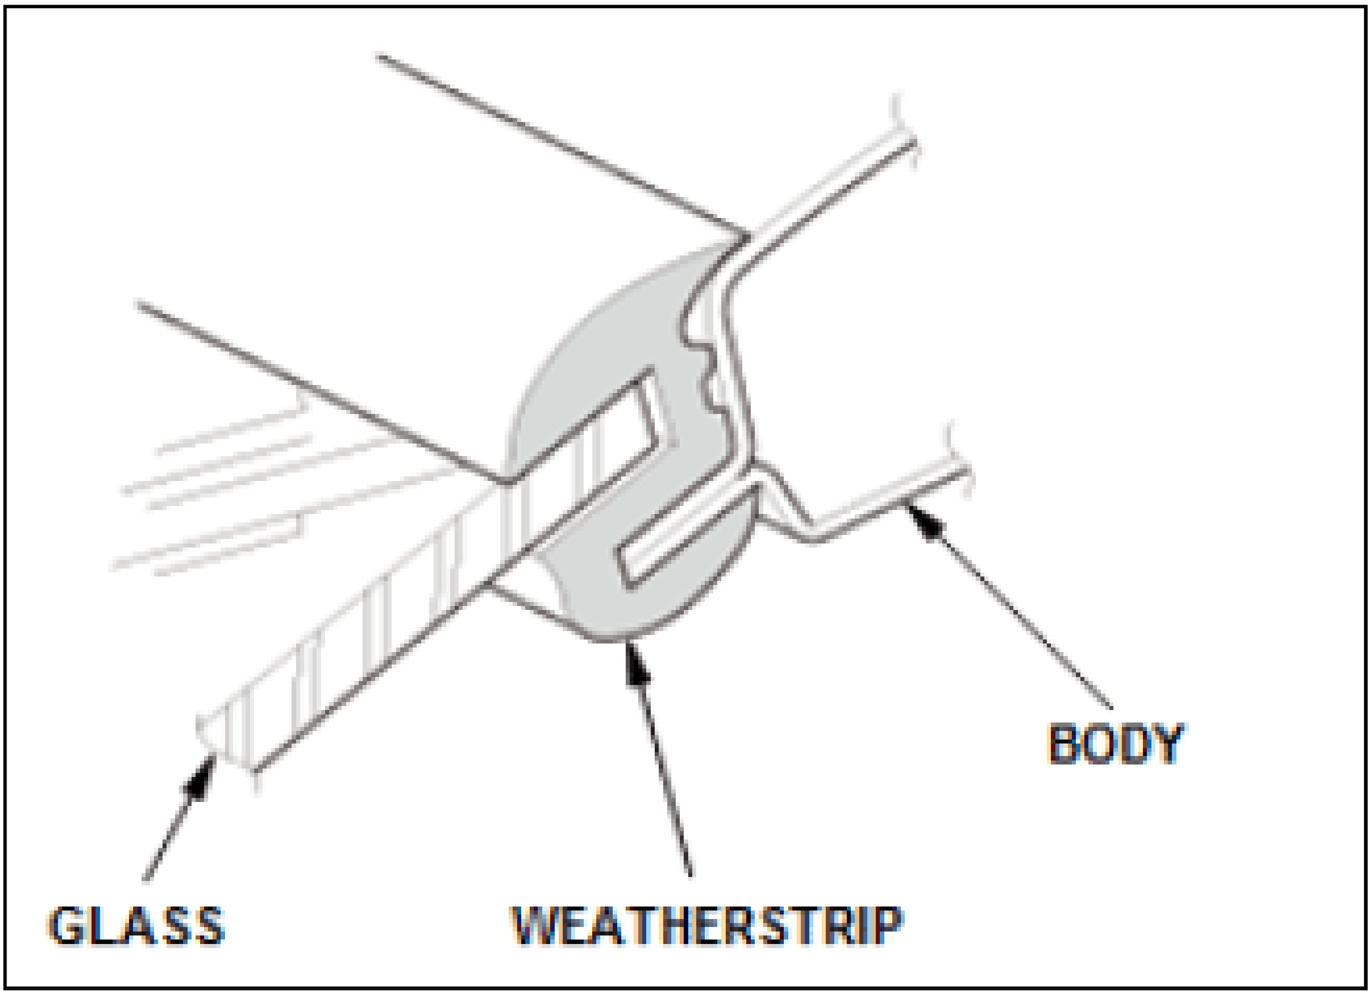


Adhesive Type

- The glass pane is directly attached to the body with a urethane-based sealer. In order to improve the adhesive effect between the body and glass and also to heighten the rigidity of the window opening area and tightness, glass primer and body primer are applied to the glued areas.
- Installing this type of glass has a safety advantage because the glass is securely retained during a collision. Wind noise is also reduced through its flash surface effect.
- This adhesive type is used for front windshield, rear windows (including tailgate), and quarter windows (excluding an open/closing type),

Weatherstrip Type

- The glass is fixed in the body by being tucked into a rubber weatherstrip that is weather and solvent-proof.
- During glass installation, sealer is applied on the contact surface to prevent entry of dust, water, and noise. The sealer also helps prevent the glass from falling out of the weatherstrip during a collision.
- This adhesive type is most often used for rear and side windows of commercial vehicles such as panel vans and pick-ups.



Types Of Glass

As the vehicle collision performance improves, requirements are increased for automobile glass as well; better visibility, improved safety from external impact, isolation of noise from the passenger compartment, and enhanced appearance.

Tempered Glass

This glass is a specially processed with a high strength by heating a glass to the softening temperature about 1202Â°F (650Â°C) and then evenly and quickly air-cooling the surface. Another characteristic is that it instantaneously shatters into tiny pieces when broken.

Partially Tempered Glass

A type of tempered glass. It was designed to improve the visibility problems created when normal tempered glass breaks. By reducing the level of tempering, cracking of the glass is reduced and the driver can maintain his/her visibility.

Laminated Glass

Two glass panes are compressed together with a transparent, high adhesive film resin in between. As a result, even if the glass is impacted and broken by an external force, it does not separate into sharp pieces. It is most commonly used for windshields.

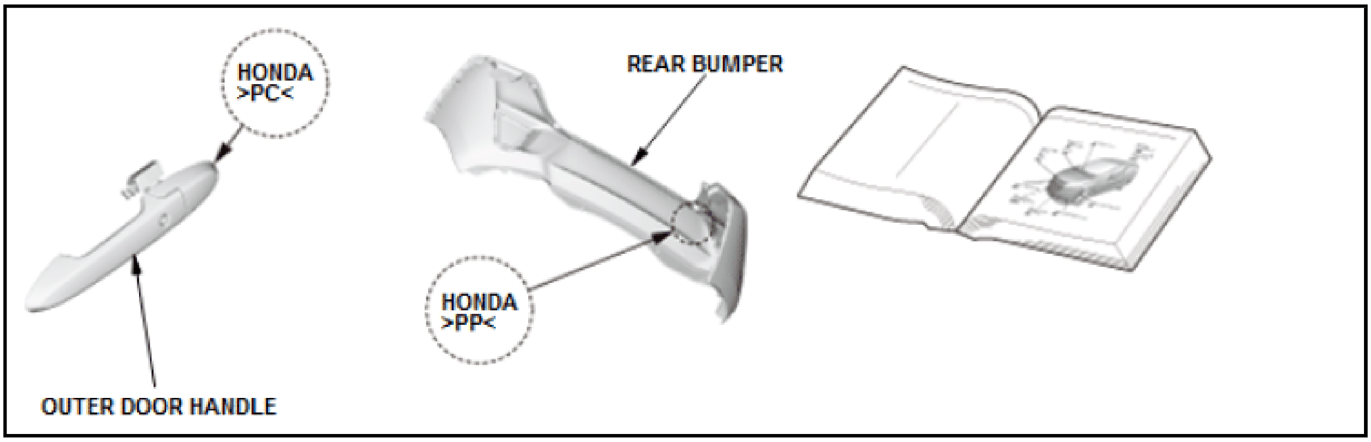
NOTE: **In body repair, if the body is straightened with the glass in position, the glass may break.**

Types of Glass	Characteristics	Main Use
Heater printed glass	Electric conducive powders are printed in the shape of a hot wire on the surface of glasses before heat treatment.	Windshield and rear window
Heat absorption (colored) glass	A small amount of metal such as cobalt or iron is mixed in a normal glass to color it so that it can absorb infrared rays (heat rays).	All
Partially shaded glass	Only upper part of a glass is colored to reduce transillumination rate. The color becomes darker as it goes to the upper part and thinner as it does down to the lower part.	Windshield
Antenna-buried glass	Antenna line for receiving radio transmission is buried in the middle layer of the laminated glass or the line is printed on the glass surface. There is also a type that has both a buried wire and printed wire.	Rear window and side windows

RESIN

Identification Of Resin Type

- It is necessary to be able to repair plastic parts as similar to the other body parts since there are many plastic parts used for vehicle exterior.
- The repair methods and materials used depend on the materials that the plastic parts are made from.
- Refer to the stamped code (ID) on the backside of the parts and the appropriate service information for detailed material identification.
- Always check the plastic resin characteristics before repairing.



Plastic Resin Types

Many different kinds of plastic resins are used for automotive parts depending upon their purposes. Plastic resin characteristics are also very different from one to another. It is important to know the material names and their chemical and mechanical characteristics.

Plastic resins can be roughly divided into two categories: thermoplastic resins and thermosetting resins.

- Characteristics and Main Types of Thermoplastic Resins

  When heated, these resins become soft. If heated further, they will melt. When the temperature is reduced, they return to a solid state.

Resin Materials	Codes	Features
Polyethylene	PE	Good in cold resistant, electrical characteristic, and chemical-resistant properties. Impenetrable except air. Though inferior in strength, rigidity and thermal resistant properties, as density is increased, rigidity and thermal resistant property is improved.
Polypropylene	PP	The lightest in weight of all the resins. Used for large size parts like bumpers. Its strength, rigidity, and surface hardness are greater than those of Polyethylene (PE). It has a high thermal resistant temperature. Good in electric characteristics, anti-water and chemical-resistant properties. Strong in bending. Inferior in adhesiveness and weatherproof property.
Polyvinyl chloride	PVC	Through addition of plasticizer, it is possible to adjust its property from soft to hard. Good in electrical characteristics, chemical-resistant, and weather resistant properties. Inferior in anti-shock and anti-bending properties.
ABS resin	ABS	Good in mold forming, anti-shock property, and metal-plating properties. Easy secondary processing. Inferior in weatherproofing, heat resistant, and chemical resistant properties.
Acrylic resin	PMMA	Great in appearance. Used for lens for tail light lens. High transparent rate. Good in strength, weather proofing, and workability. Inferior in anti-shock, anti-solvent, heat-resistant properties.
Polyamide (Nylon)	PA	Used for structural member parts because of its high strength and tenacity. Good in self-lubricant, anti-wear, anti-solvent properties. Wide range of temperatures for use. High water absorption rate. A change of dimensions and or softening due to water absorption may cause troubles.
Polycarbonate	PC	Strong in shock absorption. Good in heat resistant and cold-resistant properties, electrical characteristics, self-digesting and weather proofing properties. Low fatigue strength. Stress cracks and solvent cracks may happen.

- Characteristics and Main Types of Thermosetting Resins

  Once this type of resins is heated and, as the result, hardened, they are not softened again even if they are heated again.

Resin Materials	Codes	Features
Polyurethane	PUR	High elasticity. Good in anti-wear, anti-deterioration, anti-oil, and cold-resistant properties. Weak in alkali and hydrolytic dissociation easily takes place. Its hard foam is good for heat insulation and sound-insulation. As an adhesive, it can be hardened at room temperature and is strong.
Unsaturated polyester	UP	A typical material based on glass-based fiber for FRP. Good mold forming property Cheaper than epoxy resin. Good in strength, rigidity and electrical characteristics. Weak in alkali and hydrolytic dissociation easily takes place. Greatly shrinks when hardened. Insufficient heat-resistant property.
Glass fiber enhanced plastic	FRP	Resin (= matrix) is reinforced by fiber (= reinforcing material) to significantly increase the strength. A fiber reinforced plastic which offers a various superior features. There are a wide variety of properties available for both resin (unsaturated polyester resins, epoxy resin, phenol resin etc.) and reinforcing materials (glass fibers, carbon fiber, aramid fiber etc.) and the combinations can achieve many types of characteristics.

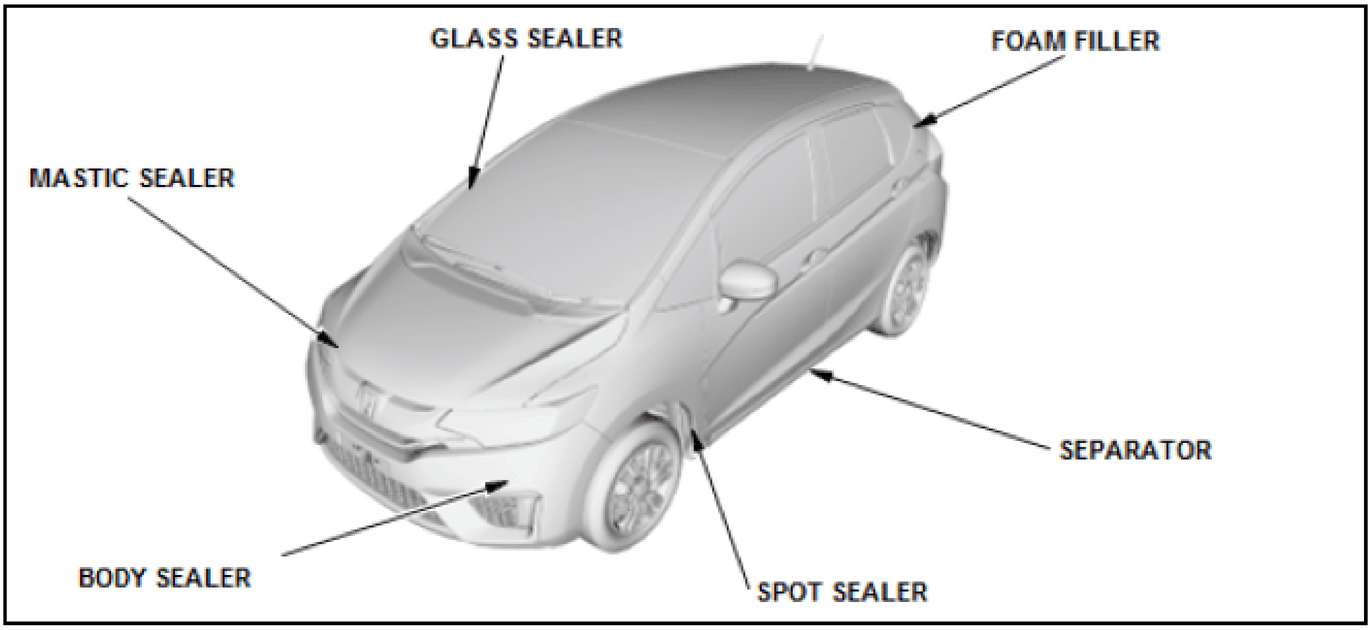
SEALER (ADHESIVE)

Types And Use Of Sealer

- Sealers can be categorized according to their ingredients, applications, hardening types, functions or effectiveness. There are three kinds of sealers (adhesive) used for car manufacturing. One type is a structural use, used for adhering structural components together that need a strong adhesion.

  The second type is a non-structural use, used for adhering interior upholsteries, and the third type is a quasi-structural use, used to fill-in clearances between the body component parts.

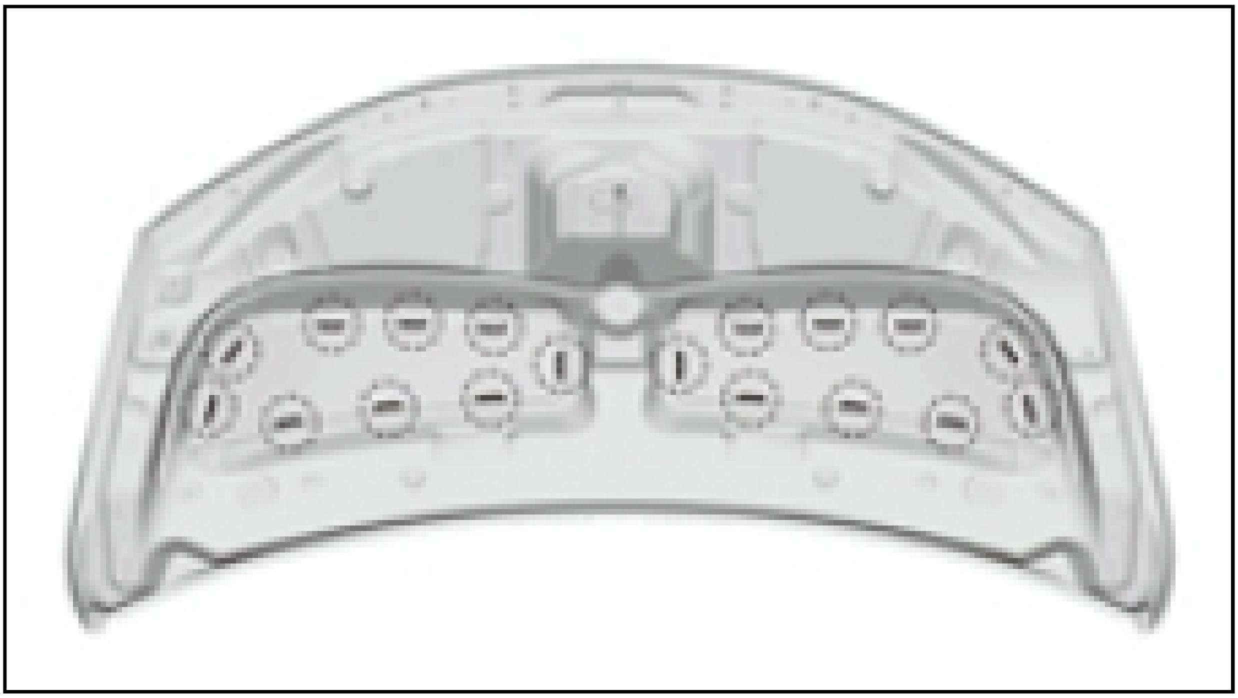
- For quasi-structural use sealer, there is a mastic sealer that is used for improving panel rigidity preventing vibration and noise, and a body sealer that is effective for preventing entry of water, dust and wind.



GLASS SEALER
FOAM FILLER
MASTIC SEALER
SEPARATOR
BODY SEALER
SPOT SEALER

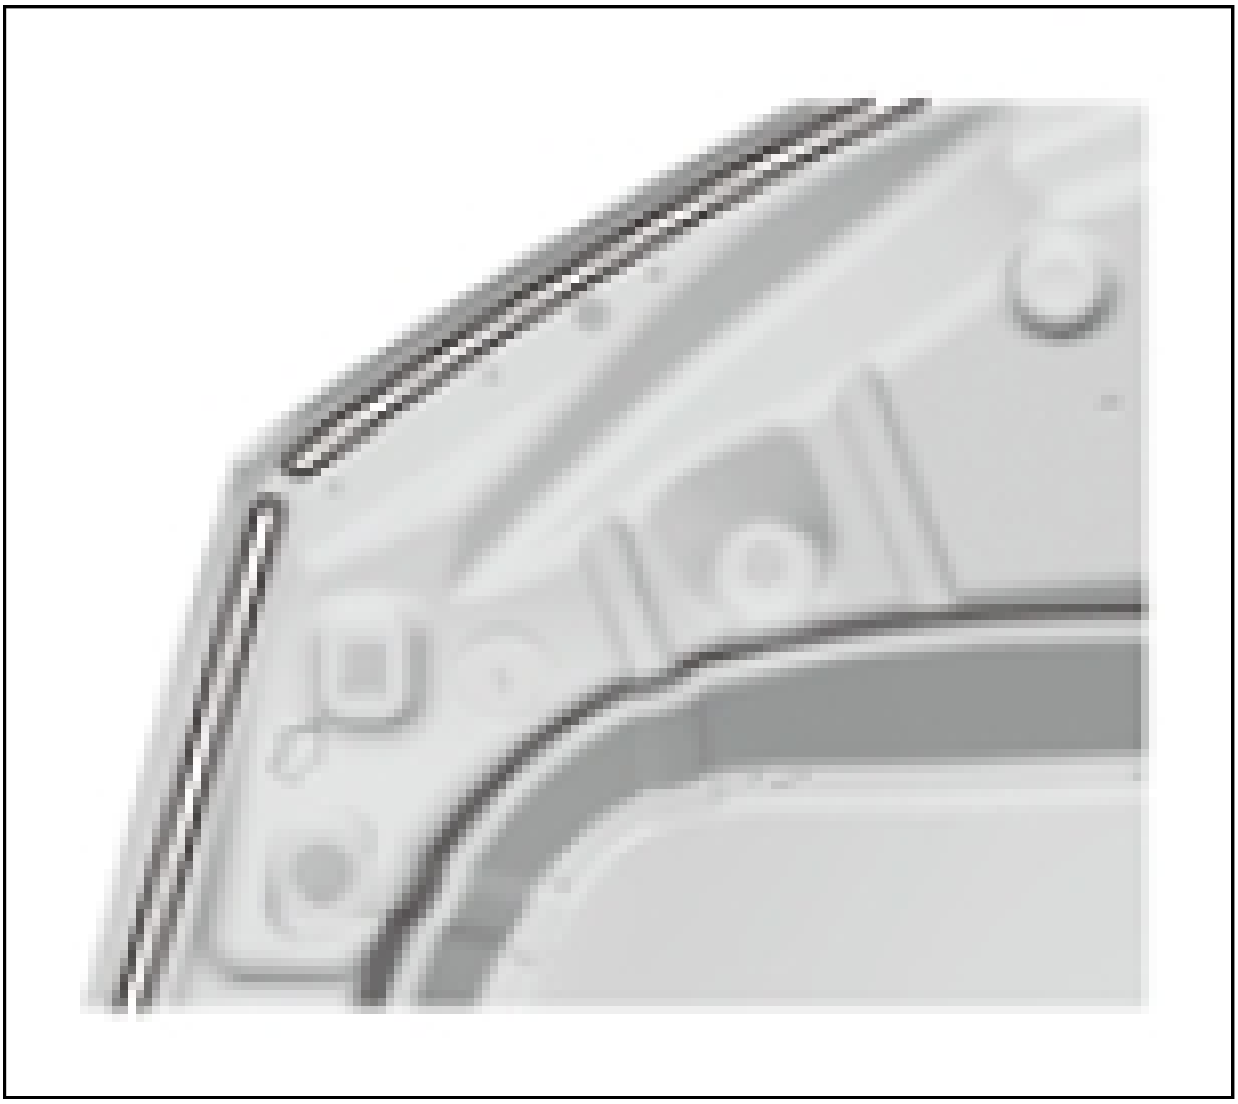
- Mastic Sealer

  Used to adhere the hood, trunk, door and roof with outer panels. It not only joins them together, but also contributes to increased rigidity of the panels, helping to prevent vibration and noise form the outer panels.



- Body Sealer (Paint Sealer)

  Applied to part contact surfaces to prevent entry of water and dust. It also has a rust-prevention effect for the edges of steel sheets and is used to improve exterior appearance.

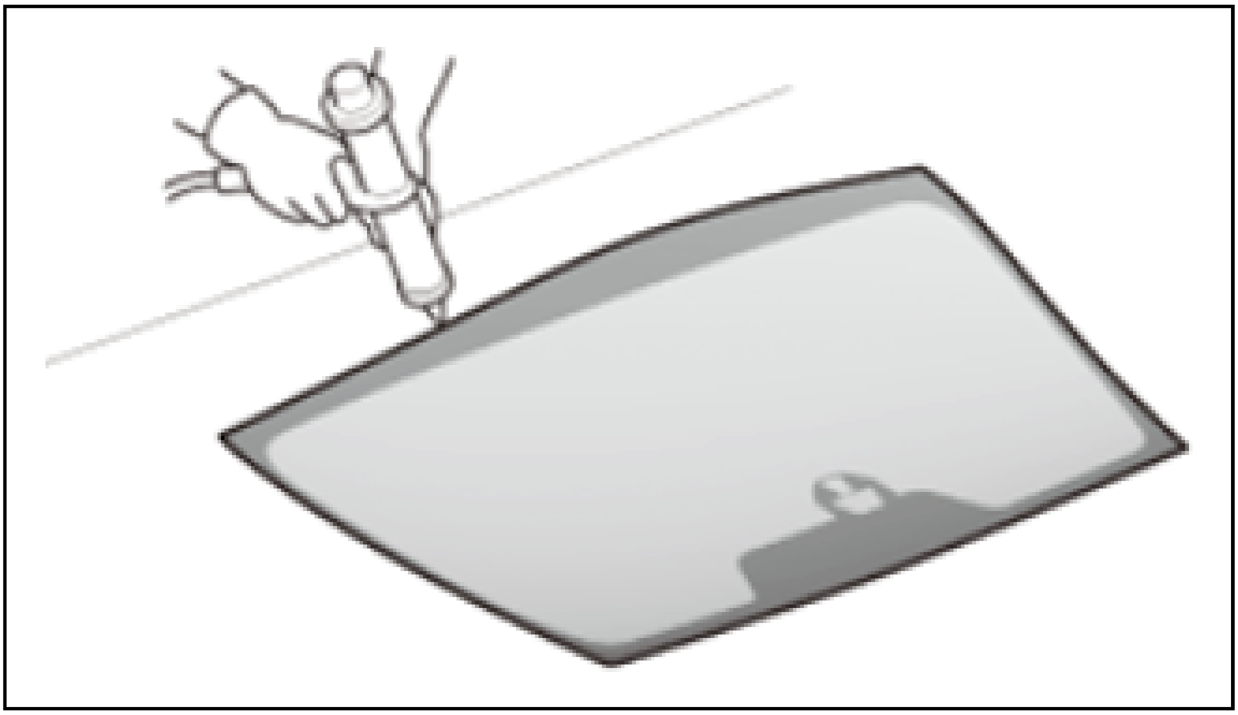


- Glass Sealer (Urethane-based Sealer)

  For glasses and other external parts (including the side protector), a urethane-based sealer that is hardened at room temperature is used.

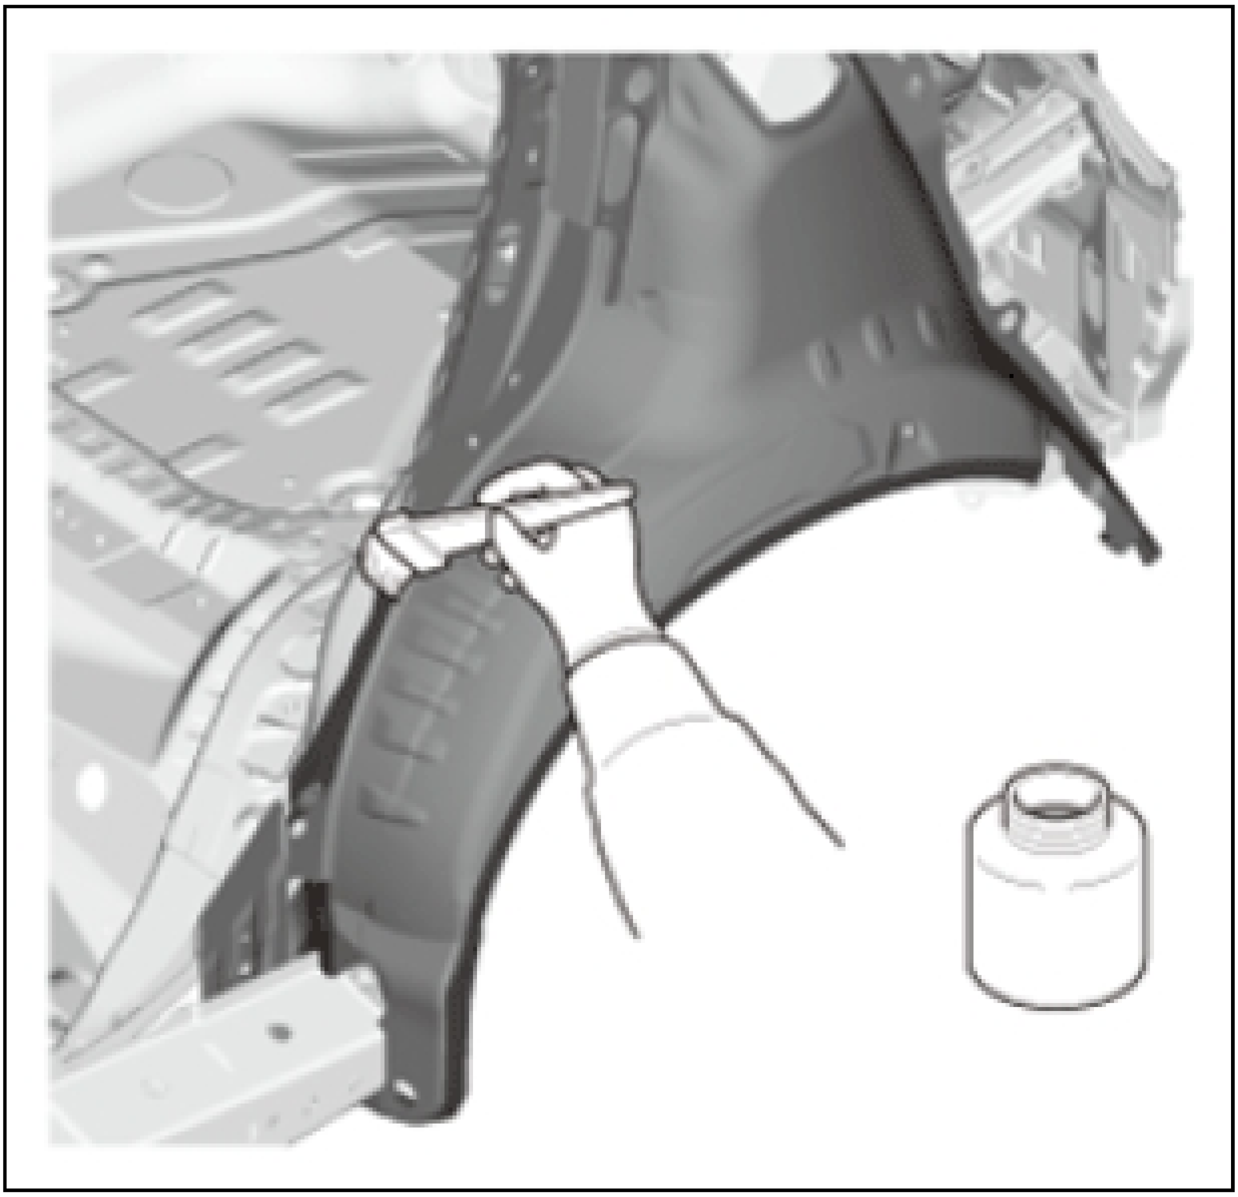
The automobile window glasses are attached with a method called direct glazing, which directly adheres the laminated glasses onto the painted body.

In this method, one-component moisture-curing polyurethane type adhesive is used. The adhesion surfaces are a ceramic coated glass and painted steel panel. To improve the adhesion, primer is applied on both surfaces.



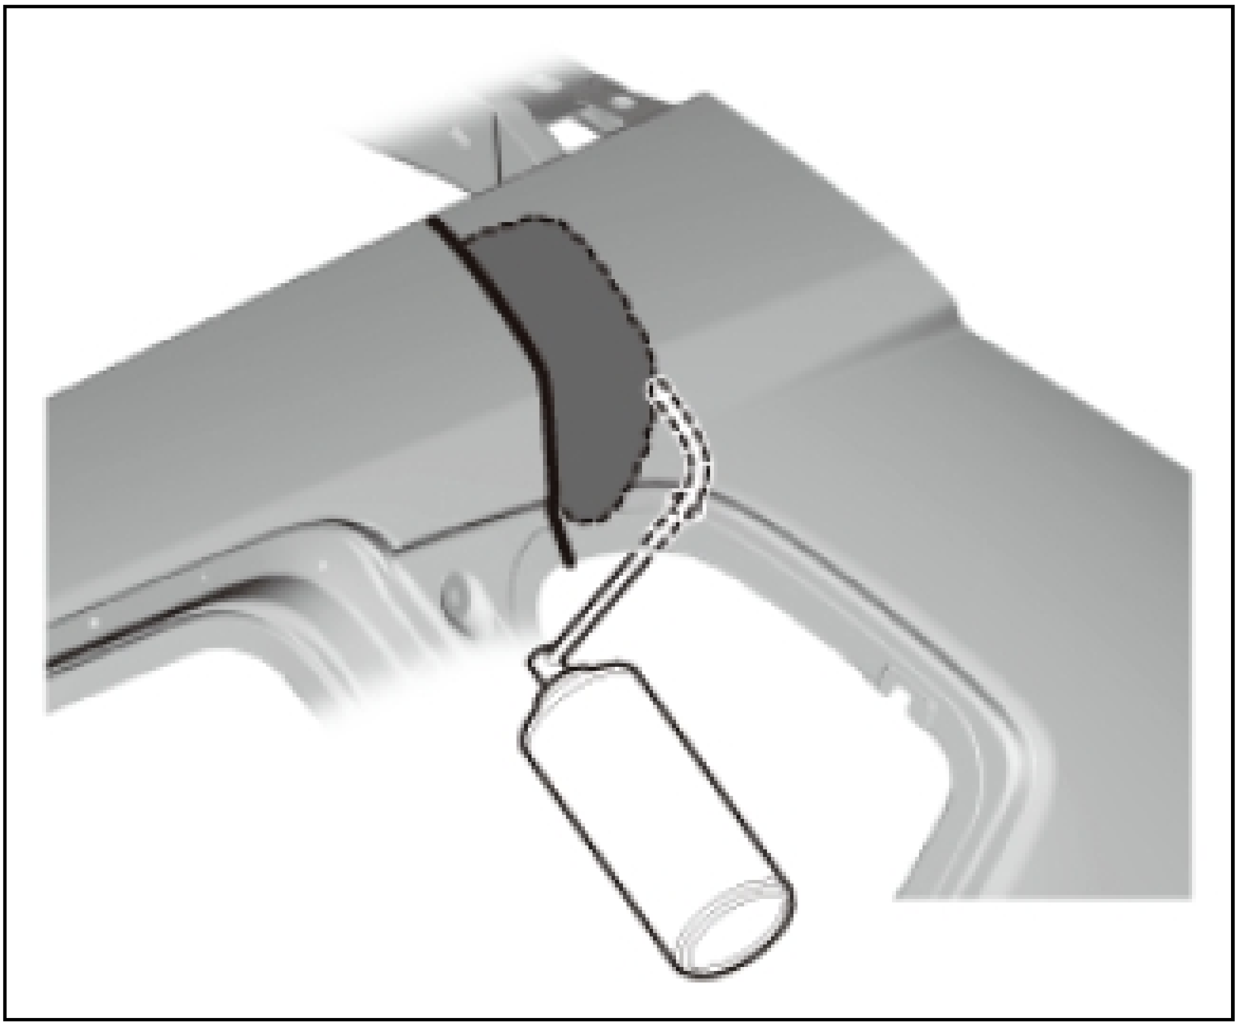
- Spot Sealer (aka Weld-Through Primer)

  Used to prevent rust on the mating surfaces of spot welds.



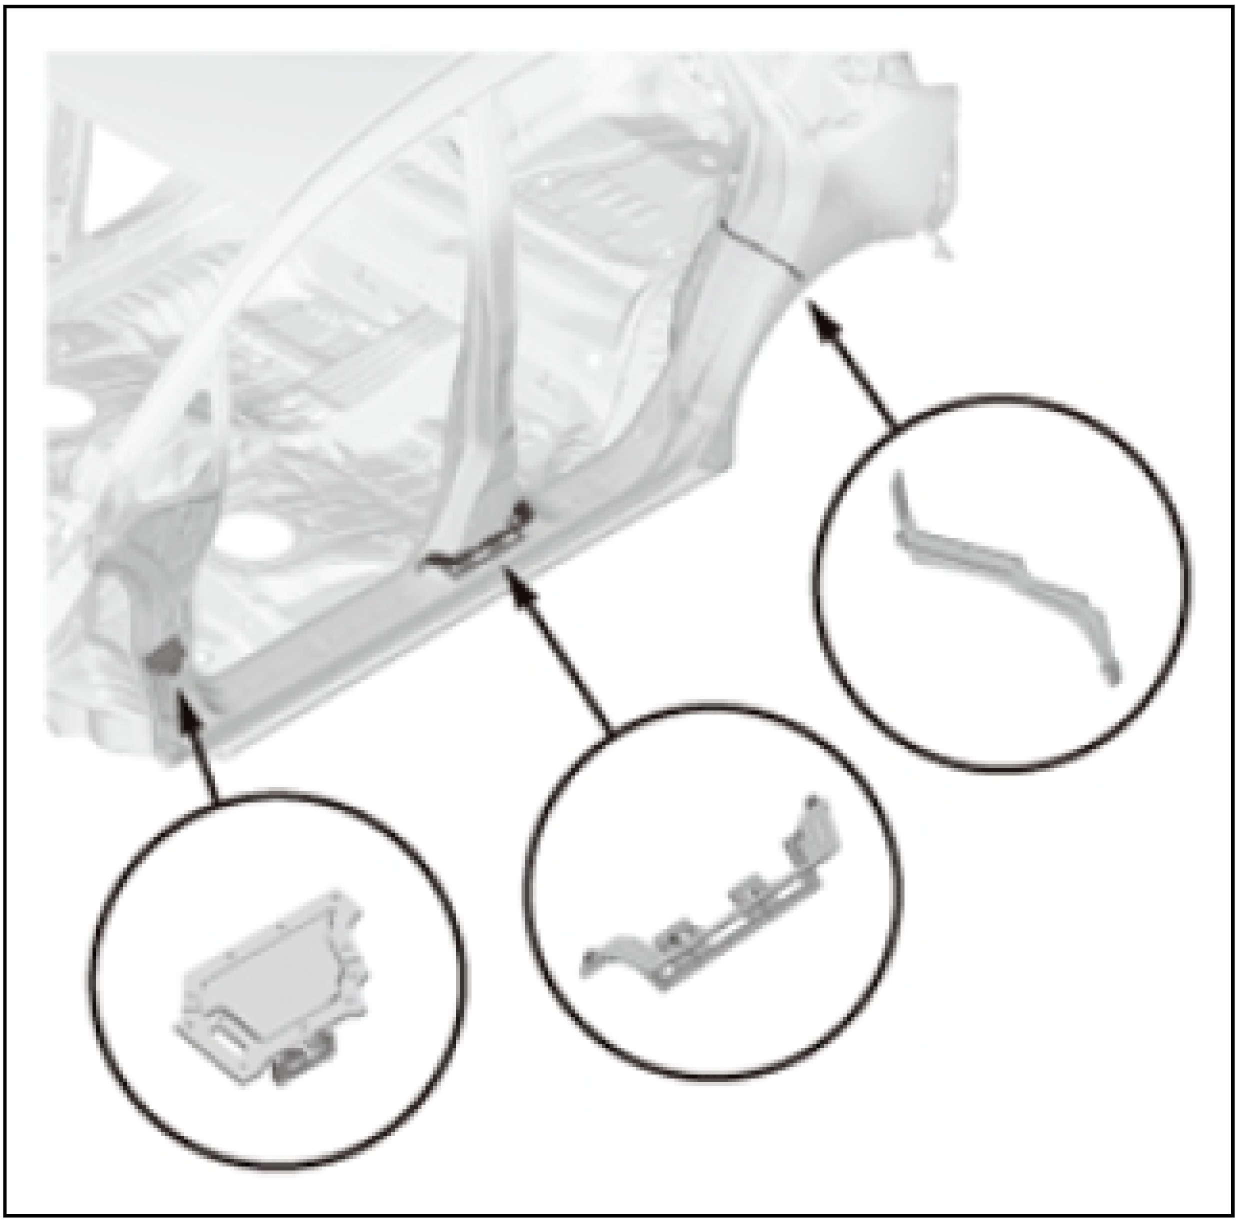
- Foam Filler Material

Significantly reduces the amount of passenger compartment road noise when applied to close off body cavities.



- Separator

  Separators are installed in between the panels of mass produced vehicles. Foam is generated around the separators by heat during paint baking process fill up body cavities. Some newer models use expandable foam applied through the inner panel holes for this same purpose.



BASIC WELDING INFORMATION

GENERAL WELDING INFORMATION

Automobile Body Welding

Most of the body is welded using spot welding during mass production in order to achieve maximum strength and efficiency. Spot welding is also the preferred method for repairing body damage to ensure the same level of strength and durability as a mass production body. However, spot welding cannot be applied in every instance due to the way the parts are assembled or for other reasons. Use MAG (plug or butt welding) or MIG brazing (plug welding) as specified in the model specific service information instead.

NOTE: **Do not use gas welding during automobile body repair.**

Joint Types

Vehicles are assembled by various joining methods categorized as follows:

Mechanical Joint

Parts are joined by bolts, nuts, rivets, etc. It is necessary to machine the affected parts before for joining.

Chemical Joint

Parts are glued together. It is usually unnecessary to machine the affected parts before joining.

Metallurgic Joint

Surfaces to be joined are melted to join them together. Welding falls into this classification. Welding types include: pressure welding, fusion welding, and soldering:

- **Pressure Welding**

  This method melts parts together by electrical current and resistance without using filler material while pressure is applied to the joint. Spot welding is a common example.

- **Fusion Welding**

  This method melts the parts together using a filler material such as welding wire or rod. MAG and MIG welding are common examples.

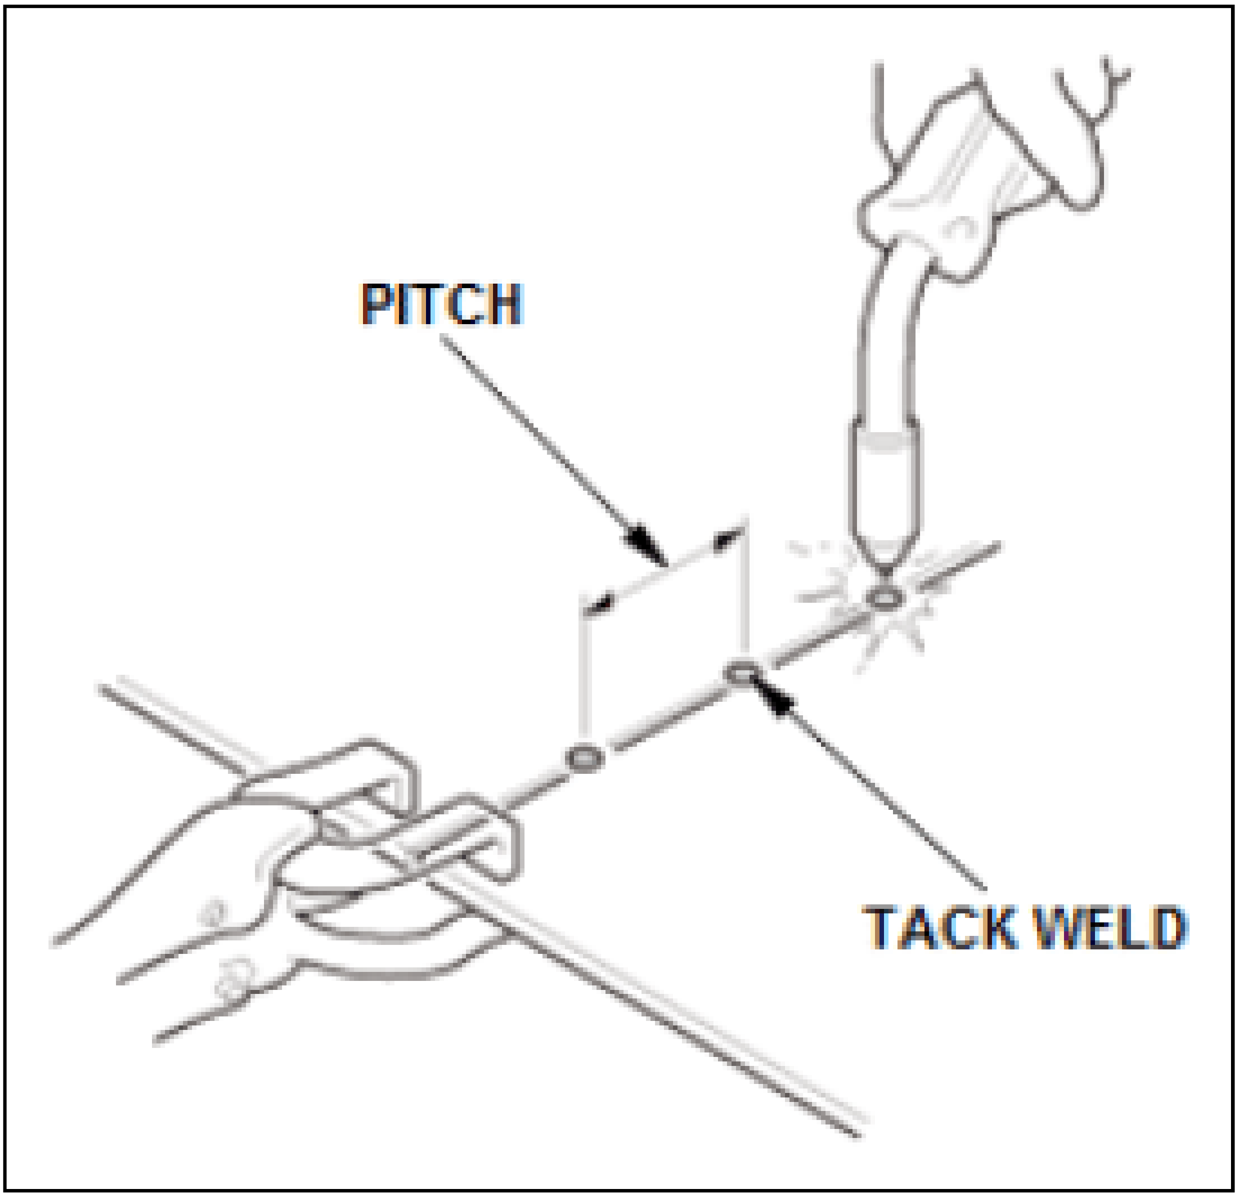
- **Braze Welding**

  This method bonds two pieces of metal without melting them by using a filler material (brazing filler material) that has a lower melting point than the materials being joined.

MAG WELDING

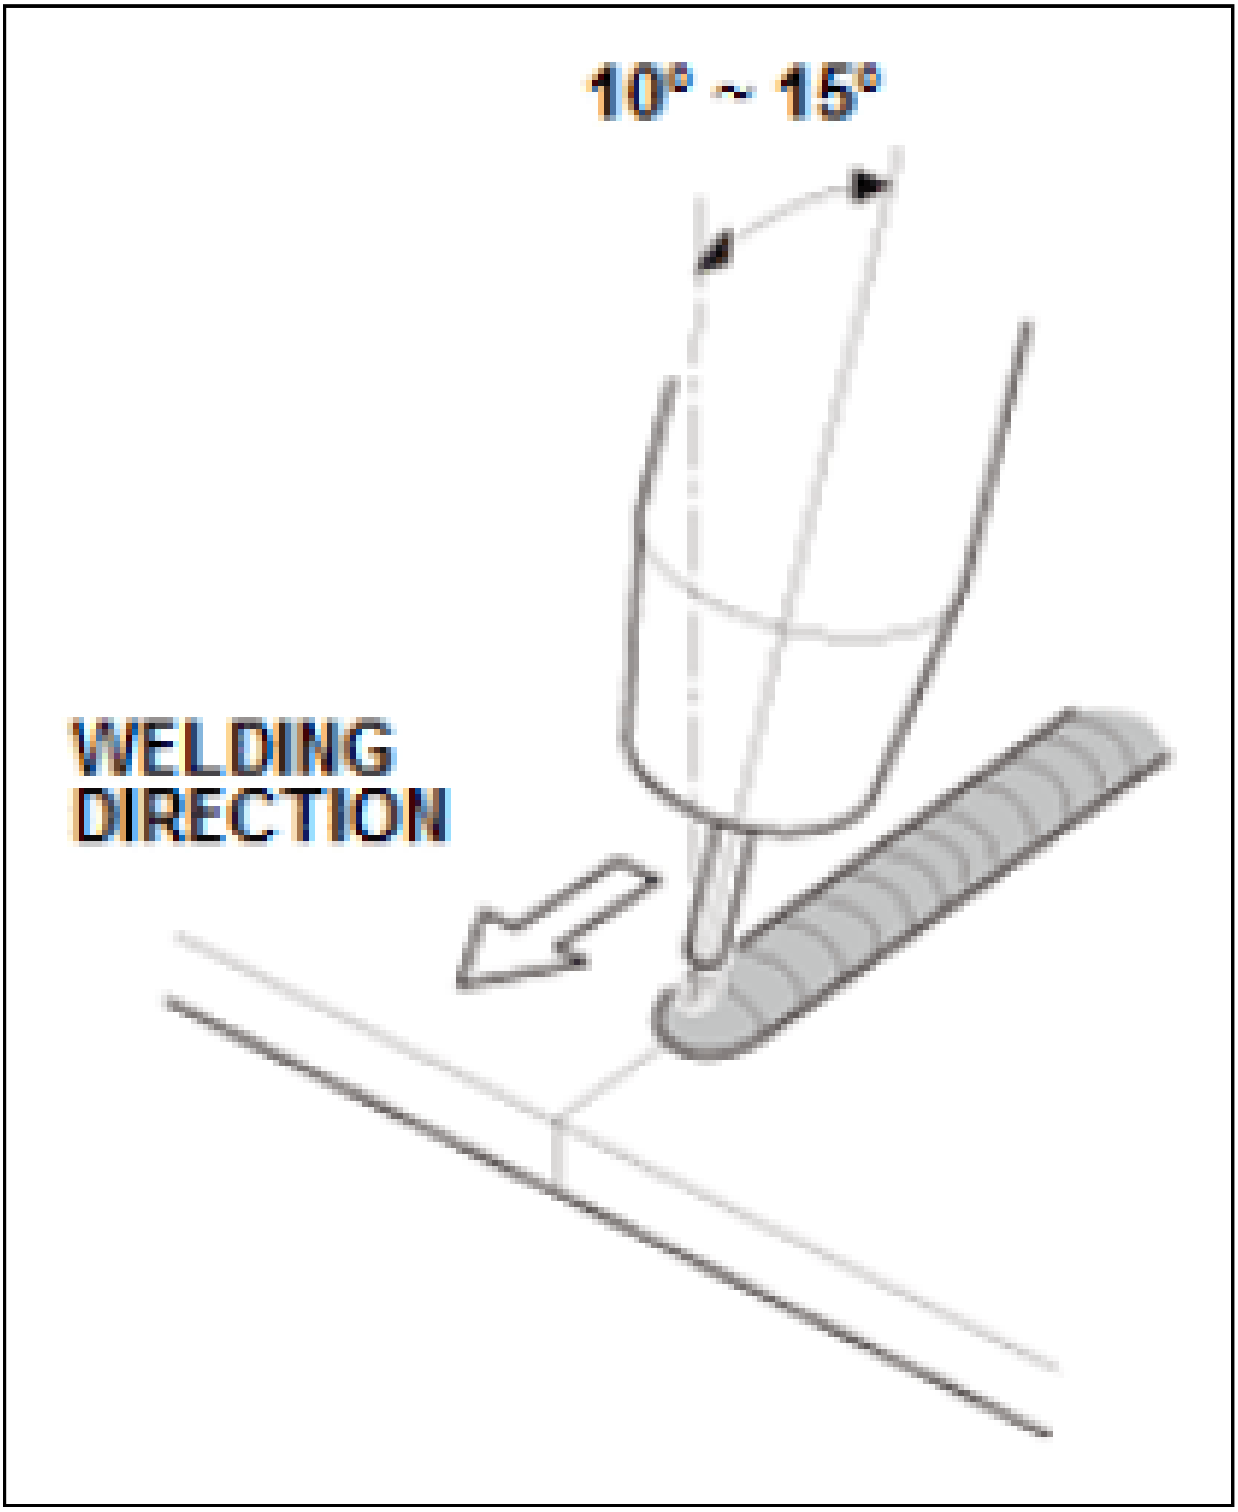
Butt Welding

1. Tack welding:
    - To prevent distortion and ensure precision of joints, make several tack welds along the area to be butt welded.
    - The thinner the panel, the smaller the pitch of the tack weld.



2. Main welding:
    - Tilt the torch 10 to 15 degrees and use the push (forward) welding method to weld along the mating line.

- To prevent an unsteady hand while welding, place yourself in a comfortable and supported position to help maintain the correct tip-to- work clearance and torch angle.
- Move the torch at a steady speed while confirming adequate weld penetration.
- When welding thin panels, such as an outer panel, use a skip or stitch welding technique, by moving the torch to different areas of the butt weld. This will help avoid overheating the panels, which can cause warpage or burn through.

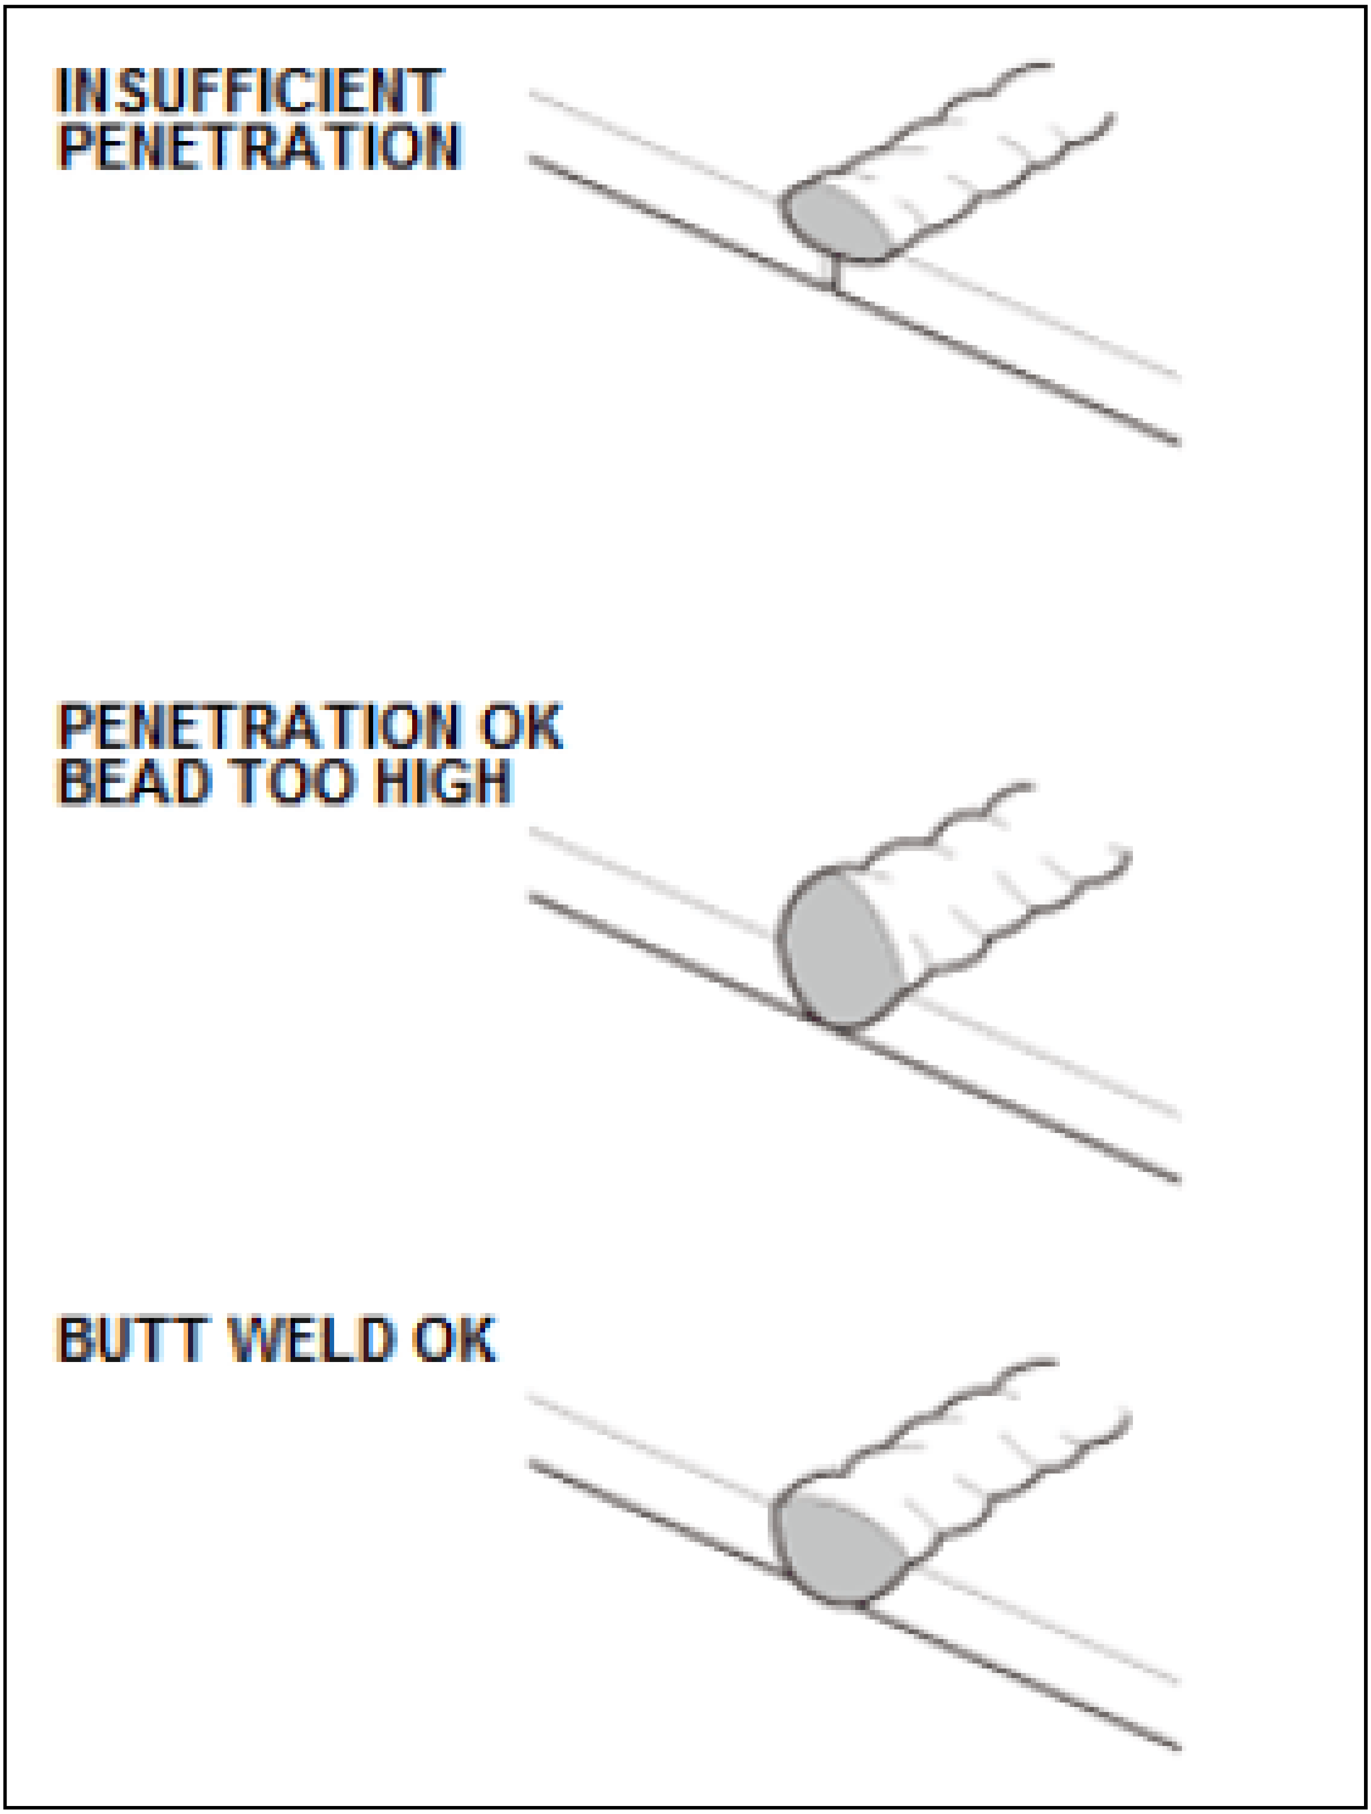


3. Butt Weld Visual Inspection

Penetration

Examples of typical faults:

- Lack of penetration resulting in insufficient strength Weld may fail or cracks when it is being ground smooth.
- Arc length too long.
- Sufficient penetration, but bead is too high requiring excessive grinding to finish.



INSUFFICIENT PENETRATION
PENETRATION OK BEAD TOO HIGH
BUTT WELD OK

MAG Welding Conditions For High-Strength Steel Parts (Except 1500 MPa)

If a high-strength steel part (340 MPa or higher) is MAG welded, the welding wire used must have a tensile strength equal to, or greater than, the lowest tensile strength of the parts being welded. The wire below, or equivalent, may be used for 980 MPa or less (except butt welding for 980 MPa, which is prohibited) high-strength steel welding.

MAG Welding Wire

Must use 0.8 mm (0.031 in) diameter wire with a tensile strength of 980 MPa or higher (142 ksi or higher).

Tensile strength of steel plate and welding method

Tensile Strength (MPa)	Welding Method	
	MAG Weld	
	Plug	Butt
340	◦	◦
440	◦	◦
590	◦	◦
780	◦	◦
980	◦	x
1180	◦(1)	x
1500	◦(1)	x

(1) MAG plug welding is only allowed on these steel grades in selected locations as specified in the body repair information. Welding instructions must be followed exactly as specified to ensure adequate weld strength.

NOTE: **Be sure to check the product specifications issued by the manufacturers for details on welding wire.**

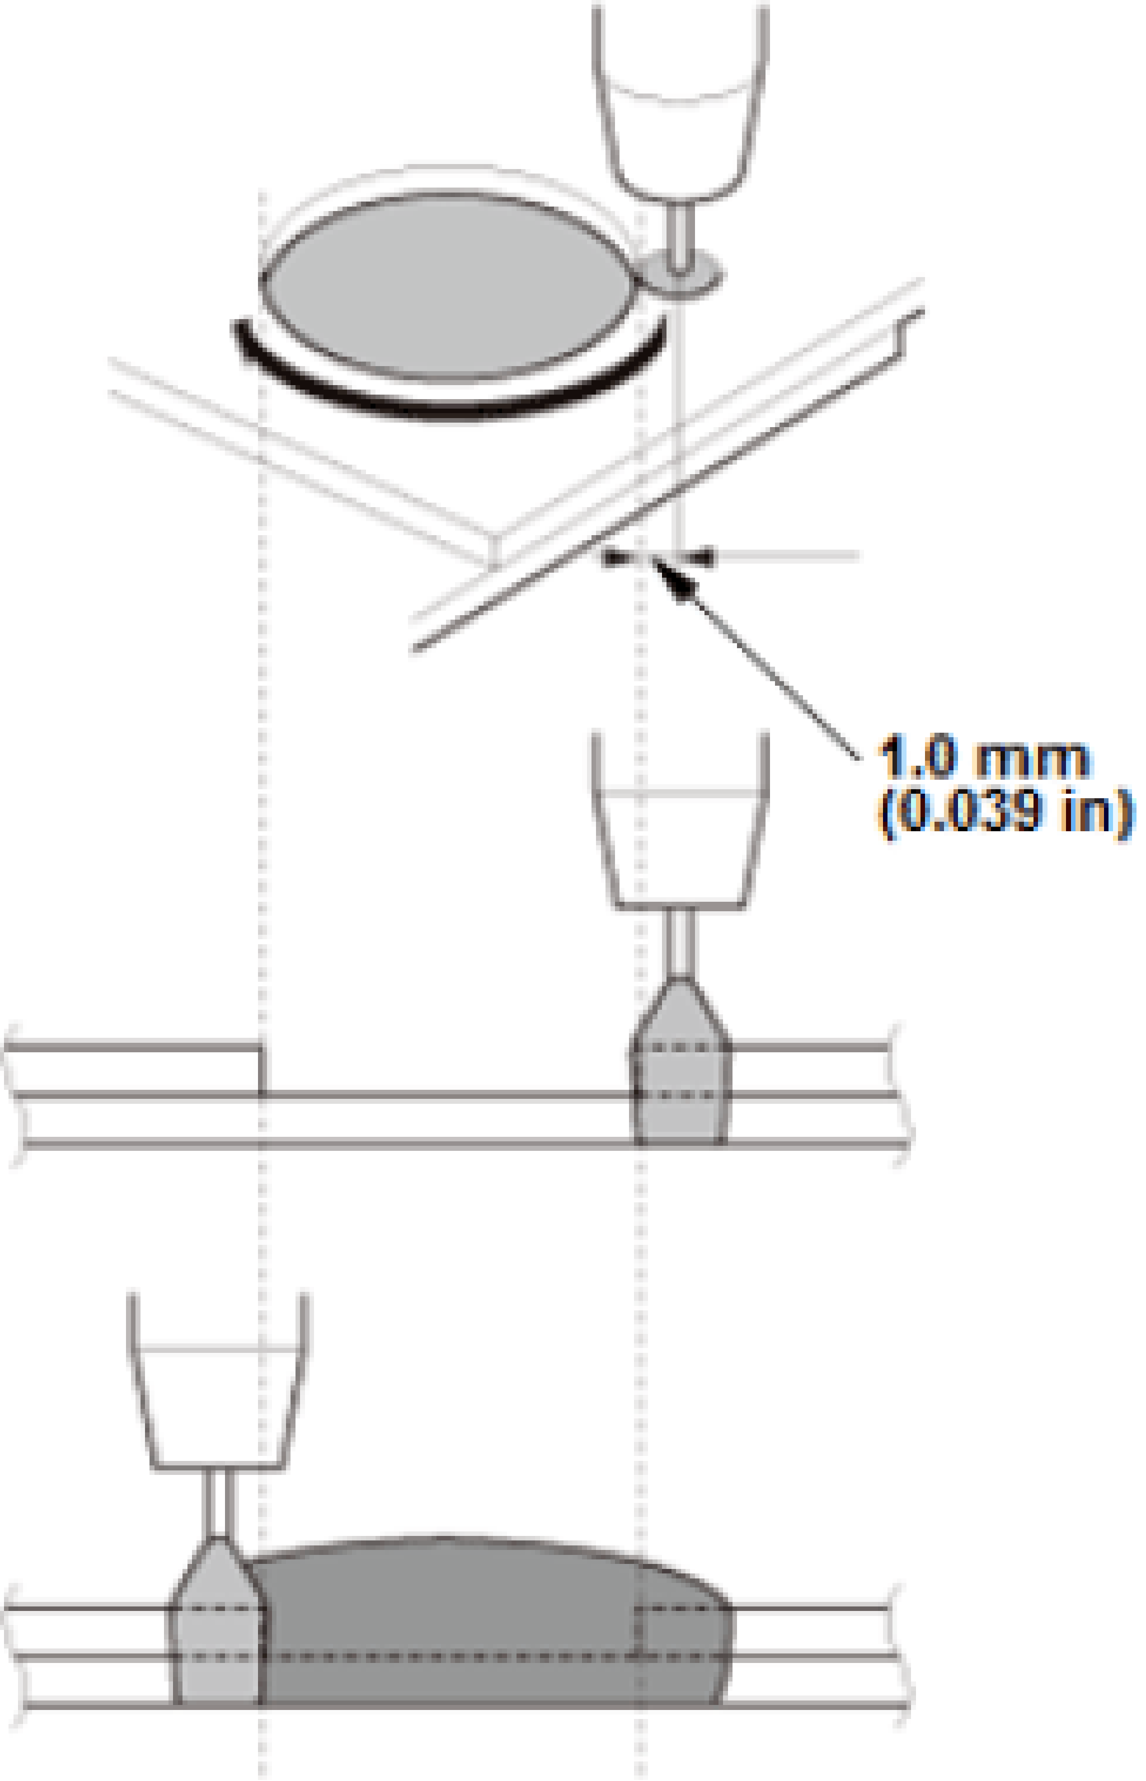
Plug Weld

- Drill plug holes according to the sheet thickness referring to the table below.
- To determine the thickness of the parts being welded, refer to the appropriate body construction information.

Thickness mm (in)	Less than 1.0 (0.039)	1.0-1.5 (0.039-0.059)	1.6-2.3 (0.063-0.091)
Hole diameter Ã˜ mm (in)	6.0 (0.24)	8.0 (0.31)	10 (0.39)

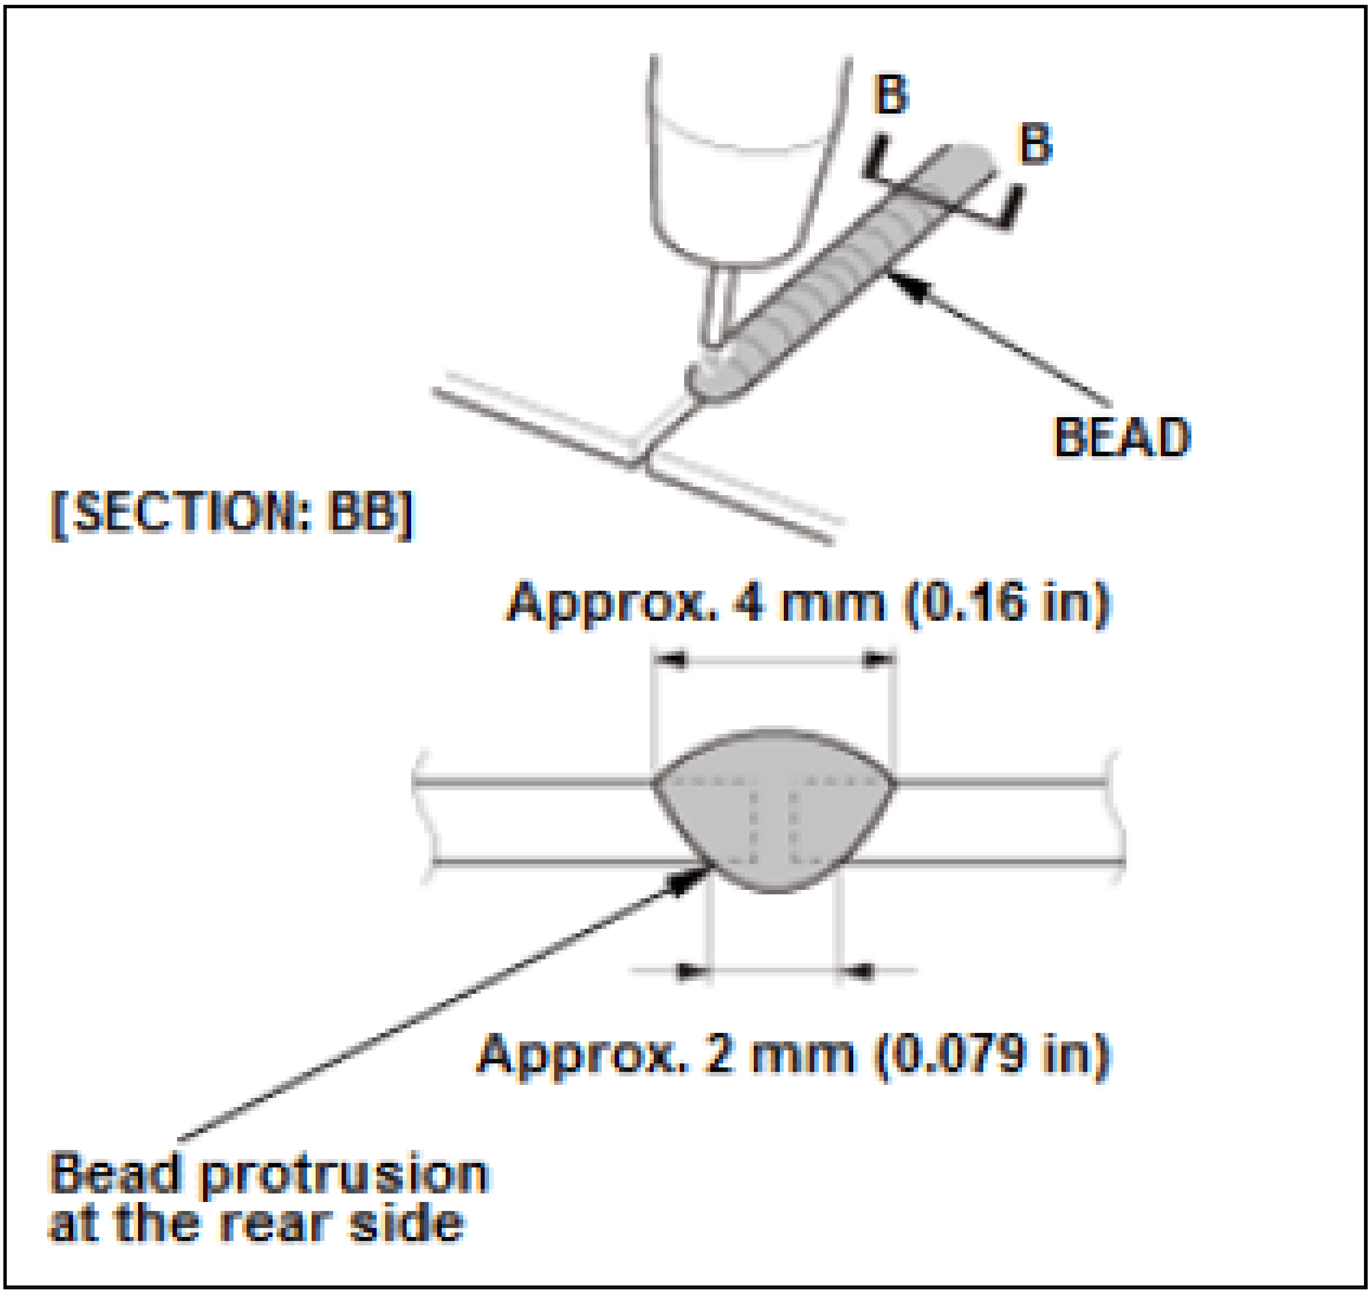
Plug Welding

- Start welding 1.0 mm (0.039 in) from the outer circumference of the edge of the plug hole.
- Weld upper and lower plates completely around the edge of the hole.
- Perform a trial weld to confirm welded finish using test parts. Then perform the actual welding.



Butt Welding

- Perform a trial weld using the same welding conditions as the actual welding you will be doing. Confirm that the bead protrudes from the back side of the weld.
- To ensure adequate weld strength, grind the test weld flat and then perform the welding so that the bead will protrude from the back side of the weld.



B

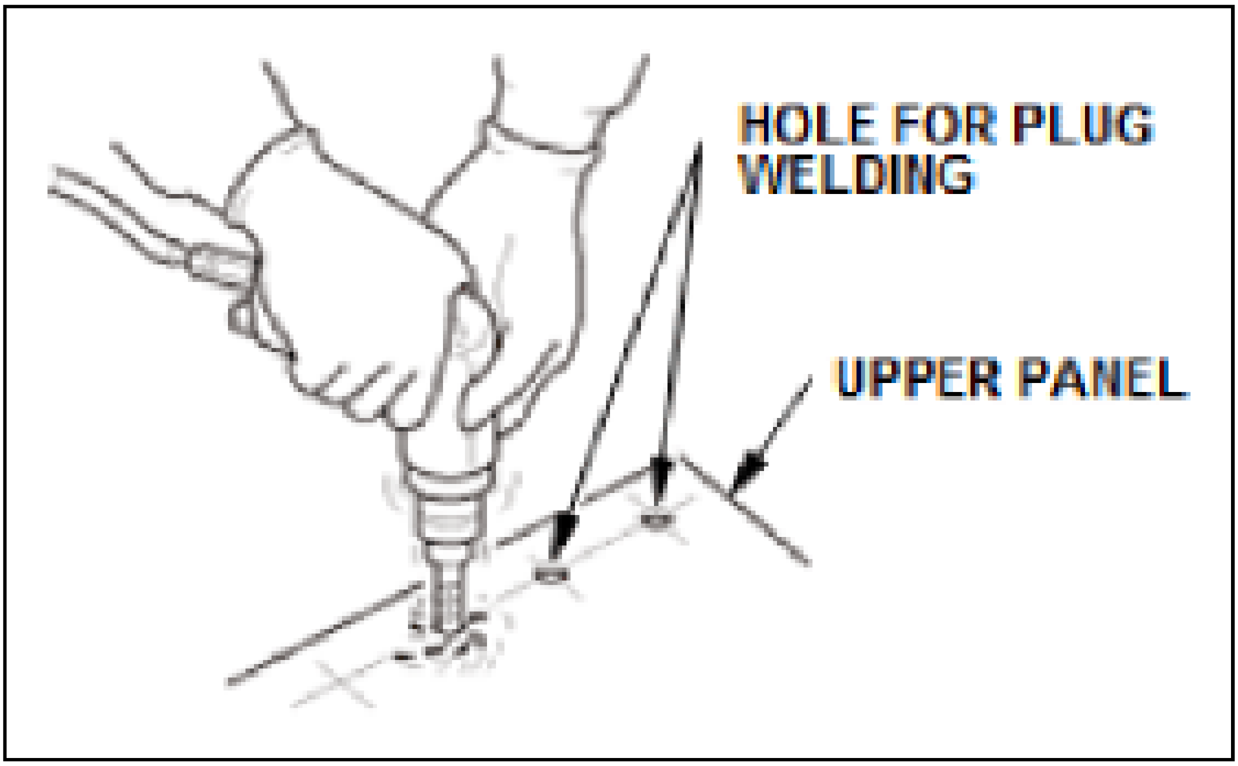
Approx. 2 mm (0.079 in)
Bead protrusion
at the rear side

Plug Welding

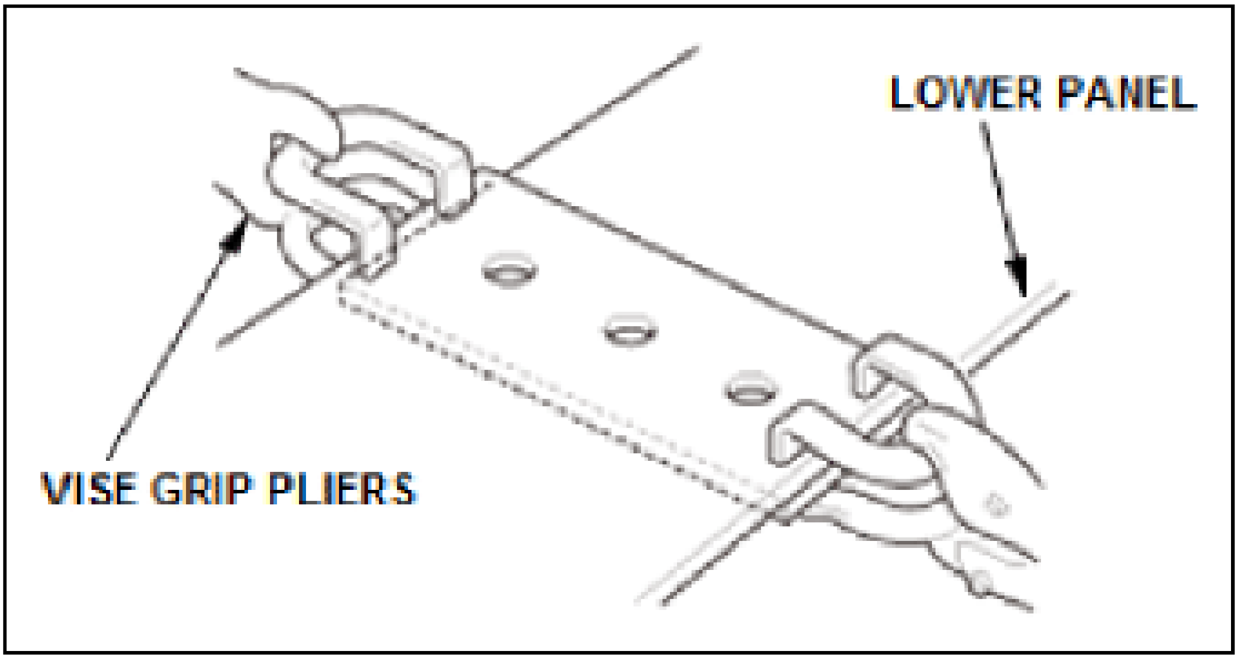
1. Plug hole drilling:
    - Drill holes for plug welding in the upper panel.
    - To ensure adequate weld strength, the proper hole diameter must be chosen based upon the metal thickness.
    - Use 0.8 mm (0.031 in) MAG welding wire equal to or greater than lowest tensile strength of the parts being welded to ensure adequate weld strength.

Thickness mm (in)	**Less than 1.0 (0.039)**	**1.0-1.5 (0.039-0.059)**	**1.6-2.3 (0.063-0.091)**
Hole diameter mm (in)	6.0 (0.24)	8.0 (0.31)	10 (0.39)



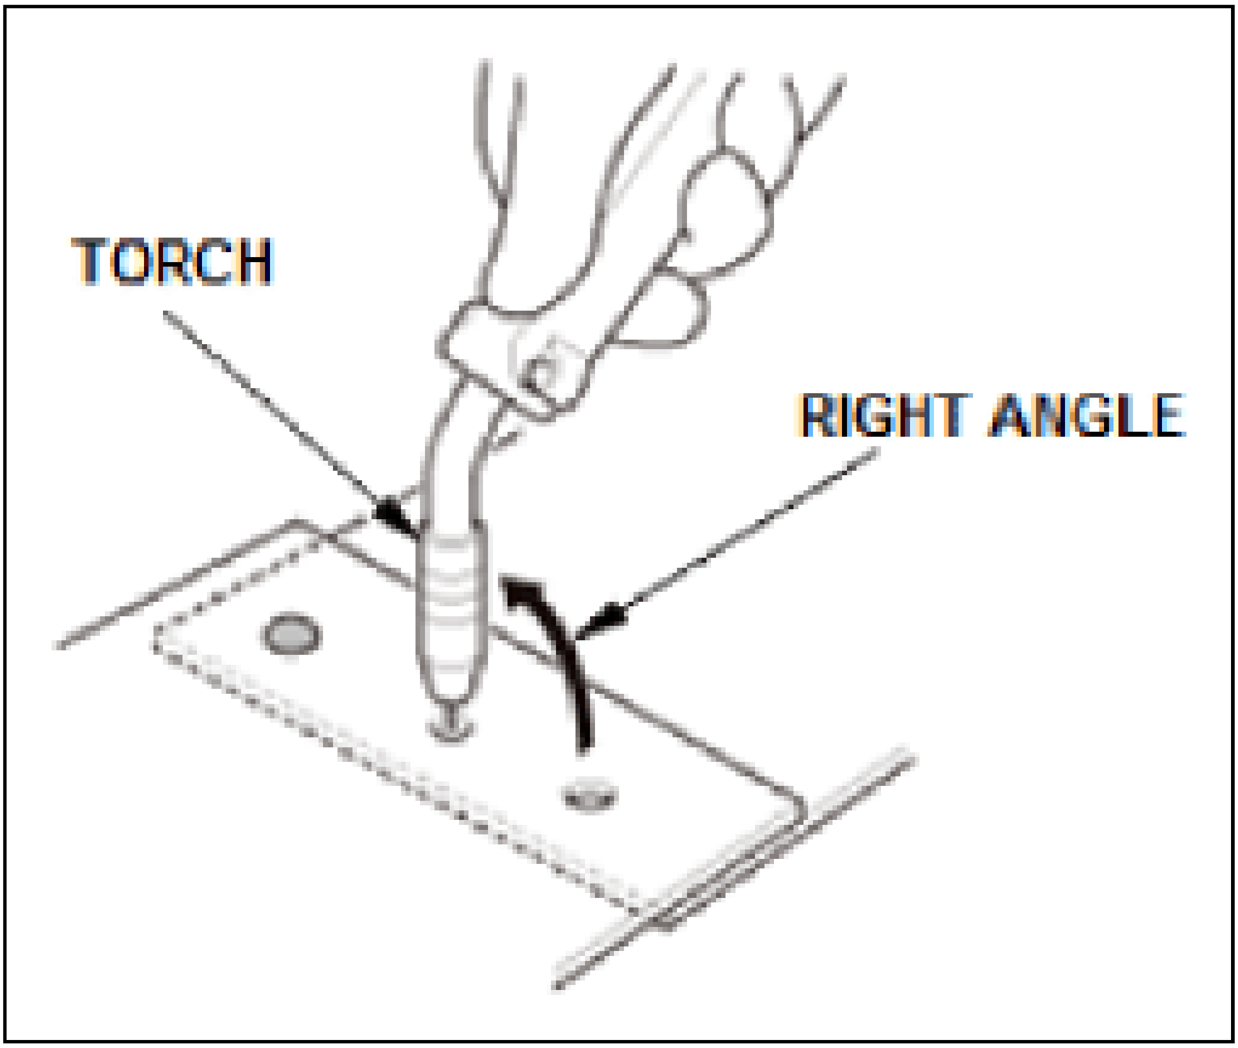
HOLE FOR PLUG WELDING
UPPER PANEL

2. Clamping weld location:
    - Use vise grip type pliers to tightly clamp the upper and lower panels together.
    - Use a hammer to correct any deformation and ensure a tight fit between the panels.

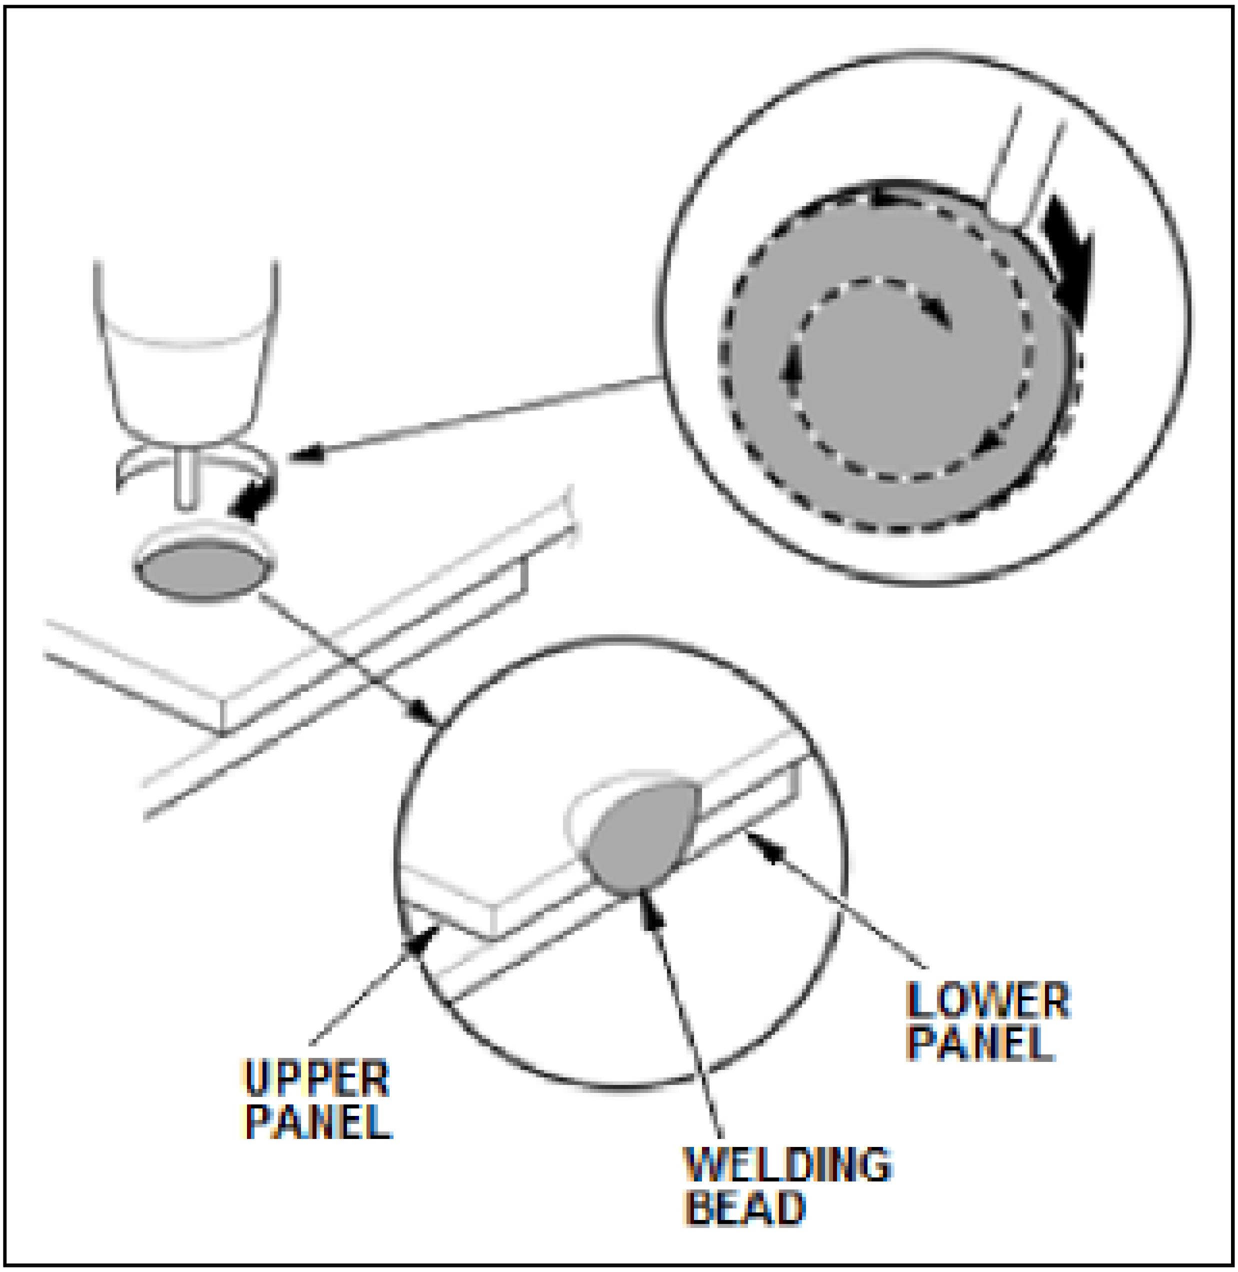


LOWER PANEL
VISE GRIP PLIERS

3. Making the plug weld:
    - Hold the torch firmly at a right angle to the plug welding hole.
    - Move the torch in a circular motion along the hole inner diameter to weld it closed.
    - Check penetration depth and ensure adequate penetration of the bottom panel.



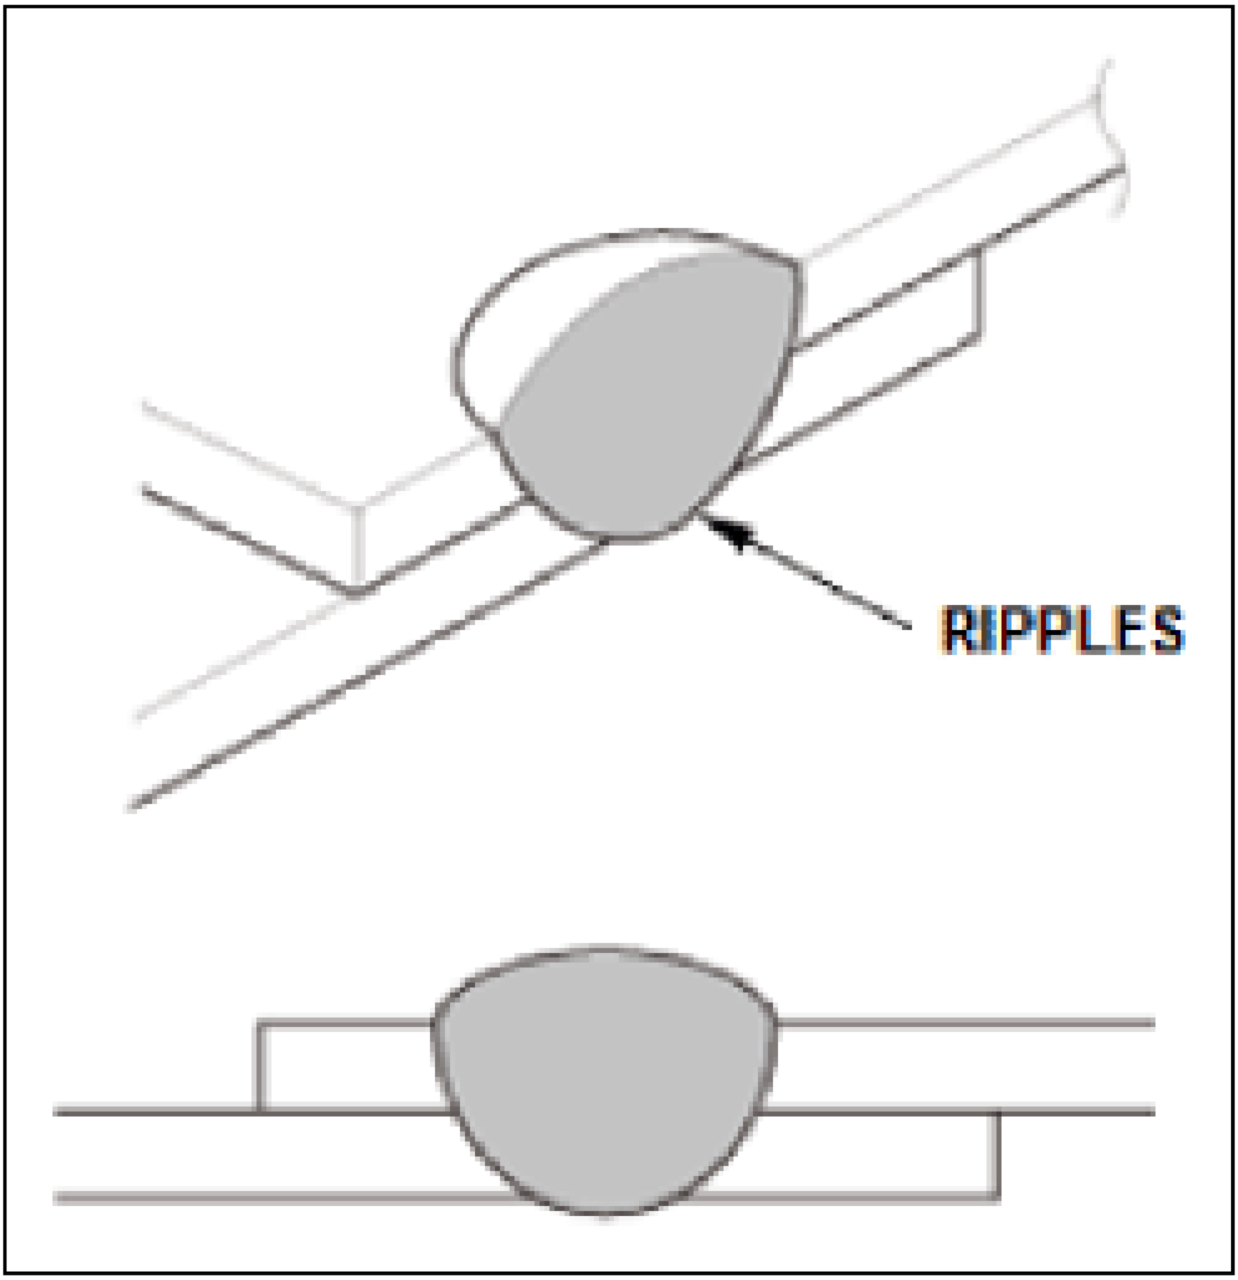
TORCH
RIGHT ANGLE



UPPER PANEL
WELDING BEAD
LOWER PANEL

4. Plug weld inspection

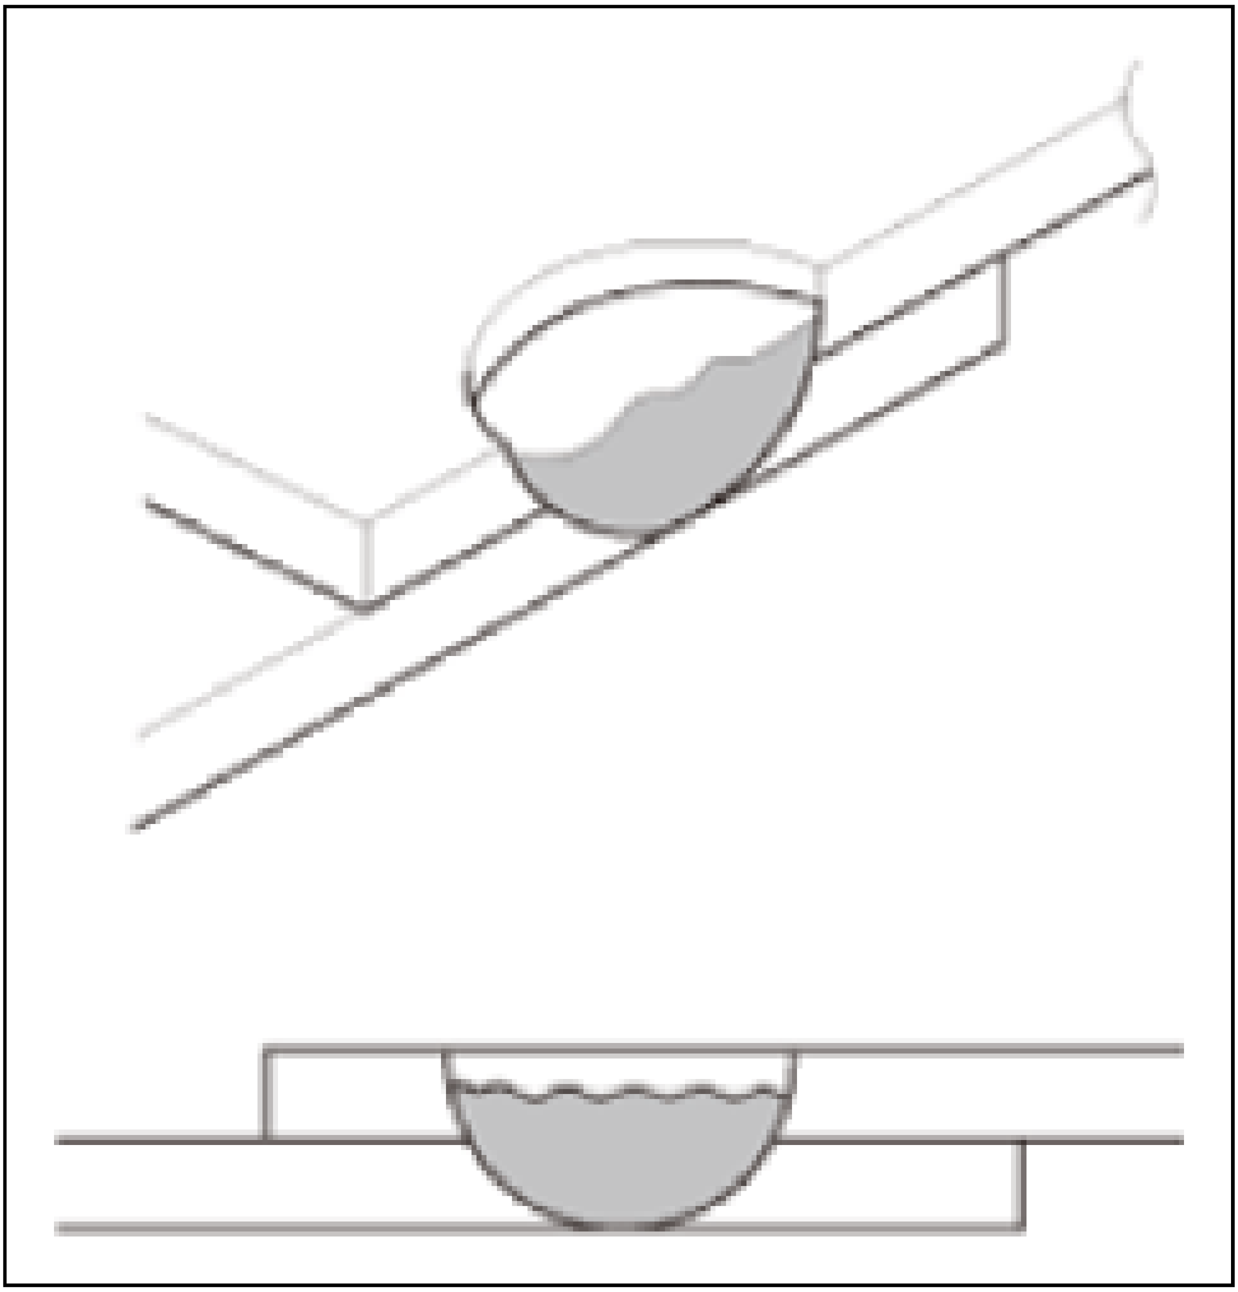
If the ripples (round marks) appear on the bottom panel due to the welding heat, weld penetration is sufficient.



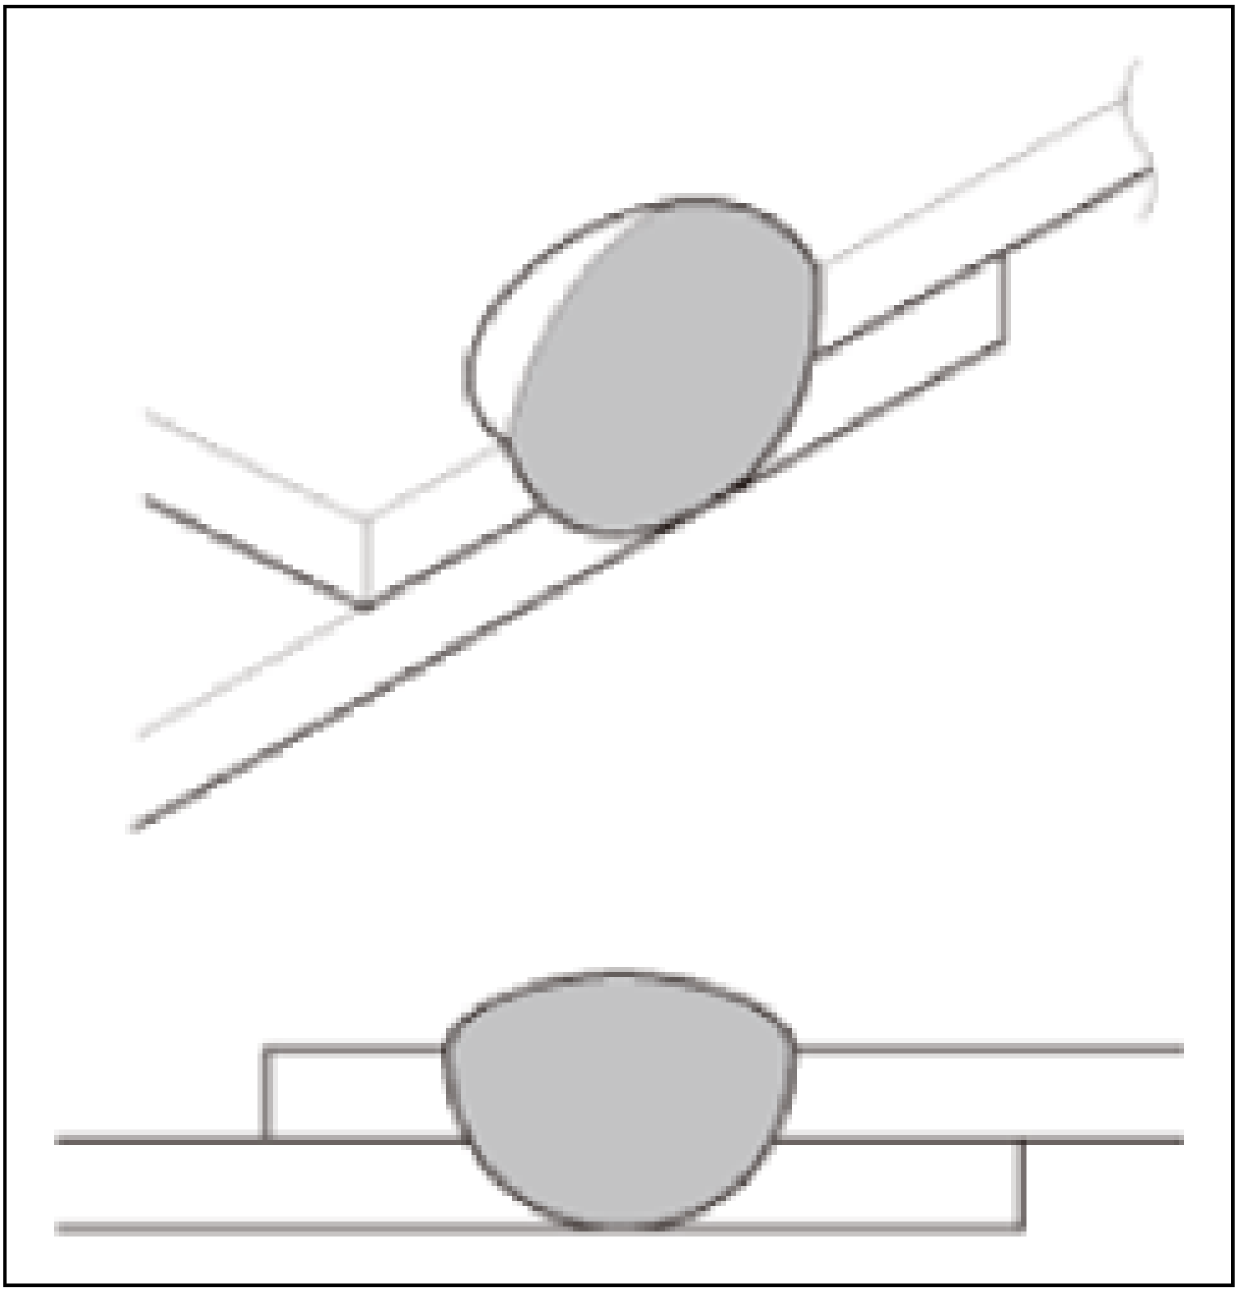
Bead shape

Example of typical faults:

- Lack of penetration resulting in insufficient strength.
- Insufficient welding current.

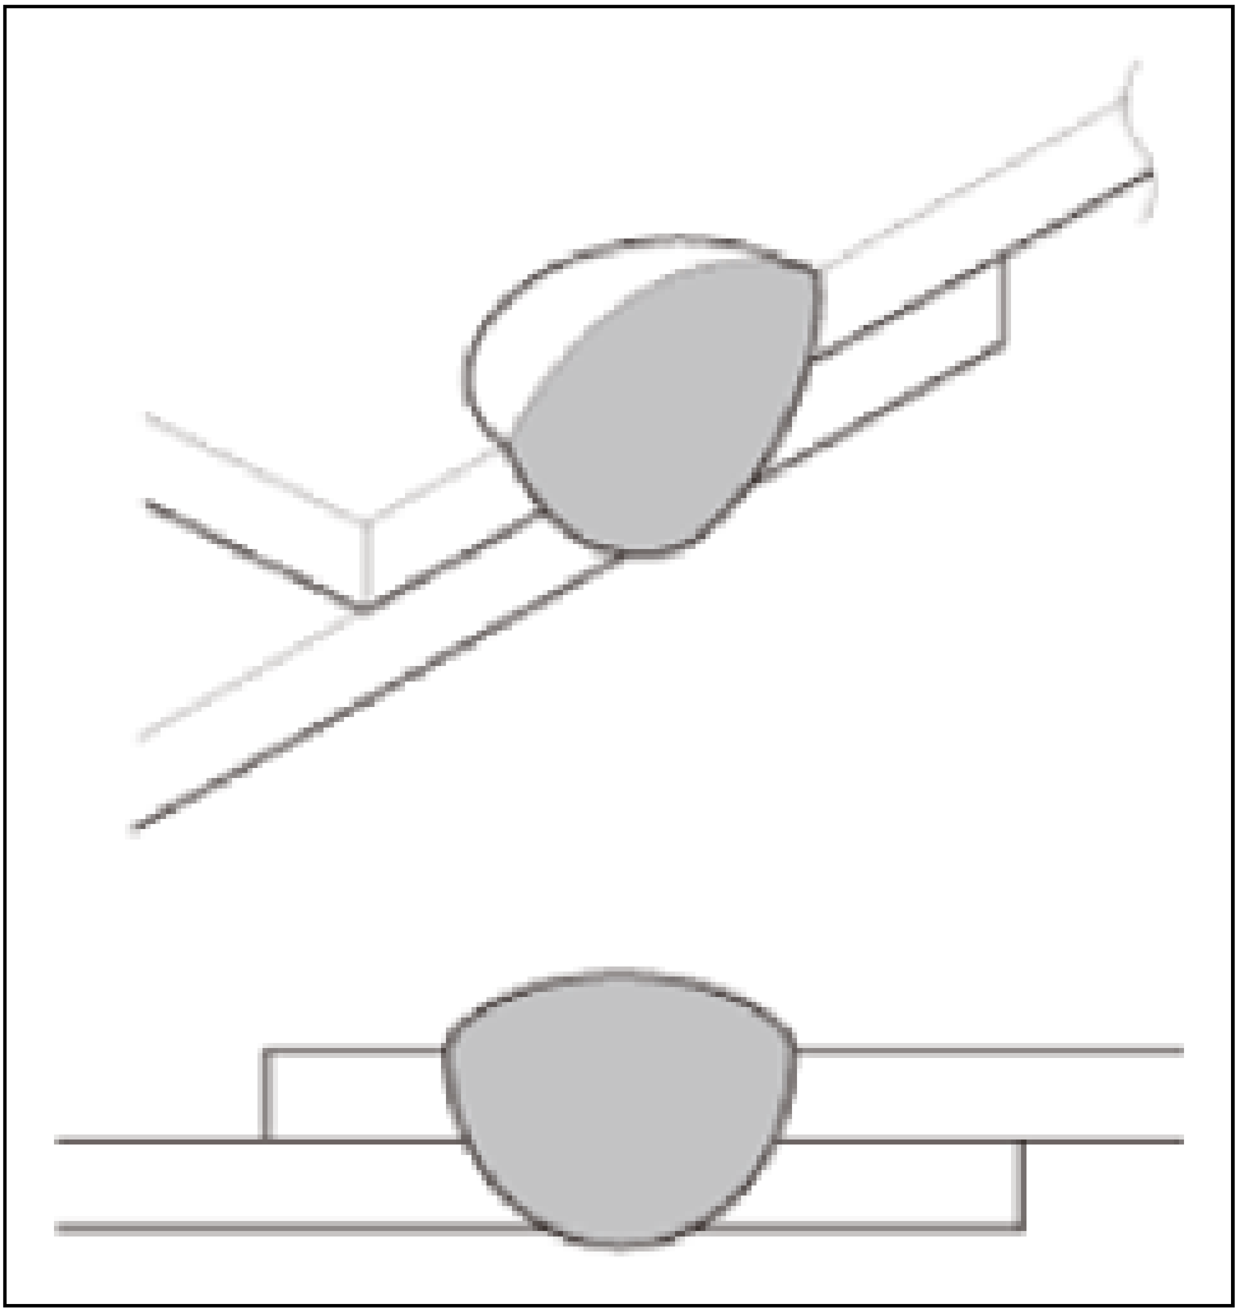


- Though penetration is sufficient, if the beads protrudes from the panel too far, it will take longer to grind smooth.



<Good Example>

- A moderate bead height



Principles And Characteristics

MAG welding is a gas metal arc welding (GMAW) method where an electric arc forms between the consumable welding wire and the work piece, which heats and melts the wire and work piece, welding them together. The welding wire is automatically fed at a constant sped, based on the welder settings.

During welding, shielding gas is supplied from a gas cylinder protect the welding area from atmospheric gases such as nitrogen and oxygen. These gases can cause fusion defects, porosity and weld metal embrittlement if they come in contact with the electrode, the arc, or the welding metal.

In carbon-dioxide gas-arc welding, a unique, melt-drop-transfer process know as the "short circuit method" is used. When welding thin panels, problems such as distortion and burn through tend to occur. To prevent such problems, it is necessary to reduce the heat input. The short-circuit method illustrated below keeps the depth of penetration lower for optimum welding of thin panels.

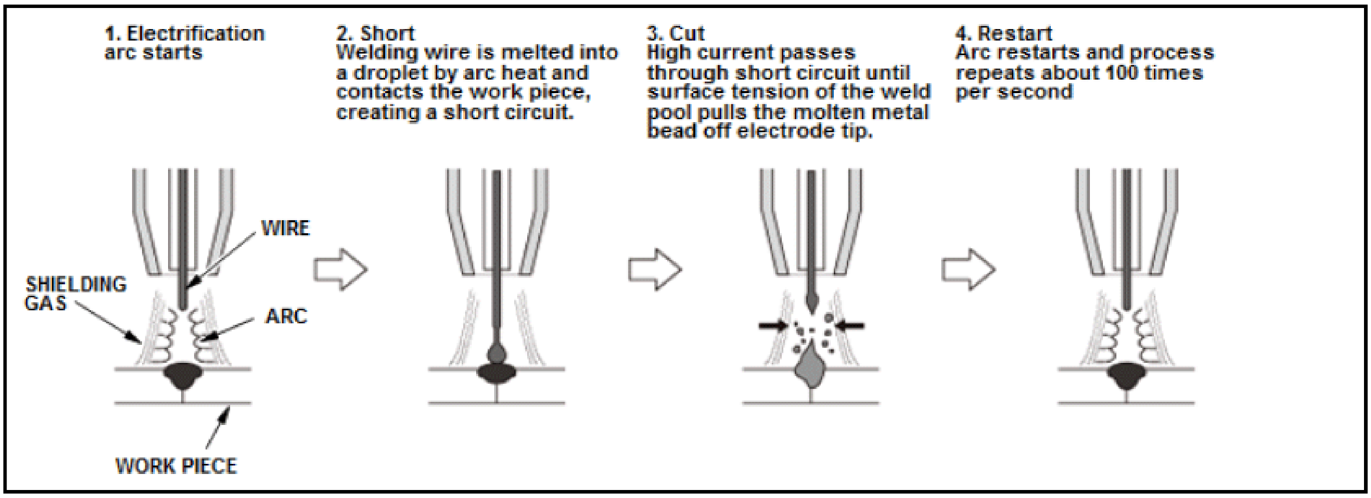
Transfer of molten droplets in short-circuit welding

The end of the welding wire melts due to heat from the arc. This makes a molten droplet that contacts the work piece, creating a short circuit, which briefly extinguishes the arc. As the short circuit occurs, high current passes until surface tension of the weld pool pulls the molten metal bead off electrode tip. The Arc then restarts again and the process repeats itself about 100 times per second.



1. Electrification arc starts
2. Short Welding wire is melted into a droplet by arc heat and contacts the work piece, creating a short circuit.
3. Cut High current passes through short circuit until surface tension of the weld pool pulls the molten metal bead off electrode tip.
4. Restart Arc restarts and process repeats about 100 times per second
WIRE
SHIELDING GAS
ARC
WORK PIECE

Characteristics of MAG Welding

- The risk of distortion and burn through is reduced, allowing thin plates to be welded.
- Simple to learn. Weld quality is not dependent upon the welder's skill level.
- Low molten metal temperature, little fluidity, all position welding is possible with high workability.
- Very little formation of welding slag, so there is no need to remove it.
- Because shielding gas must remain around welding area, it is unsuitable for welding outdoors or where a strong breeze exists.

NOTE:

- **MAG welding**

  Metal Active Gas welding where the shielding gas used is pure carbon dioxide (CO_2), or contains a mixture carbon dioxide (CO_2) and other gases. It is considered active because the CO_2 undergoes a limited reaction with the molten weld pool. MAG welding reaches a temperature of approximately 2732Â°F (1500Â°C).

- **MIG welding**

  Metal Inert Gas welding where an inert shielding gas such as 100% argon (Ar) is used. Because argon is inert, it does not react with the molten weld pool.

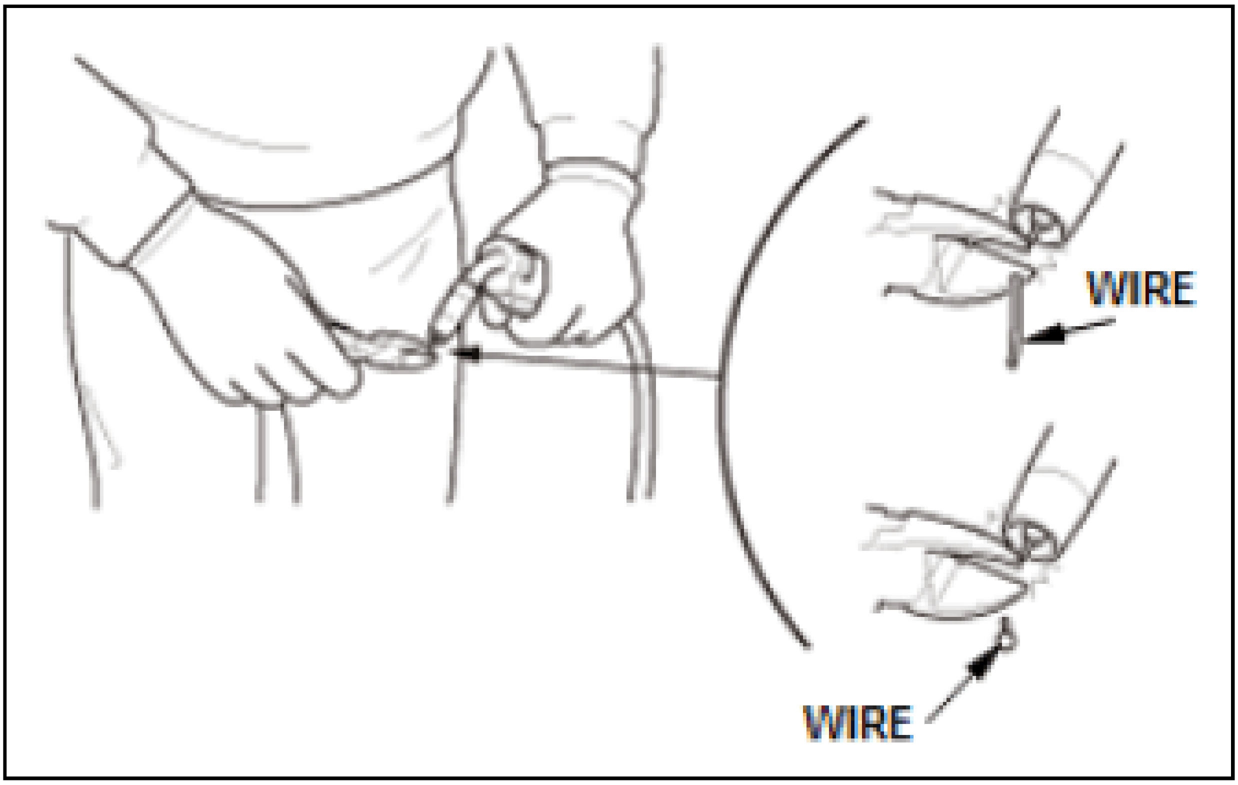
- **MIG Brazing**

A metal jointing method that bonds the work pieces together using a filler material at a much lower temperature than MAG welding, approximately 1742Â°F (950Â°C). The base metal remains below a temperature that would weaken UHSS such as 1500 MPa steel. A pulsed MIG welder, Silicon bronze wire (CuSi-A or CuSi3), and inert 100% Argon (Ar) shielding gas must be used.

Starting The Arc

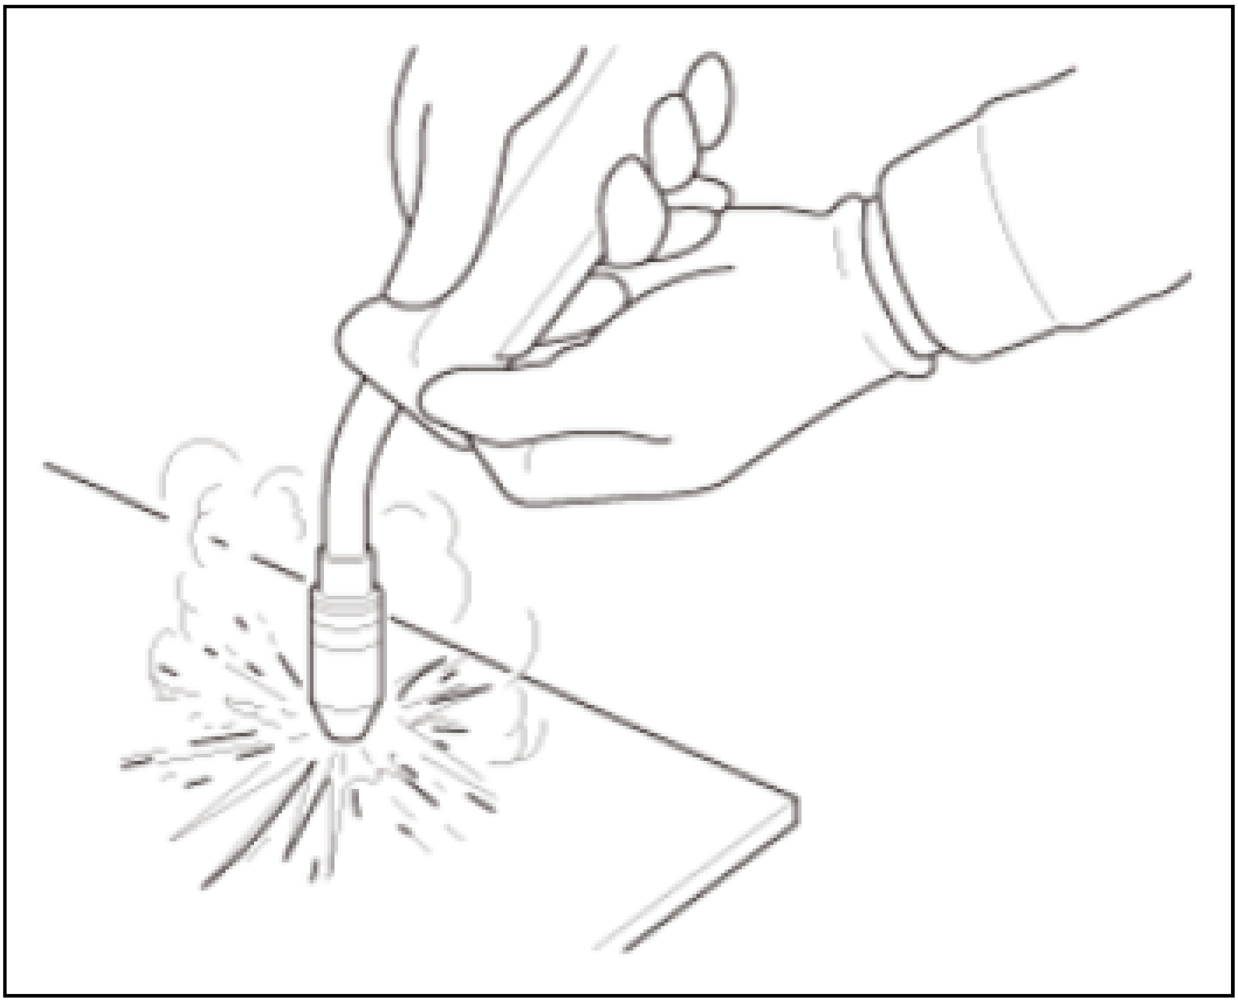
1. Thoroughly remove paint or other contaminants from the area to be welded.
2. Check the length of the wire projecting from the contact tip (stick out). If the stick out is too long, or the wire's tip is round, the arc will not start smoothly Adjust the wire length by cutting it with a pair of side (diagonal) cutters.

NOTE: **When cutting wire, keep the torch facing down and away from your face to avoid being struck by the clipped end.**



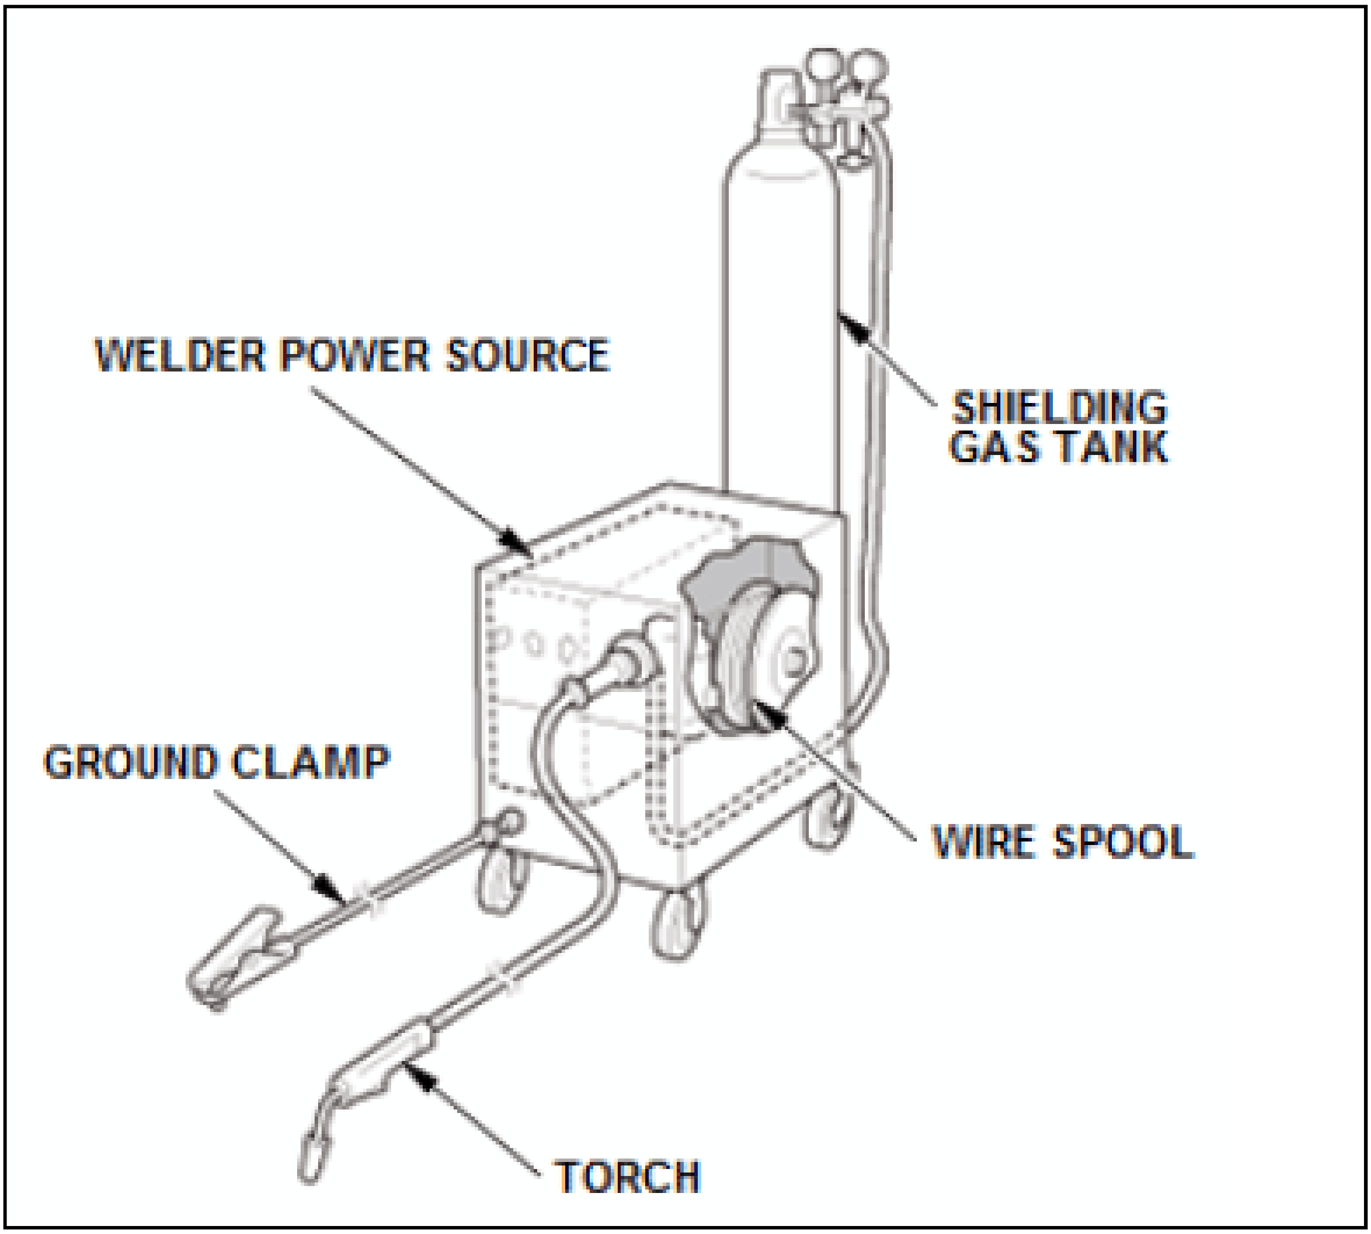
3. Start the arc.

   As you pull the trigger (torch switch), shielding gas and welding wire will be fed out. Touch the work piece with the tip of the wire to start arc. By keeping a narrower tip-to-work clearance, the arc will start easier.



Welding Equipment Structure

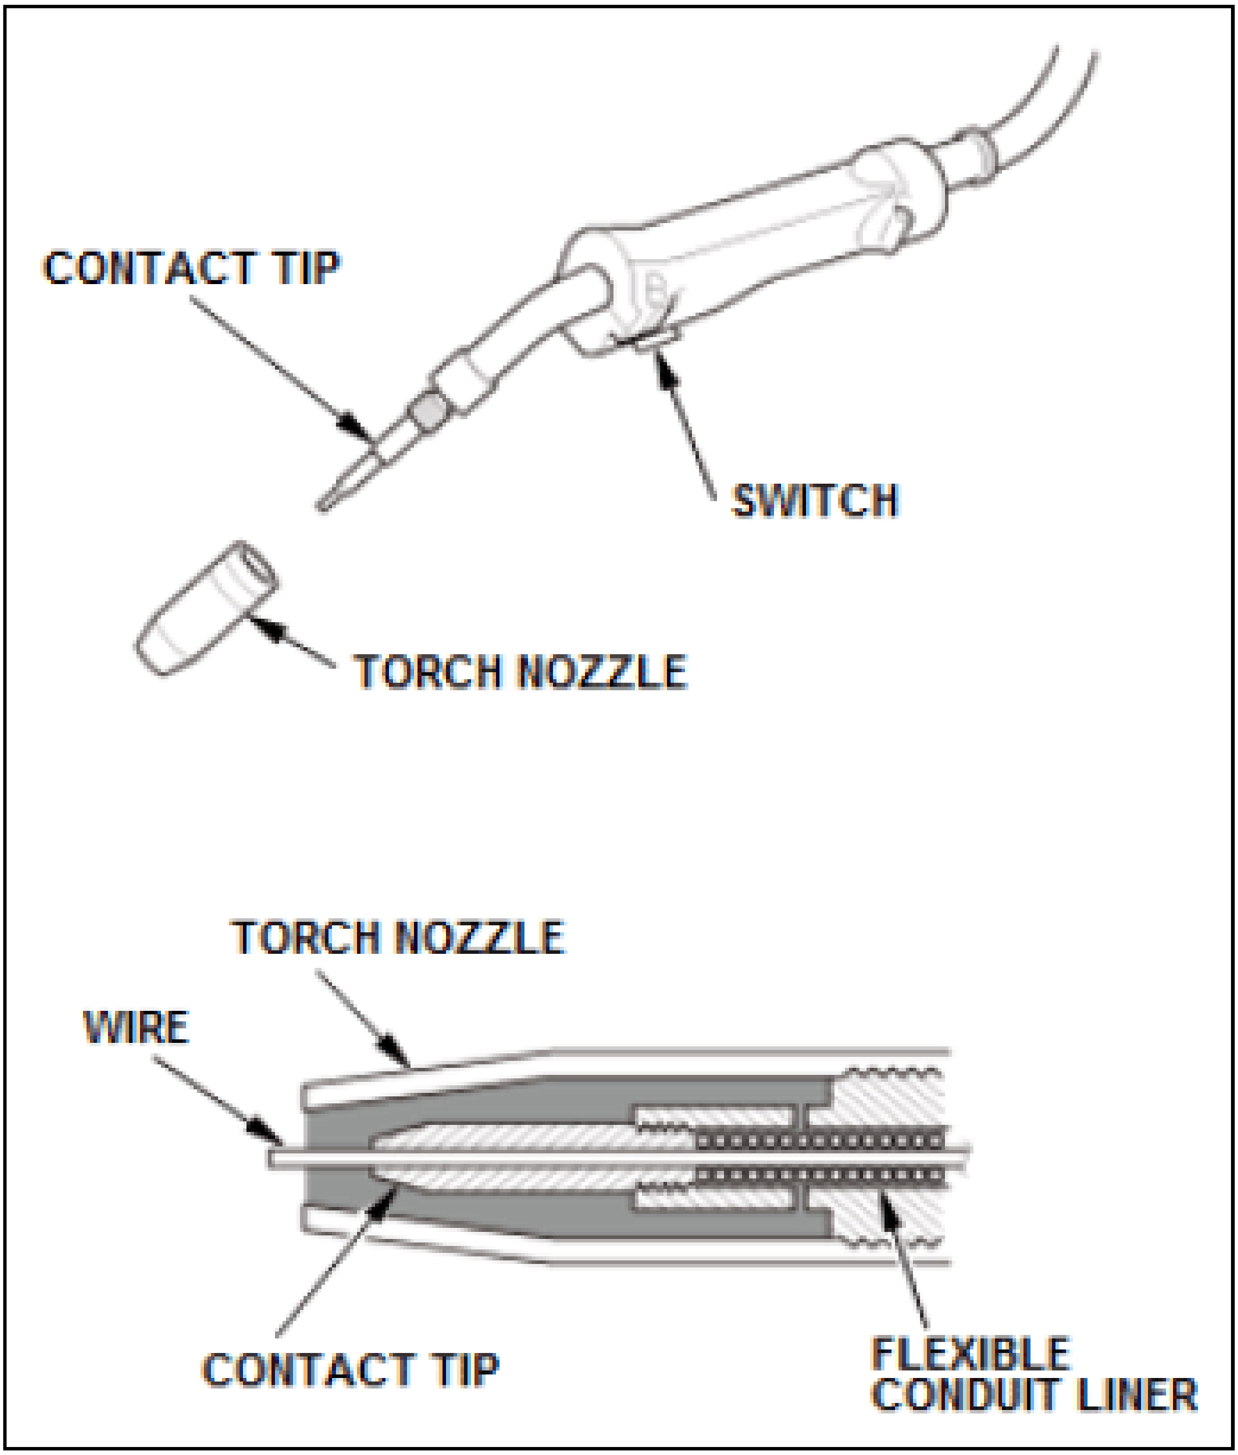
MAG welding equipment consists of the torch, wire feeder, shielding gas supply control unit and the welding power supply. The wire feeder and welding power supply are integrated in most modern welders.



WELDER POWER SOURCE
SHIELDING GAS TANK
GROUND CLAMP
WIRE SPOOL
TORCH

a. Torch

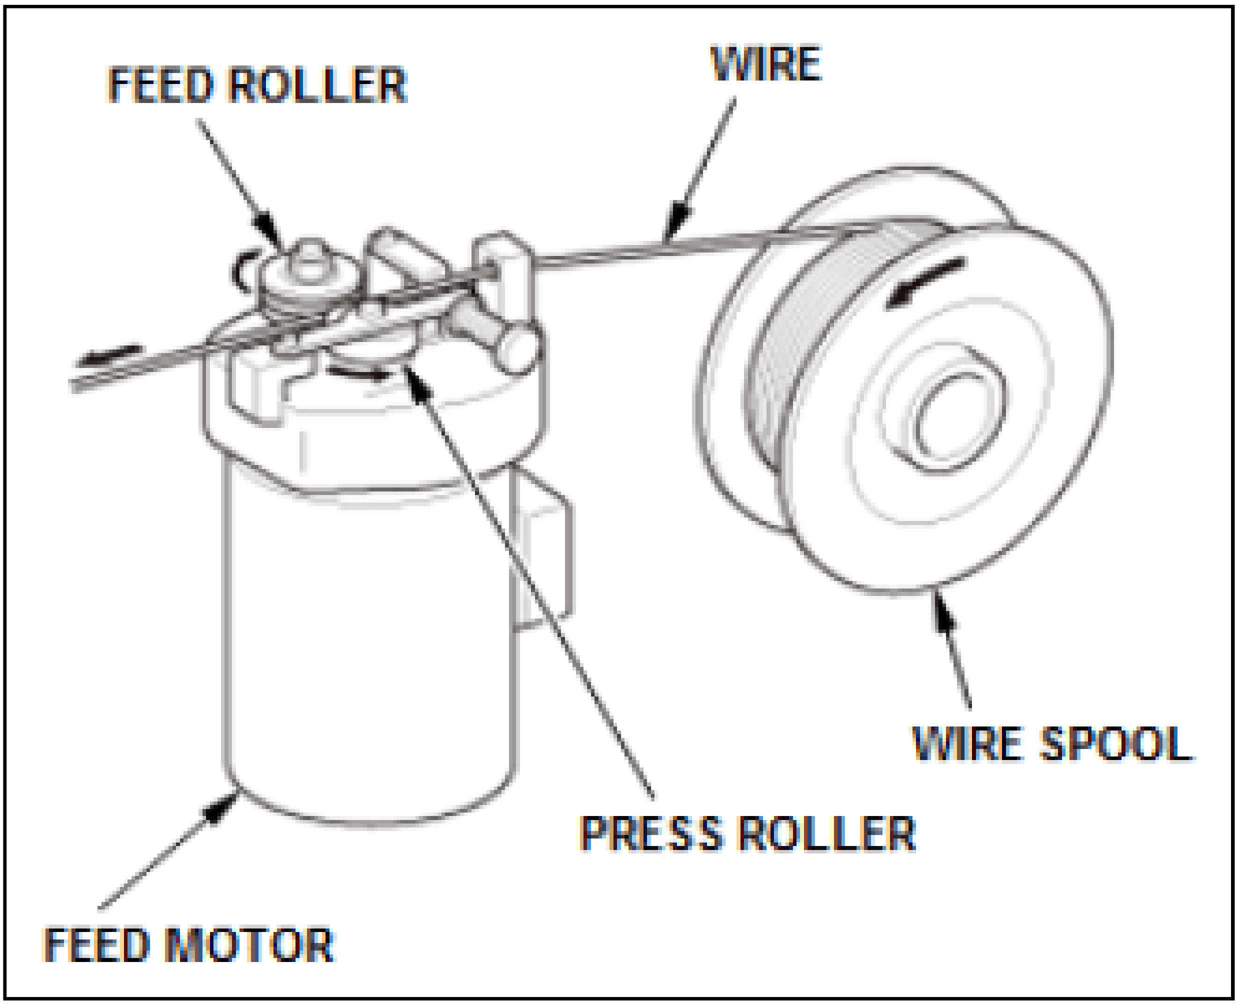
- Provides a stream of shielding gas to the weld area.
- Allows current to flow through the wire and generate an electric arc:
  - Attached on the end of the torch is a nozzle that guides the shielding gas to the welding area, and the contact tip, which transmits current to the welding wire.
  - A multipurpose cable connect the torch to the welder. Inside is an electrical cable that carries the welding current to the contact tip, a flexible conduit liner to allow the welding wire to feed smoothly and a passage that carries the shielding gas.



CONTACT TIP
SWITCH
TORCH NOZZLE
TORCH NOZZLE
WIRE
CONTACT TIP
FLEXIBLE CONDUIT LINER

b. Wire Feeder and Wire

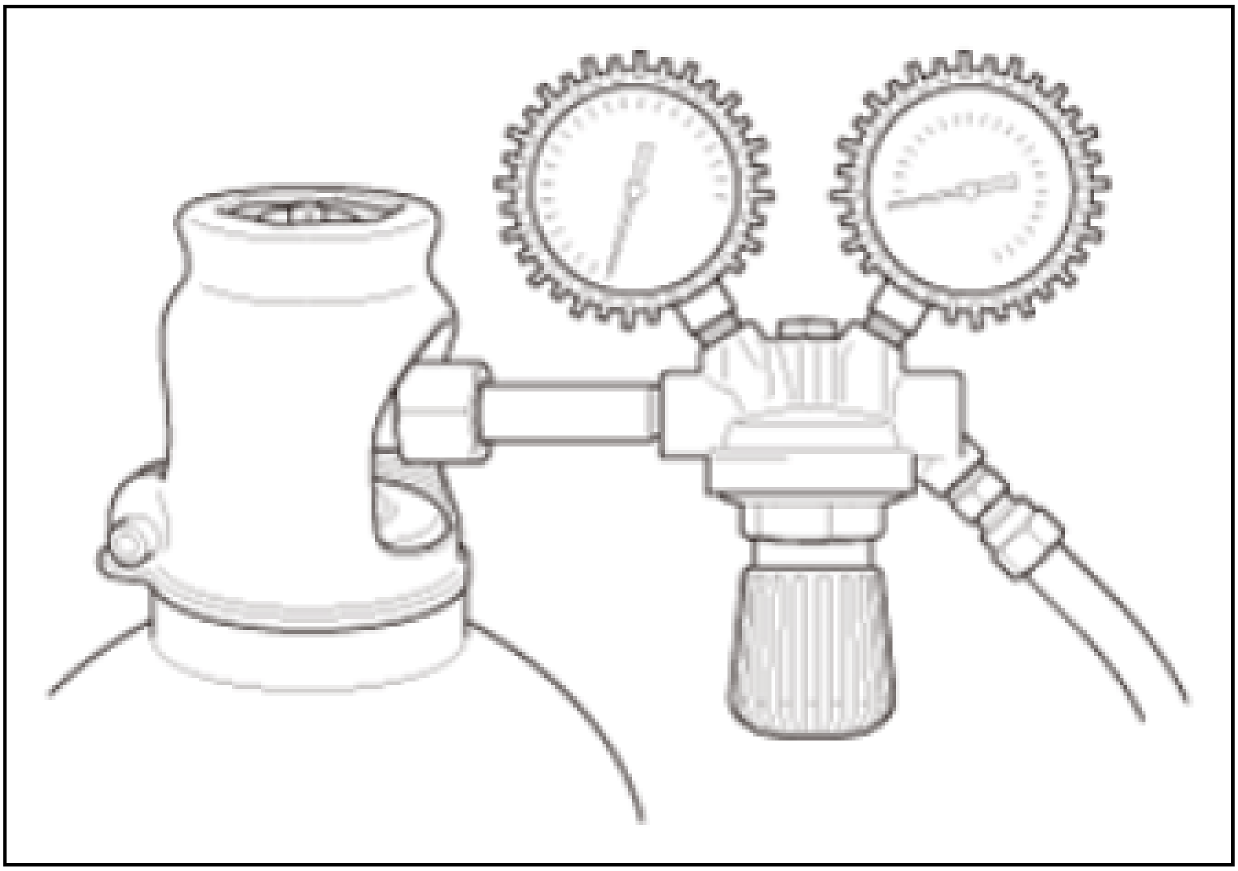
- The wire feeder is the device that sends the wire, which acts like a welding rod, to the torch. It consists of the feed motor, reduction gear, feed roller, and press roller.
- The spinning of the motor is transmitted to the feed roller via the reduction gear. The wire is then sent to the torch by pinching it between the press roller and the feed roller. The wire is provided at a desired speed based on the welder settings.
- The wire is a long, single string of steel rod. The welding wire must have a tensile strength equal to, or greater than the lowest tensile strength of the parts being welded.
- The wire is coated with thin copper plating to prevent corrosion and to improve conductivity with the contact tip.



FEED ROLLER
WIRE
WIRE SPOOL
PRESS ROLLER
FEED MOTOR

c. Shielding Gas Supply

The shielding gas supply is a device that directs the shield gas from the gas cylinder to the torch. It consists of the regulator, which reduces the high pressure in the gas cylinder to the required low pressure for welding. It also allows a flow rate adjustment and has a solenoid valve starts and stop the shielding gas flow as the welder operates.



d. Control Unit

- The control unit receives signals from the torch switch and then:
  - Switches the welding power supply on and off
  - Regulates welding wire feed
  - Controls the shielding gas supply
- The most important roles are wire feed regulation and speed control in proportion with current and voltage to maintain as constant an arc length as possible. A large number of semi-conductors are used in the power unit's electrical circuits.

e. Power Unit

The power unit provides the electrical energy to generate an arc. It converts energy from the power supply to the desired voltage level for welding using a transformer and rectifier.

Precautions

Welding Current

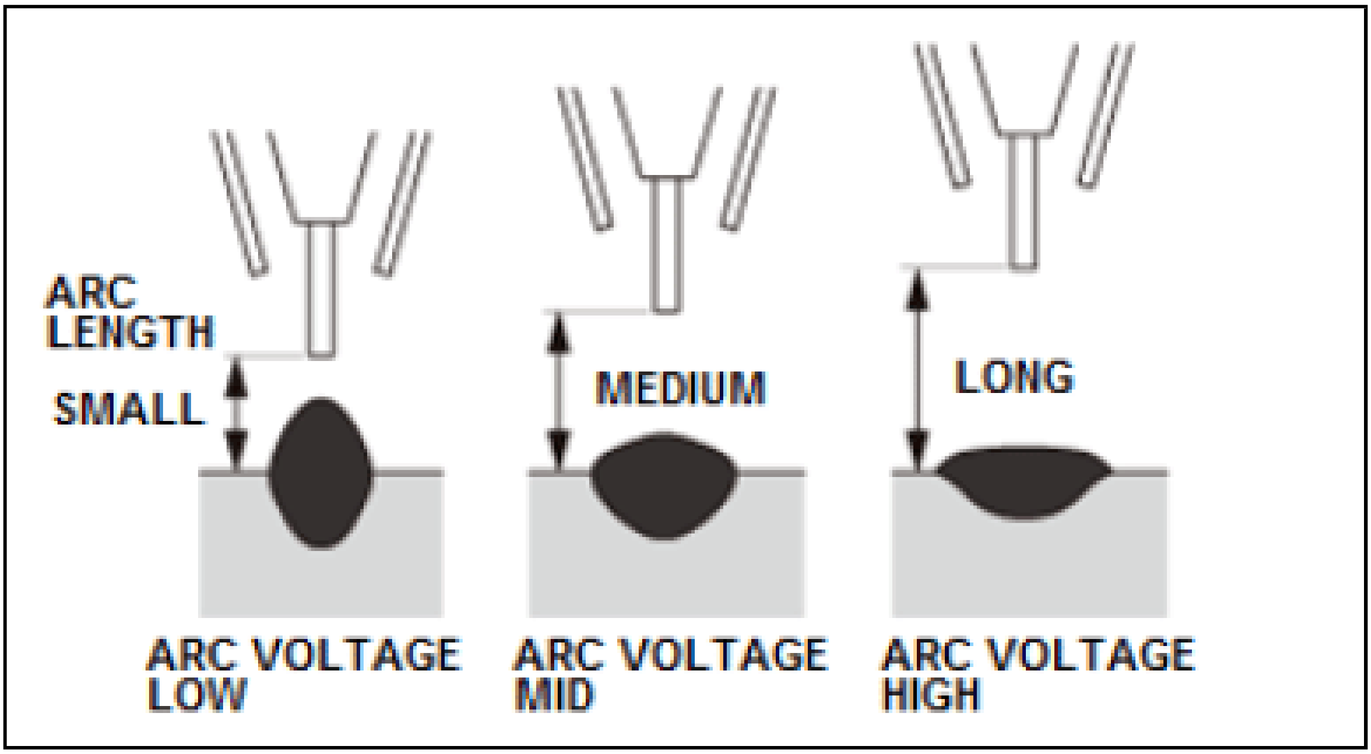
Welding current affects the depth of penetration and the melting speed of the wire. It also affects arc stability and the amount of weld spatter. As welding current increases, penetration increases along with the welding bead height and width.

Wire Diameter mm (in)	Current (A)
0.6 (0.024)	40 to 90
0.8 (0.031)	50 to 120
1.0 (0.039)	60 to 150

Thickness mm (in)	Wire Diameter mm (in)	Current (A)
0.8 (0.031)	0.8 (0.031)	60 to 70
1.0 (0.039)	0.8 (0.031)	60 to 70
1.2 (0.047)	0.8 (0.031)	70 to 75
1.6 (0.063)	0.8 (0.031)	80 to 85

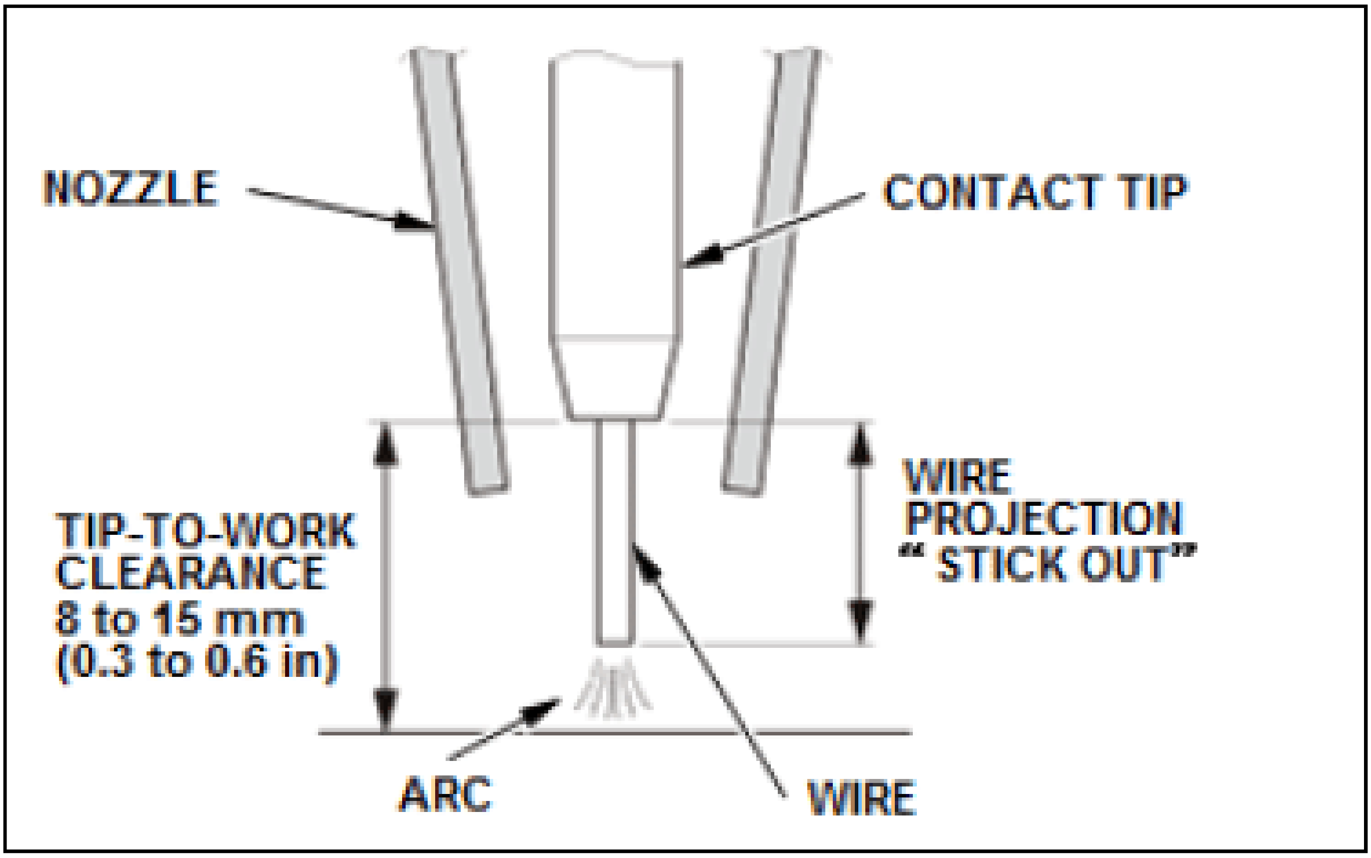
Arc Voltage

- To ensure high weld quality the correct arc length is required. Arc length depends on the arc voltage. Any change results in a large change in heat input and current.
- As voltage increases, arc length also increases, causing the weld beads to become shallow and wide. Conversely when the arc voltage decreases, weld beads become deep and high. If the voltage is excessively high voltage reduces the short circuit's frequency resulting in a poor weld quality Excessively low voltage causes the wire to contact the work piece, causing the arc instability.



Contact Tip-To-Work Piece Clearance (AKA Stick Out)

- If the clearance between the contact tip and work piece is excessive, the welding wire overheats and melts too quickly due to the excessive length of the protruding wire. Welding current and penetration decrease.
- If the clearance between the contact tip and work piece is too large or small, the effects of the shielding gas are deteriorated, which wastes gas and negatively affects weld quality The standard clearance is 8-15 mm (0.3-0.6 in).



NOZZLE

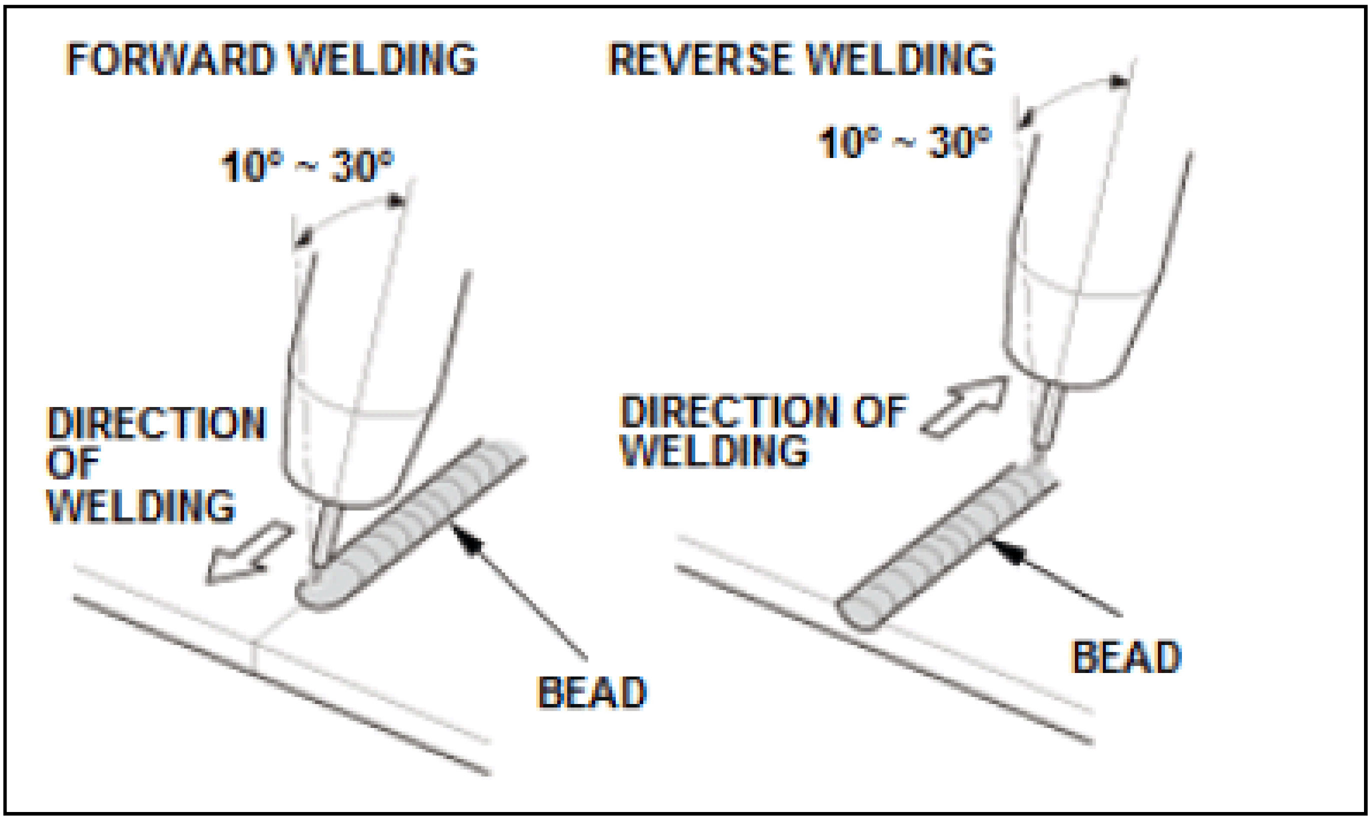
TIP-TO-WORK CLEARANCE 8 to 15 mm (0.3 to 0.6 in)
WIRE PROJECTION "STICK OUT"
ARC
WIRE

Torch Angle And Direction Of Welding

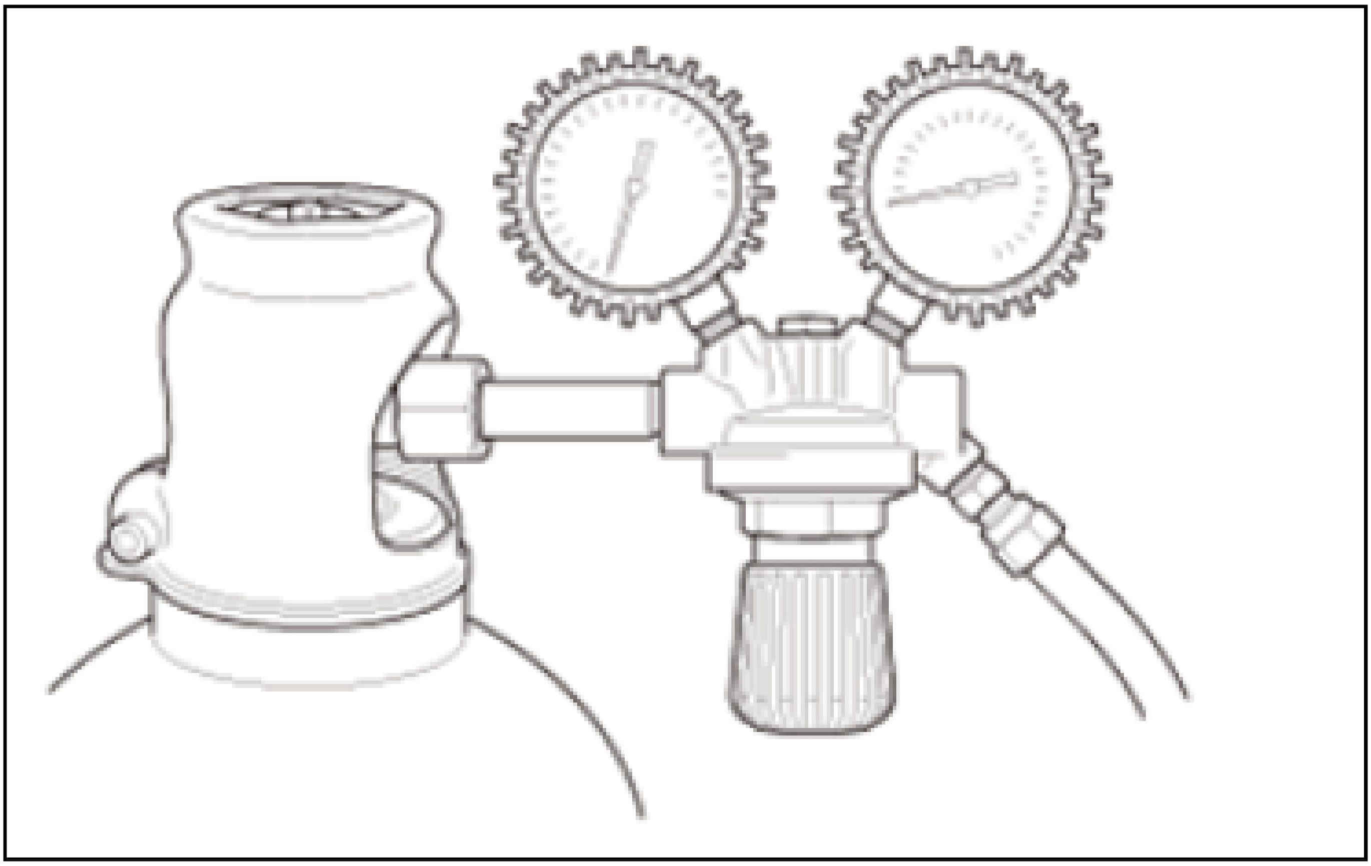
- There are two directions in welding; forward and reverse. These are more commonly known as push or forehand, and pull, drag, or backhand technique.
- The push or forward welding technique usually produces lower penetration and a wider, flatter bead because the arc force is directed away from the weld puddle.
- The pull or reverse welding technique points the torch back toward the weld puddle and it is dragged away from the deposited metal. Pulling typically produces deeper penetration and a higher, narrower bead with more buildup.
- With either technique, the torch should be held at an angle of 10 to 30 degrees.



FORWARD WELDING
10° ~ 30°
DIRECTION OF WELDING
BEAD
REVERSE WELDING
10° ~ 30°
DIRECTION OF WELDING
BEAD

Shielding Gas Volume

- A larger quantity of shielding gas doesn't always ensure good shielding effects. Excessive gas flow prevents the gas from remaining around the weld, reducing its shielding effects.
- The gas supply must be regulated depending on the nozzle-to-work clearance, welding current, welding speed and welding environment (wind velocity). The standard flow rate is 21 to 32 cubic feet per hour, or 10 to 15 liters per minute.



Welding Speed

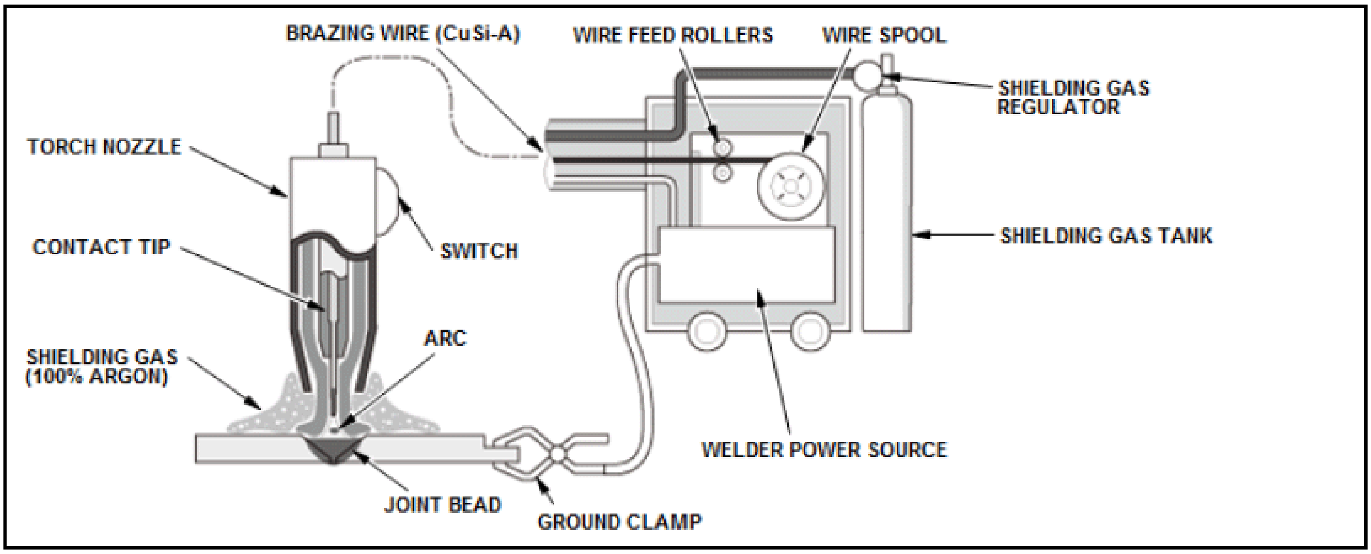
- As welding speed increases, weld penetration depth is reduced and the bead becomes tall and narrow. Continuing to increase of welding speed may cause an undercut.

- As welding speed decreases, welding performance is reduced. Generally speaking, welding speed must be increased for thinner panels.

MIG BRAZING

MIG Brazing Conditions For Ultra High-Strength Steel Parts (1180 And 1500 MPa)

MIG brazed joint locations for ultra high-strength steel (1500 MPa/1180 MPa) parts are specified in the part installation instructions contained in the model specific body repair information. You must follow the conditions detailed below to ensure adequate joint strength.



BRAZING WIRE (CuSi-A)
WIRE FEED ROLLERS
WIRE SPOOL
SHIELDING GAS REGULATOR
TORCH NOZZLE
SHIELDING GAS TANK
CONTACT TIP
SWITCH
ARC
SHIELDING GAS (100% ARGON)
WELDER POWER SOURCE
JOINT BEAD
GROUND CLAMP

MIG brazing conditions:

- Pulsed MIG Welder Set-up for brazing
- Wire:
  - CuSi3
  - AWS ER CuSi-A
  - Silicon bronze (0.8 mm (0.031 in) diameter)
- Shield gas: Argon gas 100%

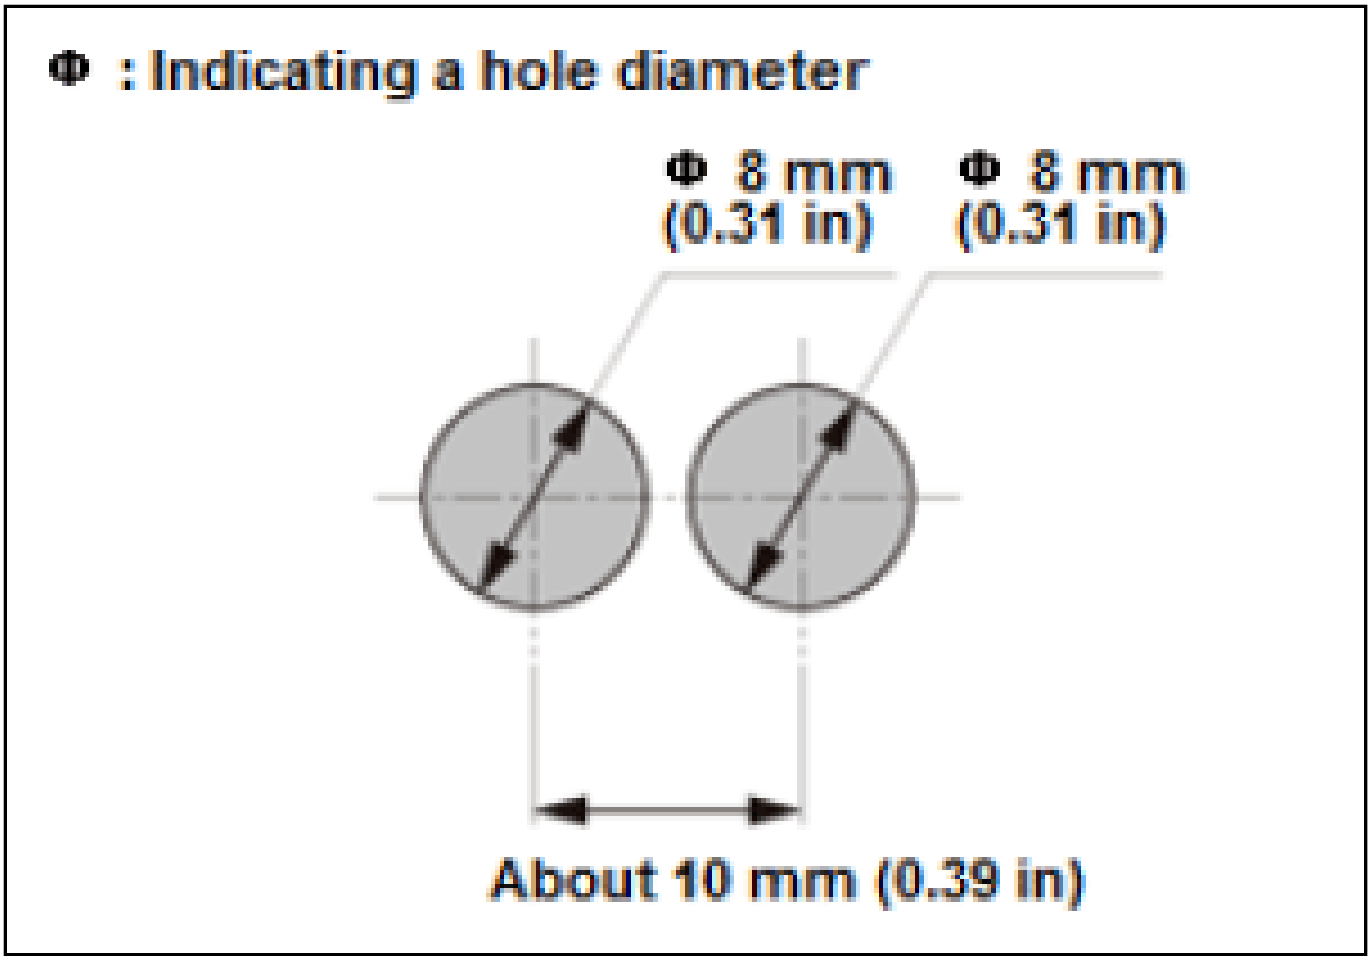
NOTE:

- **For details about correct welding current and voltage, refer to the equipment manufacturer's recommendations.**
- **MIG welding/brazing: Metal inert gas welding or brazing where 100% Argon (Ar) shielding gas is used. Argon is inert and does not react with the molten weld pool or brazing operation.**

MIG Brazing To Structural Parts

NOTE: **To prevent decreased joint strength, don't grind a MIG braze to a structural part.**

If a high-strength steel (1500 MPa) part is being brazed to another high-strength structural steel part (340 MPa or higher). Drill two 8 mm (0.31 in) holes with approximately 10 mm (0.39 in) distance between them (distance between the centers of holes) for each MIG brazed joint location shown in the model specific body repair information.

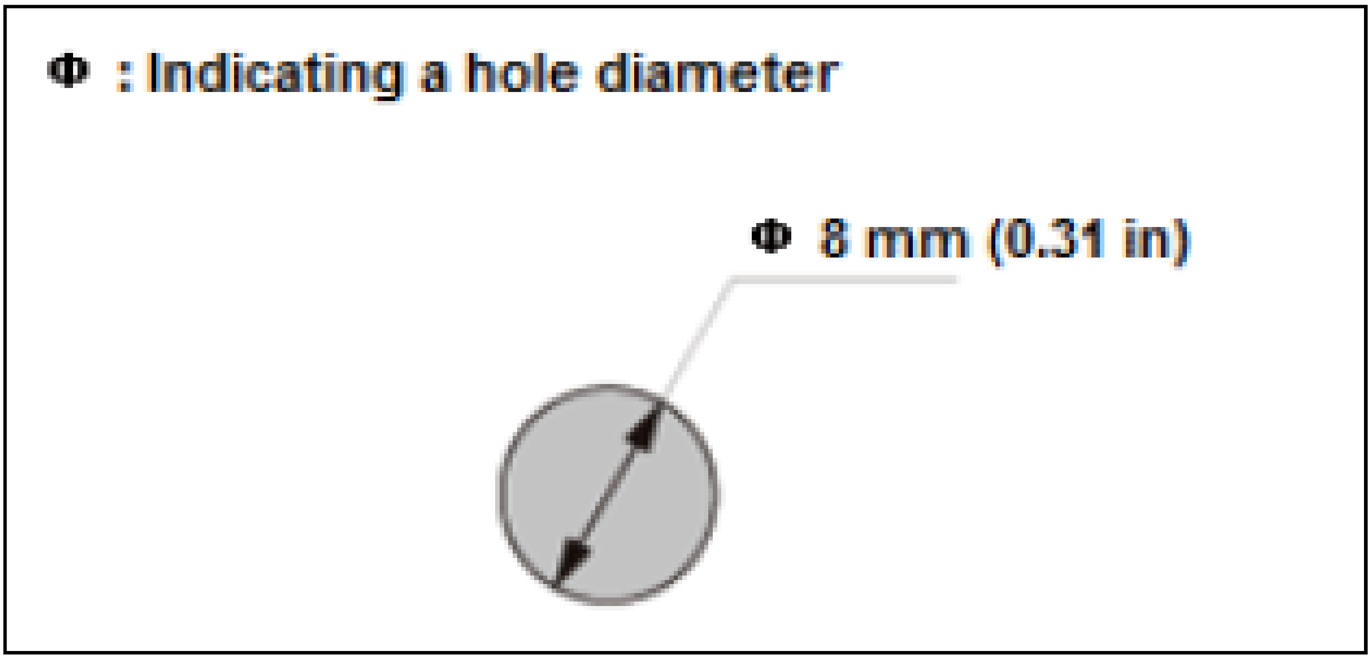


Φ : Indicating a hole diameter
Φ 8 mm (0.31 in)
Φ 8 mm (0.31 in)
About 10 mm (0.39 in)

MIG Brazing To Outer (Mild Steel) Panels

NOTE: **MIG brazed joints to an outer panel that are visible to the customer may be ground smooth.**

If a high- strength steel (1500 MPa) part is being brazed to 270 MPa part (mild steel plate) such as an outer panel, drill one hole of diameter 8 mm (0.31 in) in the 270 MPa plate for each MIG brazed joint location shown in the model specific body repair information.



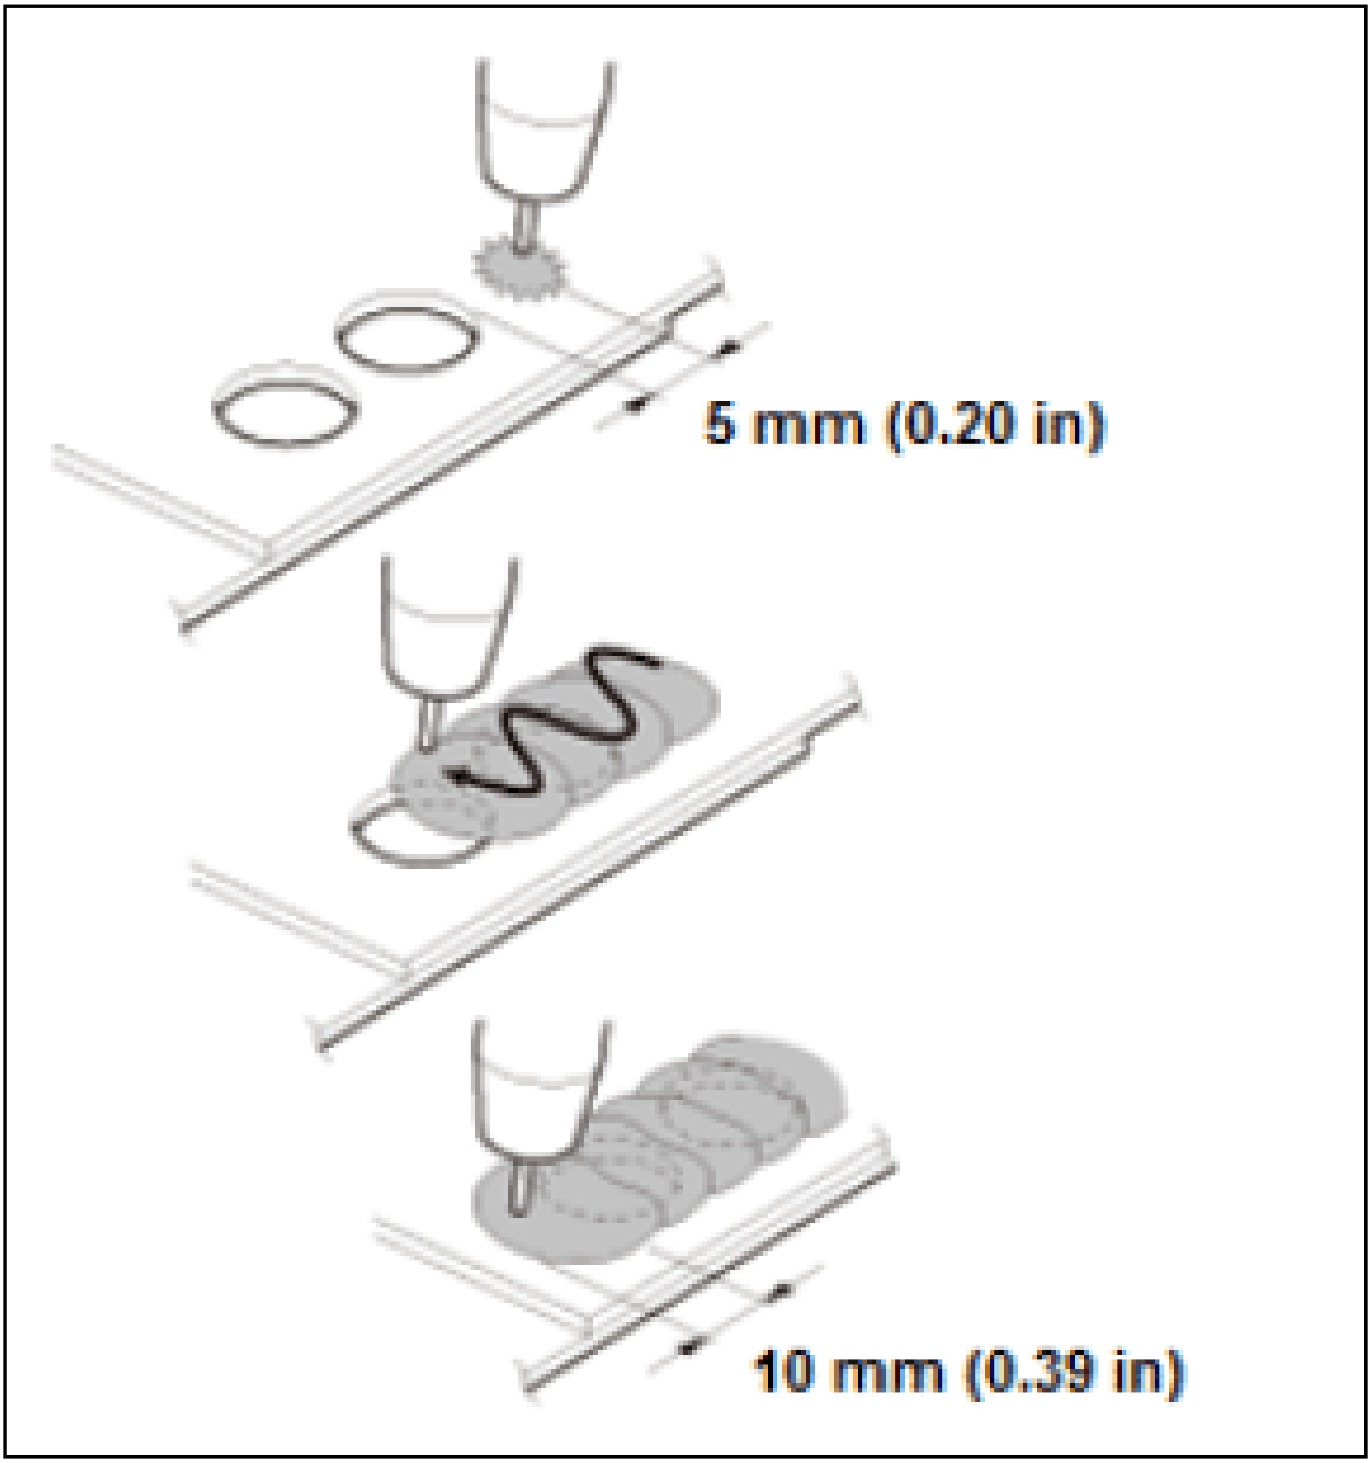
Φ : Indicating a hole diameter
Φ 8 mm (0.31 in)

MIG Brazing Method

To ensure adequate joint strength, use a pulsed MIG welder with specified wire and the following brazing technique. This will create a capillary action in order to liquefy the MIG filler wire so that it can penetrate into the upper and lower plates:

- Begin brazing about 5 mm (0.20 in) before the hole(s).

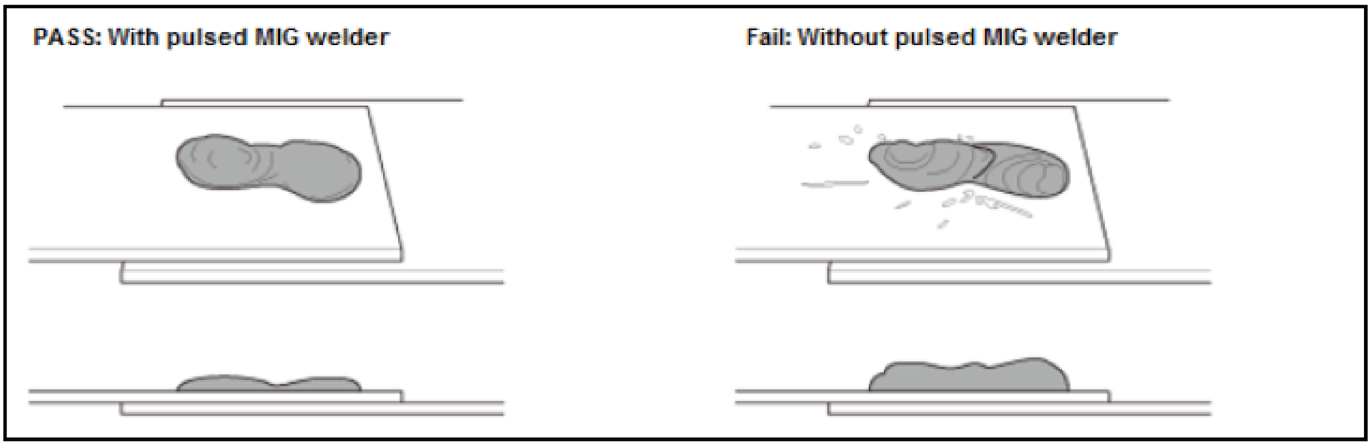
- Move the torch across the hole in a zigzag pattern as you close the hole(s).
- Continue the brazing operation about 10 mm (0.39 in) past the hole(s).



MIG Brazing Joint Inspection

Visual Inspection

Brazing must achieve penetration in the overlapped joint area. To make this possible, both plates need to be the same temperature.

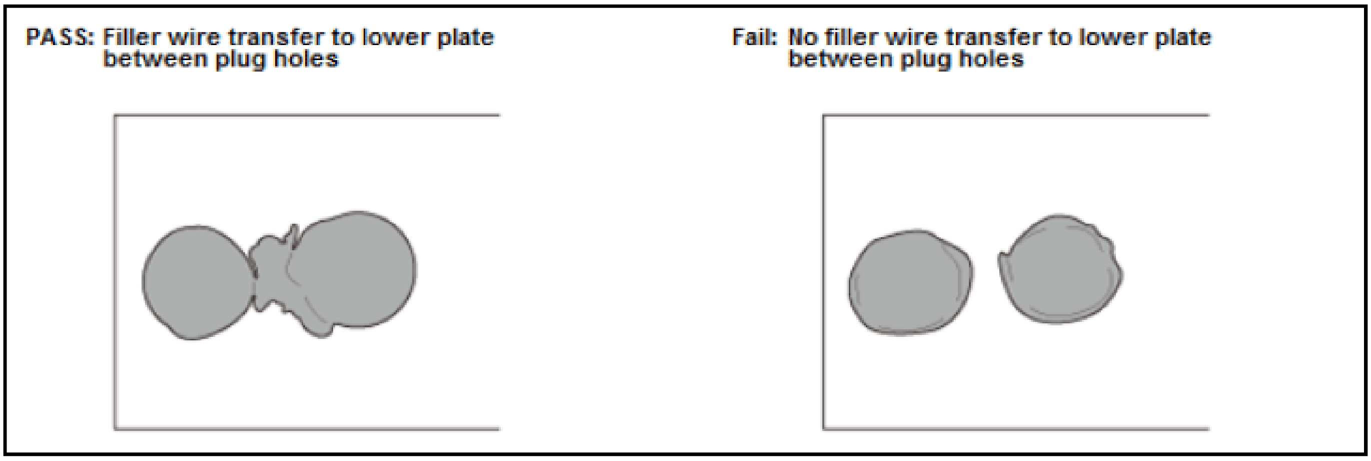


PASS: With pulsed MIG welder
Fail: Without pulsed MIG welder

Destructive test

Cut the test piece to separate lengthwise as shown: Joint passes inspection if there is copper silicone filler wire transfer on the lower plate as shown below.

Without a pulsed MIG welder, it is difficult for the lower plate to reach the required temperature. If the bottom plate does not reach the correct temperature, brazing filler remains on surface, and you cannot achieve sufficient strength.



PASS: Filler wire transfer to lower plate between plug holes
Fail: No filler wire transfer to lower plate between plug holes

SPOT WELDING

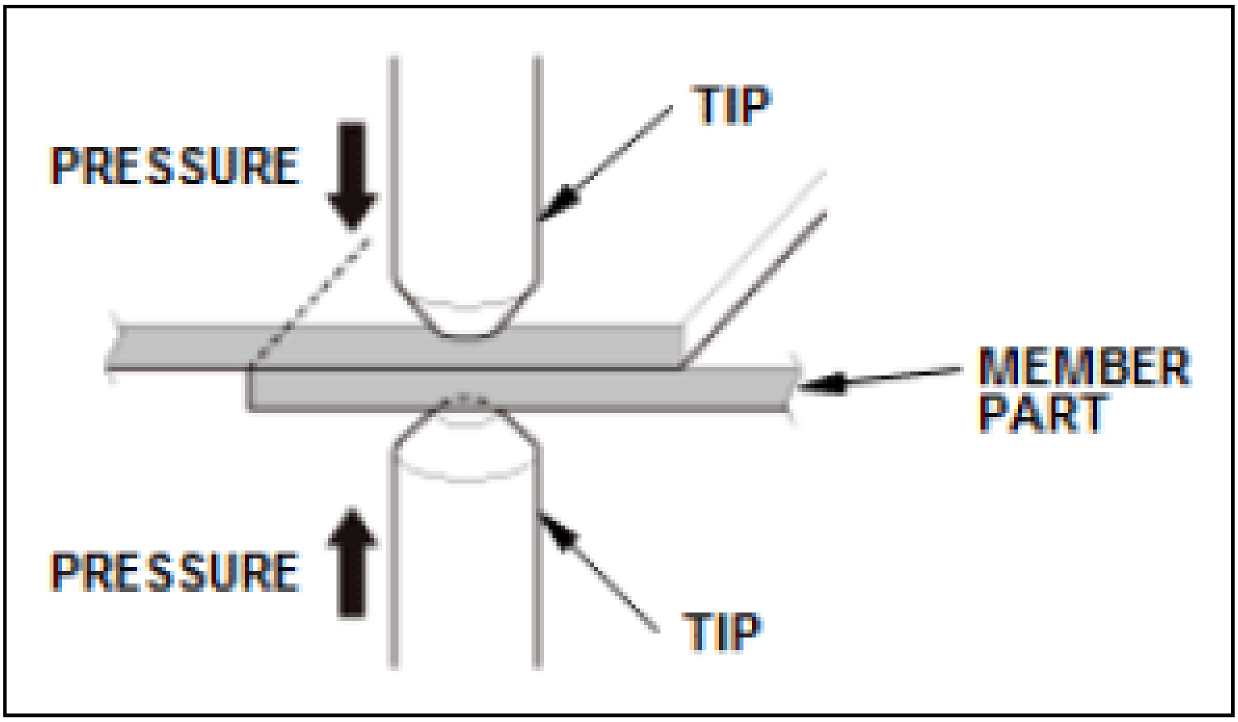
Principles And Characteristics

Spot welding is a type of electric resistance welding that also uses pressure. Two or more metal plates are held under pressure between two electrodes. When an electric current is applied, the heat occurring from the electrical resistance fuses a small areas of the parts together. The processes are as follows:

Spot Welding Processes

1. Pinching (Tight Holding)

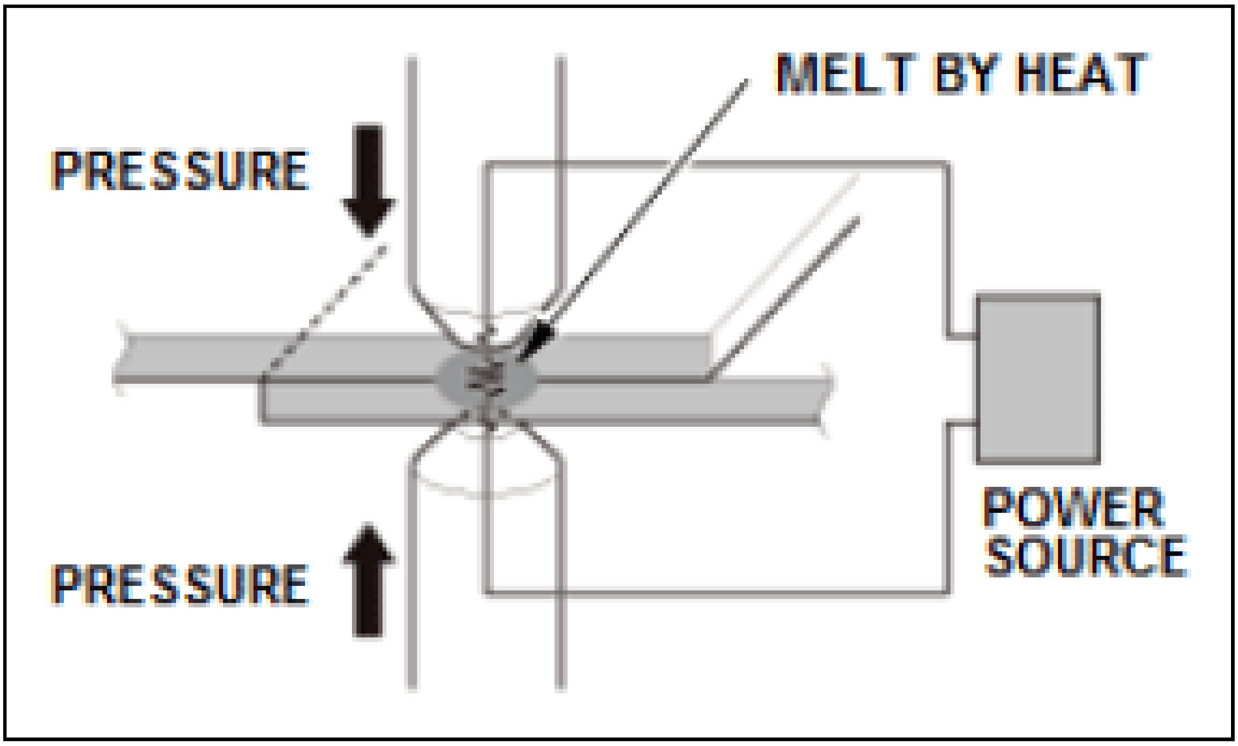
   Allows the current concentration in the welding area, the work pieces are held tight by electrode pressure.



TIP
PRESSURE
MEMBER PART
PRESSURE
TIP

2. Electricity Fusion

While the work pieces are pinched together, a high current is applied to melt the and join contact surfaces of the metal layers under the electrodes.



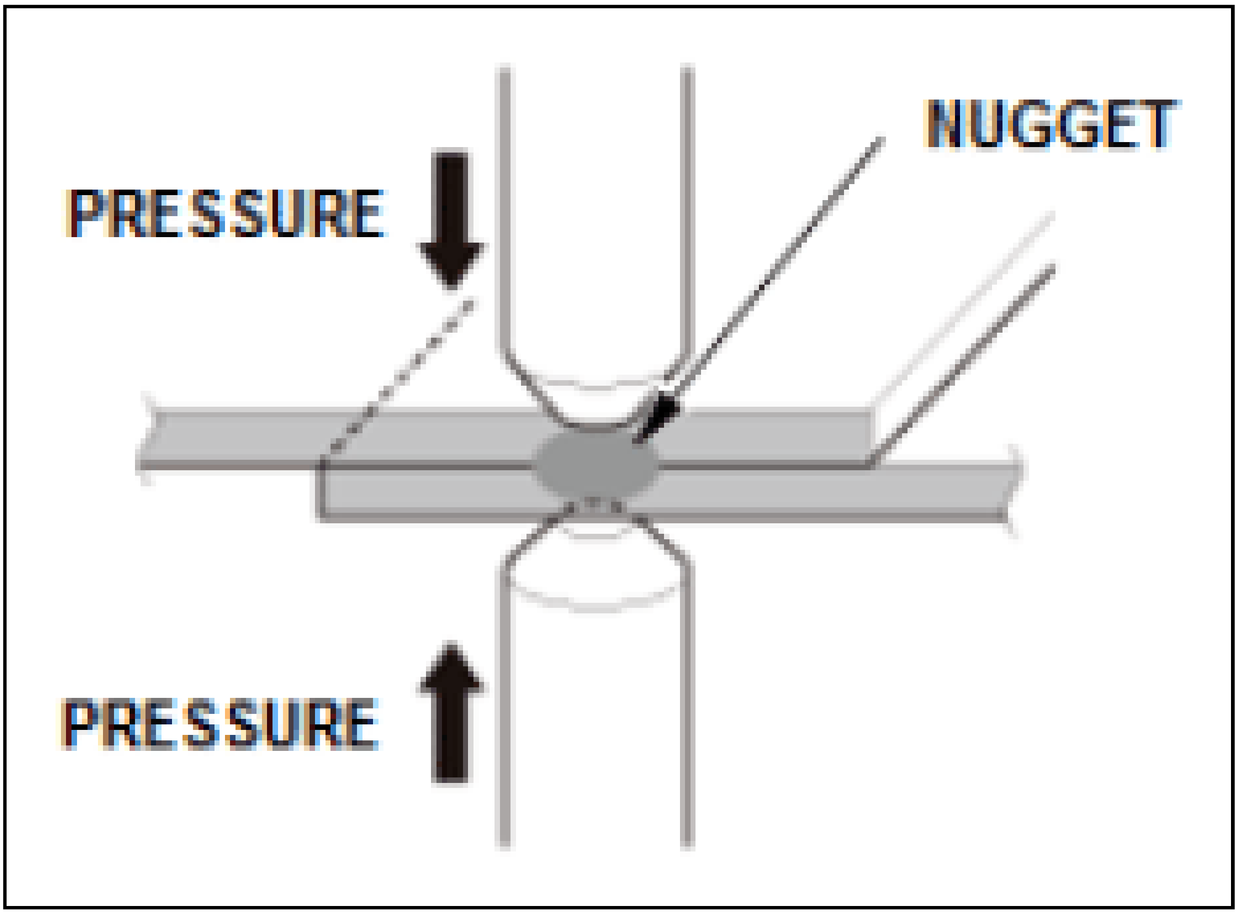
MELT BY HEAT
PRESSURE
POWER SOURCE
PRESSURE

3. Pressure Holding

After applying the current, pressure is held until the melted surfaces cool down to reinforce the welded area (nugget).

4. Release

Releasing the pressure moves electrode tips away from the joint area.



Characteristics Of Spot Welding

- Welding time is short and heat in localized, minimizing distortion.
- Best suited for thin sheet steel.
- Required skills or technical expertise is lower than other weld types.
- Difficult to visually inspect weld quality as the welded parts are layered on top of each other.

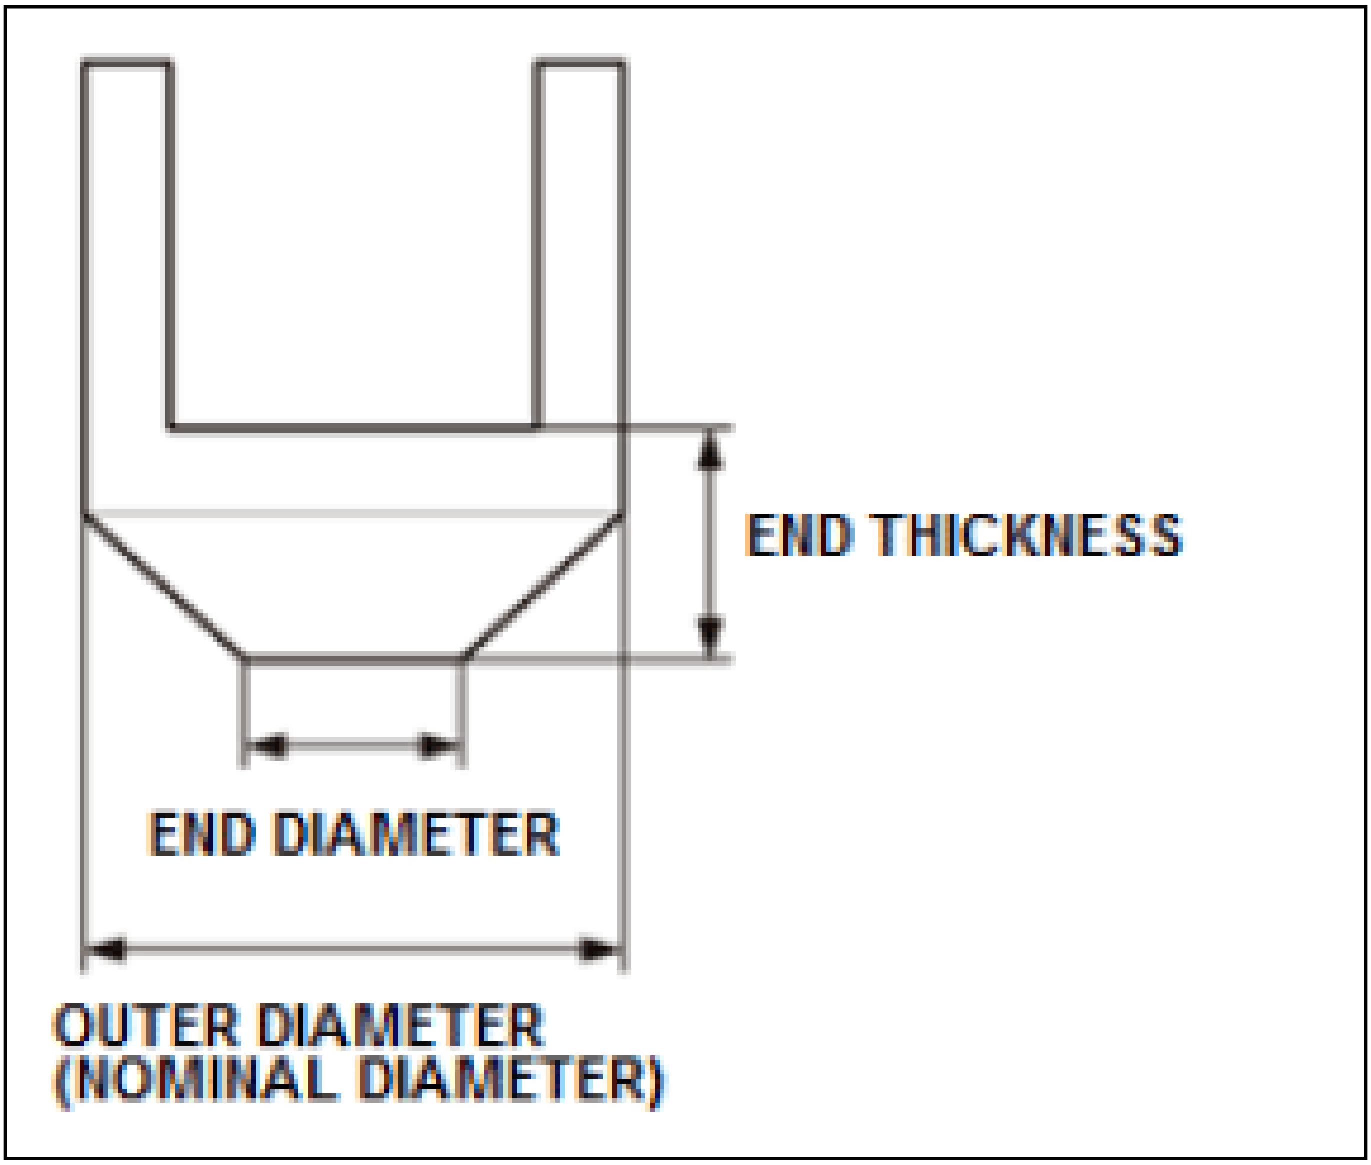
Electrode Tip Design And Shape

Spot Welder Electrode Tip Design And Shape

- There are two electrode designs; one-piece type and cap type.
- The cap type is more popular due to its high cooling performance and ease of replacement.

Spot Welder Electrode Roles

- Allows electrical current to pass through the parts being welded
- Applies pressure to the weld area to prevent spatter
- Acts as a heat sink to cool down the parts after welding



Selecting Electrode Tips

NOTE: **There is no single electrode tip design required for spot welding Honda and Acura vehicles. The appropriate tip may vary based on vehicle design, welding task, and welding equipment design. Consult the welder manufacturer about their recommended electrode tip to produce the test piece results detailed in "Weld Inspection".**

Electrode tips

Type	Shape	Information
F Type		Used when a flat surface is desired on the work piece. The opposite electrode must be a P, C, or R type. If both electrodes tip are F types, the current flow through the welded parts cannot be pinpointed, resulting in poor weld quality.

Type	Shape	Information
CF Type		The tip design allows the welding current to be easily pinpointed through the he tip ends. However, when welding thin plates with a thickness of 1 mm or less (0.040 in. or less), this tip design can cause distortion and/or dents unless the two electrodes are perfectly aligned in parallel. Nonparallel electrode tip positions will cause partial contact.
CR Type		This tip design has a truncated cone shape with a rounded tip surface, It is often used because of it's high current flow controllability, similar to R type.
R Type		This tip design offers high current flow controllability. Because the electrode tip is rounded, the electrode easily sinks deeper into the work piece surface as the welded surface softens. This increases contact between electrode tip and the work piece allowing efficient current flow. This allows electrode tip contact always remain proportional to the amount of current flow This proportional relationship achieves high quality nuggets, even with slight current fluctuation.

Type	Shape	Information
D Type		Same as R type design above, except the tip radius is 1/2 the outer diameter (nominal diameter) of the electrode tip.
DR Type		D type electrode tip with a flat area on the end of a rounded point diameter is known as a DR Type.

Spot Welding Conditions For Ultra High-Strength Steel Parts (1180 And 1500 MPa)

The welding conditions (condition numbers and setting descriptions) for the spot welding positions including ultra high-strength steel (1500 MPa/1180 MPa) positions are described in the model specific body repair information. Always refer to the welding conditions to help ensure adequate weld strength.

NOTE:

- **For spot welding positions excluding high-strength steel (1500 MPa/1180 MPa), confirm the sheet thickness, tensile strength and existence of the zinc treatment of both sides, and set the welder to confirm to the welding conditions by referring to the model specific body construction information.**
- **For the actual settings of the welder, refer to the specifications supplied by the welder manufacturer.**

Condition No.	Welding current A	Welding time ms	Applied force N (kgf)	Condition No.	Welding current A	Welding time ms	Applied force N (kgf)
1	6500	300	2452 (250)	17	8500	700	3432 (350)
2	7000	300	2452 (250)	18	9000	700	3432 (350)

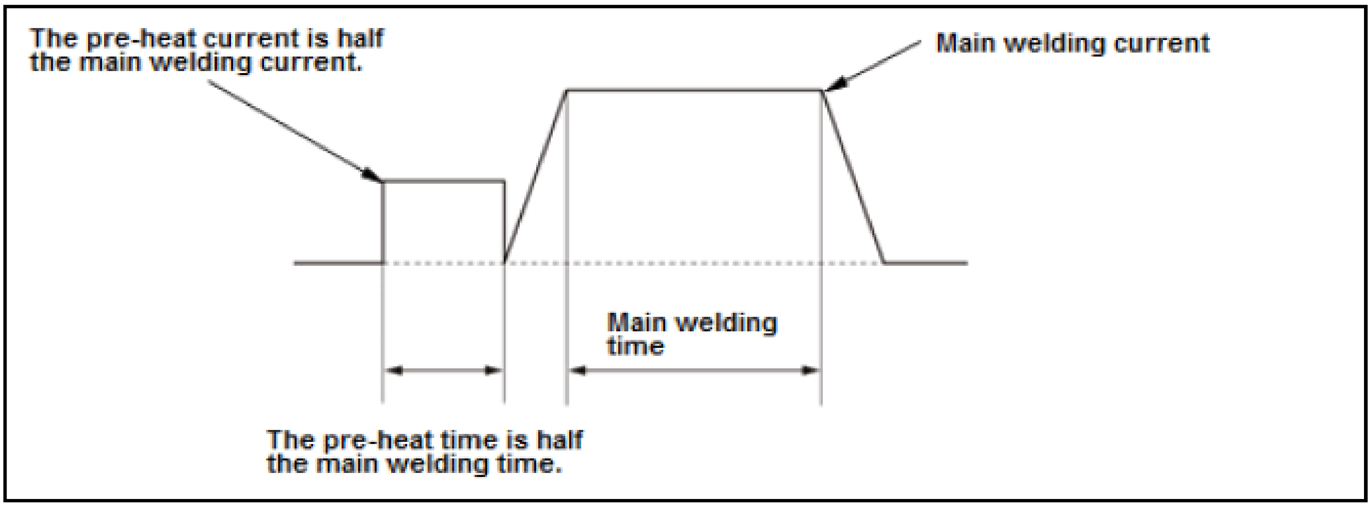
15	9000	600	3432 (350)	31	9000	1200	3432 (350)
16	8000	700	3432 (350)	Â	Â	Â	Â

NOTE:

- **The condition numbers of the above list show the type of the spot welding conditions of the spot welding points including the ultra high-strength steel (1500 MPa/1180 MPa) parts of Honda and Acura vehicles.**
- **The welding condition values described in the above list are determined by experiments using test pieces, zinc primer coating, preheat, and specified tip shapes (Round-16).**
- **For spot welds involving 1500 MPa steel parts, manual spot welder settings provided in the BRM (or a Honda-specific program) are recommended. Honda does not recommend using the spot welder's AUTO mode for this steel grade because these settings may not achieve adequate weld strength.**



The pre-heat current is half the main welding current.
Main welding current
Main welding time
The pre-heat time is half the main welding time.

Weld Inspection

Both visual inspection and destructive testing are used for spot weld inspection. One of the drawbacks of spot welding is visual inspection difficulty because the steel layers are stacked on top of each other. Because of this, destructive testing is the main inspection method. However, visual inspection is still important to check for the finishing quality. Destructive testing often requires equipment not found in most shops, such as a tensile strength test machine. The chart below details the easiest and most practical spot weld inspections.

Inspection Points	Judgment Criteria
Spot locations	• Nugget is located in the middle of flange, no holes, and no nugget overflow into flange edge. • The repair spot welds avoid original spot weld locations where possible.
Number of spots and pitch	• Number or spot welds is slightly increased over the factory number of welds where possible. • Welding pitch is set according to the model specific body repair information.
Pinhole	No visible holes.
Spatter	No excessive spatter.

Destructive Inspection

Destructive Inspection Using Test Piece

1. Prepare test pieces made of the same material and thickness as the parts to be welded and weld together as illustrated.
2. Apply force in the directions shown by the arrows to separate the spot weld. Then inspect the condition of the broken test parts.

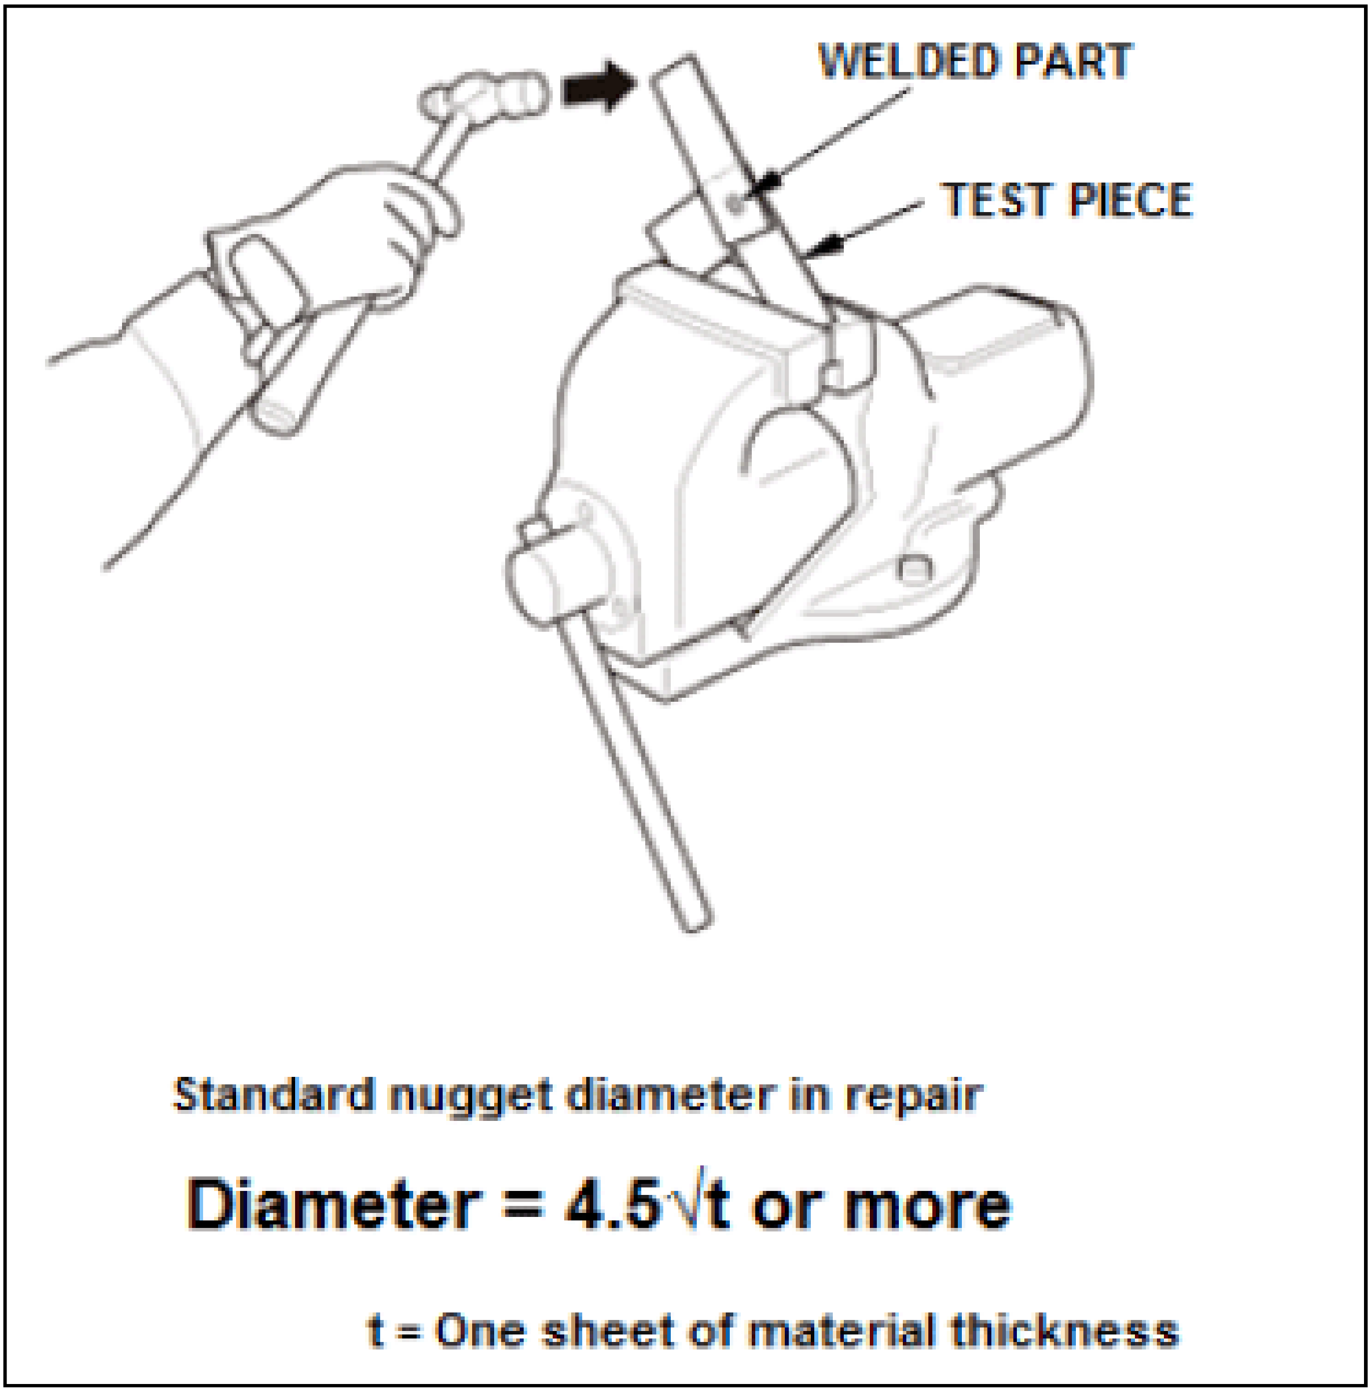
   When testing thicker test pieces, use a vise to hold one piece and hammer the other piece to rotate and separate the weld nugget area.

3. There are three types of spot weld fractures:

- Plug fracture (Nugget pullout).
- Interfacial fracture.
- Partial plug fracture.

4. Spot welds pass inspection if the weld nugget diameter is equal to or greater than 4.5 times the square root of one plate thickness.

NOTE: **In general, high-strength steel contains a higher amount of carbon and hardens the weld nugget more than mild steel. This means high strength steel has a lower workability (ductility) and fractures more easily than mild steel.**



Standard nugget diameter in repair

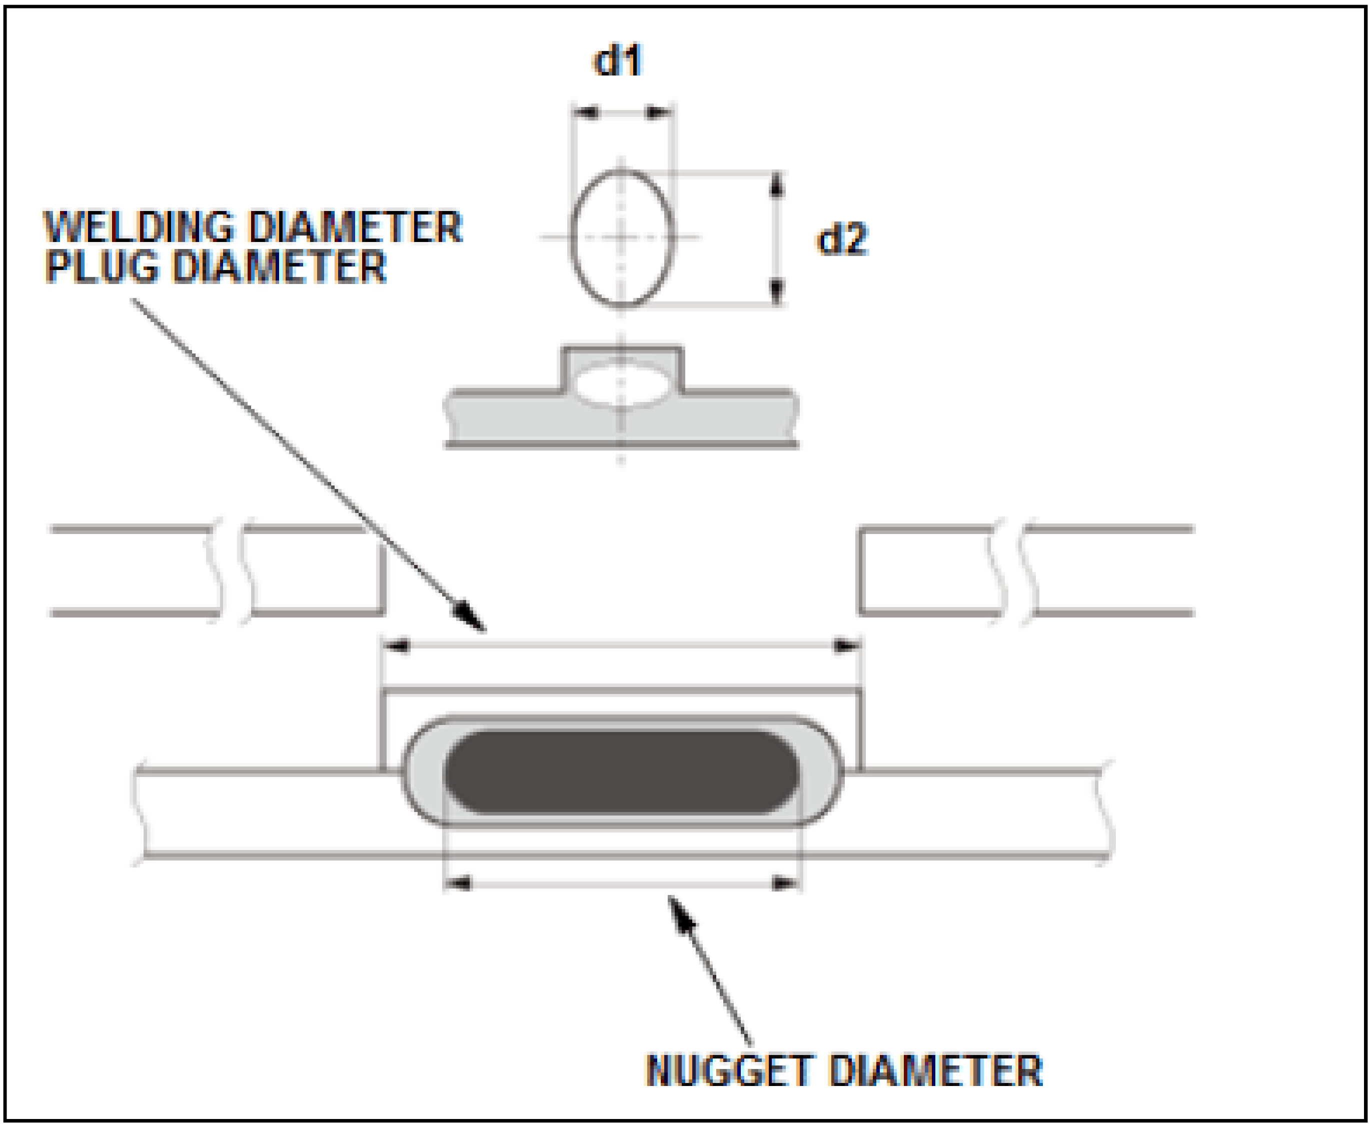
Diameter = $4.5\sqrt{t}$ or more

t = One sheet of material thickness

Plug Fracture (Nugget Pullout)

The weld nugget pulls completely out of one of the test pieces, along the outer diameter of the spot welded area.

The weld diameter or nugget diameter is calculated as [d1 + d2]/2, to get a mean diameter. However, because the diameter of plug fracture is larger than the weld nugget diameter as illustrated, calculate using the weld nugget diameter.



d1
d2
WELDING DIAMETER
PLUG DIAMETER
NUGGET DIAMETER

Interfacial Fracture

The weld nugget fails by cracking through the spot welded area of the test pieces.

The weld nugget diameter of interfacial fracture is calculated as [d1 + d2]/2 to get a mean diameter.

Corona bond diameter
Standard nugget diameter in repair
Diameter = 4.5√t or more
t = One sheet of material thickness

- Nugget

  The small area where the base metal is melted and hardened during spot welding. The nugget's cross-section is oval shaped and arched. The nugget diameter is the actual welded/fused area between the parts. The strength of a spot weld is largely dependent on nugget size.

- Corona Bond

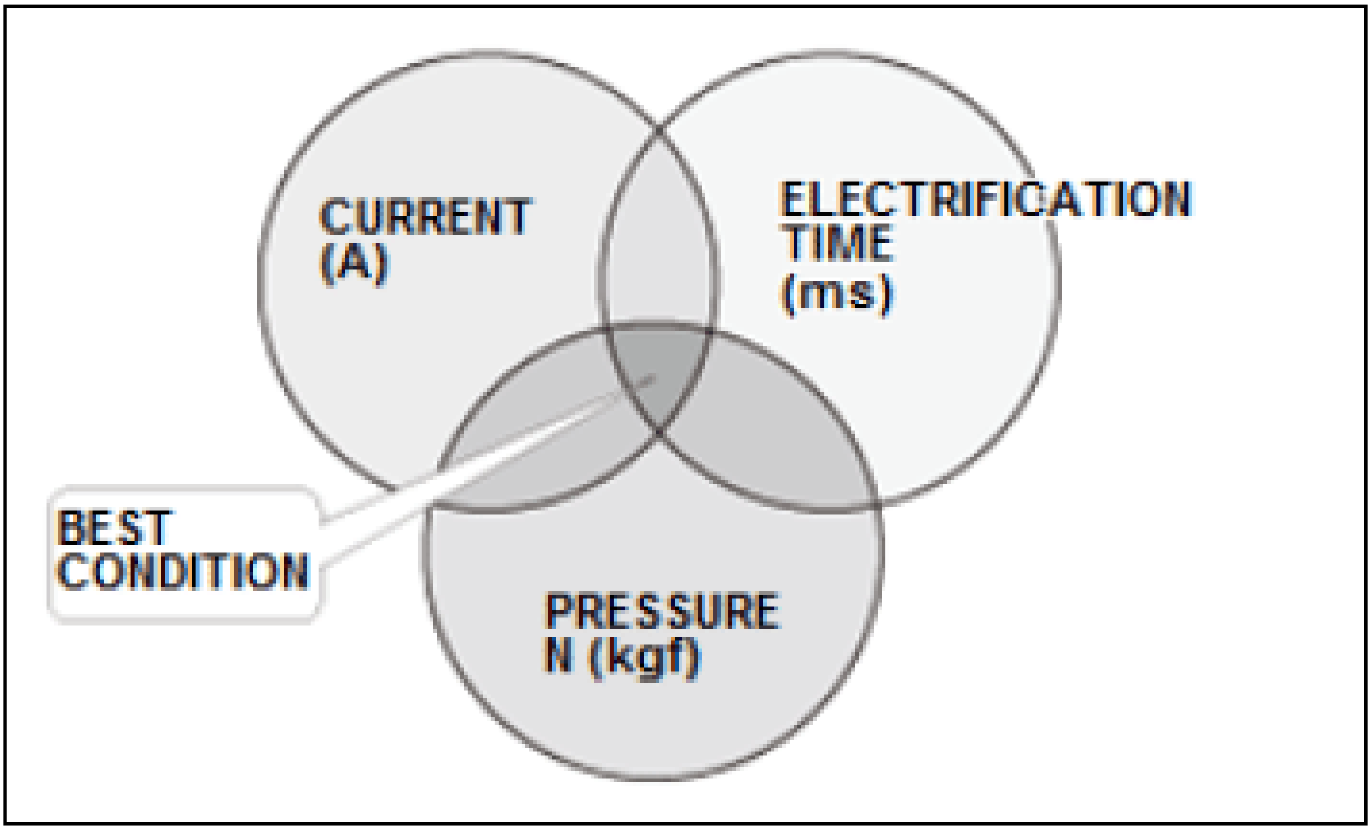
  The area where electrode pressure was applied the weld nugget. It prevents the melted metal to spatter. If the weld nugget and corona bond sizes become similar, the pressurized area won't be able to hold the melted metal and spattering will occur.

- Heat Affected Zone

  The heated area around the weld nugget. The heat changes the metal structure of this area, but there is no melting.

Welding Conditions

There are several elements to achieving a good weld. The welding pressure, welding current, and welding time have a great impact on the quality. They are called as "Three Major Welding Conditions". In addition, the shape of the electrode tip also has a great impact on the current supply and cooling processes, which helps determine the end quality of the weld. With the electrode shape included, there are "Four Major Welding Conditions".



Welding Pressure

Welding pressure minimizes the occurrence of "welding spatter" while supplying the current to the parts being joined. It also stabilizes the strength of the welded parts by holding pressure even after the current is applied. If the welding current and time remain the same and only the welding pressure is changed, the higher the pressure applied, the smaller the nugget will be and lower the strength of the welded parts. The reason for this phenomenon can be explained this way:

When two work pieces are held together by the welding tips, the current will run through the pressurized part, in other words a slightly wider area of work pieces around the tips. When the pressure is high, the surface area of which the current runs becomes larger. Under these conditions, the current does not fully concentrate (lowering of current density) and the temperature does not become high enough to melt the parts being welded thoroughly As a result, the nugget becomes smaller.

WEAK	PRESSURE	STRONG
LARGE	HEAT	SMALL
SPATTER	BEST	NO NUGGET

Welding Current

The larger the welding current becomes, the bigger the diameter of nugget becomes. Increasing the current generates "spatter", but by applying a high welding pressure to work pieces, "spatter" is minimized because the electrified surface becomes larger. In other words, spatter occurs when high current is applied in combination with low welding pressure. As such, current and pressure have a correlation.

Welding Time

Welding time impacts the size and quality of the weld nugget. A long welding time generates a large amount of heat resulting in a large nugget.

The amount of heat dissipation around the welding area and tips increases as the welding time gets longer. After a certain variable amount of time, the temperature of welding area saturates. Increasing welding time beyond that point doesn't increase the weld nugget size, but it does increase pressure dents from the weld tips and heat deflection, resulting in weld quality issues.

Electrode Tip Diameter And Current Density

- The major functions of the welding electrodes are:
  - Allows electrical current to pass through the parts being welded

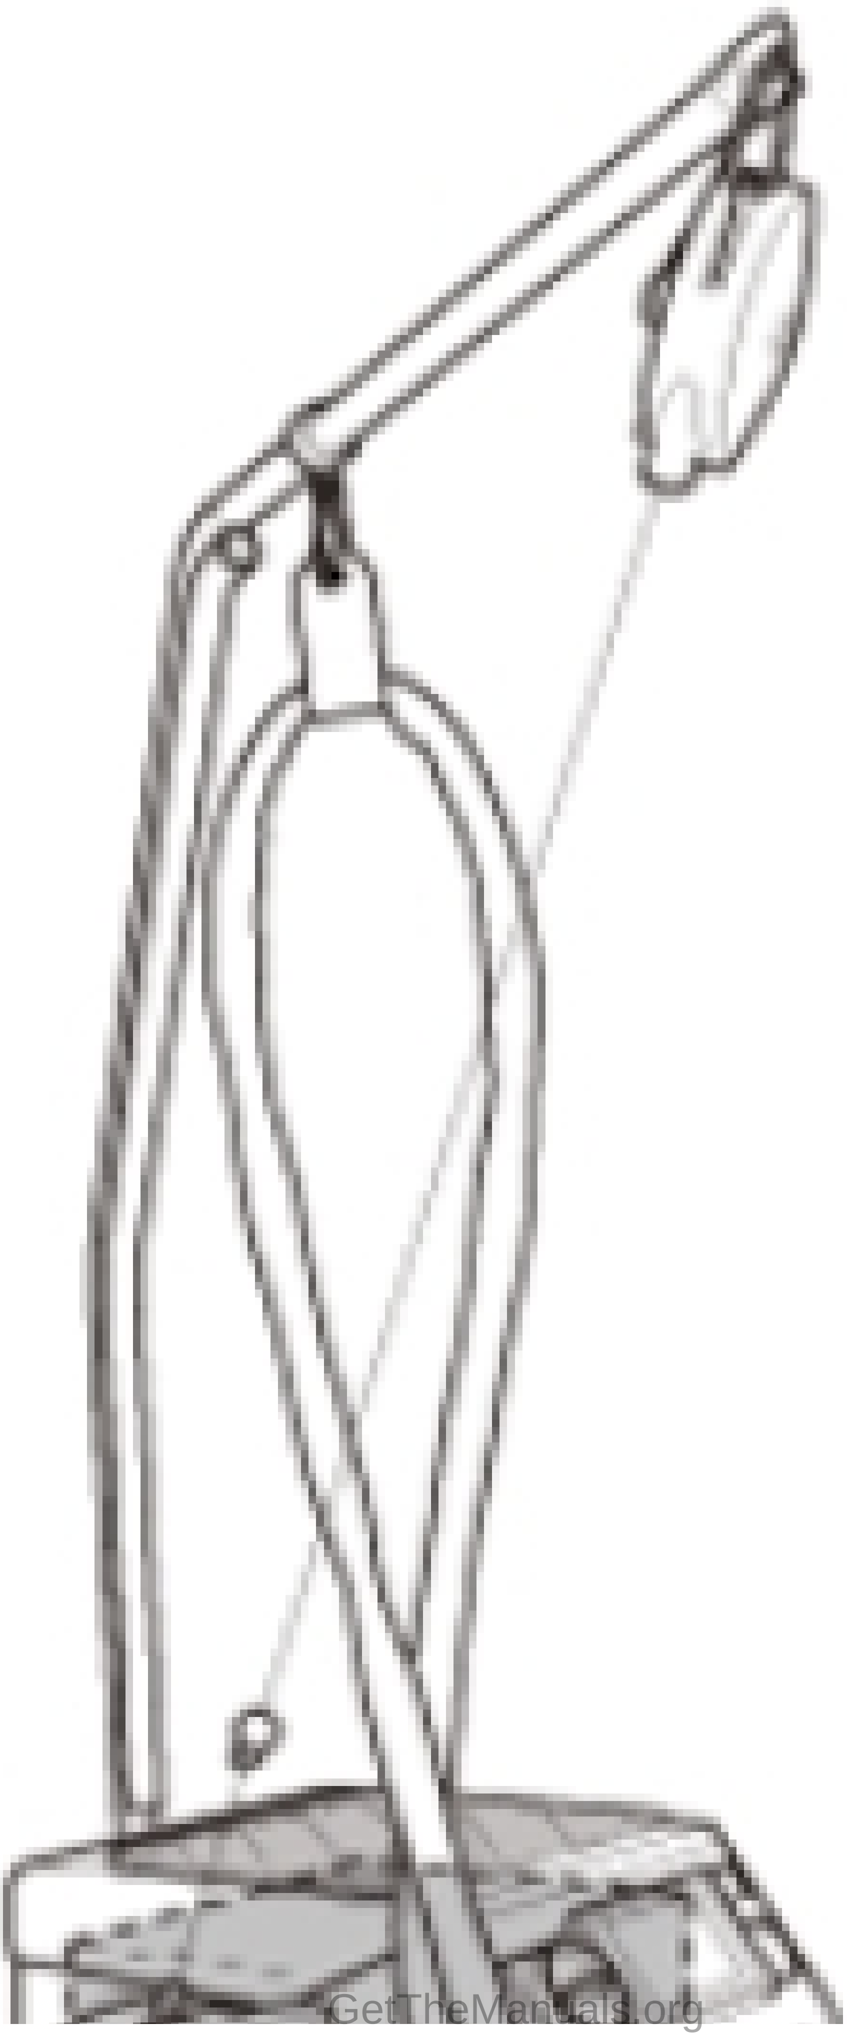
    - Applies pressure to the weld area to prevent spatter
    - Acts as a heat sink to cool down the parts after welding
- Electrodes must have high conductivity, wear-resistance, and thermal conductivity.
- After making repeated welds, the electrode contact tips become larger, reducing current density and heat transfer. This results in a smaller weld nugget size and a low weld strength.

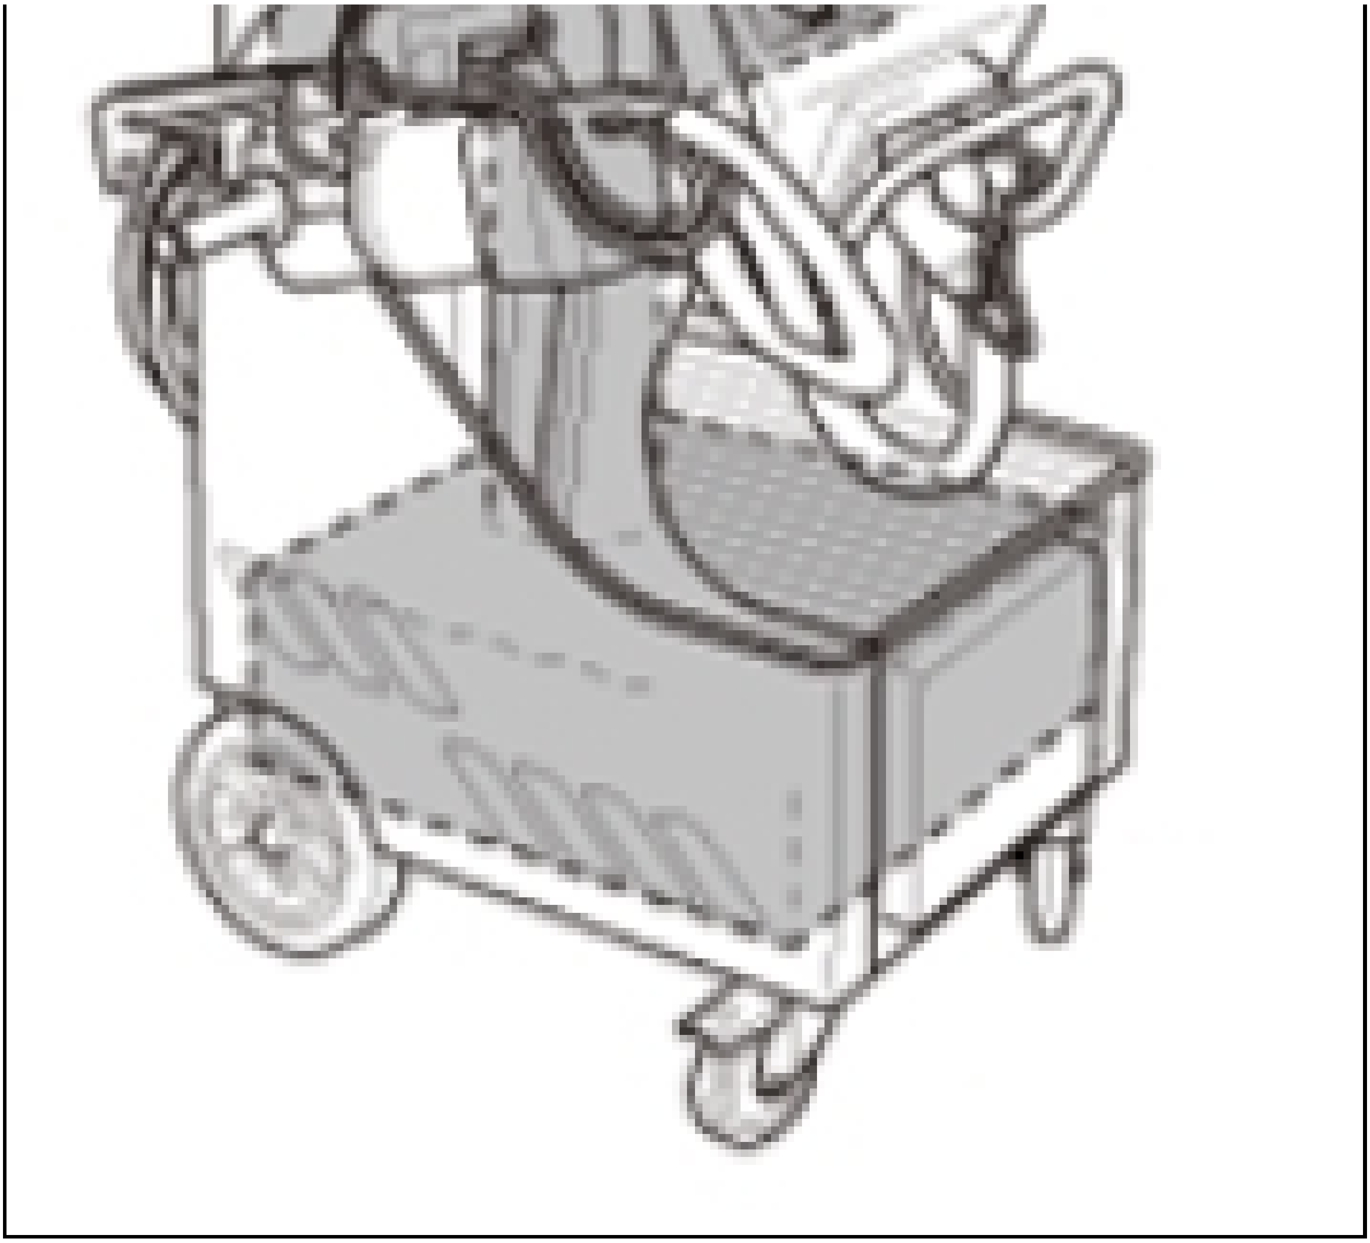
Welding Equipment Structure

A spot welder consists of the welding gun, transformer to increase welding current, and the controller to control "welding current", "welding pressure", and "welding time".

Welding Gun

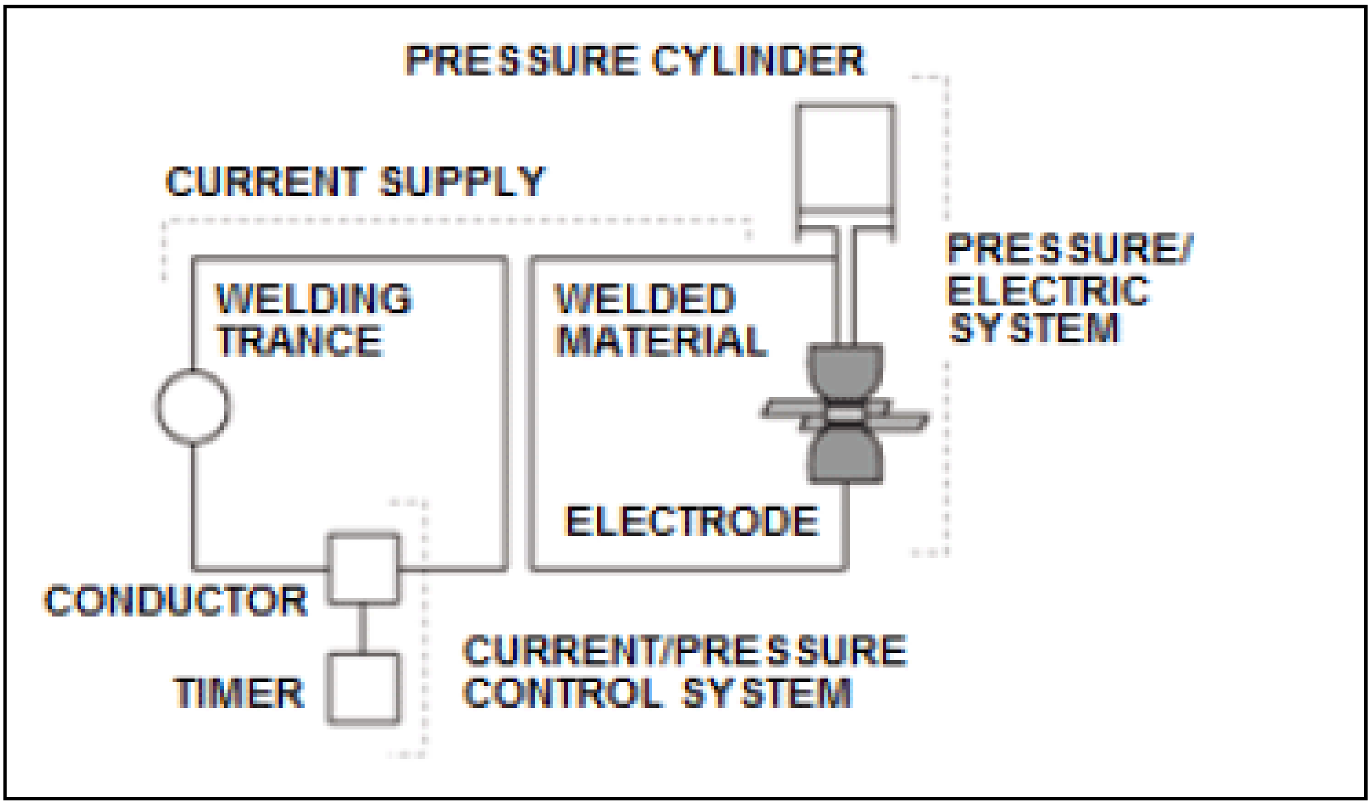
- The welding tips provide pressure to the welding area, apply current, and allow the weld area to cool while being held tightly To resist deformation and conduct heat efficiently the tips are made of copper alloy (chromium copper).
- The arms feed current to the tips to suit various requirements. They are available in many different shapes and lengths.
- Compressed air is usually used to move the tips up and down to hold work pieces tightly.





Transformer

Converts the input (primary) voltage to the low voltage and high current, required for spot welding.



PRESSURE CYLINDER
CURRENT SUPPLY
WELDING TRANCE
WELDED MATERIAL
PRESSURE/ ELECTRIC SYSTEM
ELECTRODE
CONDUCTOR
TIMER
CURRENT/PRESSURE CONTROL SYSTEM

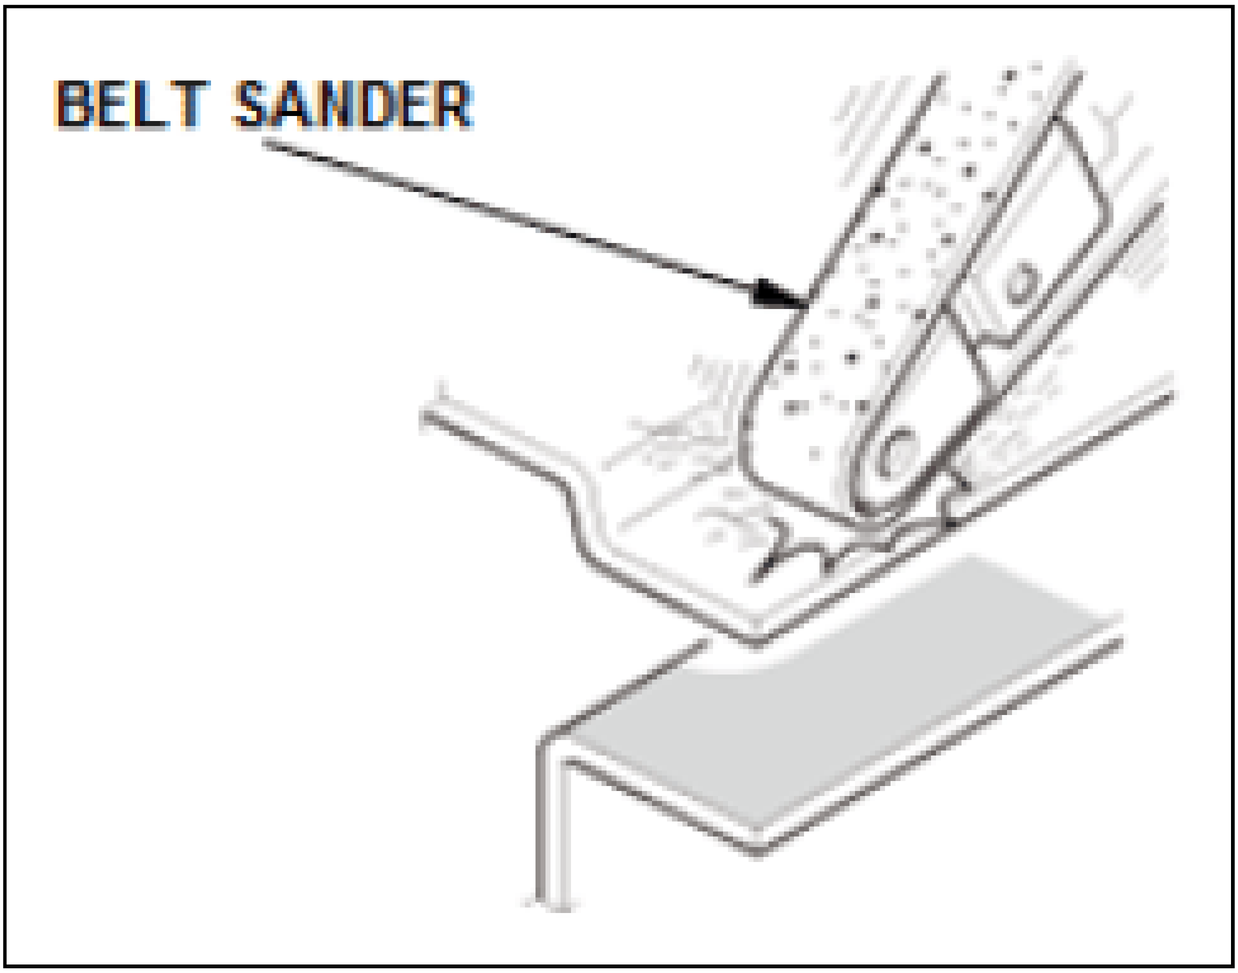
Controller

Controls the three major conditions of the spot welding process:

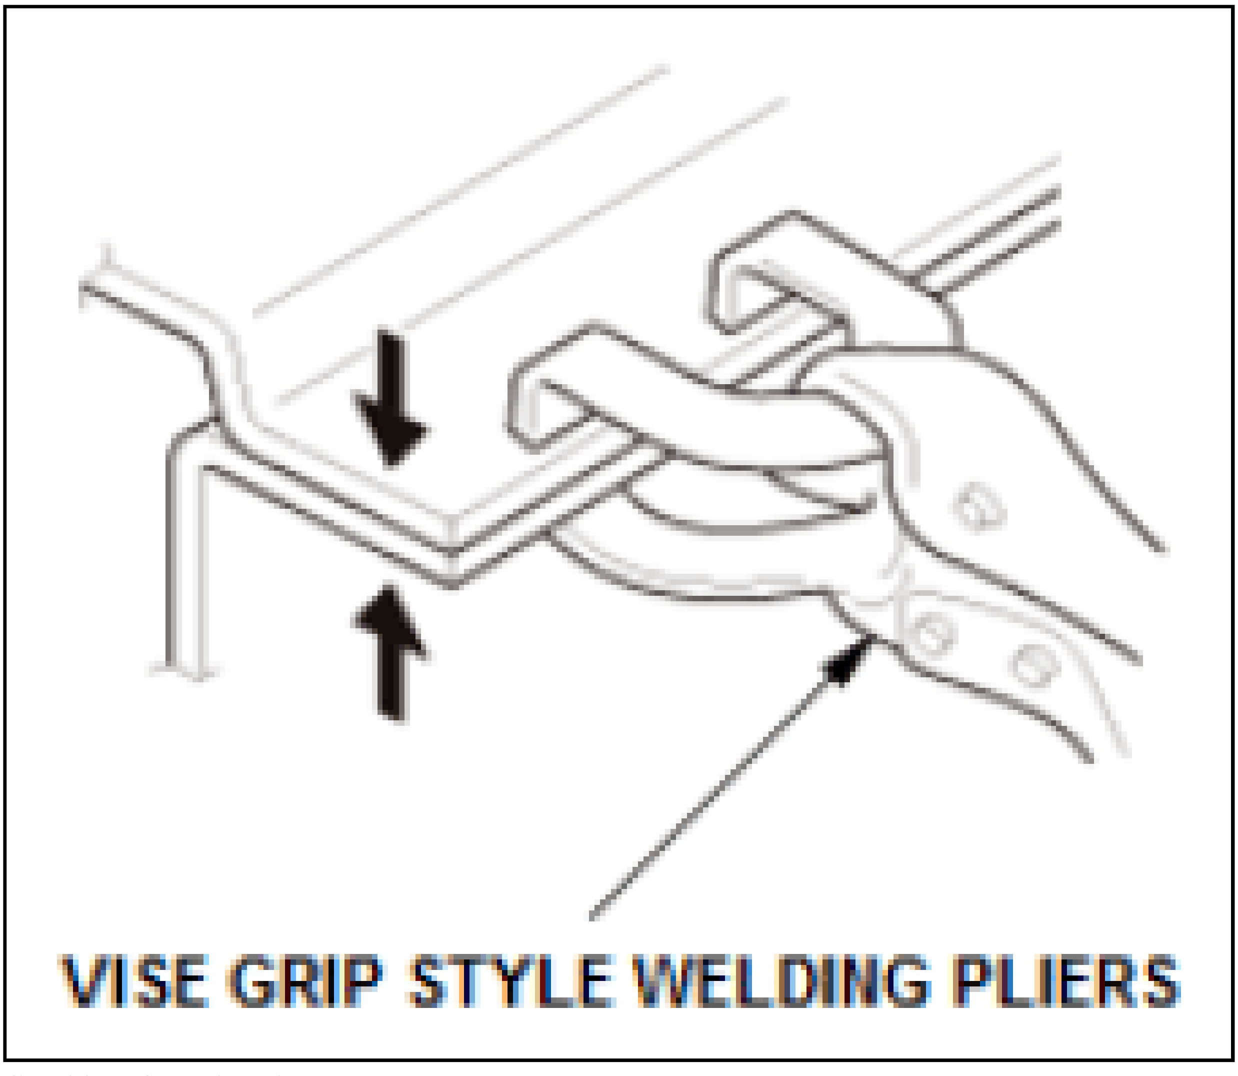
- Welding current
- Welding pressure
- Welding time

Welding Precautions

1. **Conditions of Welding Part:**
    - Contaminated welding surfaces will not allow sufficient welding current penetration. Remove paint film and rust by sanding the areas being welded with a small belt sander.
    - Use tools like vise grip welding pliers to tightly clamp parts being welded.



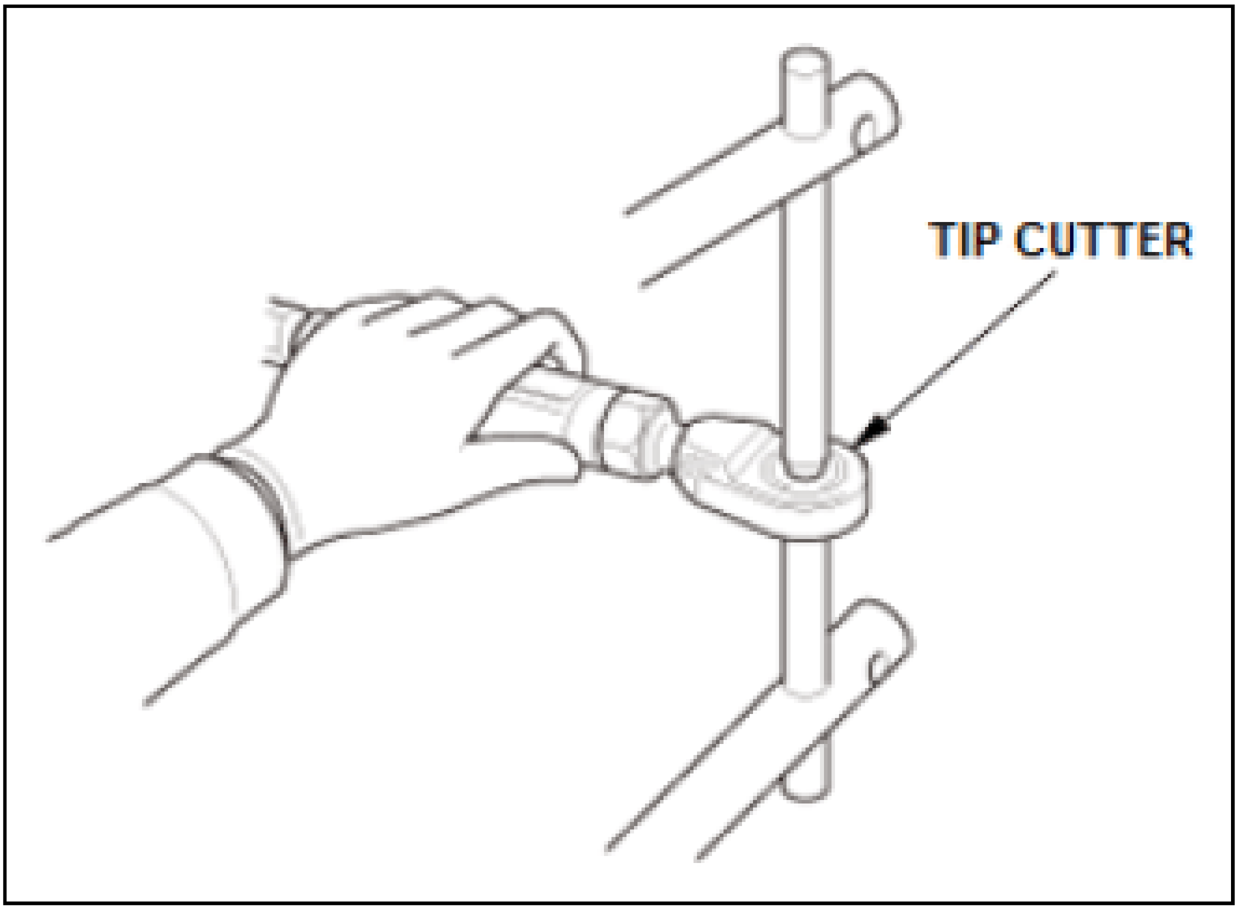
BELT SANDER



VISE GRIP STYLE WELDING PLIERS

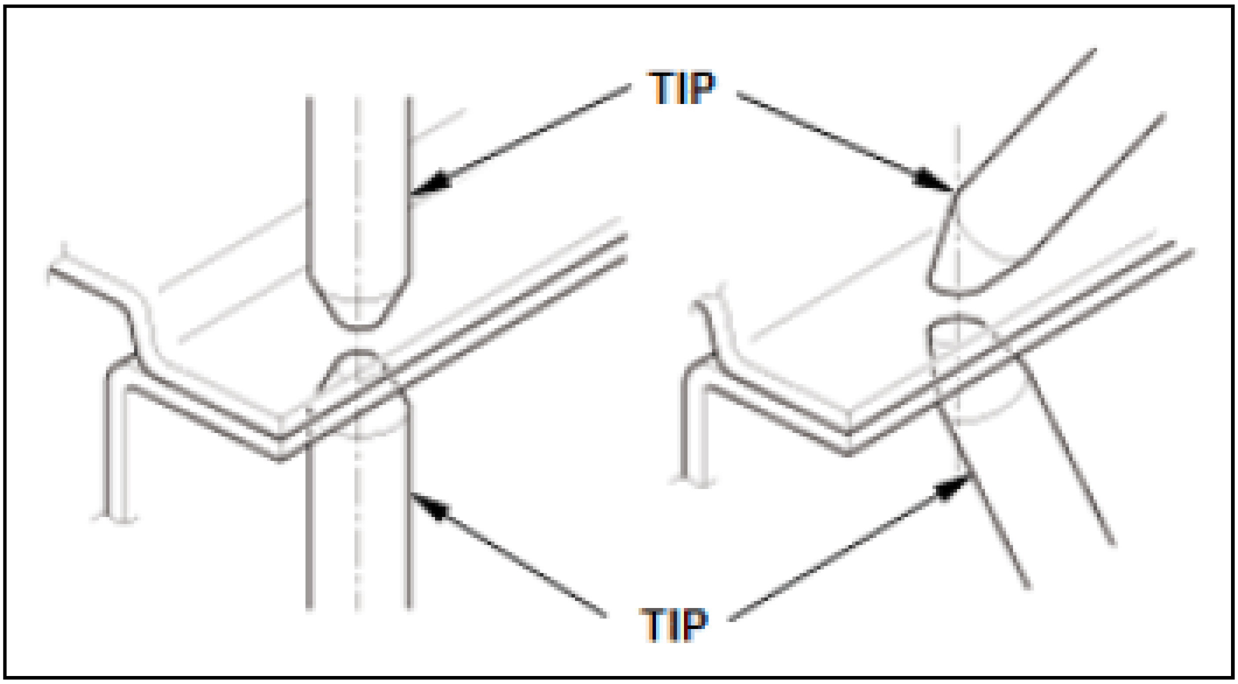
2. **Condition of Welding Tips:**

- Make sure there is no contamination, damage or deformation of the welding electrode tips before use.
- When the of the welding electrode tips degrades with use, current flow is reduced, resulting in poor welding nugget quality.
- Dress or replace the electrode tips, before each use to ensure optimal welding performance.



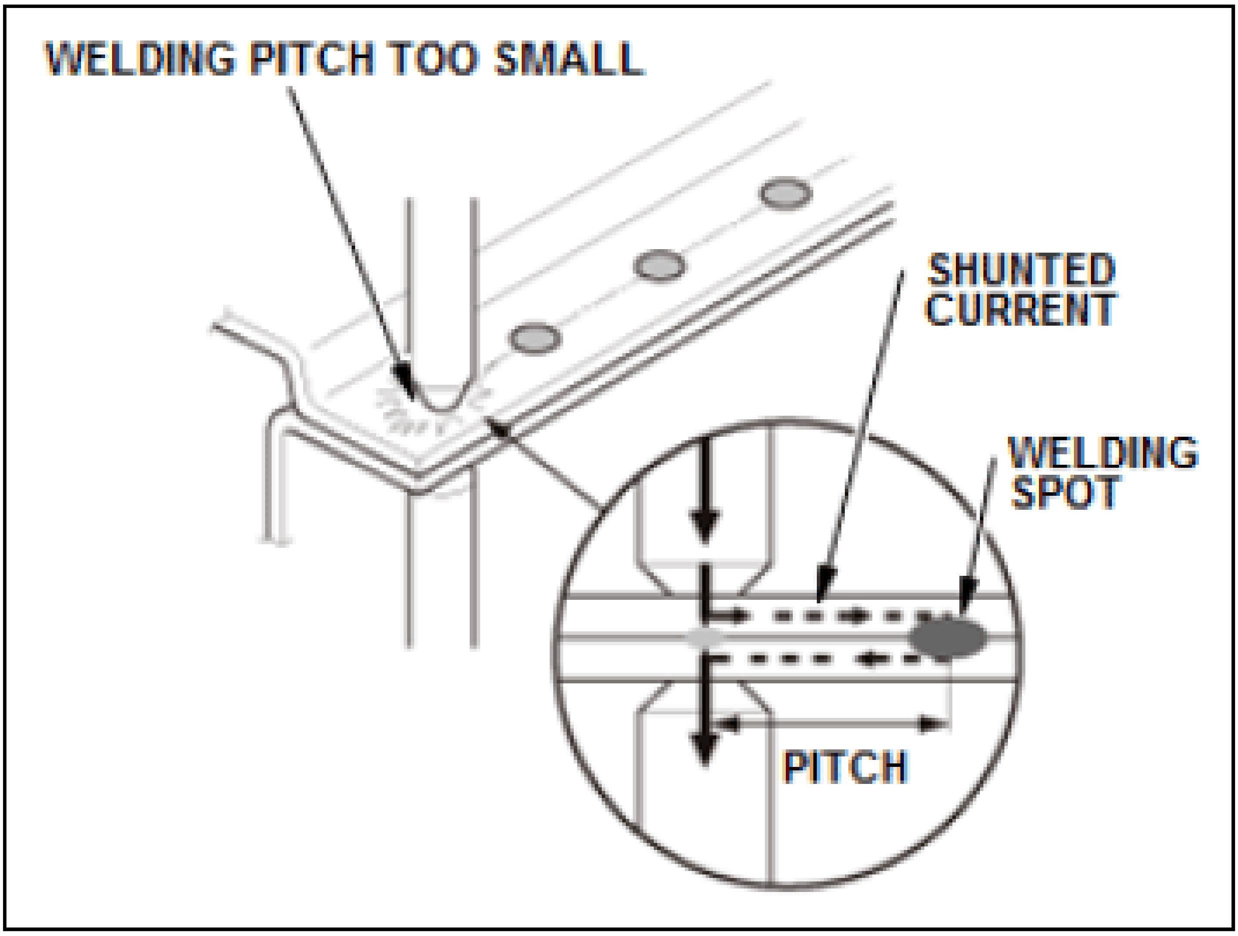
3. **Setting Arm**

   The arms selected must adjust to allow the welding electrode tips to align in a straight line.

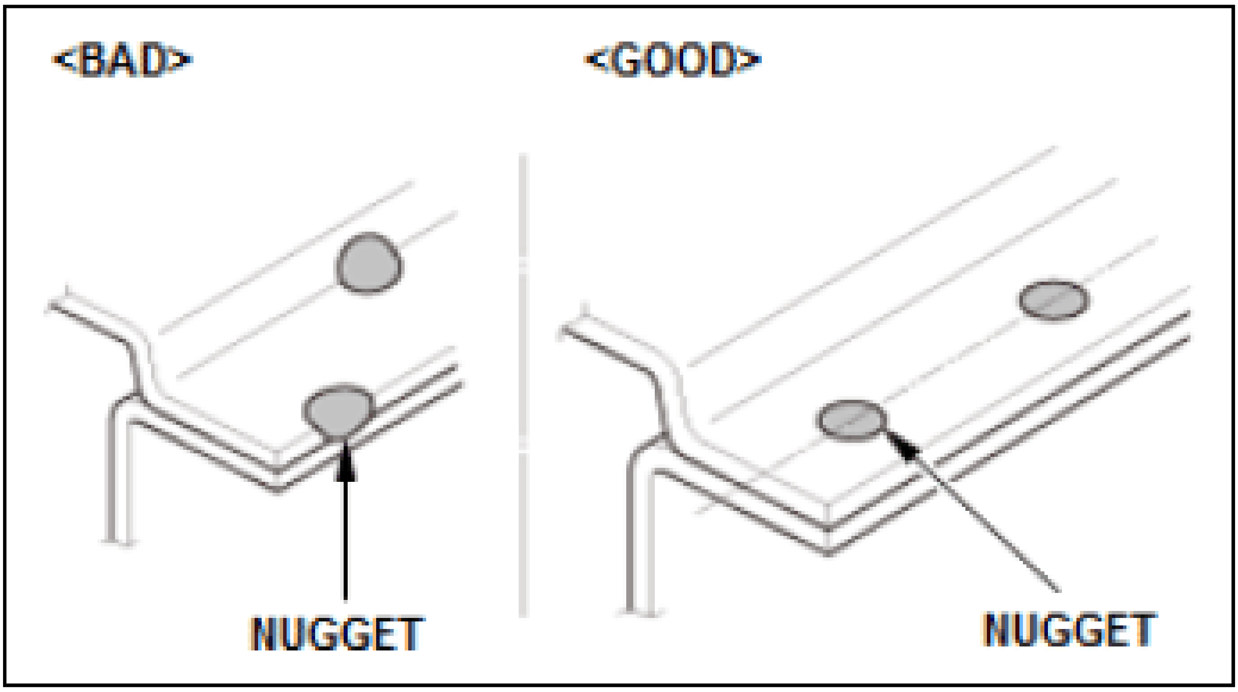


4. **Welding Pitch:**
   - When spot welds are place too close together, some of the welding current is "shunted" through the previously-welded spot. This current is then not available to complete the spot weld being made, resulting in a weaker joint. Check the welding conditions compared to the chart below and adjust as necessary to prevent shunted current.

- When the spot is too close to the edge of flange, the nugget overflows outside the flange surface reducing the welding strength. Weld spot must be located on the center of the weld flange.
- The welding pitch (distance between the spot welds) and the distance from the flange edge must be set according to the material thickness. Use the chart below as a reference for spot weld location and pitch.



WELDING PITCH TOO SMALL
SHUNTED CURRENT
WELDING SPOT
PITCH

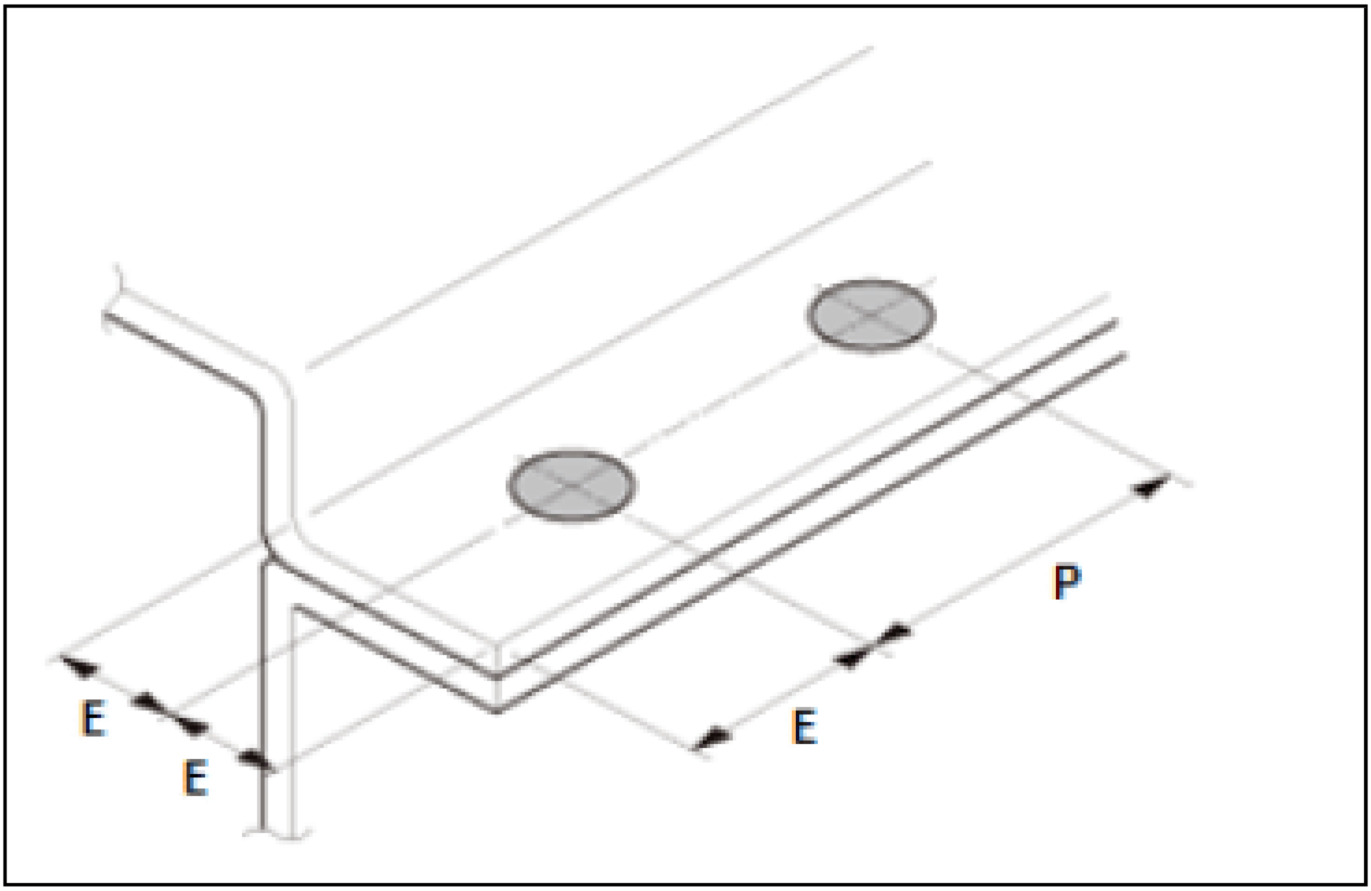


<BAD>
<GOOD>
NUGGET
NUGGET

Thickness mm (in)	Pitch P mm (in)	End Distance E mm (in)
0.6 (0.024)	11+ (0.43+)	5+ (0.20+)
0.8 (0.031)	14+ (0.55+)	5+ (0.20+)
1.0 (0.040)	18+ (0.71+)	6+ (0.24+)
1.2 (0.047)	22+ (0.87+)	7+ (0.28+)
1.6 (0.063)	29+ (1.14+)	8+ (0.31+)

- When you are making a number of spot welds at once, be sure to check the spot welder's settings and allow adequate space between each weld.

NOTE: **When doing spot welding, check the shape and condition of the welding electrode tips often.**



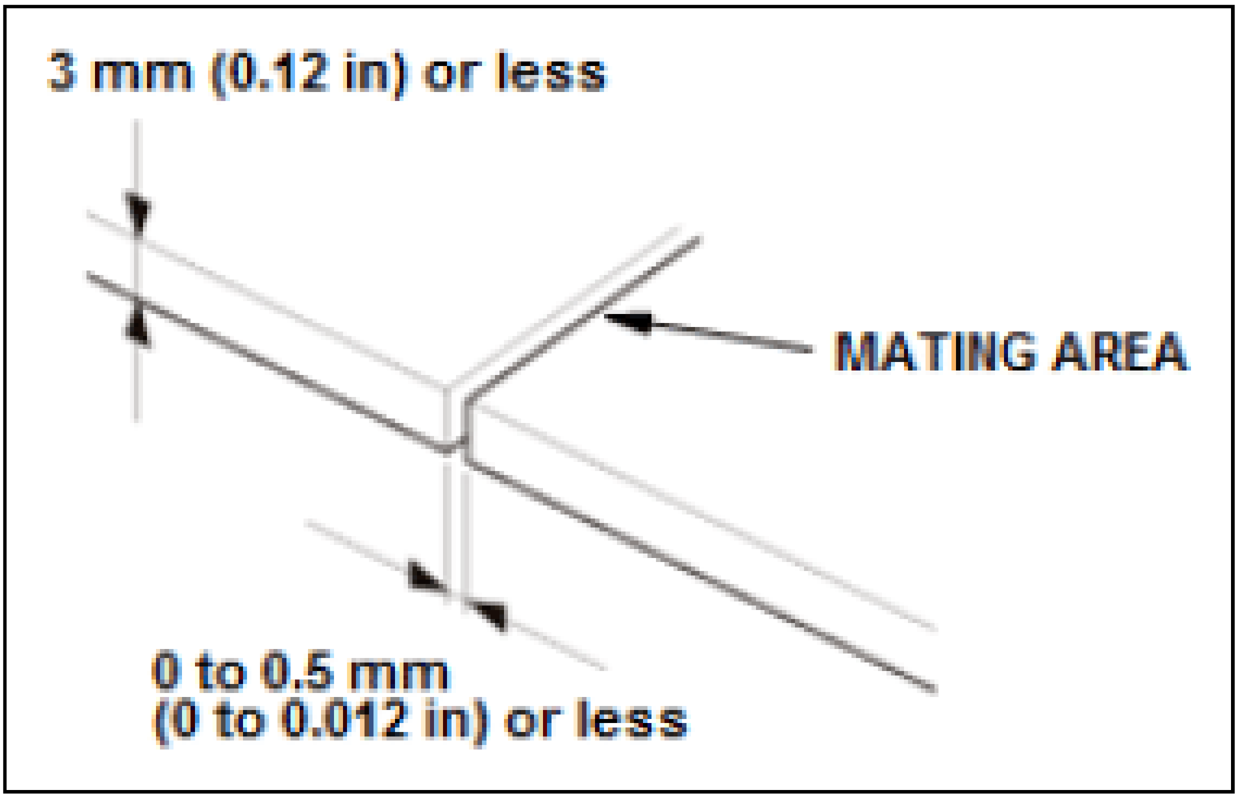
WELDING ON ALUMINUM ALLOY BODIES

Butt Welding

1. Grooving

If thickness is less than 3 mm (0.12 in):

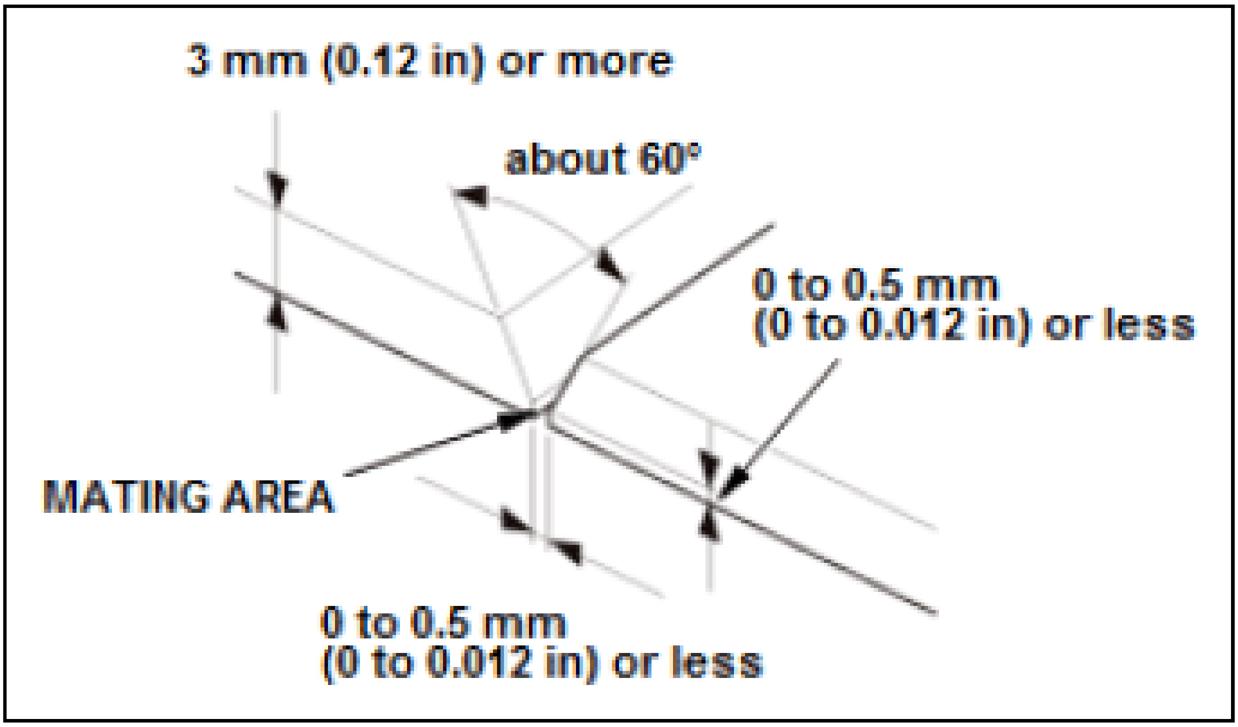
There is no need to chamfer the edges of the plates. Butt the work pieces together without a gap.



3 mm (0.12 in) or less
MATING AREA
0 to 0.5 mm
(0 to 0.012 in) or less

If thickness is more than 3 mm (0.12 in):

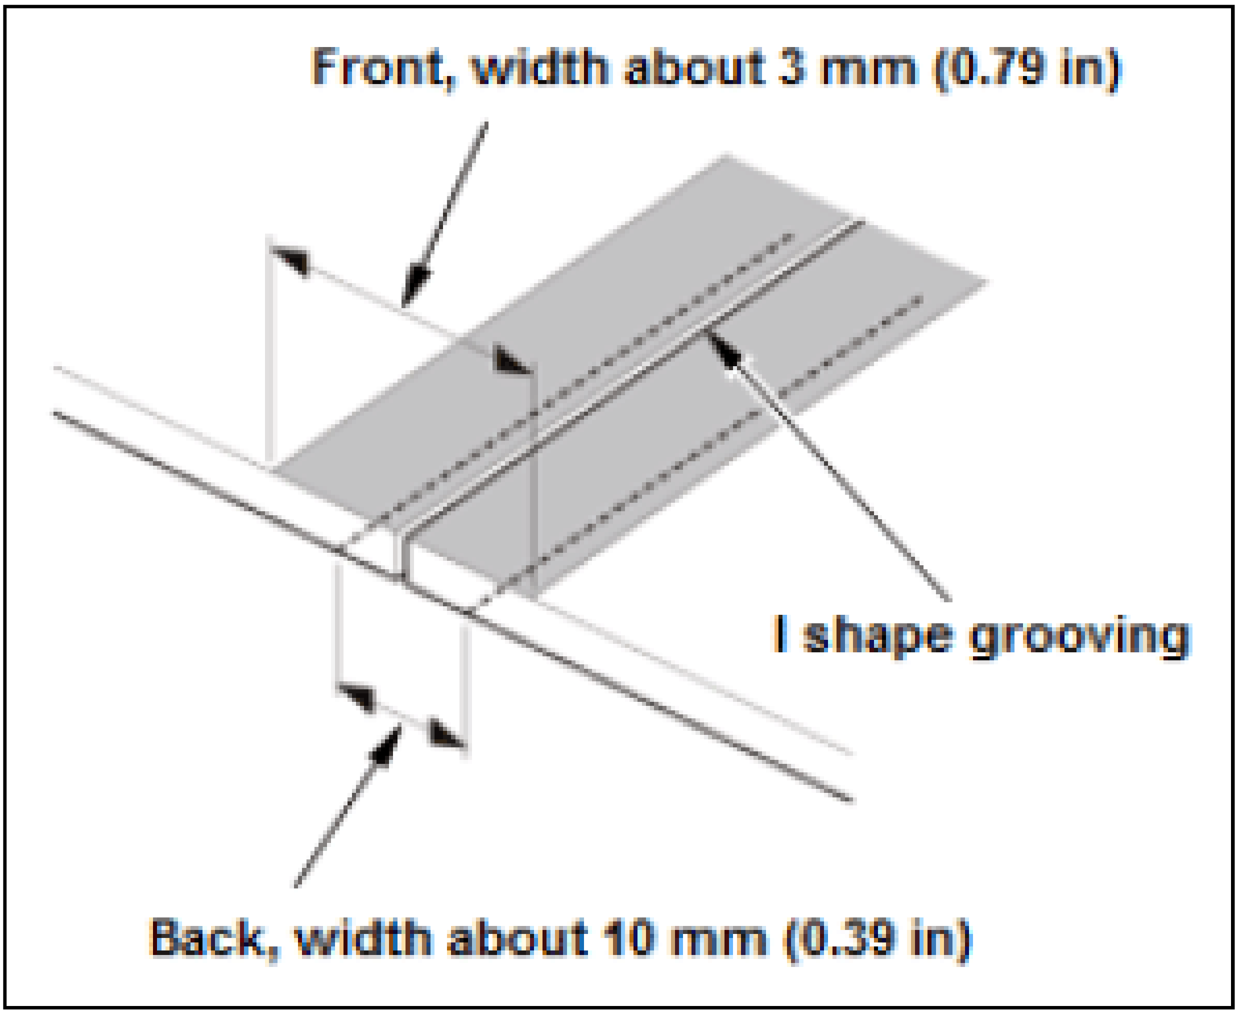
- Use a disk grinder, or course file (rough, vixen file) to make a V-groove, or chamfer, along the mating line (V-shape grooving).
- Smooth the ground surface using a disk sander (P80) or fine file.
- With a V-groove, back beads are easily formed.



3 mm (0.12 in) or more
about 60°
0 to 0.5 mm
(0 to 0.012 in) or less
MATING AREA
0 to 0.5 mm
(0 to 0.012 in) or less

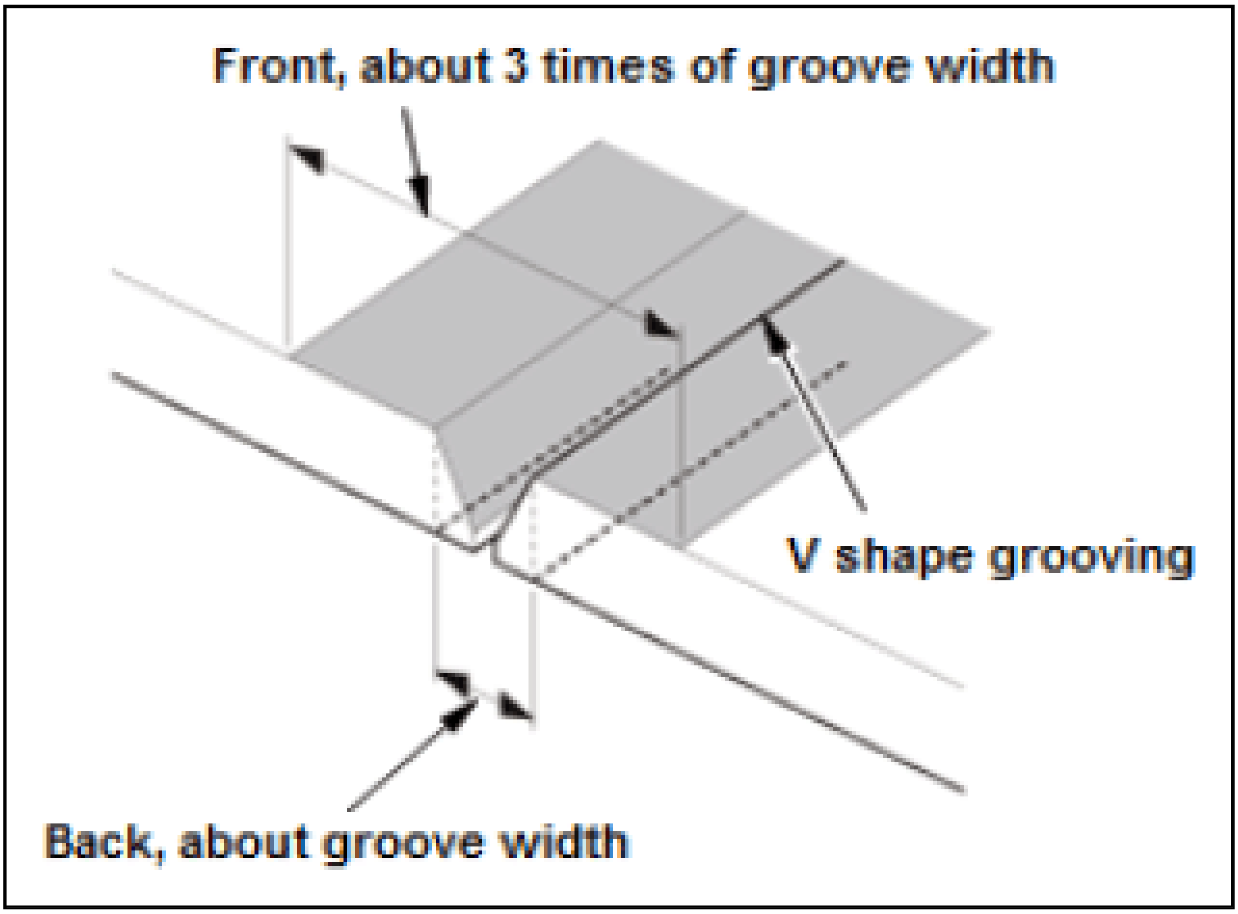
2. Cleaning and removal of oxidized layer:
    - Remove contamination and oil content from the area to be welded using degreaser.
    - Sand off paint film using a disk sander (P80).
    - Remove the oxidized layer using a stainless wire brush.
        - Remove oxidized layer from the hatched areas.

When thickness is 3 mm (0.12 in) or less:



Front, width about 3 mm (0.79 in)
I shape grooving
Back, width about 10 mm (0.39 in)

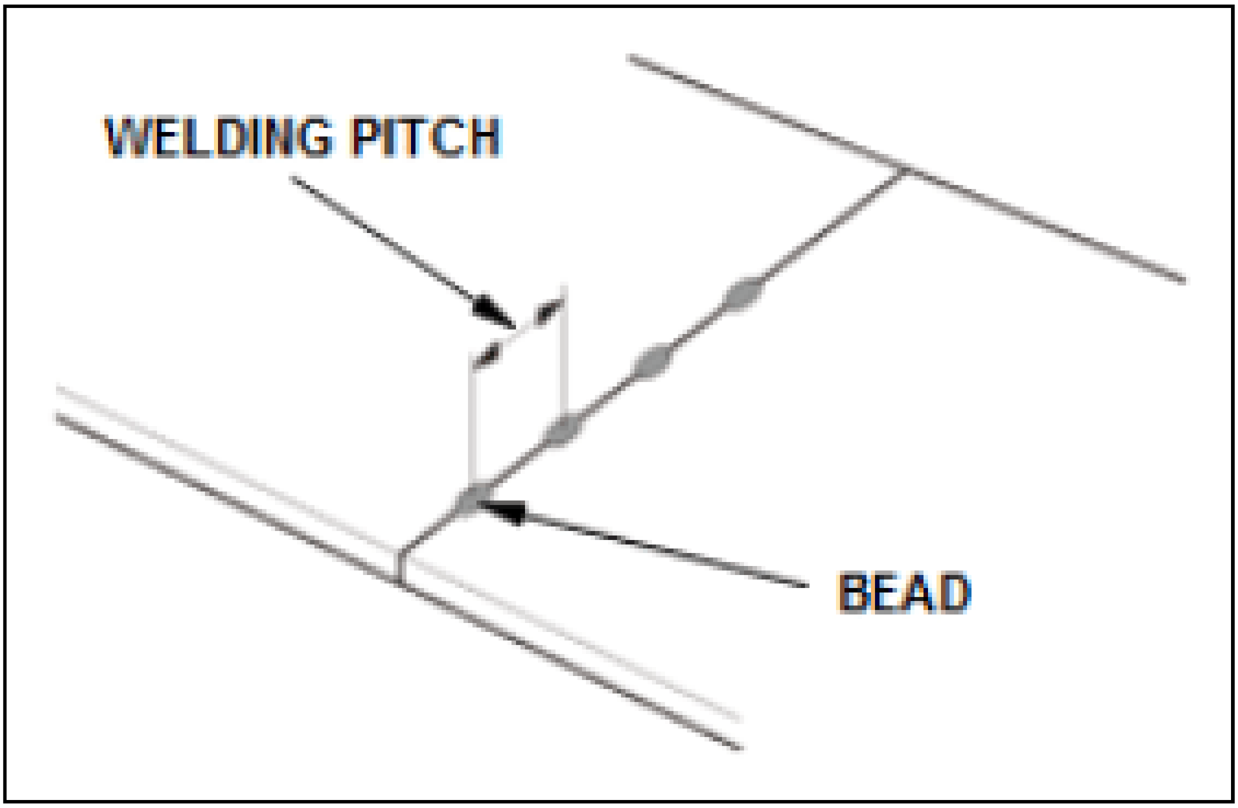
When thickness is 3 mm (0.12 in) or more:



Front, about 3 times of groove width
V shape grooving
Back, about groove width

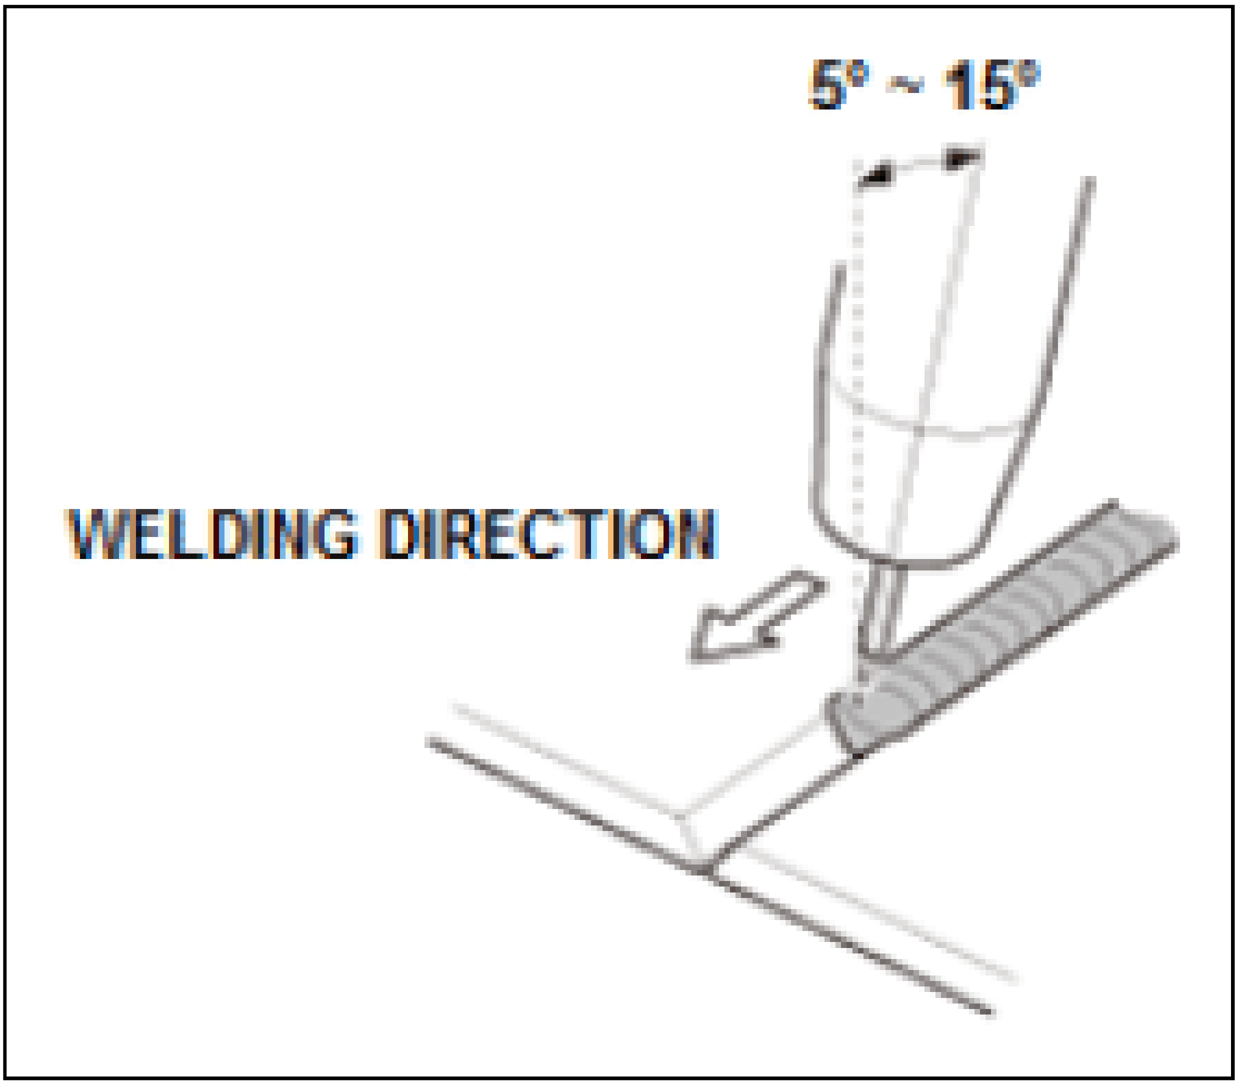
3. Tack welding:

- Basically same as the welding of steel panels. Tack welding is required to reduce distortion for precision of the welded joint.
- Weld short beads at several places. The thinner the panel, the smaller the welding pitch. Do not weld the end or corner of the work piece.



4. Main welding:
    - Clean the welding area with a stainless wire brush just before welding.
    - Hold and tilt the torch 5 to 15 degrees then weld along the mating line and use a push or forward welding technique.
    - While checking the tip-to-work clearance, torch angle and penetration, adjust torch feed speed.
    - As your welding skill improves, you can increase the torch feed speed using high power (current). Such quick welding reduces heat transfer into the work and minimizes distortion.
    - When welding thin panels, burn through can be prevented by using a skip or stitch welding technique.
    - If the welding equipment has a stitch mode, use it for stitch welding.

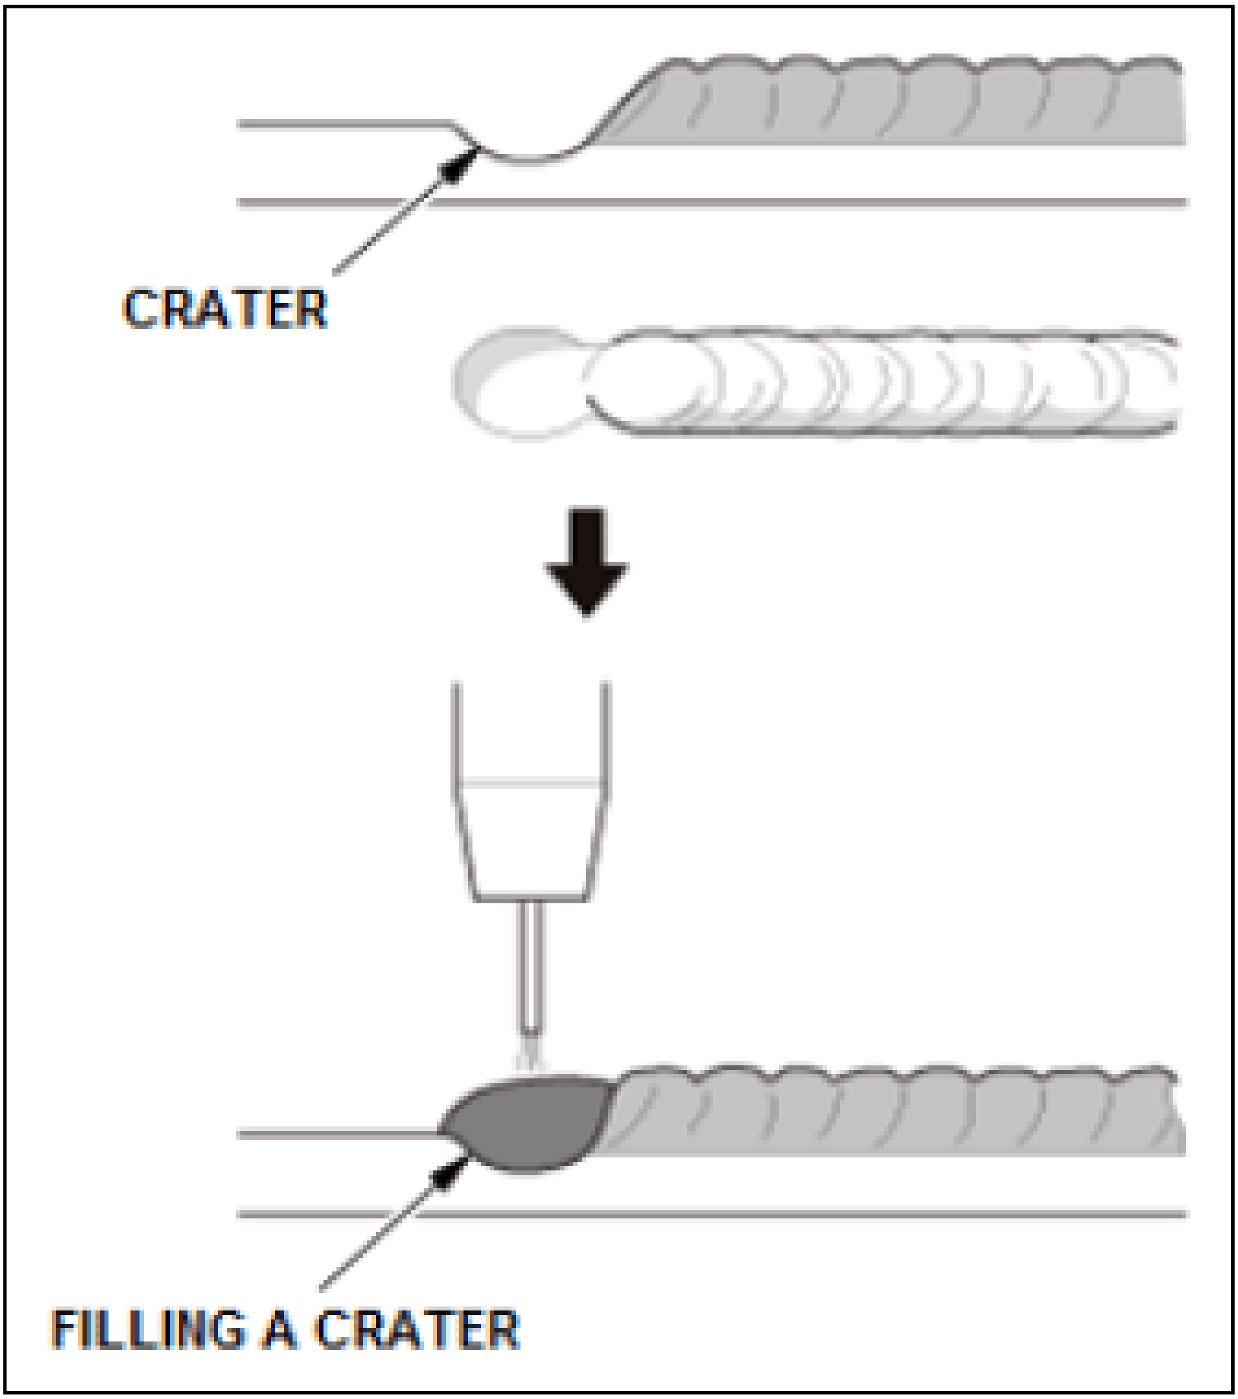
FORWARD WELDING



5. Filling a crater:
    - Stop the torch once you reach the end of welding bead and fill in the crater.
    - Stop and start the arc repeatedly to fill up a crater that occurs at the end of a welding bead.
6. Distortion-free welding

    Similar to welding steel panels, a large distortion occurs when excessive heat is applied to aluminum alloy work pieces. The thinner the panel, the more distortion occurs. Refer to the steel panel welding for tips on distortion-free welding.

7. Be sure to check for cracks after welding.



CRATER
FILLING A CRATER

Butt Welding Defects And Causes

If you make a defective weld, use the chart below to quickly determine the cause. Then make the required correction(s) that will achieve optimum results.

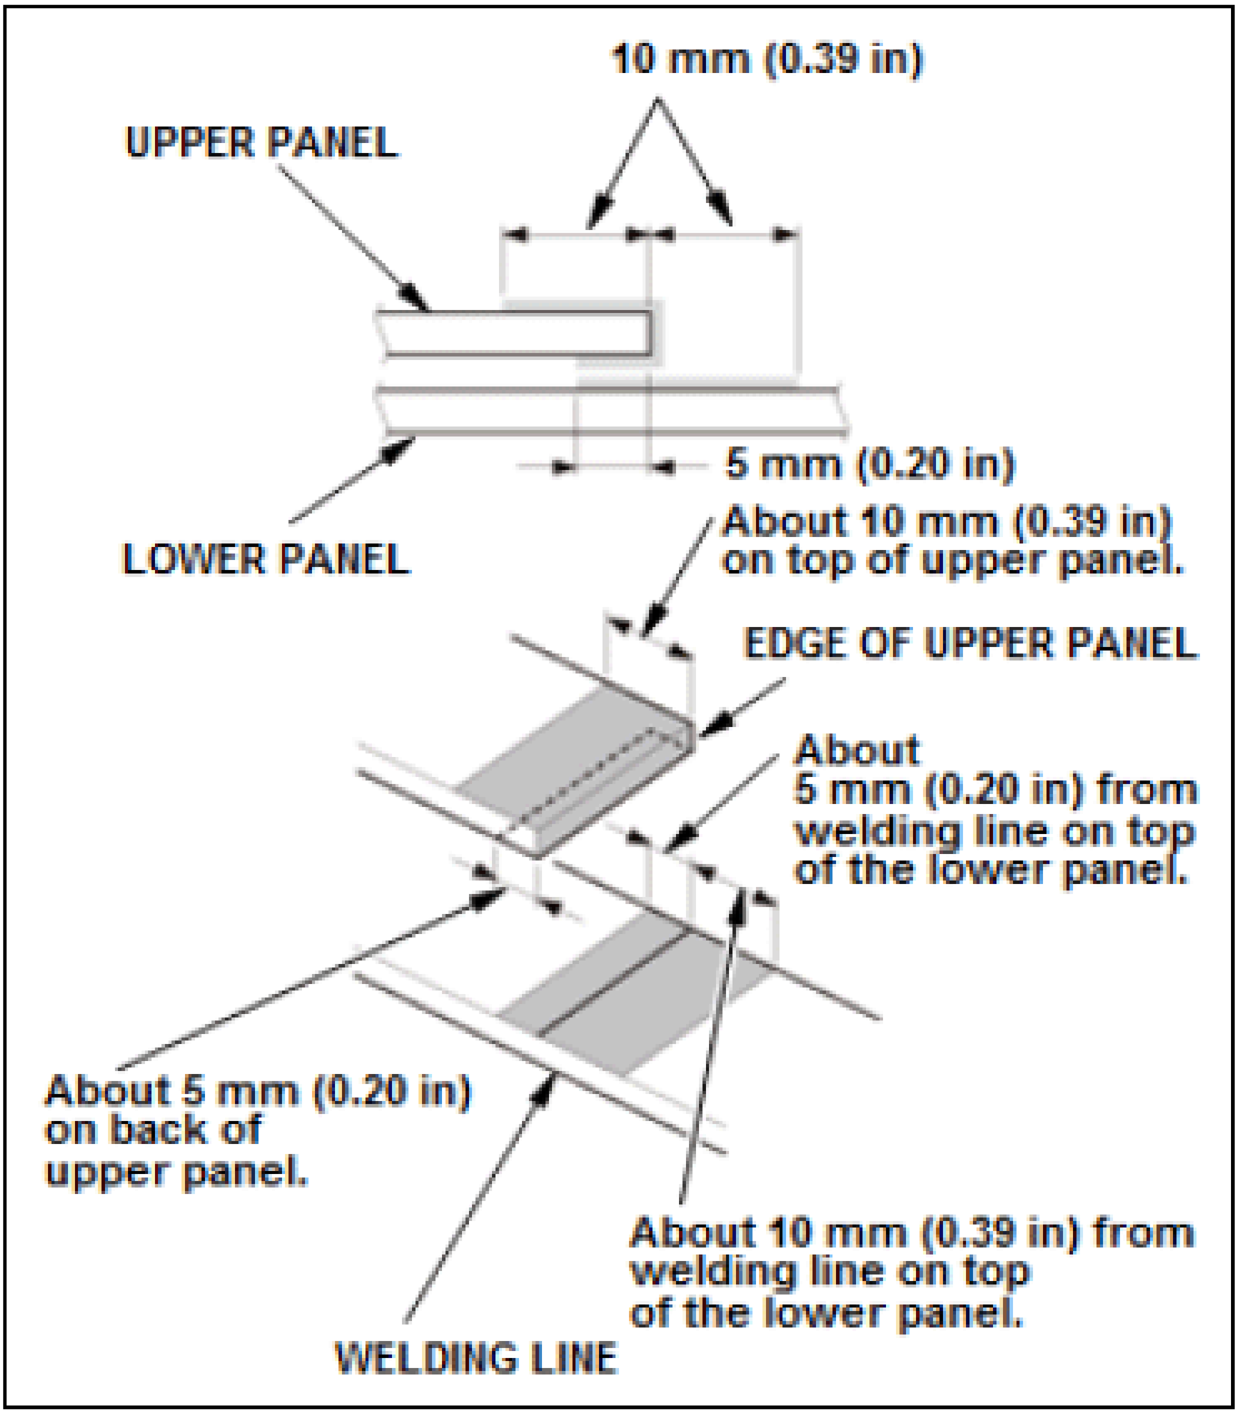
Defect	Defect Example	Cause
Bead crack		Welding amperage too high Incorrect filler material (Welding wire)
Crater crack	 Crack End of weld pass	Craters not filled at end of weld pass

Defect	Defect Example	Cause
Undercut		- Incorrect torch position - Welding amperage too high - Welding torch speed too fast
Overlap		- Welding amperage too low - Welding torch speed too slow
Incomplete fusion		- Welding amperage too low - Incorrect joint preparation - Welding torch speed too fast
Porosity/Blowhole		- Welded Material dirty/contaminated - Incorrect shielding gas - Welding in high humidity conditions
Uneven bead		- Welding wire speed too fast - Welding torch speed too fast
Burn through		- Welding amperage too high - Material gap at joint too wide
Spatter		- Incorrect torch angle - Incorrect shielding gas - Welded Material dirty/contaminated

Fillet Welding

Fillet welding is used to join panels of different thickness or when added strength is required.

1. Cleaning and removal of oxidized layer:
    - Remove contamination and oil content from the area to be welded using degreaser.
    - Sand off paint film using a disk sender (P80).
    - Remove the oxidized layer using a stainless wire brush.
        - Remove oxidized layer from the hatched areas.
2. Upper and lower panels must be positioned tightly against each other.

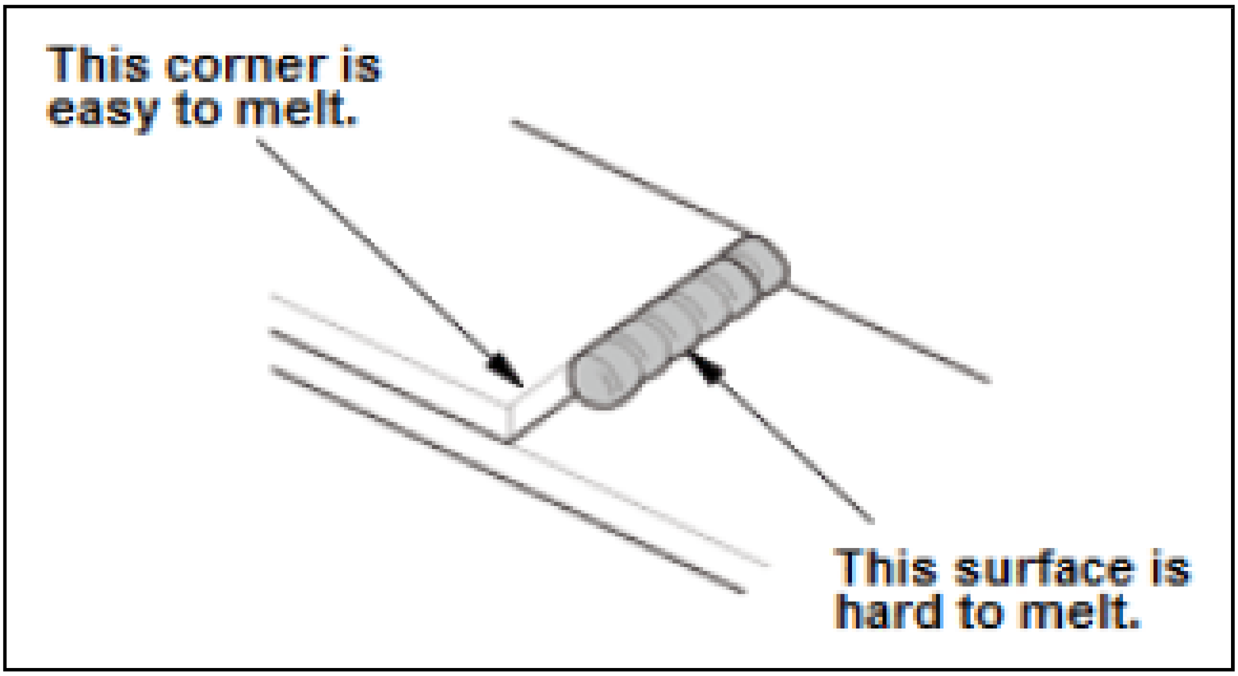


10 mm (0.39 in)
UPPER PANEL
5 mm (0.20 in)
LOWER PANEL
About 10 mm (0.39 in) on top of upper panel.
EDGE OF UPPER PANEL
About 5 mm (0.20 in) from welding line on top of the lower panel.
About 5 mm (0.20 in) on back of upper panel.
About 10 mm (0.39 in) from welding line on top of the lower panel.
WELDING LINE

3. Welding:
    - Clean the welding area with a stainless wire brush just before welding.
    - In fillet welding, penetration occurs quickly at the edge of the upper panel and slowly in the middle of the lower panel.
    - The current should be slightly lower than for butt welding. Check for proper penetration through lower plate while welding.
    - Weld while holding the torch with an angle (approximately 10 degrees) against the welded surface.

      In particular, when the thickness is different between the upper and lower panels, pay extra attention to the penetration condition while welding.

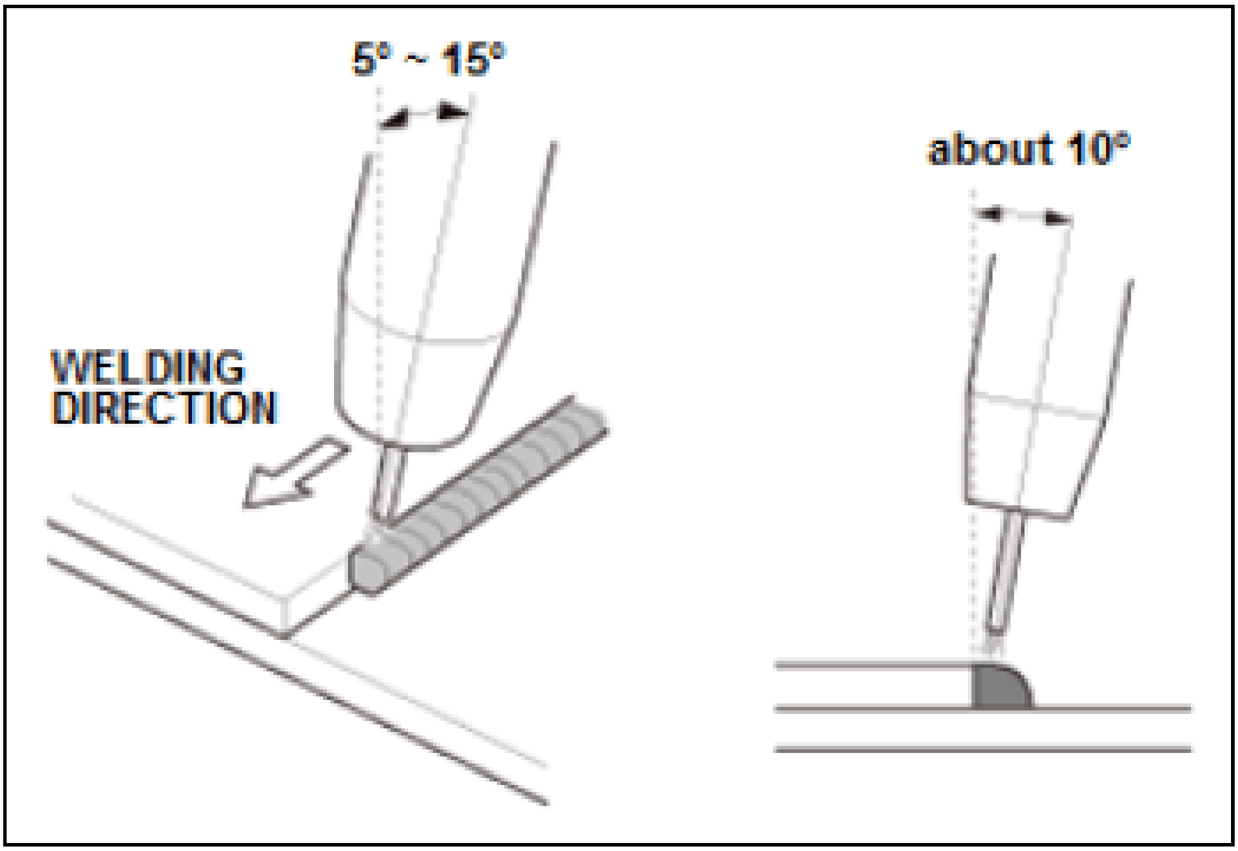
    - The beads should be of the same height as the panel thickness or slightly higher. When the thickness of the upper and lower panels is different, adjusting to the thin panel helps to reduce distortion.
    - Weld intermittently.



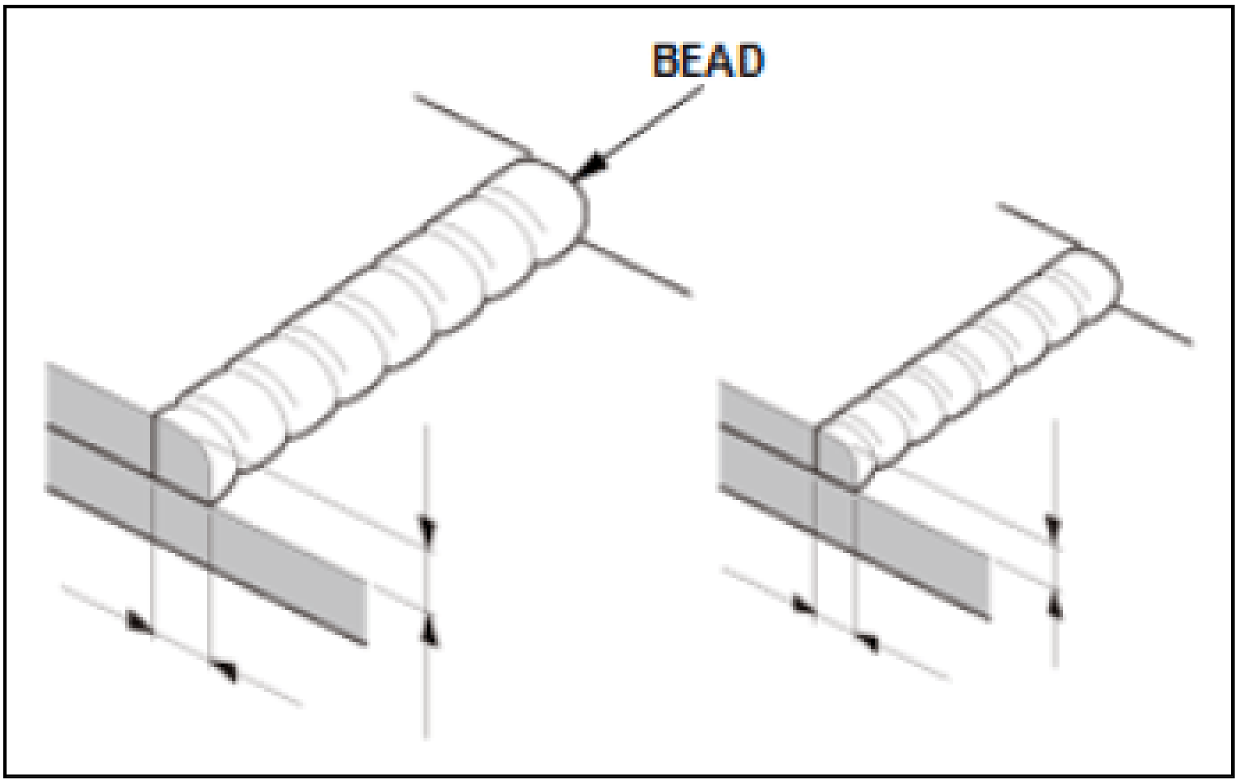
This corner is easy to melt.
This surface is hard to melt.

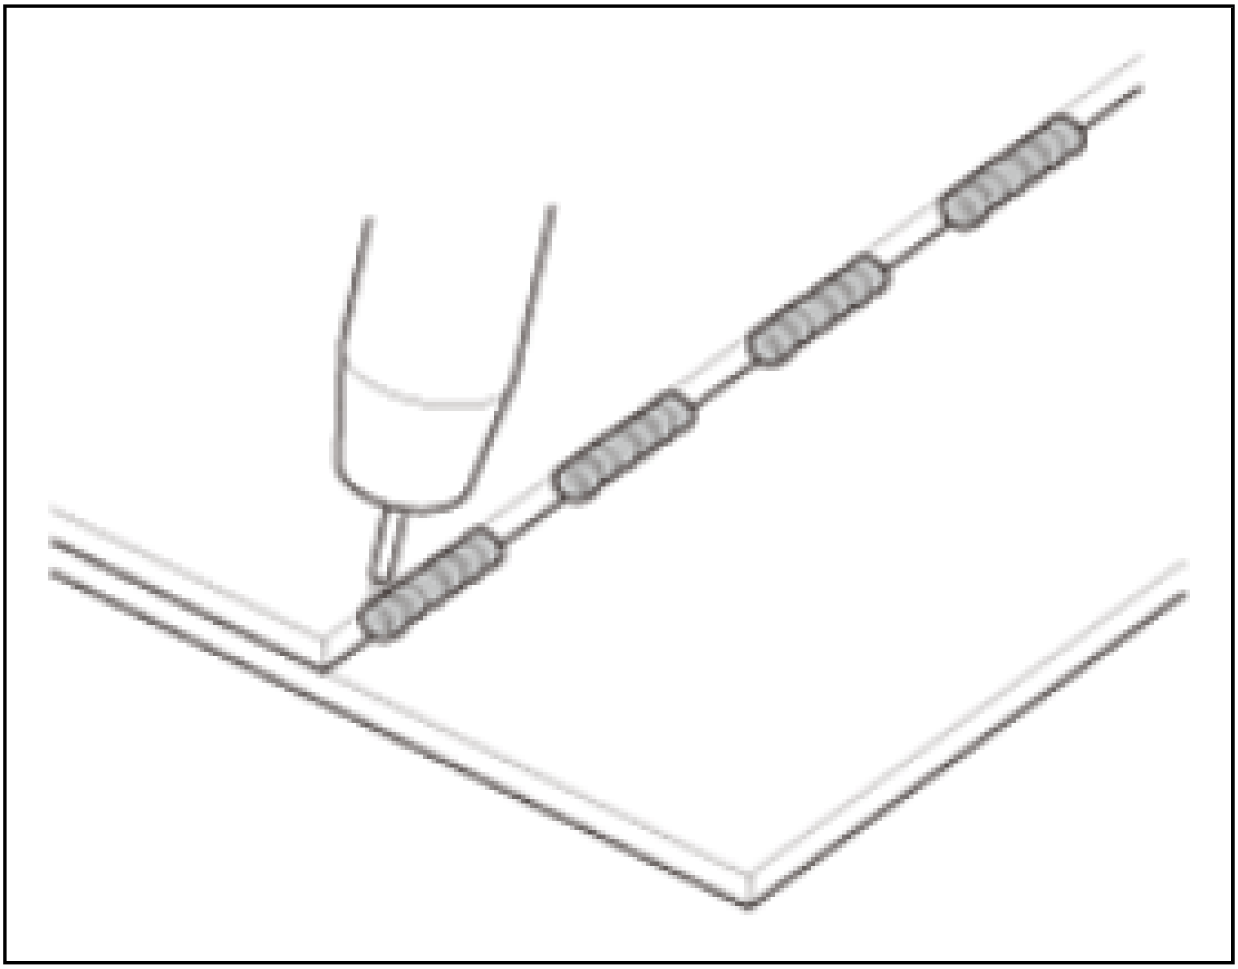
FORWARD WELDING

4. Be sure to check for cracks after welding.



5° ~ 15°
about 10°
WELDING DIRECTION





Fillet Welding Defects And Causes

If you make a defective weld, use the chart below to quickly determine the cause. Then make the required correction(s) that will achieve optimum results.

Defects	Defect Condition	Main Causes
Excessive penetration of upper panel		Torch angle Torch position Excessive current
Insufficient penetration		Insufficient welding current
Incorrect welding position		Incorrect torch feeding position
Uneven beads		Inconsistent torch feed speed Torch height
Insufficient penetration of lower plate		Incorrect torch feeding position Insufficient current

General Information

Due to the high heat conductivity of aluminum alloy the heat generated from the electric current and contact resistance dissipates quickly. This makes spot welding unsuitable for repair of aluminum panels. To spot-weld aluminum alloy an extremely strong current of well over ten thousand amperes is required. For that reason, "MIG welding" must be used to weld an aluminum alloy automobile body.

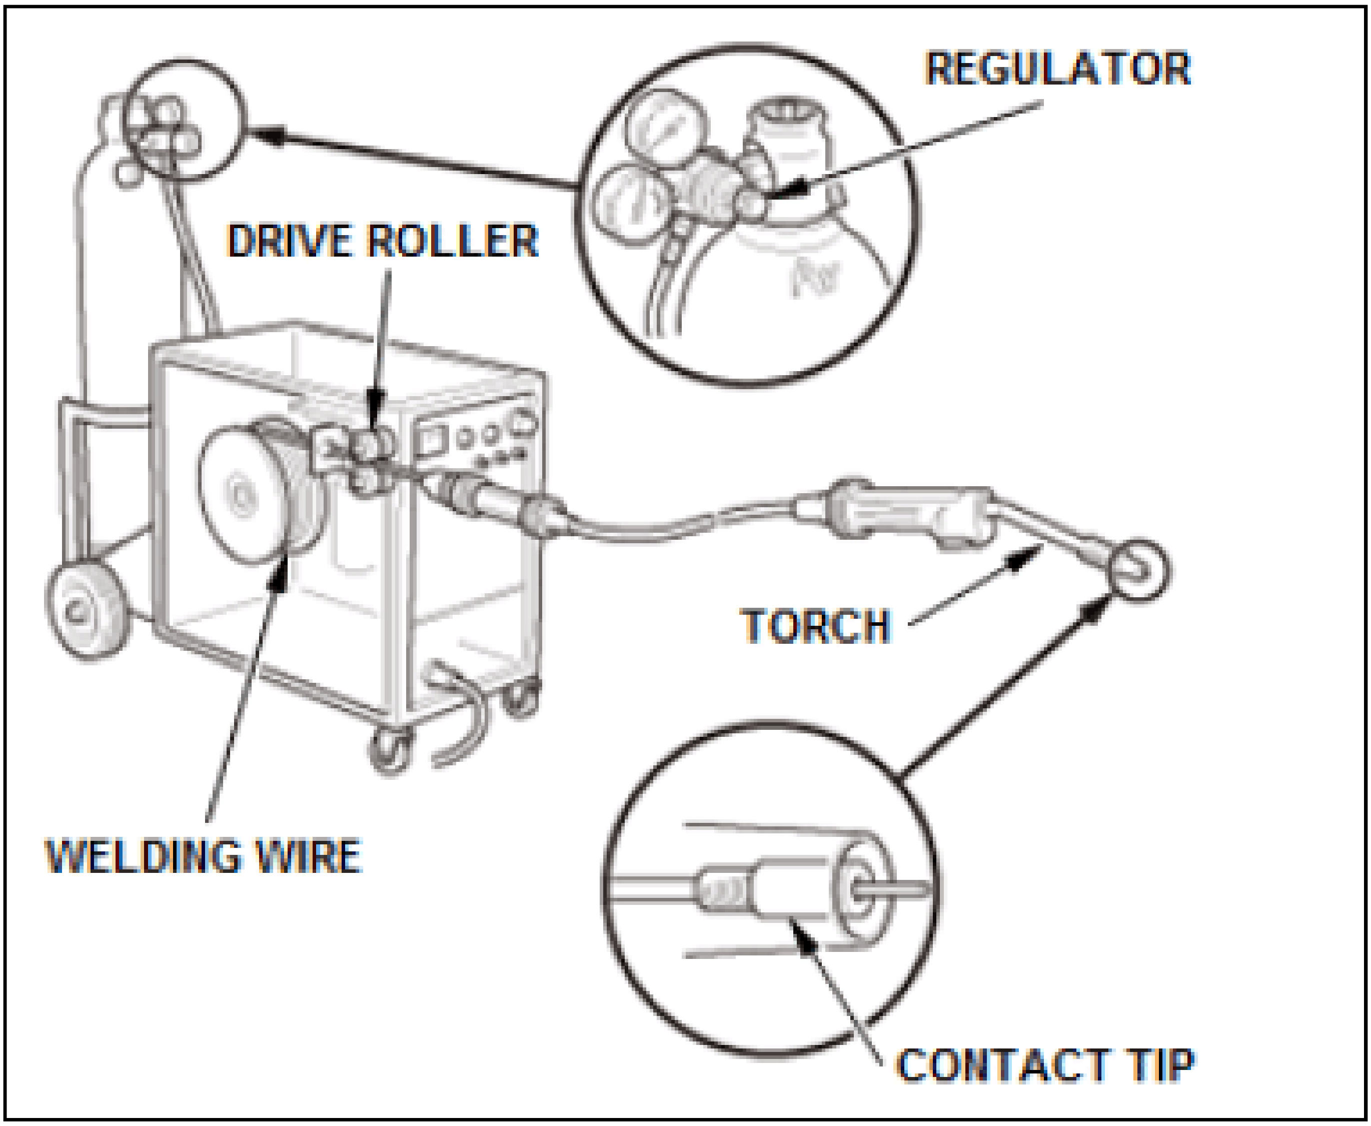
MIG Welding

MIG welding is a gas metal arc welding (GMAW) method where an electric arc forms between the consumable welding wire and the work piece, which heats and melts the wire and work piece, welding them together. During welding, inert argon shielding gas is supplied from a gas cylinder protect the welding area from atmospheric gases such as nitrogen and oxygen. The welding wire is automatically fed at a constant sped, based on the welder settings.

MIG Welding Conditions

- Must provide a maximum current of approximately 200 A
- Should allow dual purpose MIG welding of aluminum alloy and MAG welding of steel by changing attachments.
- Most often used welding panels are 1.6 to 3.0 mm thick, but this depends on a skill level of the welder. Some newer equipment allows welding of panels of less than 1 mm thickness.

NOTE: **Refer to the welding equipment product specifications issued by the manufacturers.**



Use a wire specified for MIG welding. Select an appropriate wire which results in the desired qualities (defect, strength, toughness, corrosion resistance etc.).

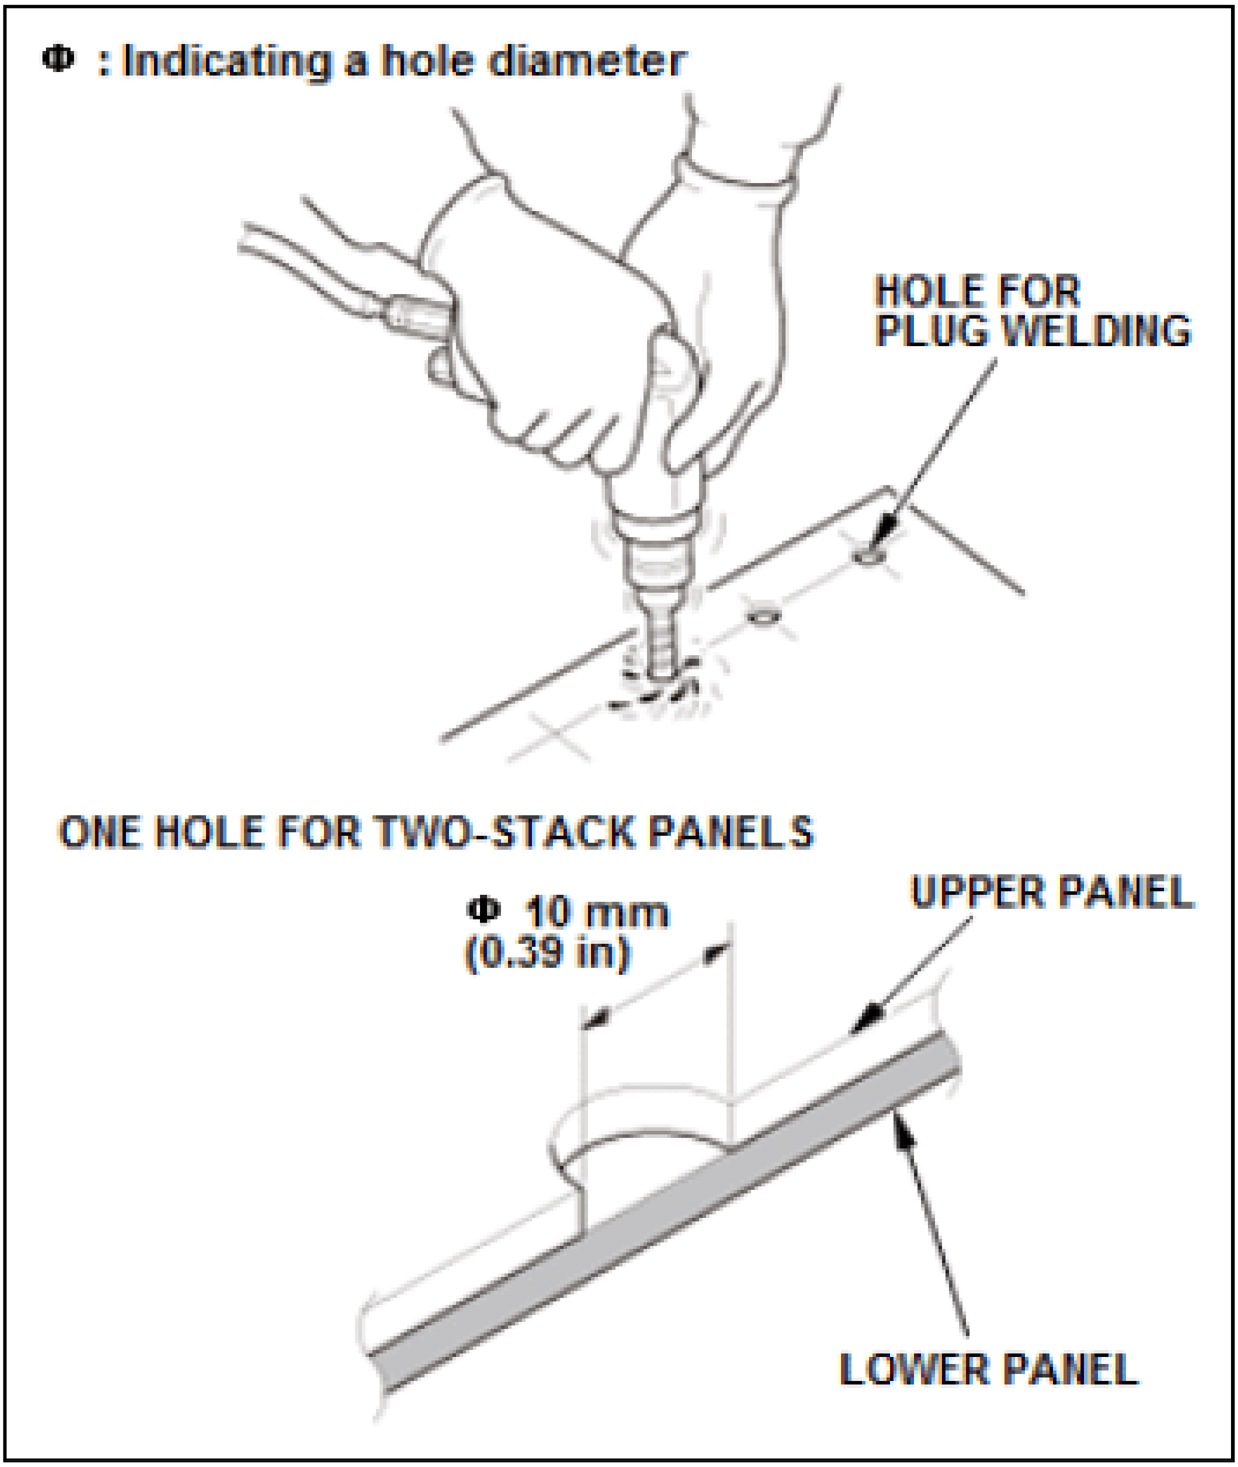
NOTE: **The electrode wire for Honda/Acura's aluminum alloy vehicle body should be with a diameter of 0.8 to 1.2 mm depending on the thickness of the work pieces.**

100% argon gas must be used.

Thickness mm (in)	1.6 (0.063)	2.0 (0.079)	2.5 (0.098)	3.0 (0.12)	5.0 (0.2)
Wire diameter mm (in)	0.8 (0.031)	0.8-1.0 (0.031-0.040)	1.0-1.2 (0.040-0.047)	←	←
Current (A)	50-70	60-110	80-120	100-140	120-170
Voltage (V)	10.0-11.0	12.0-15.0	13.0-16.0	15.0-18.0	17.0-20.0
Gas Volume L/min (CFH) 100% Ar	15-18 (32-38)	←	17-20 (36-42)	←	10-20 (21-42)

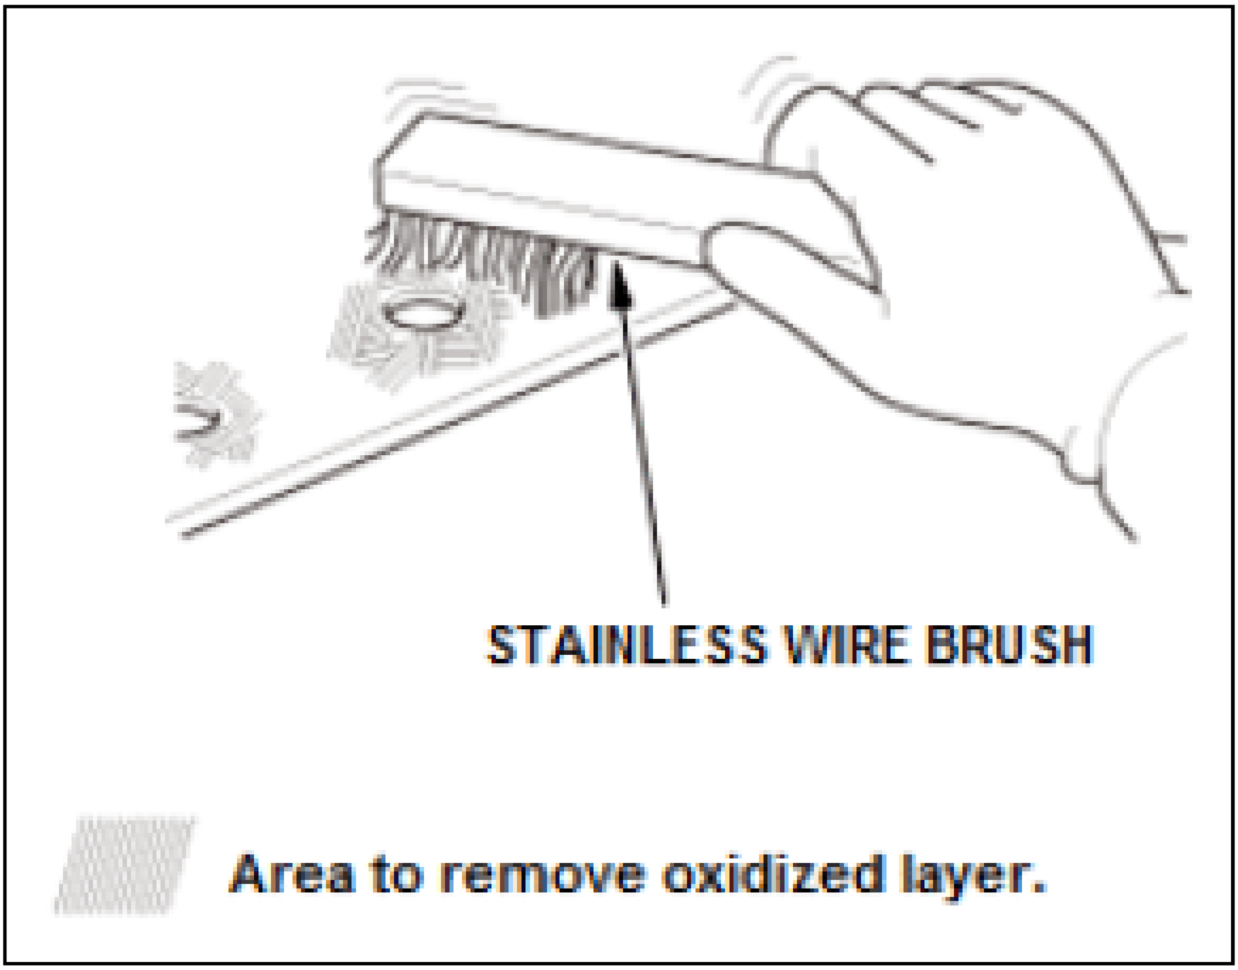
Plug Welding

1. Removal and installation of aluminum parts:
    - Drill and remove the spot weld nugget using a 10 mm (0.39 in) diameter spot weld cutter.
    - For welding use the hole drilled when removing, or drill a new plug hole (Ã˜8-10 mm (0.31-0.39 in)).



Φ : Indicating a hole diameter
HOLE FOR PLUG WELDING
ONE HOLE FOR TWO-STACK PANELS
Φ 10 mm (0.39 in)
UPPER PANEL
LOWER PANEL

2. Cleaning and removal of aluminum surface oxidation layer:
   - Remove contamination and oil residue from the area to be welded using degreaser.
   - Sand off paint film using a disk sander (P80).
   - Remove the oxidized layer using a stainless wire brush.
3. Firmly clamp the two panels being welded together. If there is excessive clearance, the weld will be defective.



STAINLESS WIRE BRUSH

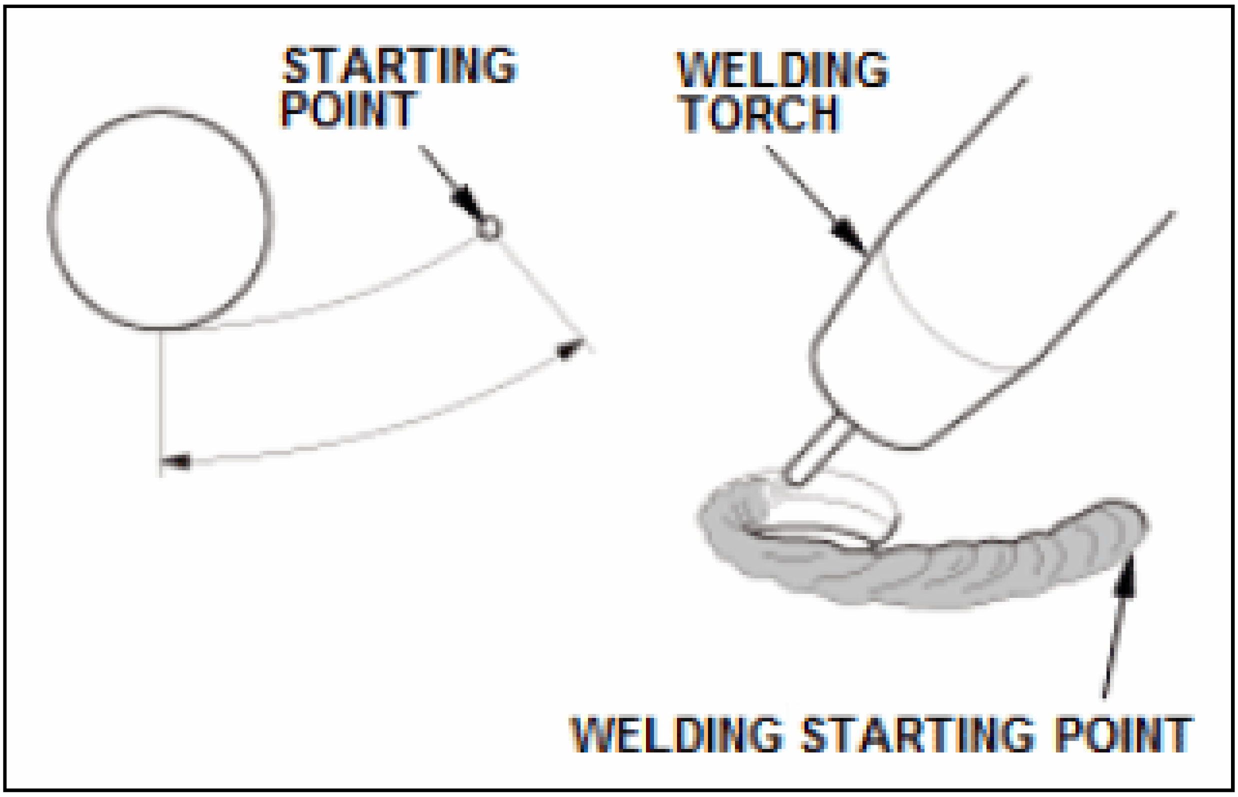
ONE HOLE FOR TWO-STACK PANELS
Φ 25 mm (0.98 in)
HOLE Φ 10 mm (0.39 in)
UPPER PANEL
FRONT
BACK
LOWER PANEL
Φ 15 mm (0.59 in)

4. Plug Welding:
    - Clean the area to be welded with a stainless wire brush just before welding to remove any oxidation.
    - Use plug welding technique, starting from outside.
    - Start from about 15 mm (0.59 in) outside of the hole to preheat the area and ensure confirmation of adequate penetration.
    - When starting, hold the torch firmly and place your body in a comfortable, supported position which also allows a clear view of the welding area.
    - While checking for the penetration status, move the torch along the edge of the hole.
    - If you are new to aluminum plug welding, be careful not to allow excessive tip-to-work clearance.

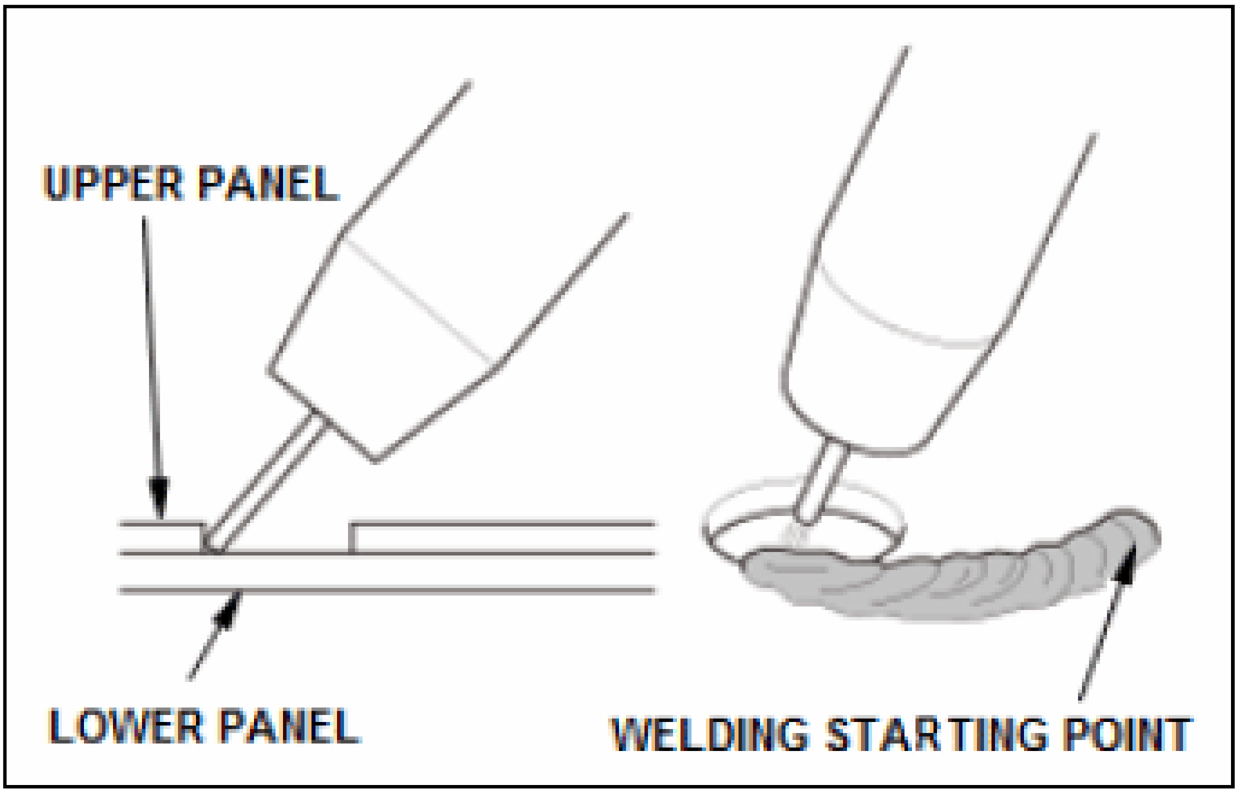


Welding Double Layer (Two-Stack Panels):

- Weld while aiming the torch at the edge of the hole on the mating surface between the upper and lower panels.
- Check penetration:
    - Depth of penetration should be 1/2-2/3 of the thickness of the bottom plate.
    - Ripples or beads (round marks) appearing on the back surface are a proof of adequate penetration.

Welding Triple Layer (Three-Stack Panels):

Weld the mating surface of the middle panel and the lower panel.



UPPER PANEL
LOWER PANEL

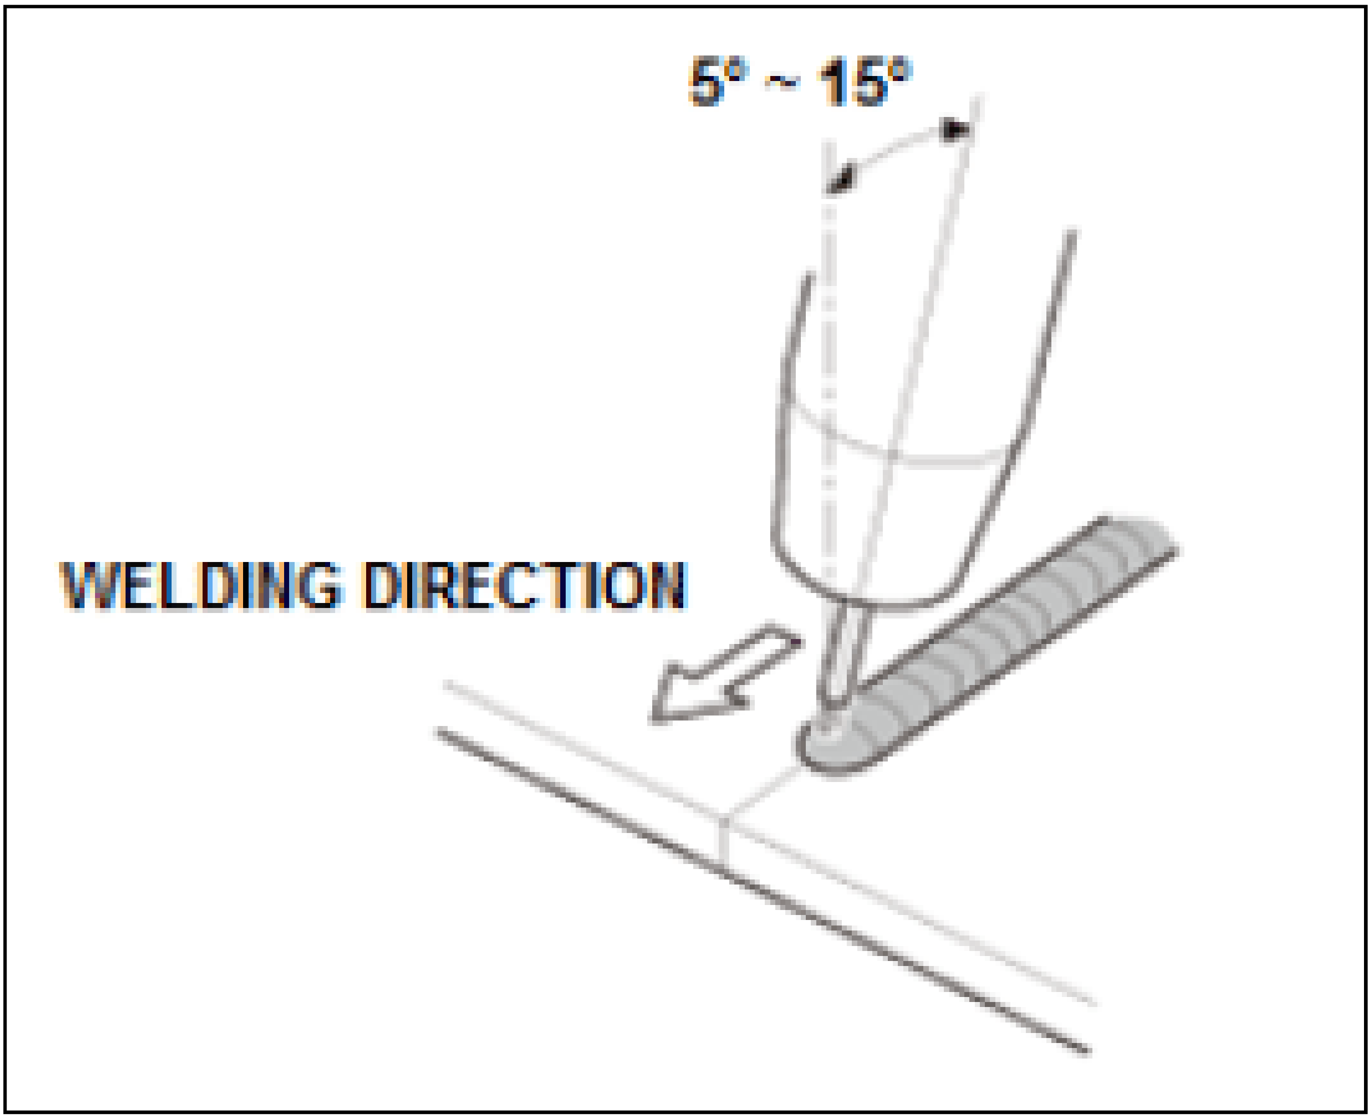
NOZZLE
TIP-TO-WORK CLEARANCE
WIRE PROJECTION
ARC
WIRE

Forward Welding



- The welding conditions for aluminum alloy must be set correctly and adjusted precisely during welding, because the allowable thickness range is rather limited when compared to welding steel panels.
- Compared to welding of steel panels, about 50% more shielding gas is required.
- When setting up the welding wire to the welding equipment, clean up the wire tip (edge) using sandpaper and push the wire through the torch by hand.

NOTE: **Care should be taken to avoid damaging the inner liner of the welder's cable.**

- Drive roller tension must be adjusted lower than when welding with steel wire. Hold the wire lightly at the contact tip and adjust the tension to allow slippage of the wire at the drive roller when the torch switch is turned on. If the drive roller tension is excessive, the wire can "bird's nest", or become jammed. Insufficient tension causes inconsistent wire speed.
- The wire feed speed is typically higher than when welding steel panels.
- The tip-to work clearance should basically be the same as when welding steel panels 8-15 mm (0.31-0.59 in).
- Use a push or forward welding technique with a torch of 5 to 15 degrees from the right angle against the work surface.

CAUTION:

- **Aluminum alloy tends to spatter during welding. Since it is very light, the weld spatter can be thrown over a considerable distance. Aluminum weld spatter is also difficult to see.**
- **It is important to provide protection for both the welder and also anyone in the surrounding areas.**
- **The edge of torch nozzle and contact tip attract spatter easily. If the spatter deposits, it disturbs the shield gas flow resulting in a poor welding quality Be sure to remove the spatter thoroughly using anti- adhesion agent.**
- **The ware of torch nozzle and contact tip will be more excessive compared to the steel welding.**

BODY REPAIR

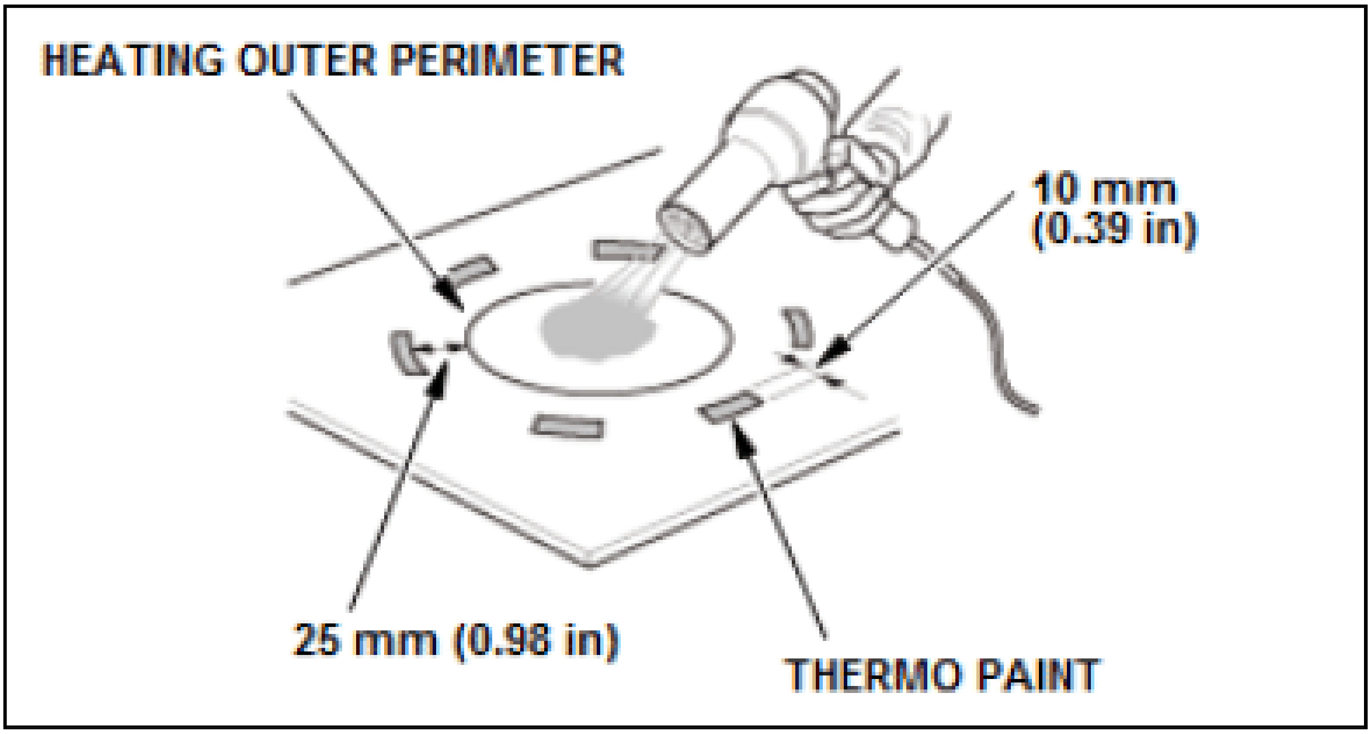
ALUMINUM ALLOY BODY REPAIR

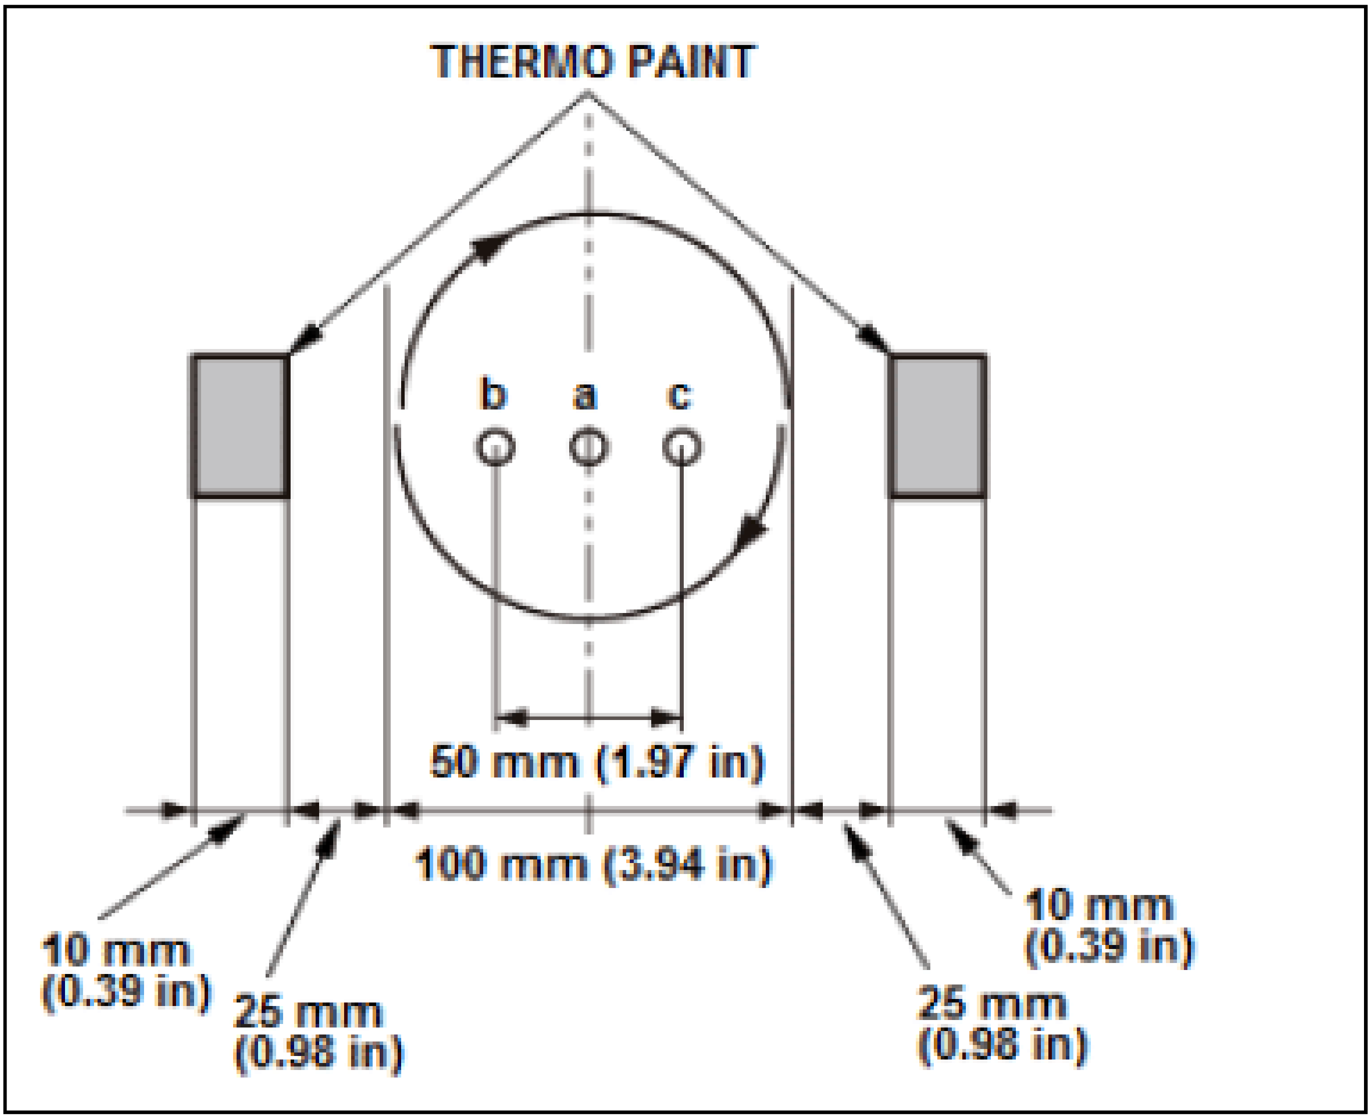
Body And Frame Correction

- Generally, the thickness of the core structural body parts (such as the frame) is 1.5 to 2 times thicker than those for a steel panel body.
- During pulling correction of an aluminum alloy body more resistance will be felt than for a steel panel body.
- When an aluminum alloy body is collapsed by collision impact, the parts are easily cracked because of work hardening. If the parts are pulled as is, cracking will occur, making repair impossible. Therefore use aluminum's elongation characteristics and pull the damaged area using a body and frame correction equipment while heating the aluminum parts being straightened.

Heating And Temperature Control Of Aluminum Alloy

- When aluminum alloy is heated over 392Â°F (200Â°C), its elongation characteristics are improved. However its melting point is as low as 1184Â°F (640Â°C).
- Heated aluminum does not change color like steel sheet. So there is no way to accurately judge the amount of heat input. Therefore, it is extremely important to carefully monitor the heating temperature by external means.
- To accurately monitor and control the correct heating temperature, always use heat detection crayon or paint that changes color at 230Â°F (110Â°C).





THERMO PAINT
b
a
c
50 mm (1.97 in)

25 mm
(0.98 in)

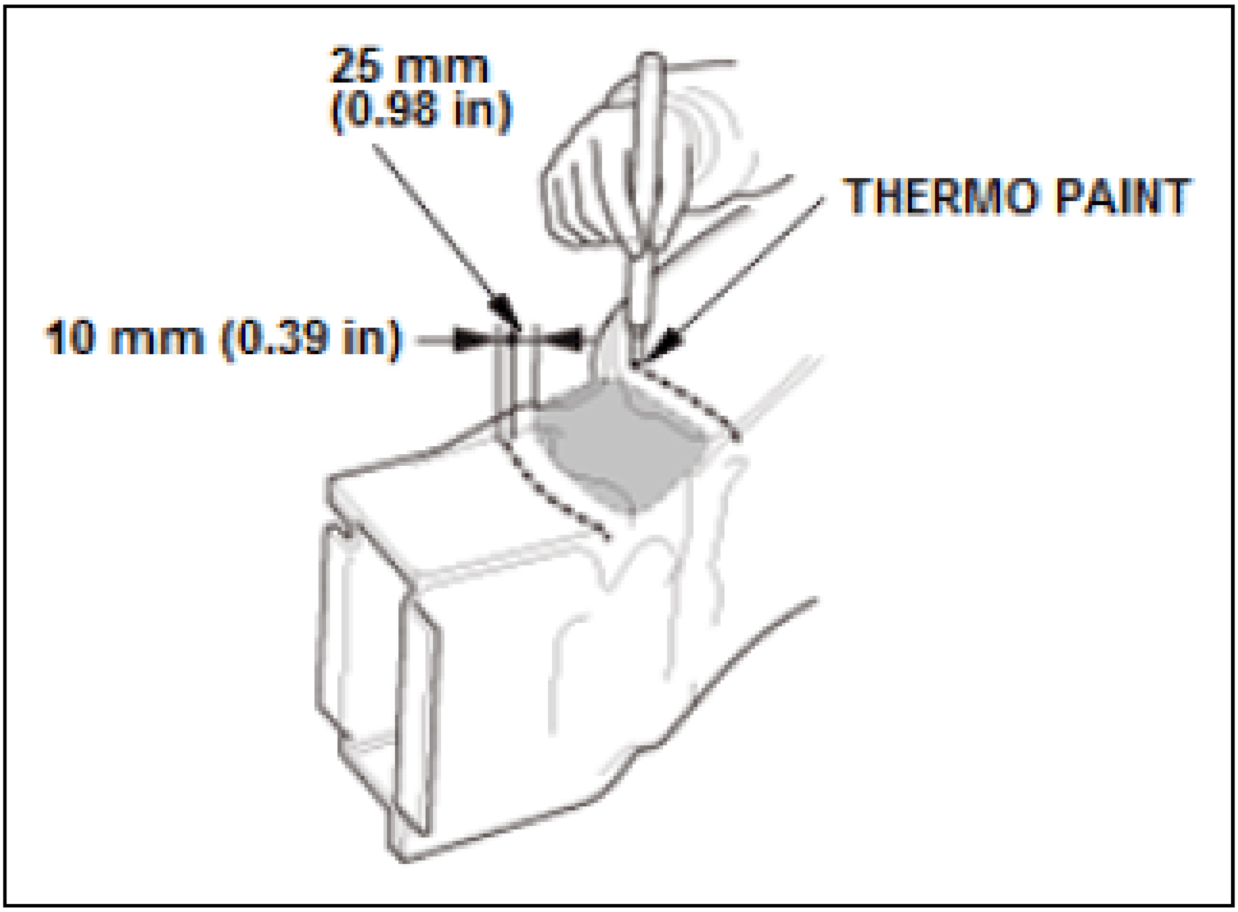
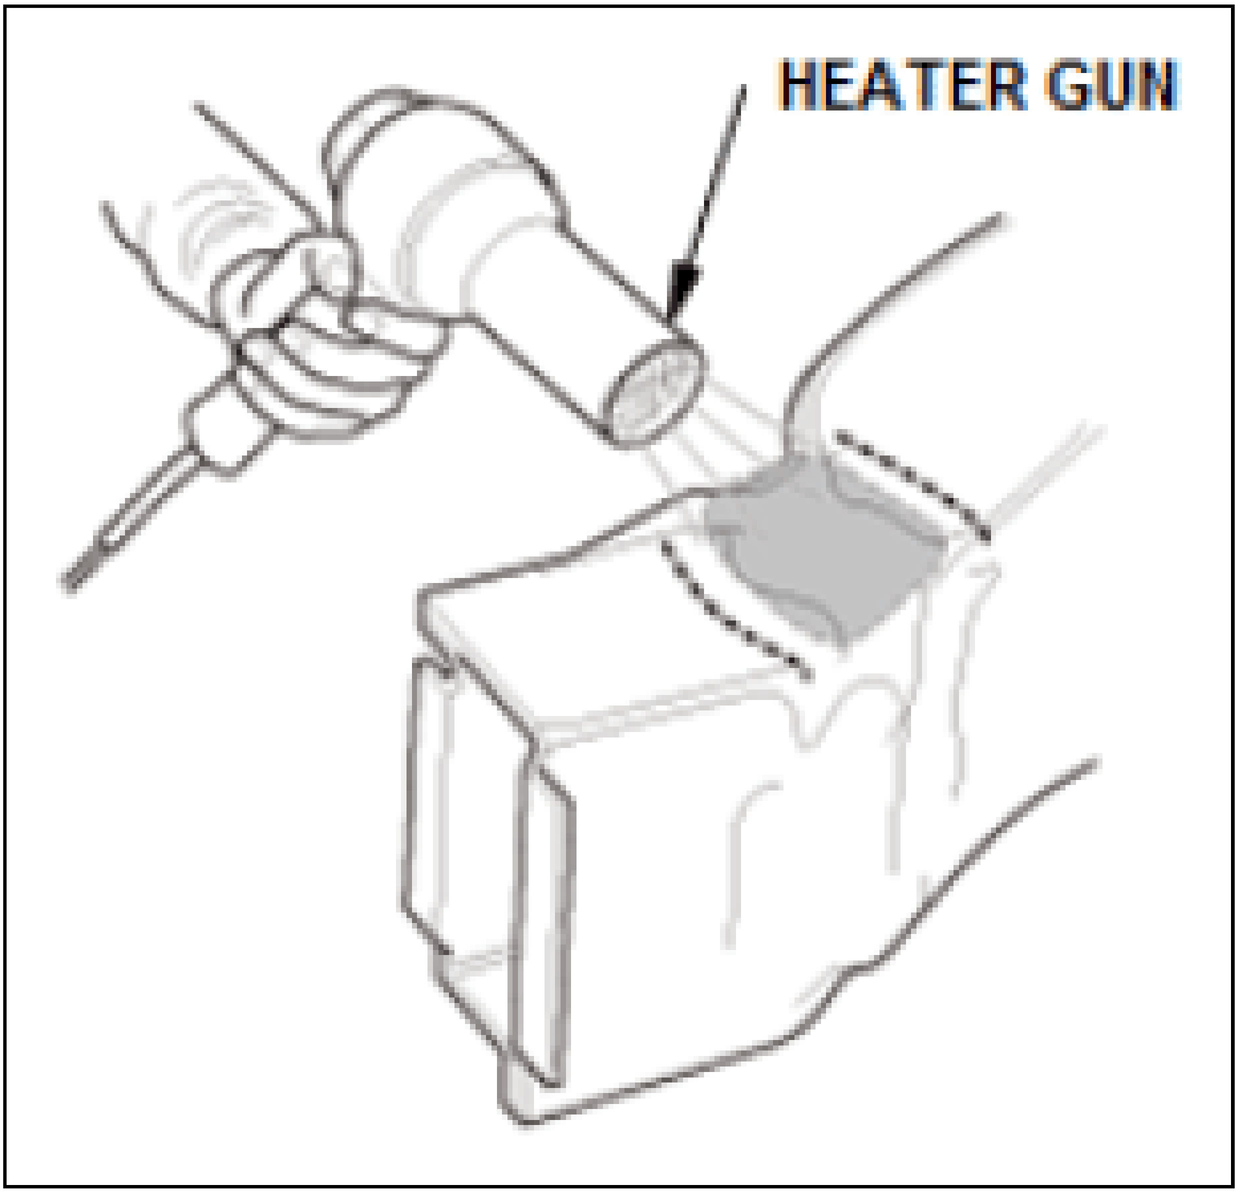
1. Apply heat detection crayon or paint about 25 mm (0.98 in) away from the border of the flame contact area shown in the figure with a width of about 10 mm (0.39 in).



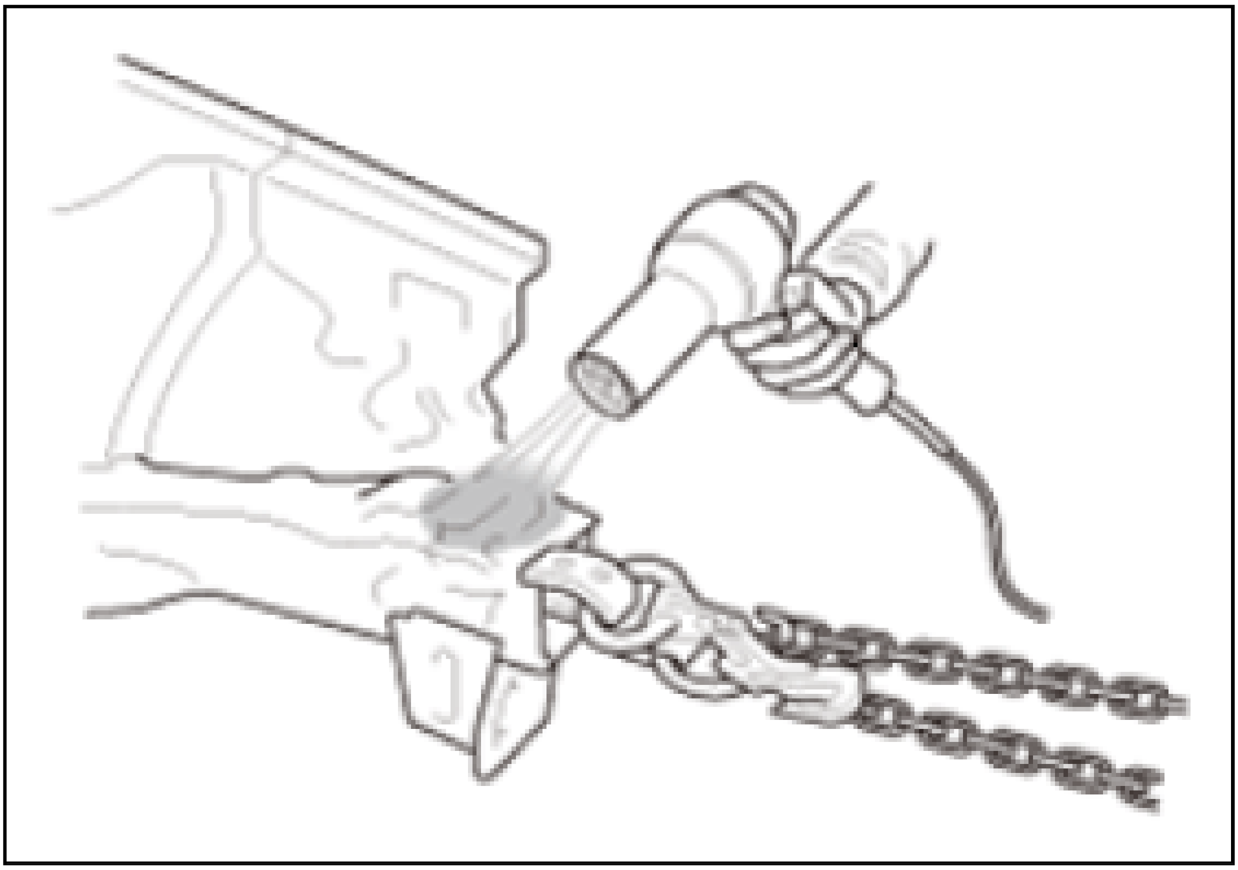
25 mm (0.98 in)
THERMO PAINT
10 mm (0.39 in)

2. Always move the flame tip around. Do not keep it at a fixed point.

3. Stop heating when the heat detection crayon or paint fully changes color.



4. Restore the frame dimensions by pulling using a body and frame correction machine. Repeat this process as necessary.
5. Be sure to check for cracks after the repair.



Crack Inspection

Always do crack inspections on aluminum alloy using a dye penetrant testing after welding and correction processes.

- Penetrant Test

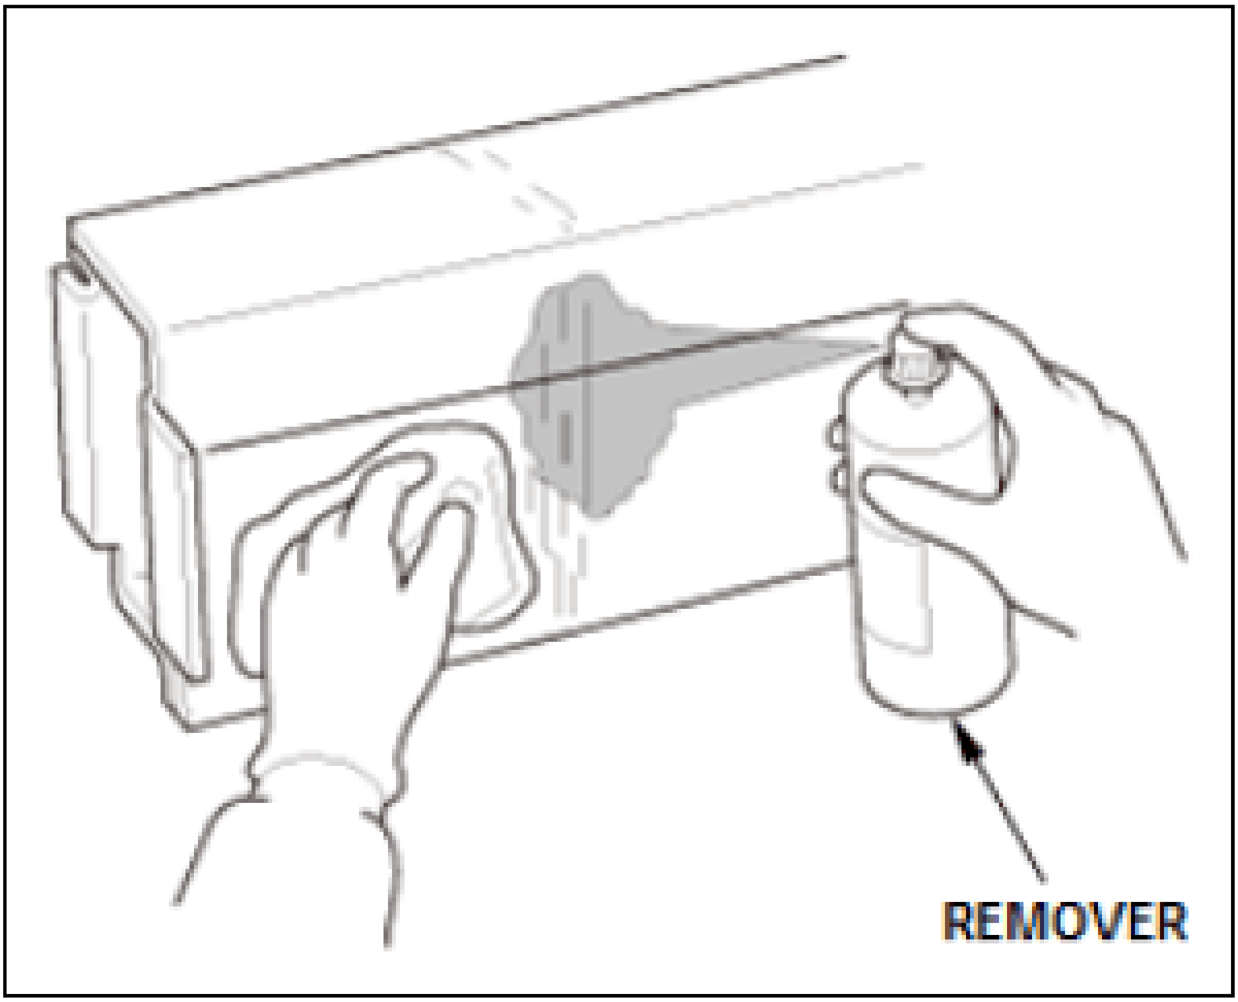
  Dye penetrant uses its capillary action and strong penetration capability to reveal minute cracks and defects that cannot be seen during visual inspection.

- Dye Penetrant Testing Method

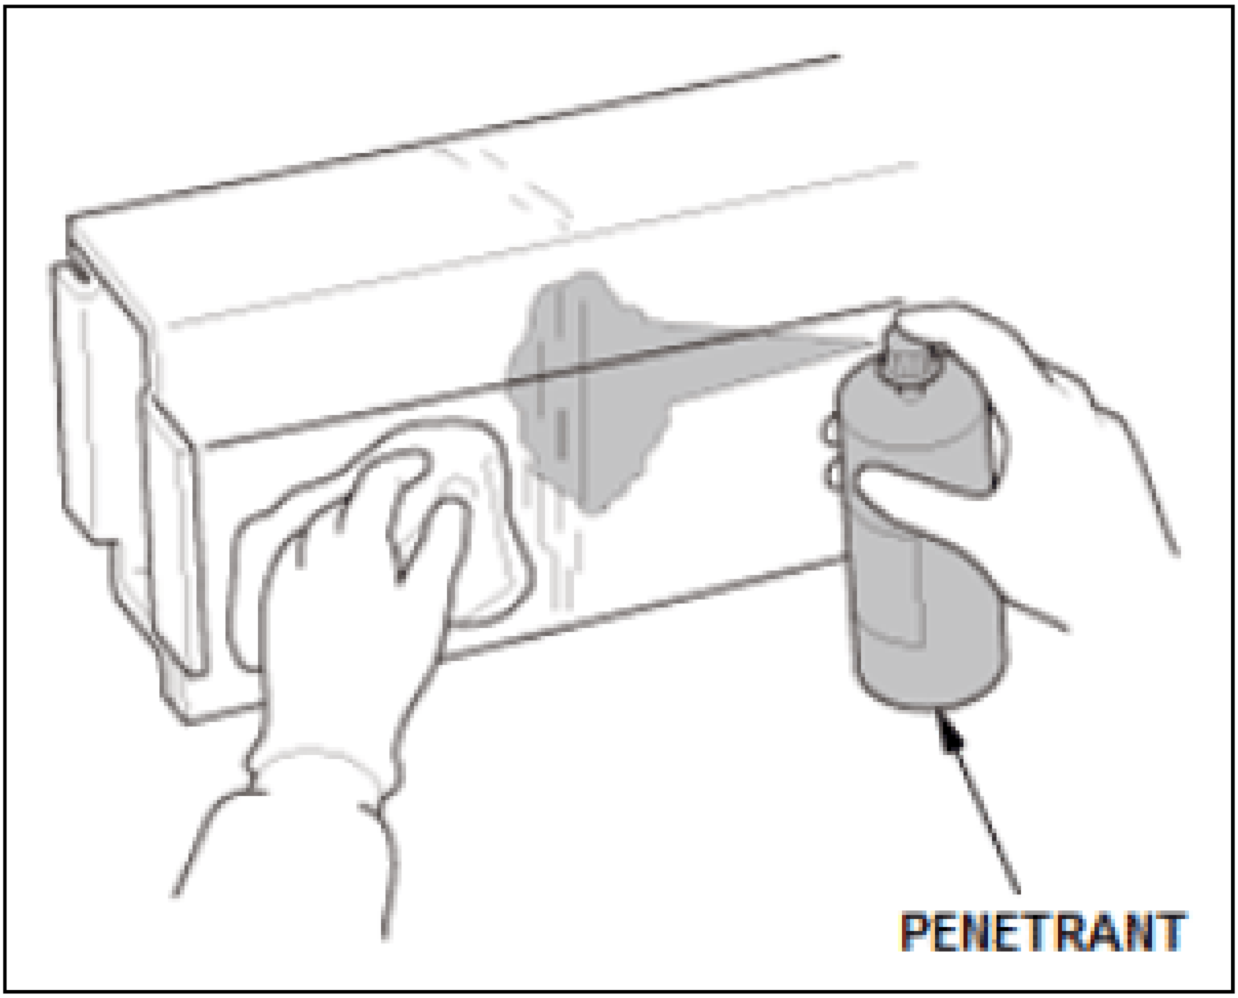
  Use a dye penetrant with a high contrast color against the developer in a well lit area for better visibility.

Inspection Steps

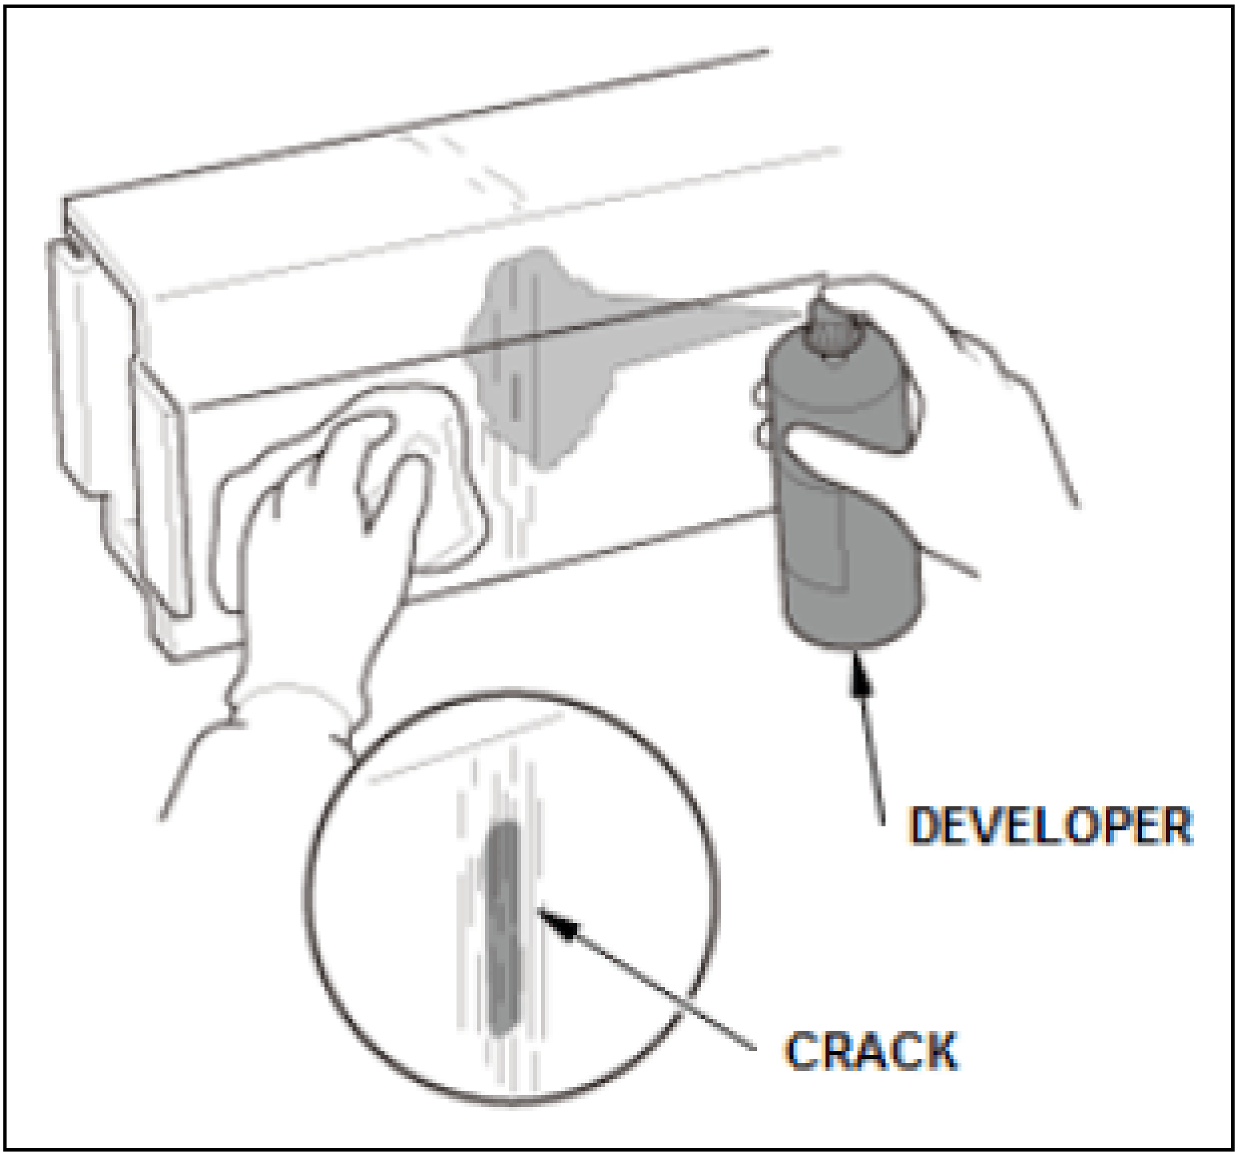
1. Prepare penetrant, developer and remover.
2. Clean dye and developer from the inspection areas using the remover.



3. Apply penetrant in the inspection areas. Let it stand for a period of time to allow it to soak into the surface.



4. Remove excess penetrant from the inspection areas.
5. Apply developer to the inspection areas. Cracks will be detected by a color change.



Overview

Aluminum alloy body repairs are basically done in a similar manner as for a steel body. However there are some points that are different from each other due to aluminum's characteristics. In particular, repair tools for aluminum-alloyed bodies are completely different, and must be isolated from, those for steel panel bodies.

Pulling And Correction Repair

Because some aluminum parts cannot be reformed due to their high rigidity refer to the model specific body repair information to identify those parts.

Welding

- For welding methods, refer to the appropriate service information.
- Be sure to check for cracks after welding.

Sanding

- Never use sanding tools that have been used for steel panels. If tools used for steel panels are used for aluminum alloy panel repairs, iron powder will remain on the aluminum panel, contaminating the welding area.
- Always use only stainless steel wire brushes.
- When a sanding tools such as a disc sander is used, set their rotational speed lower than for a steel panels. Do not press the sander as hard against the aluminum panel. The heat of friction caused by excessive pressure cause the aluminum alloy surface to peel, clogging the sanding disc surface. It will also deeply scratch the aluminum surface.

Aluminum Sheet Repair

- Do not use a shrinking hammer.
- Do not repair using solder.
- Heated aluminum does not change color like steel sheet. Always use heat detection crayon or paint to measure and control the heat input during repairs.

Parts Installation:

Be sure to use fasteners specific deigned with anti-corrosion treatment for attaching aluminum parts.

WARNING: **Beware of possible thermite reactions while working. Refer to FIRE AND EXPLOSION RISKS under safety and cleanliness section.**

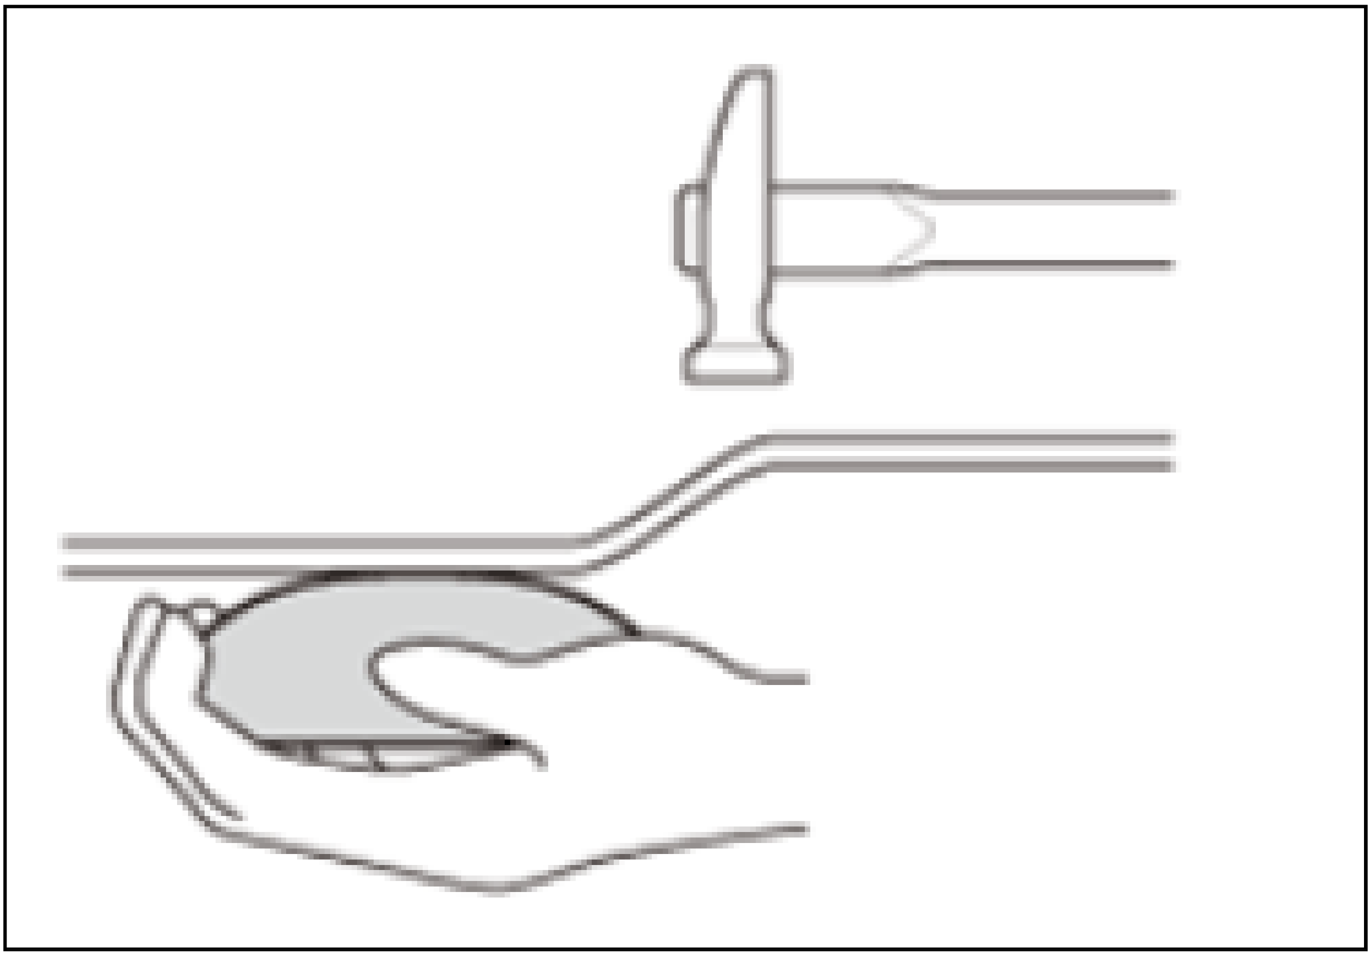
Panel Repair

Correction Using Hammers And Dollies

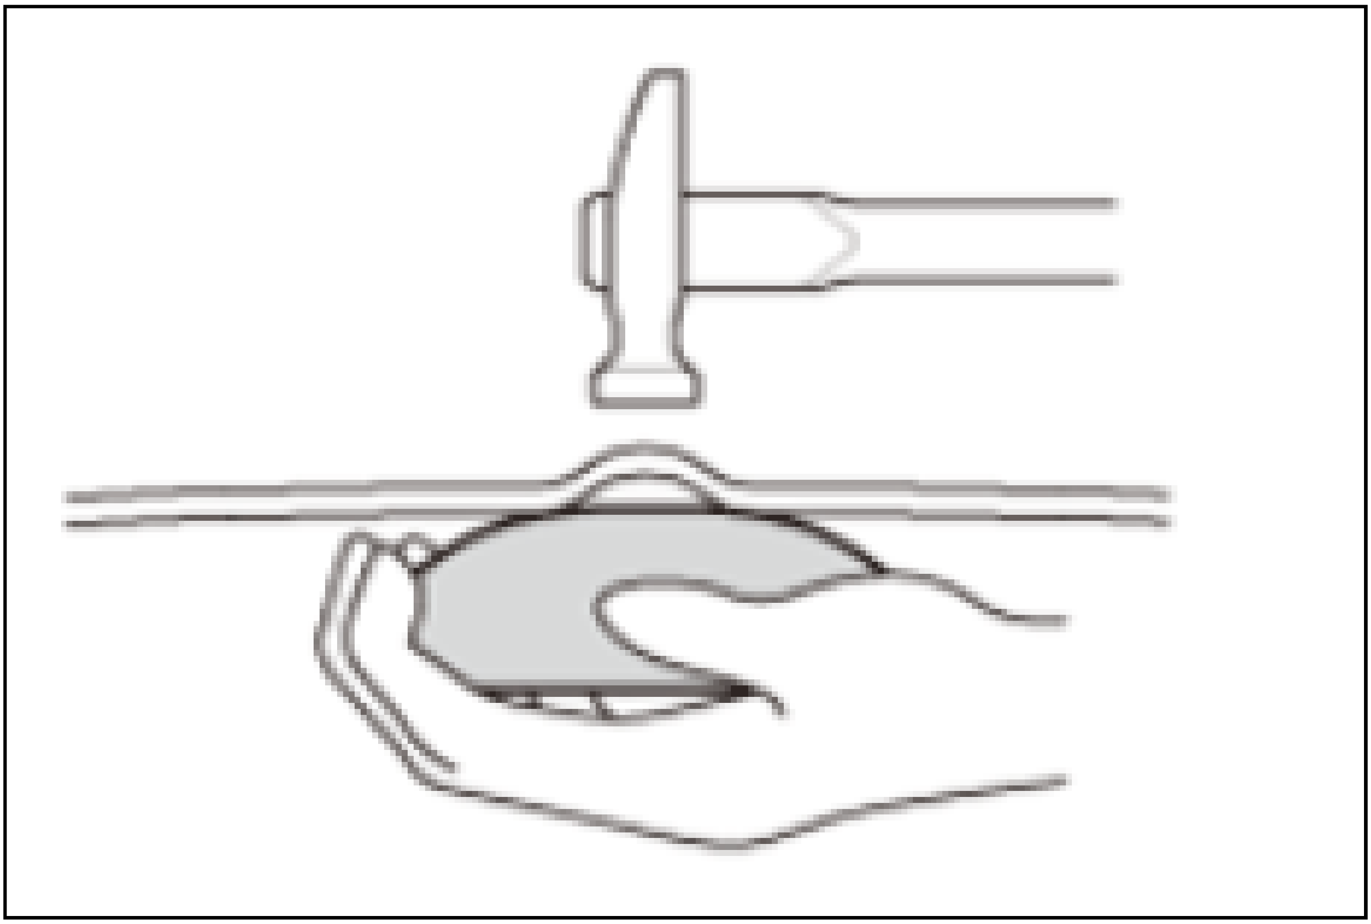
- Hammering out should be done, basically the same way as for steel panels.
- Because aluminum alloy has a higher elongation rate than steel, select use wood or plastic hammers depending upon the repair requirements.
- Always keep the hammer and dolly surfaces polished so they do not damage the panel surfaces.
- The hammer off dolly technique is used most it tends to cause less elongation and work hardening. When a hammer on dolly technique is required, pay careful attention to the elongation and tap lightly.

NOTE: **To prevent cracks and deterioration in aluminum parts, do not use solder to repair aluminum alloy panels.**

Hammer off dolly



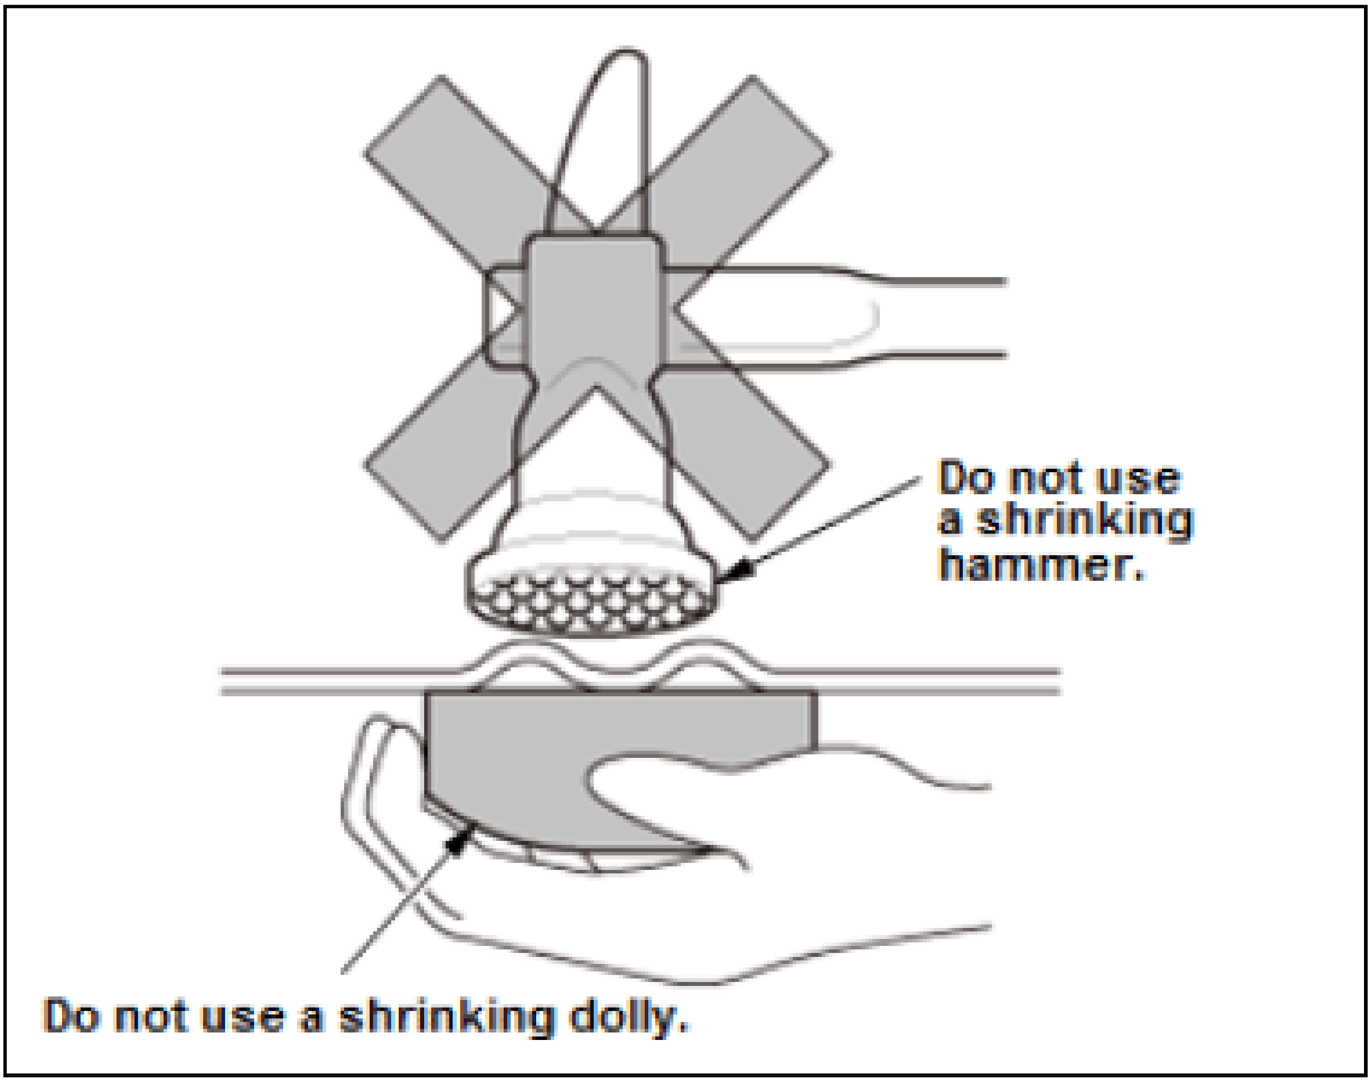
Hammer on dolly



Shrinking (Drawing)

- Shrinking of aluminum alloy panels is done the same way as steel panels.
- Always use heat detection crayon or paint to measure and control the heat input during repairs.

NOTE: **When using a hammer for finishing, do not use a serrated shrinking hammer or dolly like those used for steel panels because it may cause cracks.**



Body Filler (Putty) Repairs

- Proceed with correction and repair the same as for steel panels.
- When removing old paint layers on aluminum alloy panels, apply less pressure to the disc sander than for steel panels to prevent distortion.

  Use a sanding disk with P80 to P120.

- Finish sand filled surfaces with P80 sandpaper.
- Featheredge the repair area using P120 sandpaper.
- Somebody fillers cannot be directly applied on a raw aluminum alloy surface. In this case, apply epoxy-based primer to the surface before body filler application.

NOTE: **Refer to the specifications issued by the body filler and paint manufacturers for the appropriate body filler or putty to be used on aluminum alloy.**

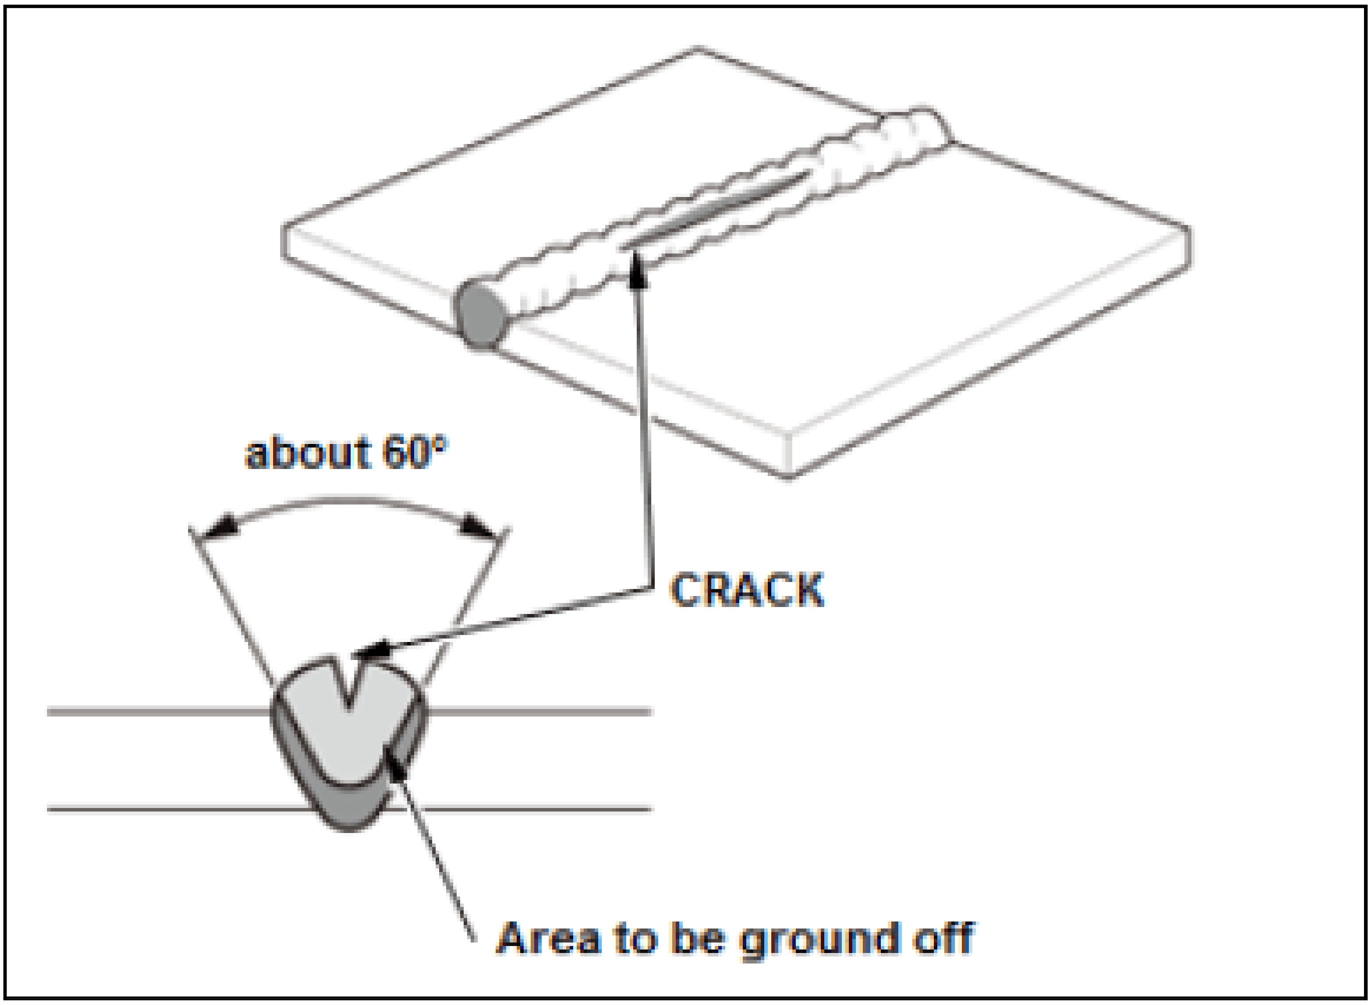
Repairing A Crack

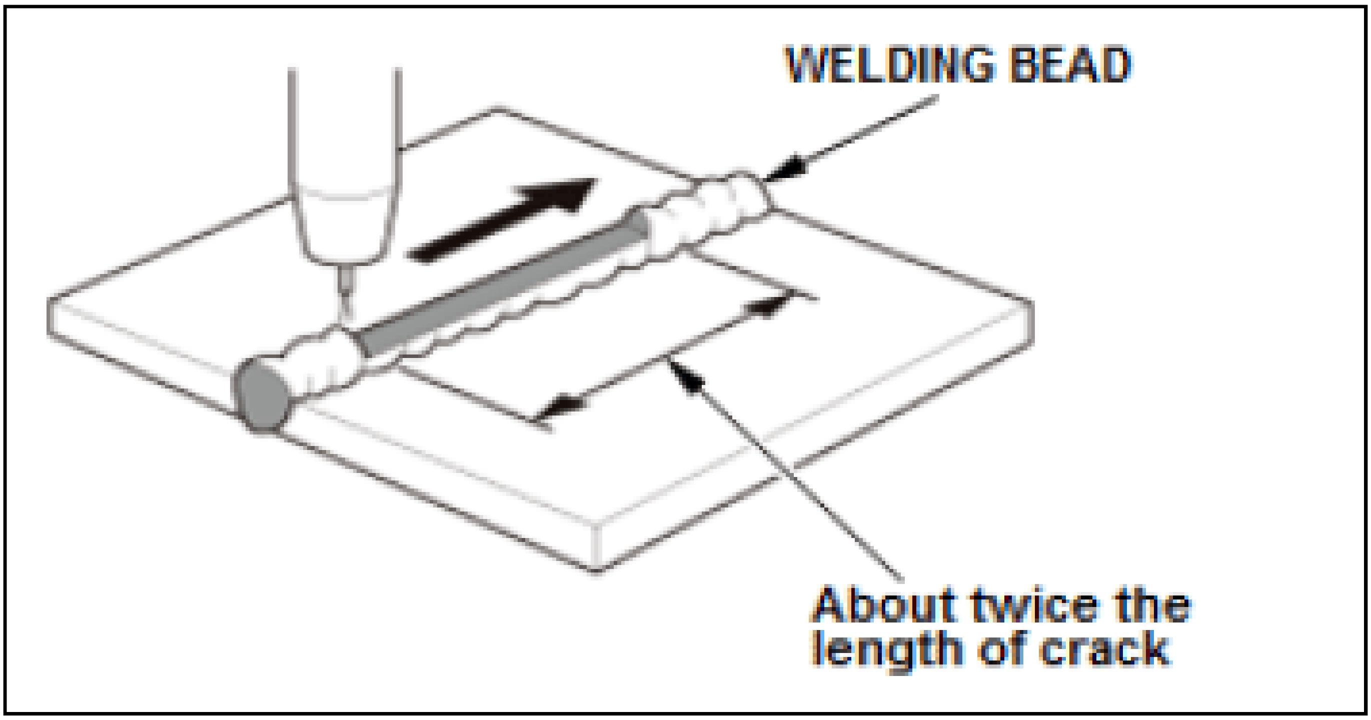
If any cracks are discovered during inspection, be sure to repair them.

Welding Area

Sand down the bead twice the length of the crack and correctly re-weld.



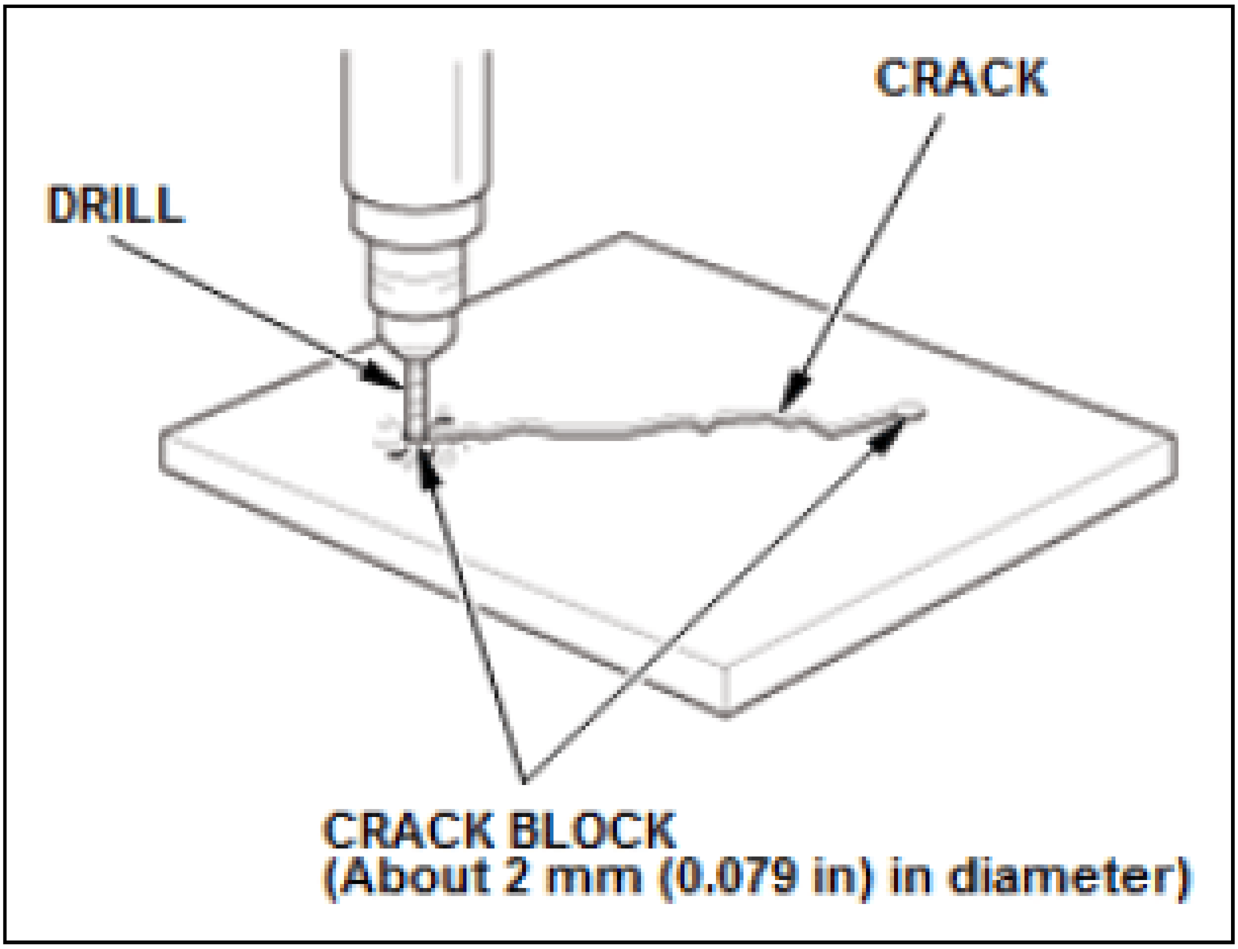
about 60°
CRACK
Area to be ground off



WELDING BEAD
About twice the length of crack

Panel Repair Area

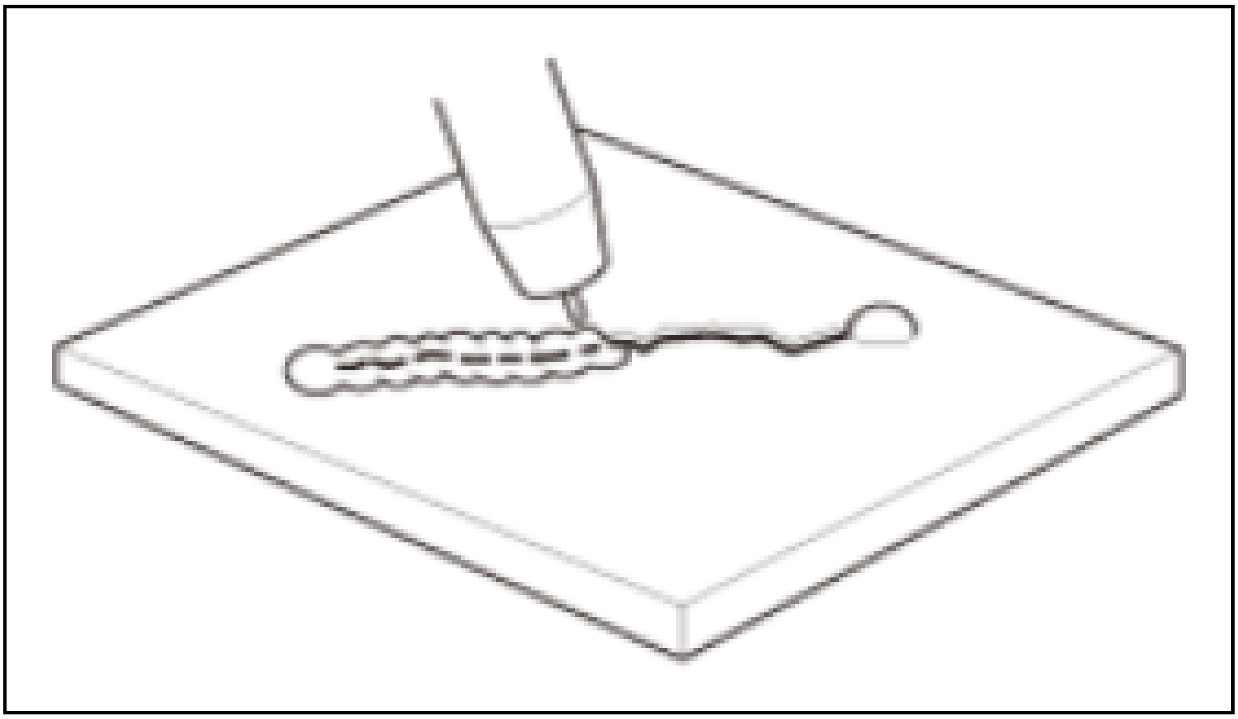
- Drill about 2 mm (0.079 in) holes at both ends of the crack to stop further progression.

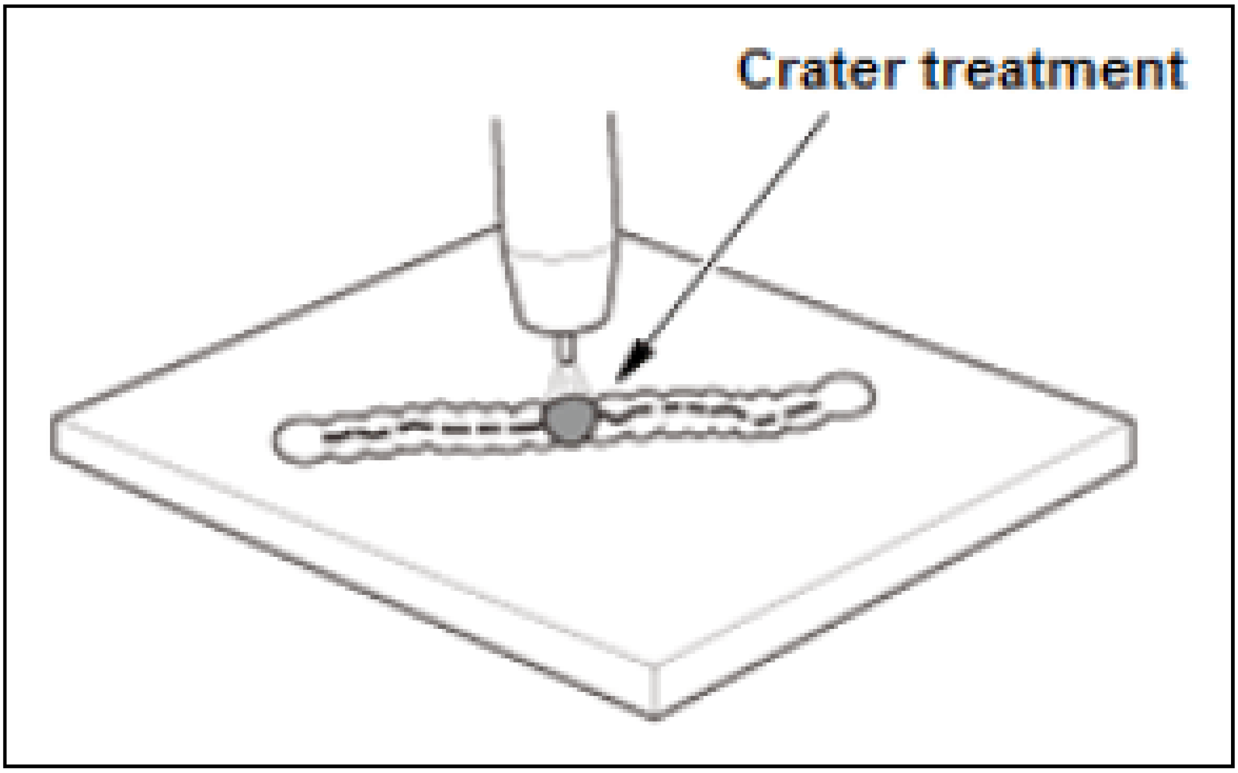


CRACK
DRILL
CRACK BLOCK
(About 2 mm (0.079 in) in diameter)

- Weld the crack thoroughly.

NOTE: **If a crack appears during the pulling, be sure to replace that part with a new one. Do not weld it.**





FINAL INSPECTION

Final inspection of collision repairs using the four perspectives below is required for customer satisfaction:

- Appearance restoration
    - Exterior finish
- Safety assurance
    - Driving performance
- Maintaining strength
    - Welding, interfacing
- Durability and anti-rust quality assurance
    - Rust, corrosion
- External appearance inspection:
    - Paint finish

      Inspect for contaminants, paint runs, sanding scratches, unevenness on filled surfaces, color match, etc.

  - Fit and finish inspection

    Inspect for gaps, steps, off-set and operation performance of hood, fender, doors, bumpers, lights, etc.

  - Assembly damage inspection

    Inspect for scratches and contamination on the painted surfaces.

  - Assembly defect inspection

    Inspect for soft set electrical connectors, wiring errors, missing screws, paint peeling due to bolt installation, etc.

  - Paint and overspray inspection

    Inspect for excessive paint or paint overspray on body components, or glass due to insufficient masking.

  - Inspect for contamination and odors

    Inspect for remaining body filler, sanding dust, and other contaminants in engine compartment, wheels, tires, underbody and chassis components, Passenger compartment and trunk spaces. Also inspect for remaining odors from painting processes.

- Safety inspection:
  - Wheel alignment

    Check and adjust (camber, caster, toe, etc.). If non-adjustable alignment angles are out of specification, body or suspension component damage may be present that was missed during the original repairs.

  - Brake related system

    Inspect for fluid leakage and air mixing etc.

  - Lights

    Check the operation of all exterior and interior lights and signals. Adjust the headlight aim if necessary etc.

  - Fuel system

    Inspect for fuel leakage.

- Maintenance and assurance of strength

  High quality welding done according to published procedures is absolutely necessary to maintain and assure body strength. However it is difficult to thoroughly inspect welding quality only after welding work is complete. It is very important to also do intermediate inspections during the repair process to assure welding quality in addition to the final welding quality inspection.

- Inspection for anti-rust:
  - Under body

    Check the application status of undercoating.

  - Mating of panels

    Check the application area and status of body sealer.

  - Water intrusion (rain intrusion test)

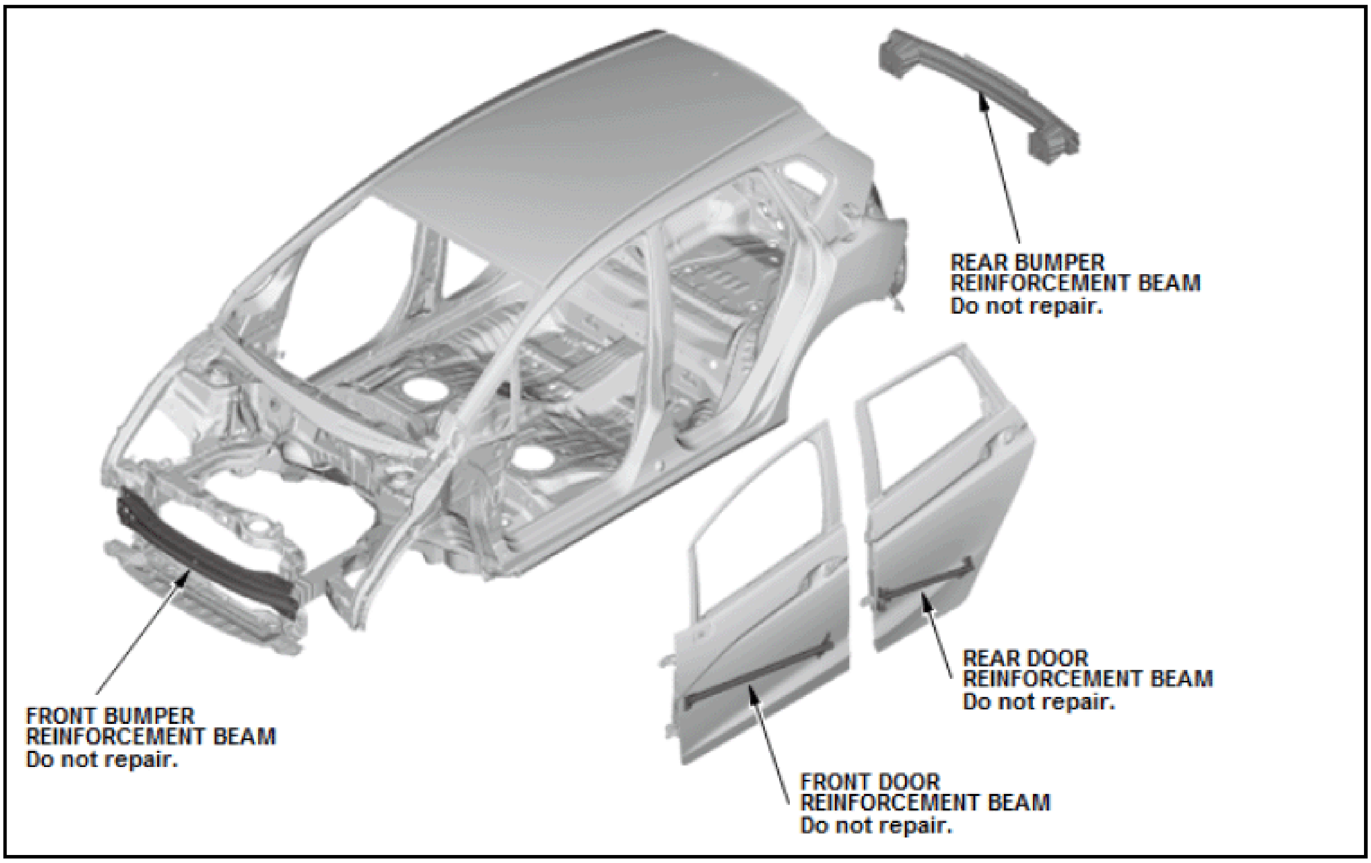
    Check for water leaks where panels or other parts mate (glass, taillight etc.), weatherstrips on doors, etc.

REPAIR OVERVIEW

Door And Bumper Reinforcement Beams

Door reinforcement beams and bumper reinforcement beams, should NEVER be repaired!

The entire door, or bumper beam, must be replaced if they are damaged.



REAR BUMPER REINFORCEMENT BEAM
Do not repair.
REAR DOOR REINFORCEMENT BEAM
Do not repair.
FRONT BUMPER REINFORCEMENT BEAM
Do not repair.
FRONT DOOR REINFORCEMENT BEAM
Do not repair.

High Strength Steel Sheet Welding Overview

Spot welding is the recommended and preferred procedure for the welding for high-strength steel parts same as for a mild steel plate welding. In areas that cannot be accessed by a spot welder, perform the MAG welding or MIG brazing as specified in the Replacement procedures.

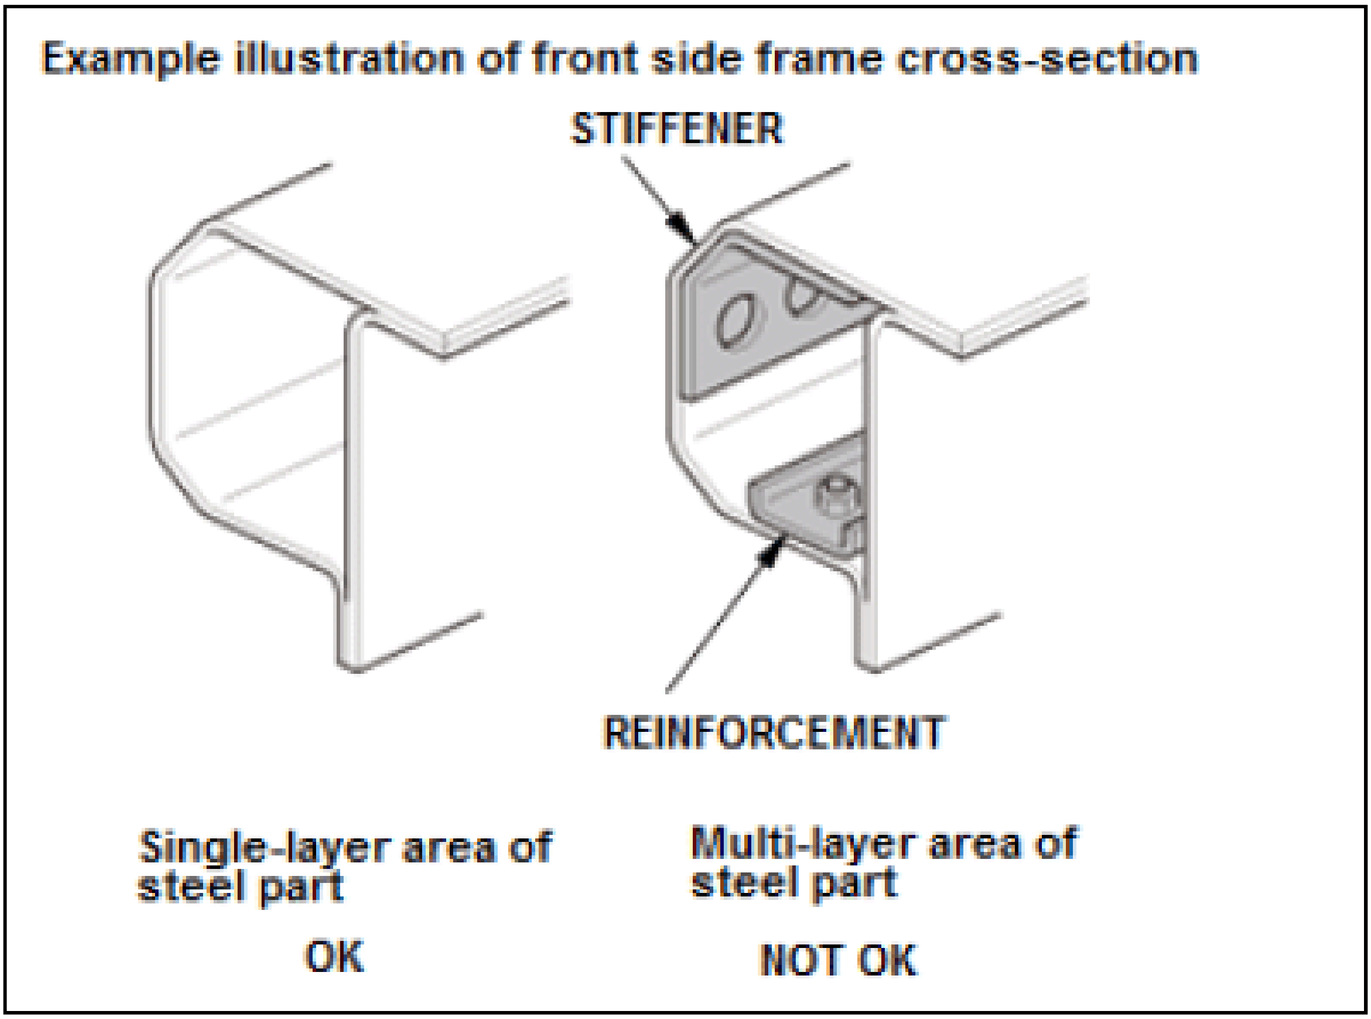
Tensile strength and welding method

Tensile Strength (MPa)	Welding Method		
	Spot welding	MAG Weld	
		Plug	Butt
270	◦	◦	◦
340	◦	◦	◦
440	◦	◦	◦
590	◦	◦	◦
780	◦	◦	◦
980	◦	◦	x
1180	◦	◦(1)	x
1500	◦	◦(1)	x

(1) MAG plug welding is only allowed on these steel grades in selected locations as specified in the body repair information. Welding instructions must be followed exactly as specified to ensure adequate weld strength.

- MIG welding/brazing: Metal inert gas welding or brazing where 100% Argon (Ar) shielding gas is used. Argon is inert and does not react with the molten weld pool or brazing operation.
- MAG welding: Metal active gas welding where the shielding gas being used contains a mixture of 80% Argon (Ar) and 20% Carbon Dioxide (CO_2). It is considered active because the CO_2 undergoes a limited reaction with the molten weld pool. A shielding gas mixture of 75% argon (Ar) and 25% carbon dioxide (CO_2), is also acceptable.

Parts Sectioning Guidelines - Cut And Join



Example illustration of front side frame cross-section
STIFFENER
REINFORCEMENT
Single-layer area of steel part
OK
Multi-layer area of steel part
NOT OK

Replacement of steel parts at factory seams and matching the replacement part configuration remain the preferred repair methods. However, these methods alone are not always practical nor cost effective in all body repair situations. While some limited sectioning procedures are provided in the body repair information, it is not possible to develop published procedures covering every type and angle of impact. The revised guidelines detailed below are intended as "basic rules" for properly trained collision repair professionals to use when sectioning steel parts on Honda and Acura vehicles.

Follow these guidelines to avoid an unsafe repair:

- Outer body and floor panels may be sectioned as necessary. Specific sectioning procedures are not provided in the service information.
- Depending on the type of vehicle damage, steel parts with a tensile strength of 780 MPa or less may be sectioned provided all three of the following conditions are met:
  - Sectioning must be done in a single-layer area of the part.
  - Multi-layer internal steel reinforcements and stiffeners must not be cut.
  - Do not section in load bearing areas, such as engine, transmission, or suspension mounting points.
- To determine if a part has a single-layer area that can be sectioned, do the following:
  - Check the appropriate body repair information to determine the steel grade(s) and part configurations of the parts being replaced.
  - Inspect the original and replacement parts to confirm if there are internal reinforcements and/or stiffeners.
  - Spot welds not directly on a flange or joint indicate a reinforcement or stiffener inside.
  - The appropriate service information shows some internal reinforcements as shown.
- If any of the above sectioning conditions cannot be met, replace those body structural components (stiffeners, reinforcements, and other multi-layered steel parts) as assemblies that match the replacement parts configuration.

Partial Panel Replacement At Factory Seams

When you are determining whether to replace a body part as supplied, or do a partial replacement at the factory seams, follow these guidelines:

- Replacement of body service parts as supplied at factory seams is the preferred repair method, except when it may cause unnecessary or excessive intrusion into the body structure.
- In these cases, the service part may be disassembled at factory seams as required to replace only the damaged portion.

- For example, if only the vehicle's rear wheelhouse is damaged, that part may be removed from the rear inner panel service part assembly at the factory seams and installed on the vehicle.
- All basic welding & sectioning guidelines specified in the electronic service information must be observed during partial panel replacement.

Repair Basics

Assuring Repair Quality

The purpose of collision repair is to restore the quality and performance of the vehicle to its pre-loss condition. The four basic principles below must be assured during collision repairs.

- Appearance restoration...... exterior finish
- Safety assurance...... driving performance
- Maintaining strength...... welding, interfacing
- Durability and anti-rust quality assurance...... rust, corrosion

Protecting Vehicle

- Washing before repair:
  - Helps identify the damaged area and prevent overlooking any damage. (check also for other scratches and dents outside the repair area).
  - Reduces the introduction of dirt, dust, and other contaminants into your workshop.
  - Reduces time required to polish and correct errors and contamination after the painting process.
- Protecting and storing the removed parts...... To avoid damages (scratches), deformation and contamination
- Passenger compartment, tires, engine compartment, etc....... Help reduce entry of hidden contamination during repair and painting. These increase repair time.
- Helps prevent weld spatter (sparks)...... Possible burns and damage to glass and paint.

Damage Inspection

Wash the vehicle as it is impossible to properly inspect a dirty vehicle for damage.

Closely inspect the vehicle from all angles to prevent overlooking damaged areas, or degree of damage.

Before beginning collision repairs, compare the repair estimate to the actual vehicle condition. Check the identified repairs and compare them to the actual damage. Then develop a repair plan.

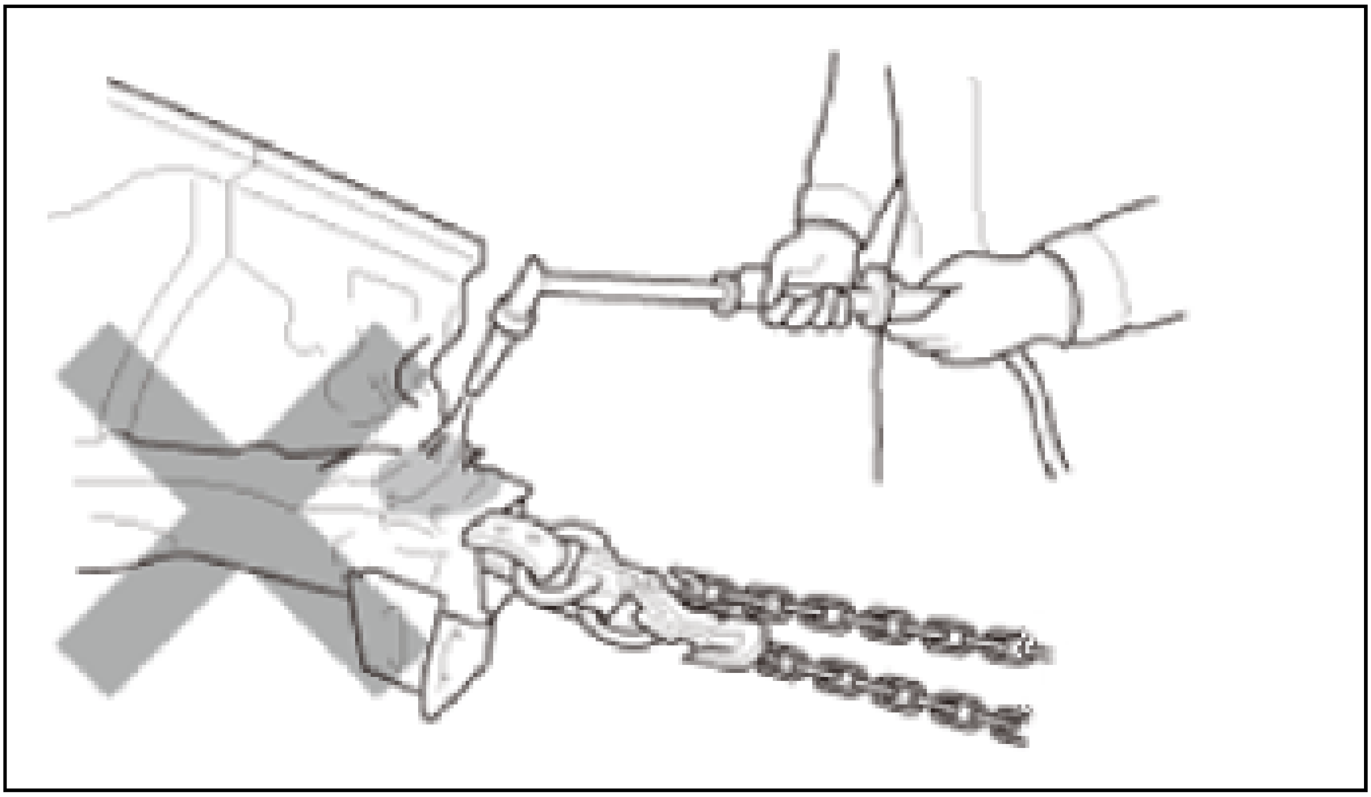
The general confirmation steps are as follows:

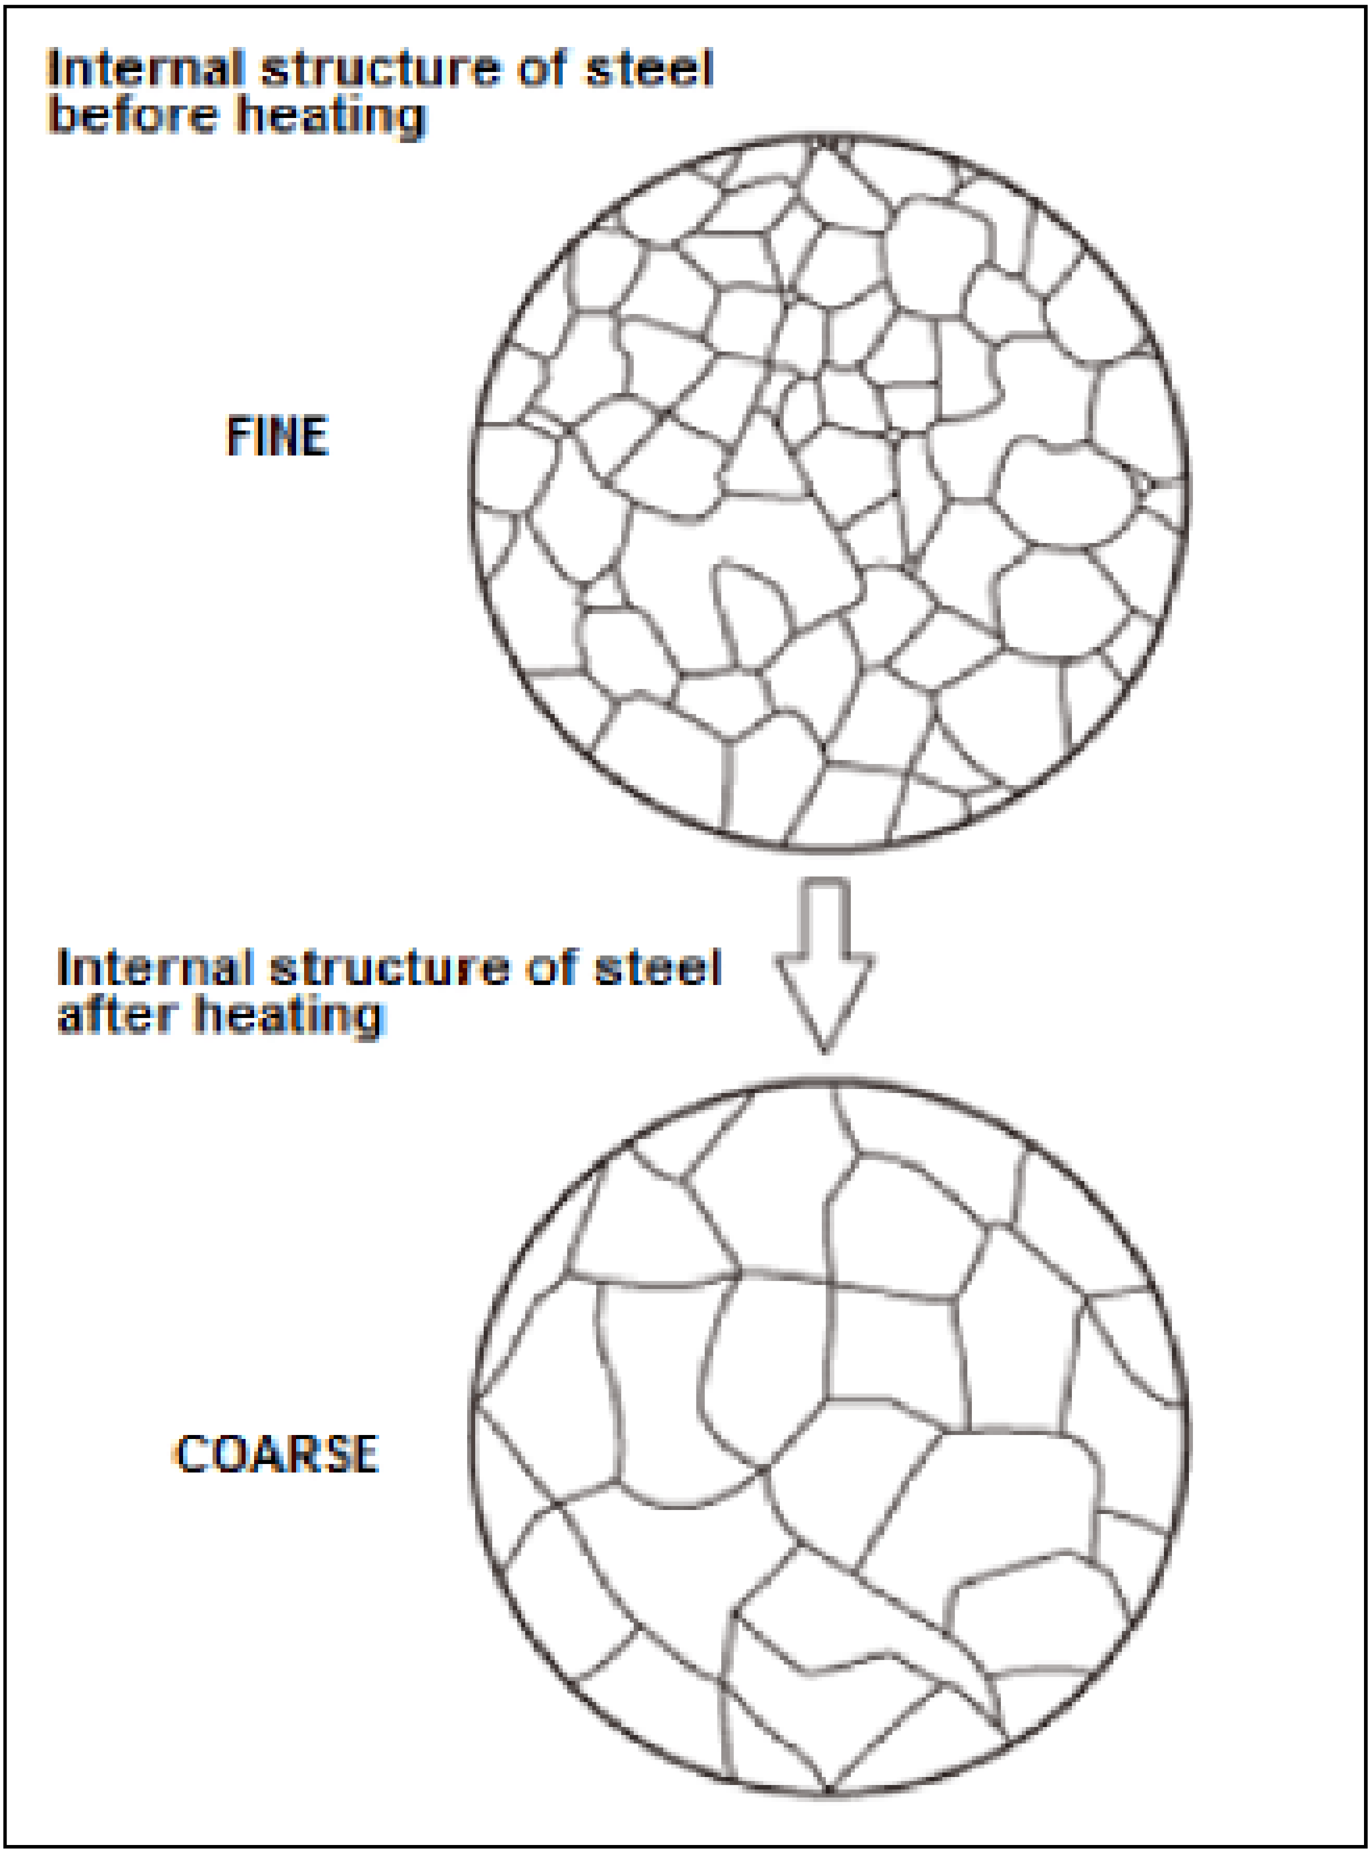
- Visual Check:
  - Closely inspect the damaged area from multiple angles so that the dents can be captured more accurately.
  - Also use extra lighting to help identify damage during your inspection for greater accuracy.
  - Inspect panel alignment and gaps in the damaged and surrounding areas. Also compare them to the undamaged side of the vehicle if possible.
- Feel Check:
  - Gently feel across the damaged surfaces with your fingers and palm to confirm to confirm any unevenness after the vehicle and damaged areas have been thoroughly cleaned.
  - Cloth gloves are recommended to increase touch sensitivity.
  - Feel In addition, touch thoroughly from multiple directions in order to avoid any overlook.
- Repair Bench Confirmation:
  - Confirm the body dimensions using your body and frame measurement equipment.
  - Document primary (directly) damaged areas and secondary (induced) damage.
  - Confirm the original dimensions of the damaged area, then develop a plan to restore the correct measurements.

Handling Removed Parts

- Remove all attached parts in the repair area to make repairs easier.
- Pay extra attention to the removed parts not to damage and store them in a protected location.
- Confirm that the repair estimate documents any prior damage or missing parts not part of the current repair. Immediately report any inconsistencies between the vehicle and estimate.
- If you damage any parts during removal, report this immediately and order replacements.
- To avoid confusion during reassembly, organize the removed fasteners by grouping them per panel or part.

Repair Guidelines For High-Strength Steel Parts





Internal structure of steel before heating
FINE
Internal structure of steel after heating
COARSE

WARNING: High strength steel is defined as any steel with a tensile strength of 340 MPa or higher. Ultra high strength steel is defined as any steel with a tensile strength of 980 MPa or higher. If a part is constructed of, or includes, high-strength steel, observe the following important guidelines.

High-strength steel is more rigid and has more memory than traditional steel, making it more difficult to straighten. To prevent further body damage when using frame straightening equipment, apply pulling force gradually and closely monitor body dimensions during the straightening process to ensure the body dimensions are returned to the proper specifications.

High strength steel parts over 590 MPa must not be straightened. These parts should be replaced with new parts if damaged.

NOTE: **Do not apply heat, such as an oxyacetylene torch, to any body part during straightening. This may compromise the internal structure and high-strength steel parts. Any of these parts that had heat applied to them during straightening MUST be replaced with new parts. Ignoring these instructions may significantly reduce occupant protection in any subsequent collision.**

Removing Spot Welds

Use a spot weld cutter or drill bit designed for high-strength steel to remove spot weld nuggets from the steel parts being removed. If the cutting performance of the spot cutter decreased, grind the spot cutter using a grinder as soon as possible. Or change the spot cutter to a new one. Decreased cutting performance unnecessarily increase cutting time and generates heat that may compromise the internal structure of high-strength steel parts. An automotive file belt sander may also be used to remove spot welds.

NOTE: **In order to protect the blade of the spot cutter, mark the center of the spot welding nugget using a center punch and grind the edge of the nugget to be flat using a belt sander (about P60) and then begin the cutting work. Apply the specific cutting oil to protect the blade during the cutting work.**

Repair Process

The degree of damage determines the collision repair workflow.

For minor body damage, the repair process includes: Repairing the damaged part by washer welding or using hammers and dollies, body filler repairs, and refinishing.

For major body damage, the repair process includes: Body and frame correction, Replacing the damaged panels and frame parts with new ones, anti-rust treatment, sealing, and refinishing. Plastic parts repair or replacement may also be necessary.

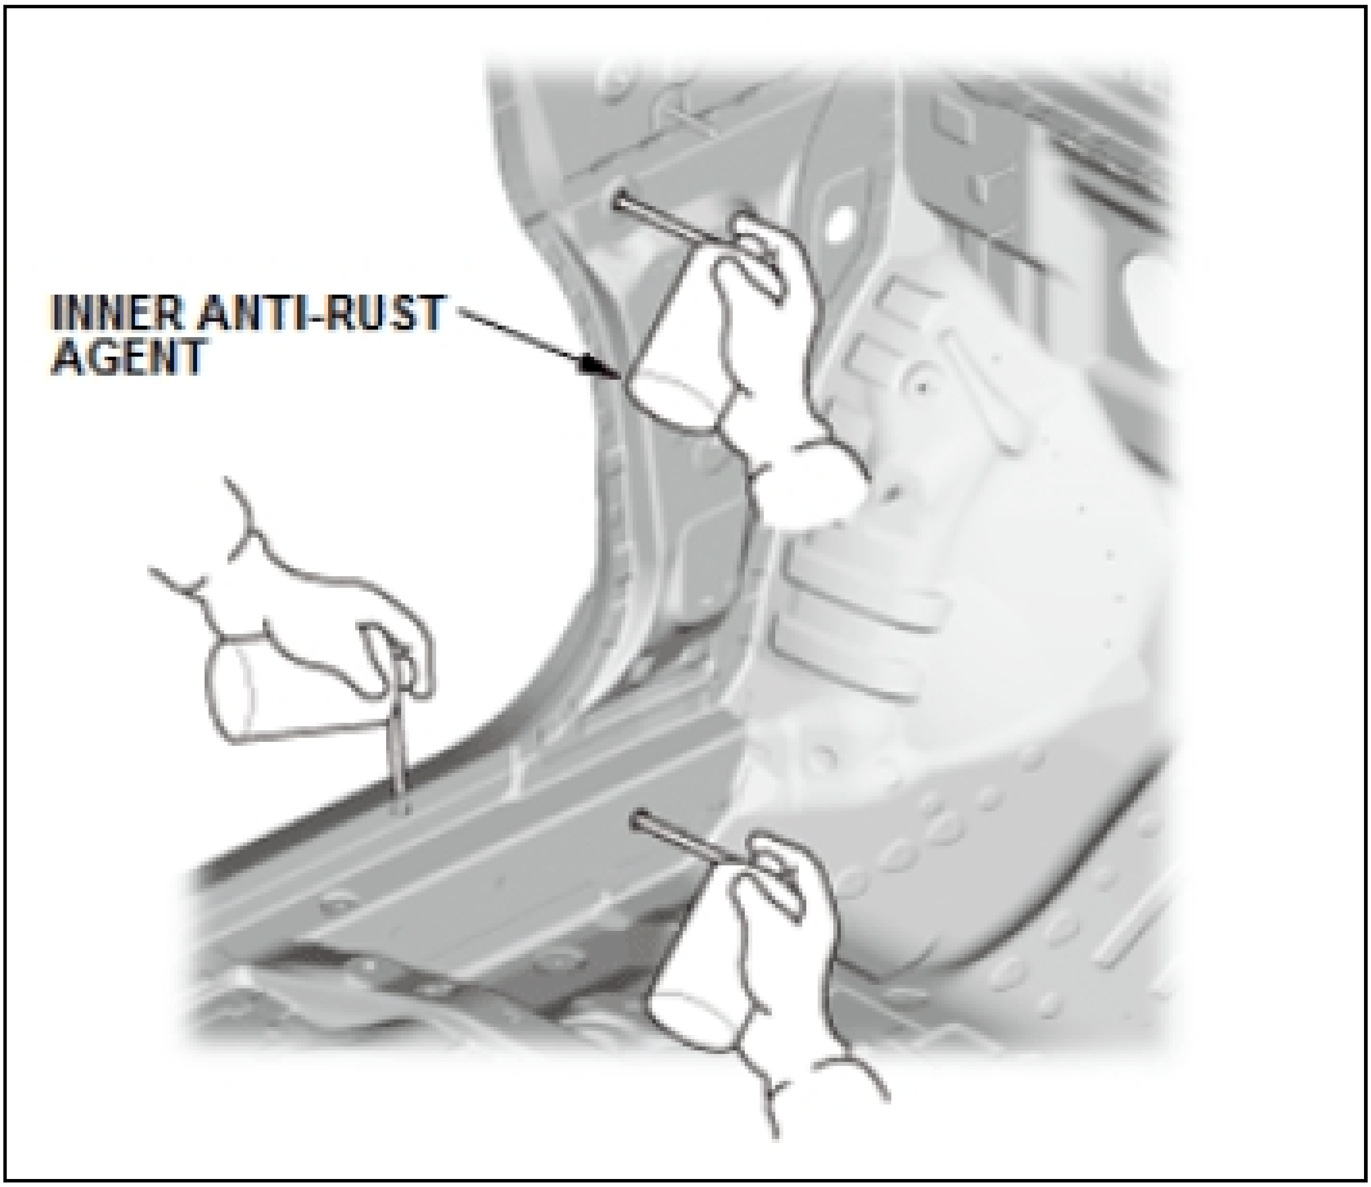
REPAIRING MAJOR BODY DAMAGE

Internal Anti-Rust Treatment (After Paint)

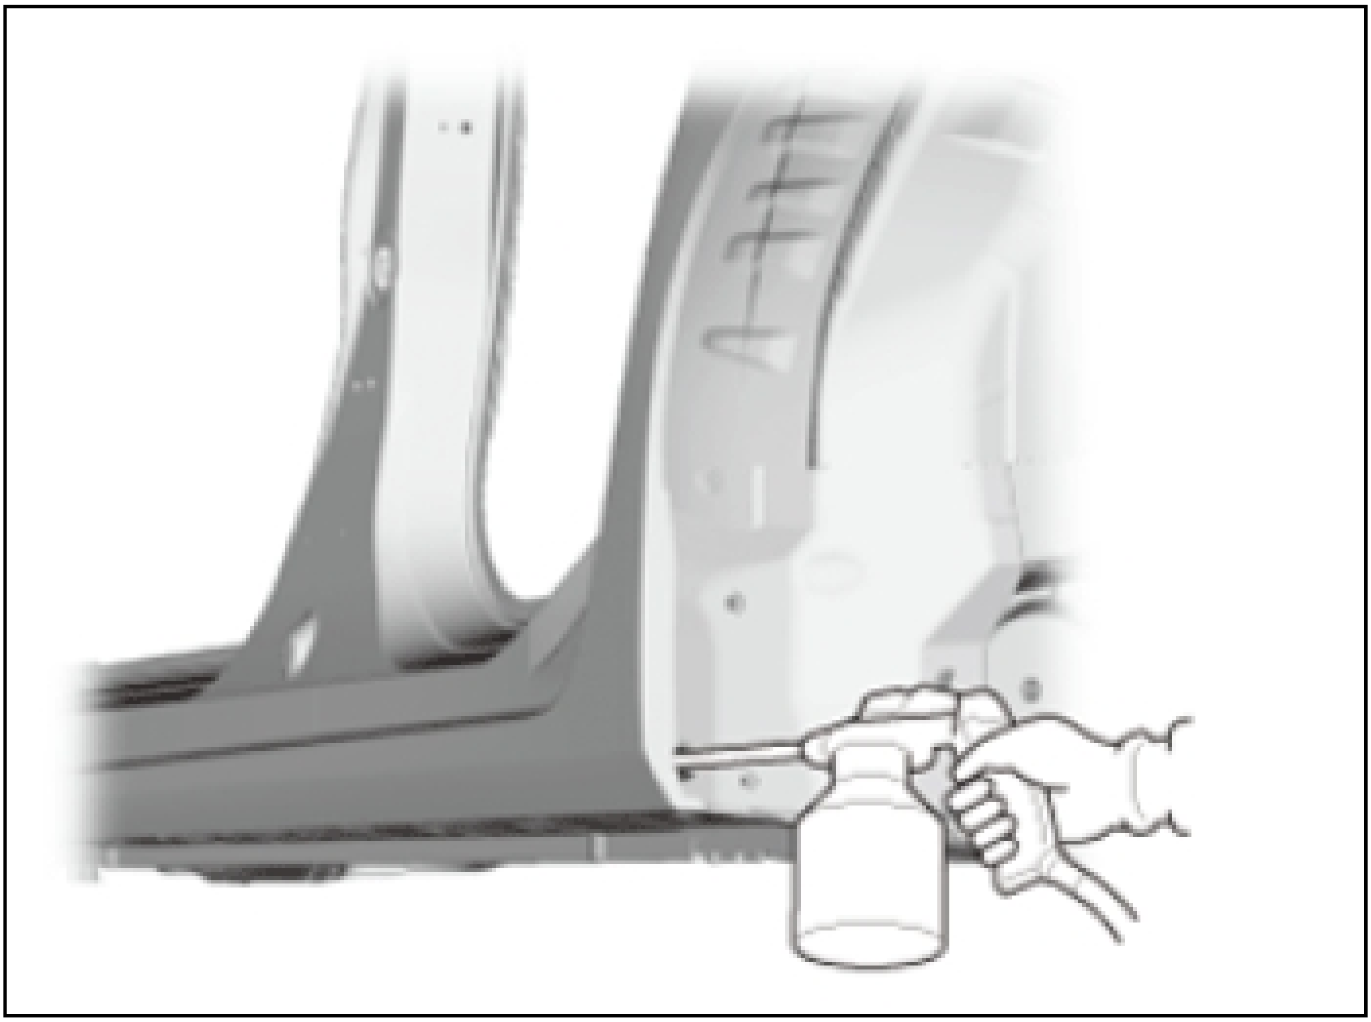
- During collision repairs, body pulling and welding destroy the e-coat film on inner panels.

  This will quickly allow rust to form on those panels. Thoroughly apply anti-rust agent on inner surfaces in the repaired areas prevent corrosion.

- Always apply anti-rust agents a little beyond the actual repair areas.
- For the basic locations of anti-rust agent application, refer to the model specific body repair information:
  - Apply internal anti-rust agent through part installation holes, inner panel openings, grommet installation holes, etc. Apply anti-rust agent liberally until it bleeds through the panel mating seams.
  - When applying anti-rust agent to a wide area, use spray equipment specifically designed for anti-rust agent application and the most appropriate nozzle (360 degree nozzle, L nozzle, etc.).



INNER ANTI-RUST AGENT



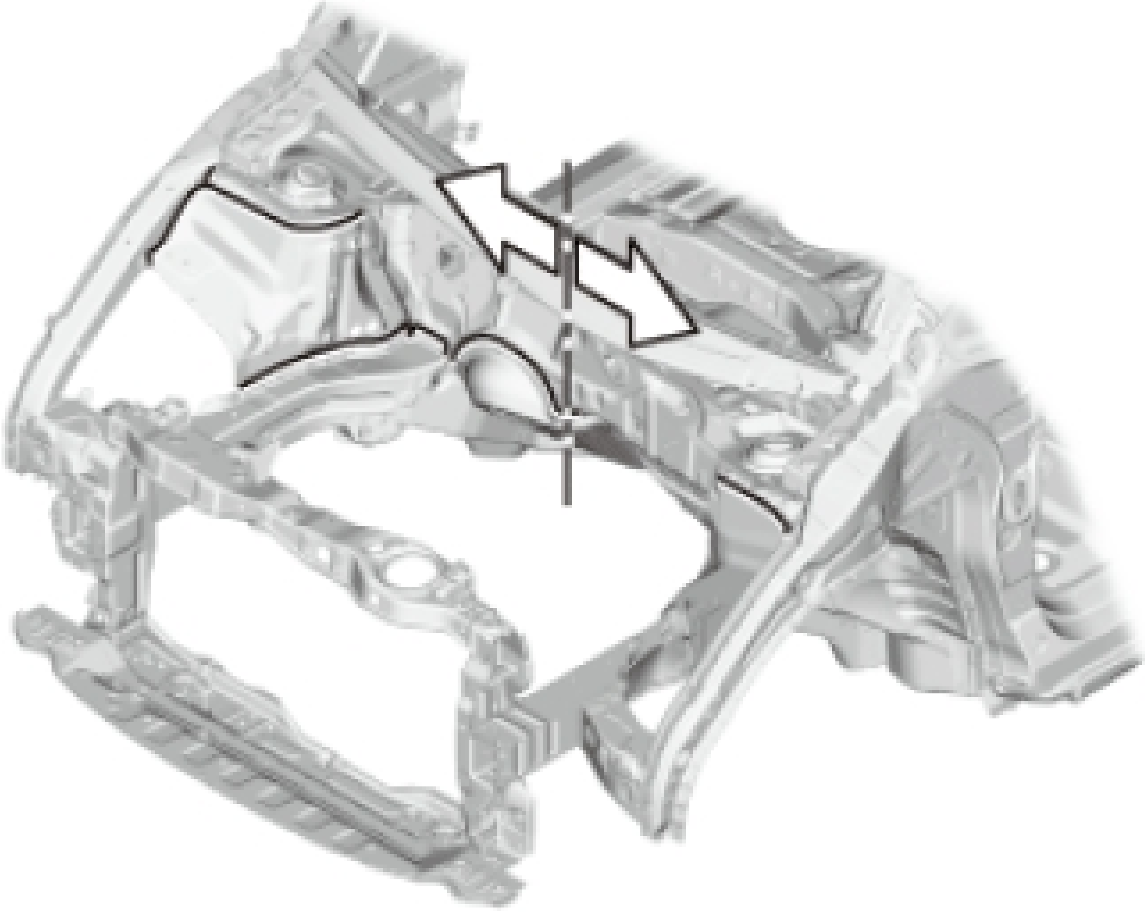
Internal Anti-Rust Treatment (Before Paint)

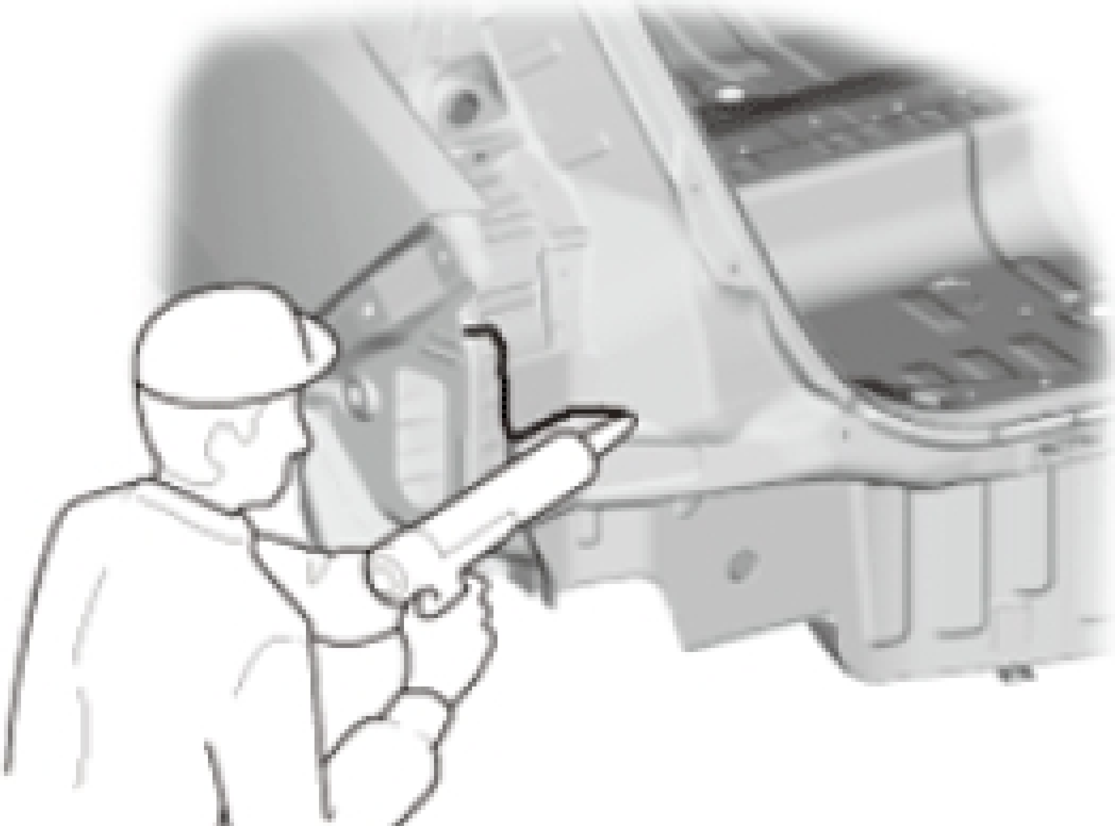
Sealing

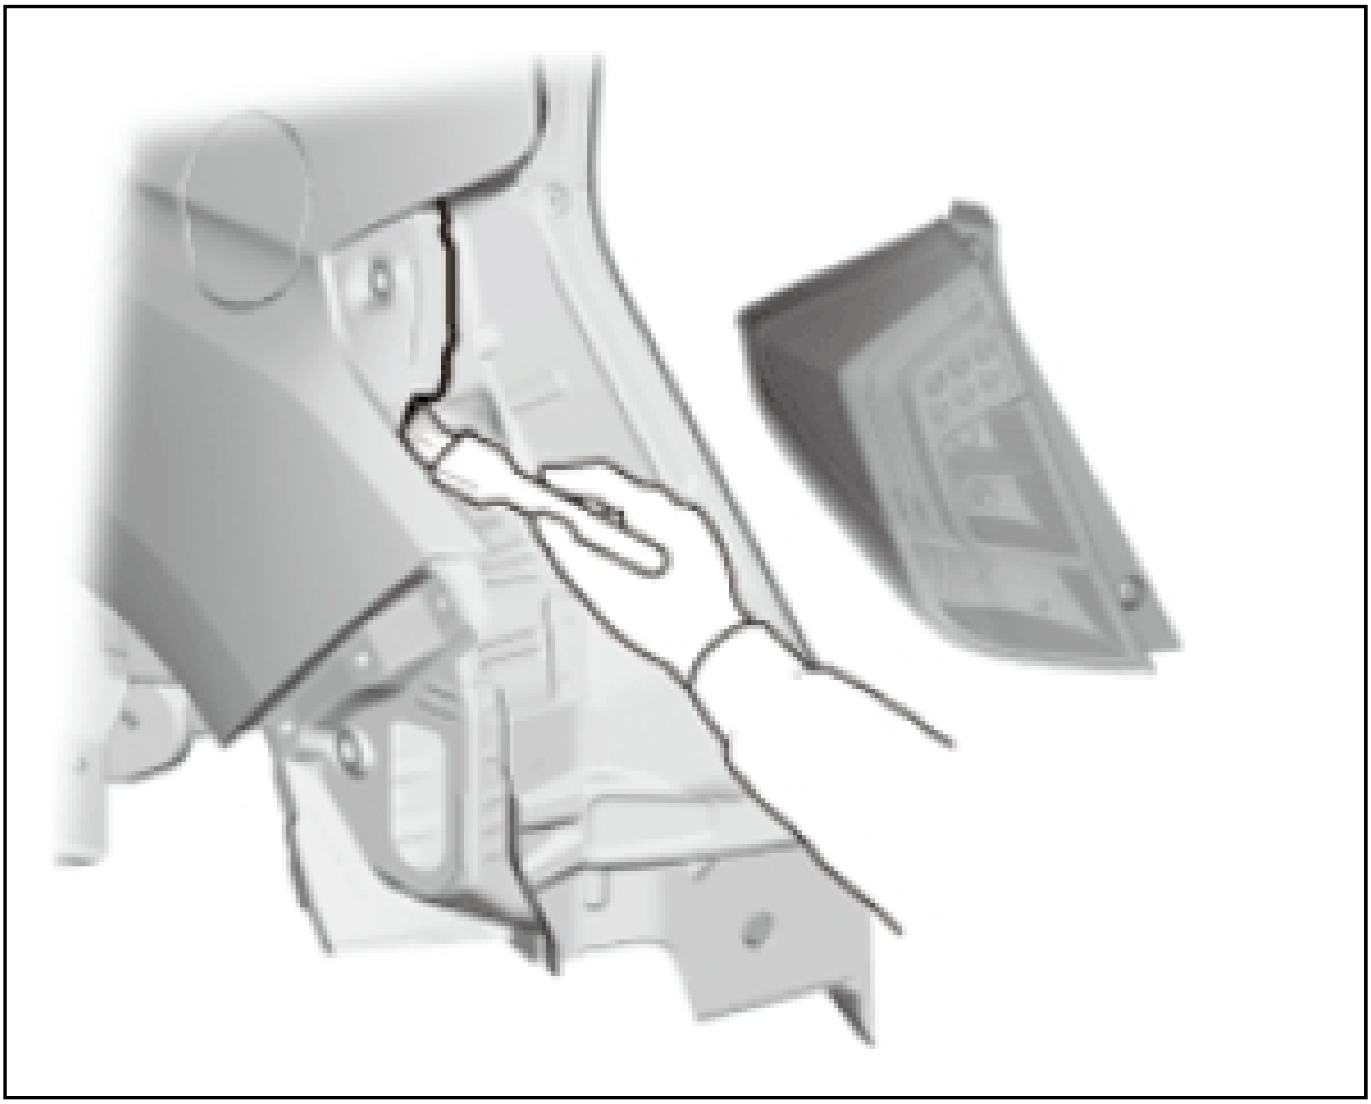
- To prevent water and dust entry, as well as to prevent rust, apply sealer where at body panel joints.
- As for where sealer should be applied, refer to the model specific body repair information or use the corresponding parts on the opposite side of the vehicle as a reference:
  - Clean and degrease the sealer application area. Remove any excess weld-through primer (spot sealer) using reducer.

    Apply primer surfacer and then sealer.
  - The outer panels, engine compartment, and trunk gutter influence exterior appearance of the vehicle and must be finished equivalent to their pre-loss condition.
  - In installation areas for the taillights and the like, use care to limit the height of the sealer bead to prevent interference. Use a brush to flatten the sealer bead.

NOTE: **Handle the body sealer material with care and observe all instructions issued by the sealer manufacturer.**

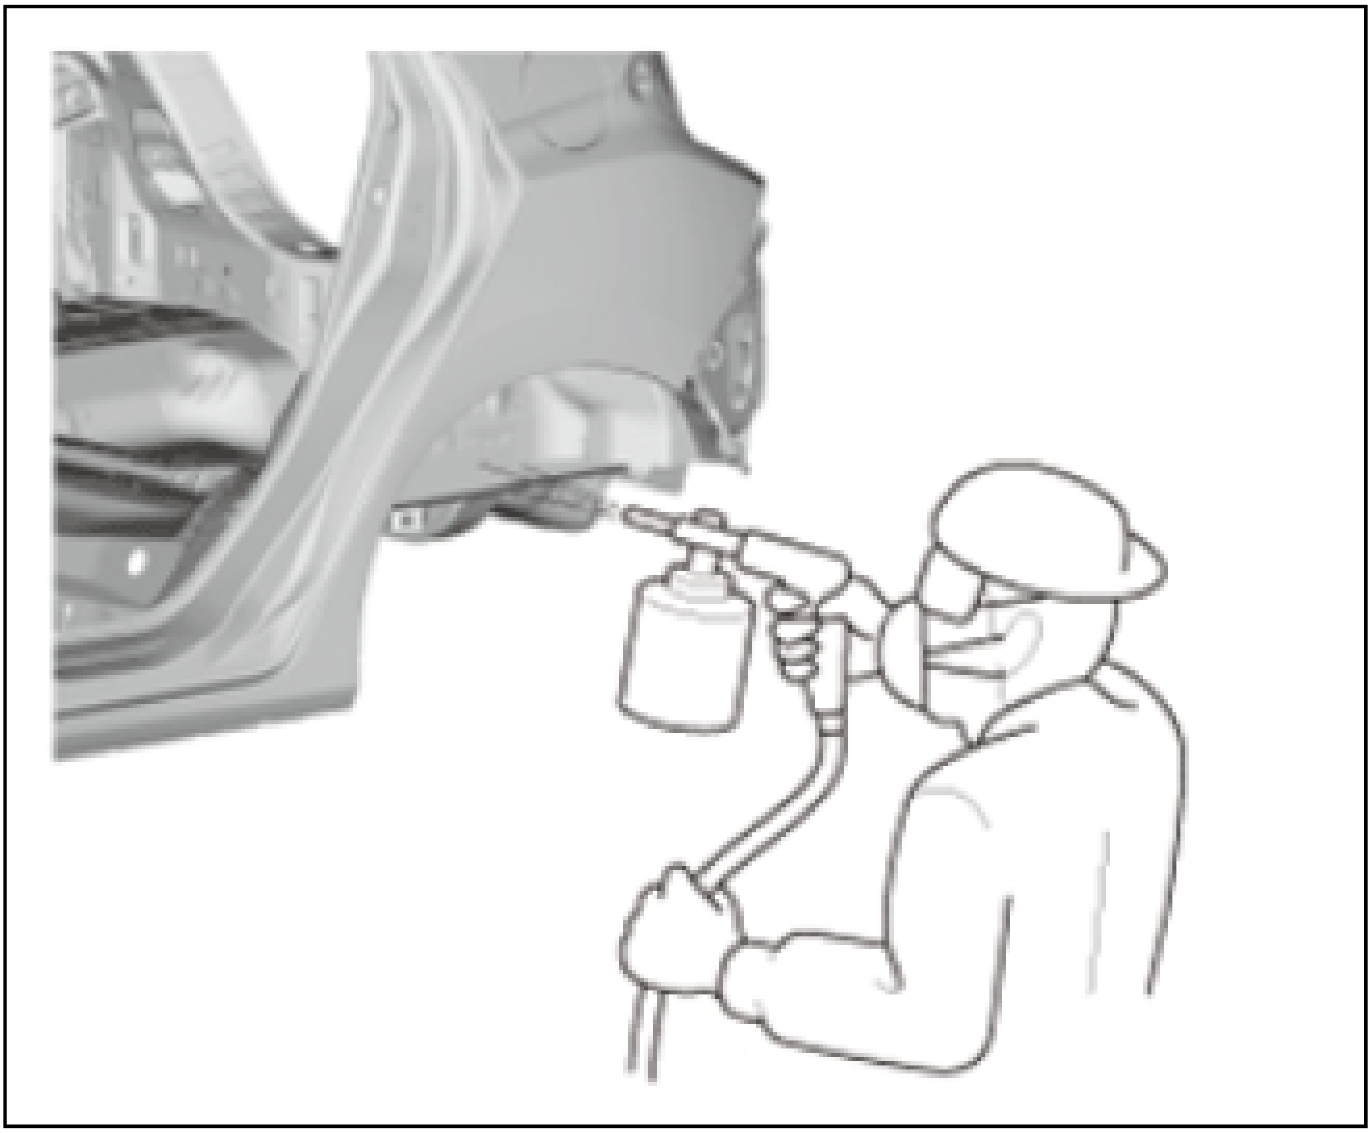


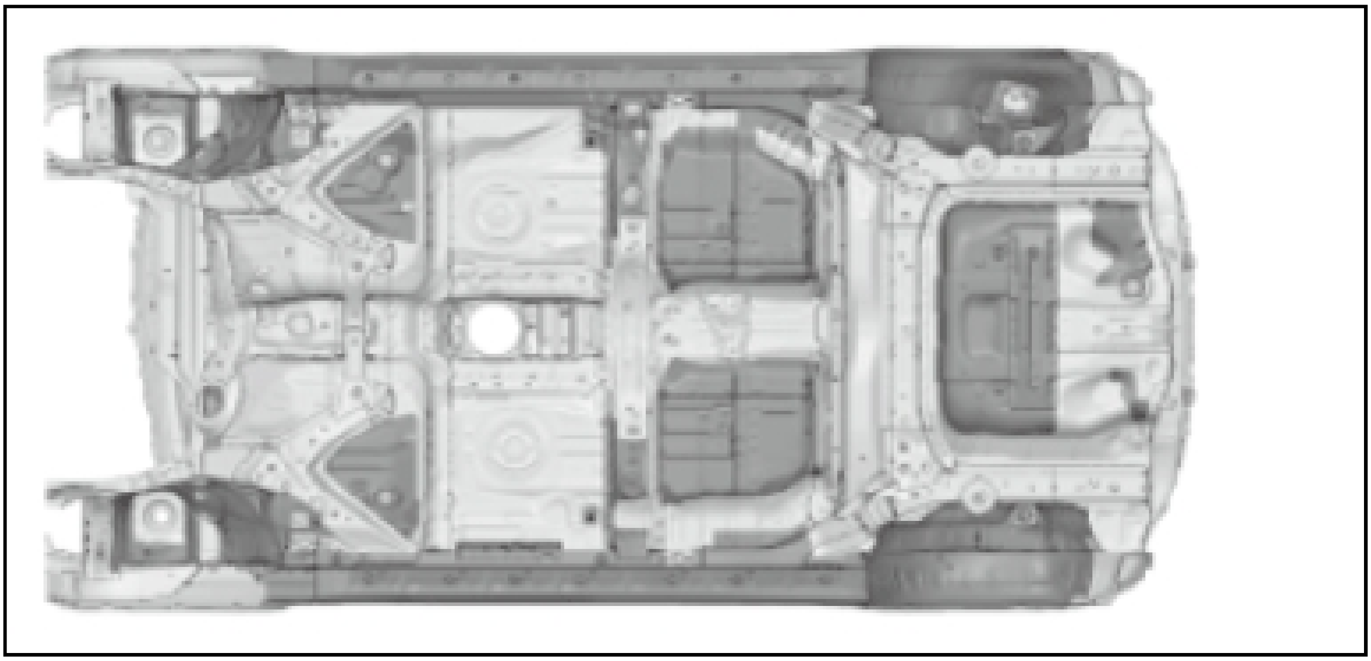




Undercoating

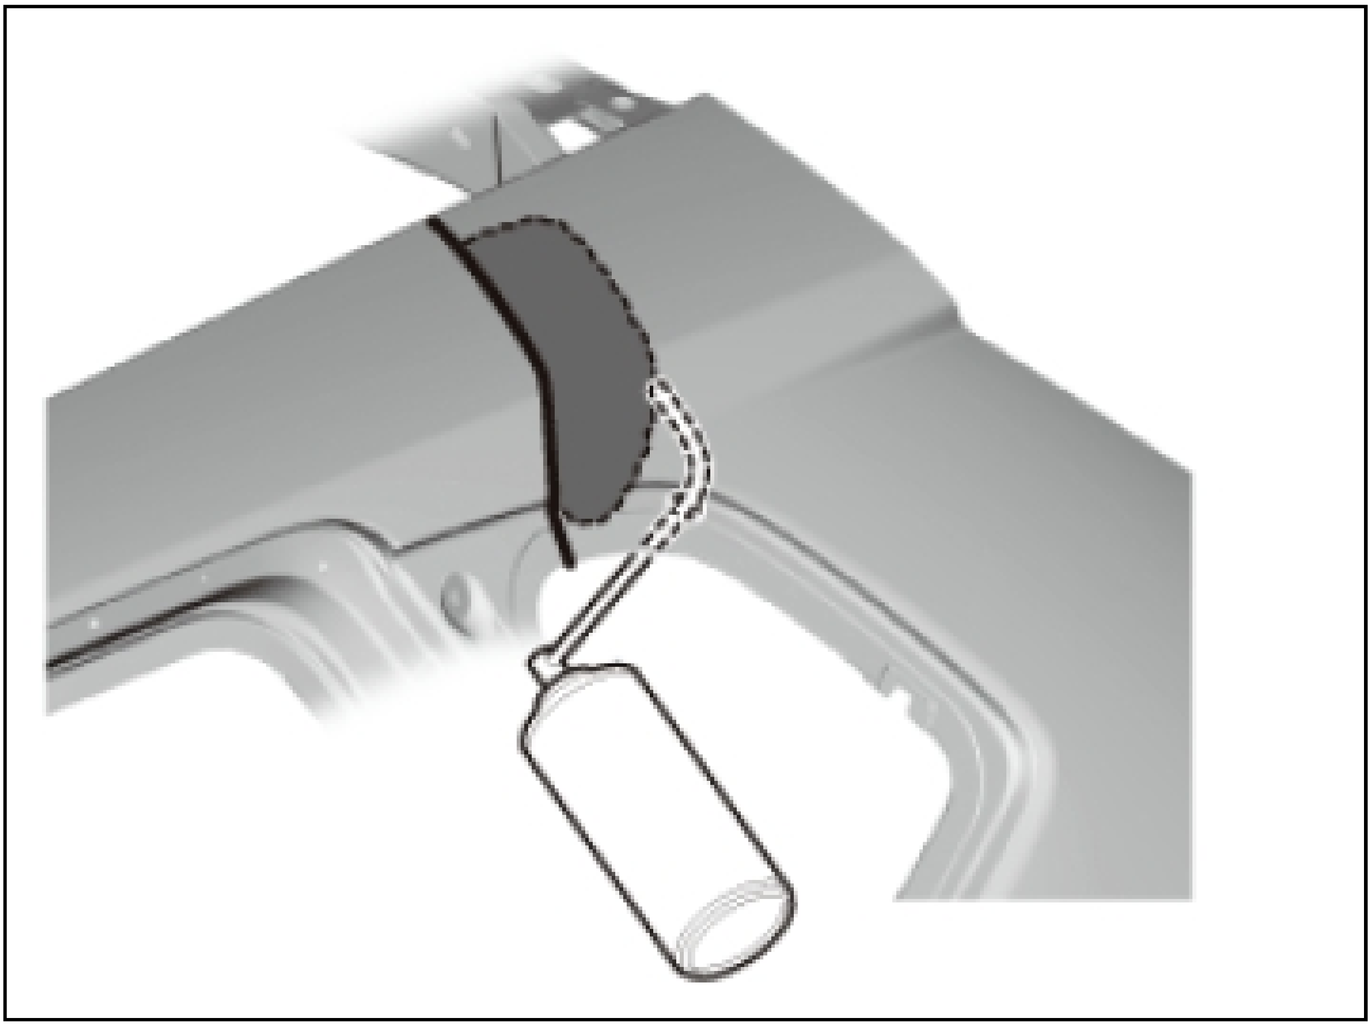
- To prevent chipping damage caused by flying stones, apply undercoat over the underbody and wheelhouse surfaces.
- Refer to the model specific body repair information for sealer application locations:
  - Clean and degrease the undercoating application areas. Apply primer surfacer then undercoat.
  - Use masking tape, where necessary, to prevent undercoat from being applied to the suspension, drive train and exhaust related parts, or parts installation areas.
  - Apply undercoat using only spray equipment designed for undercoat.



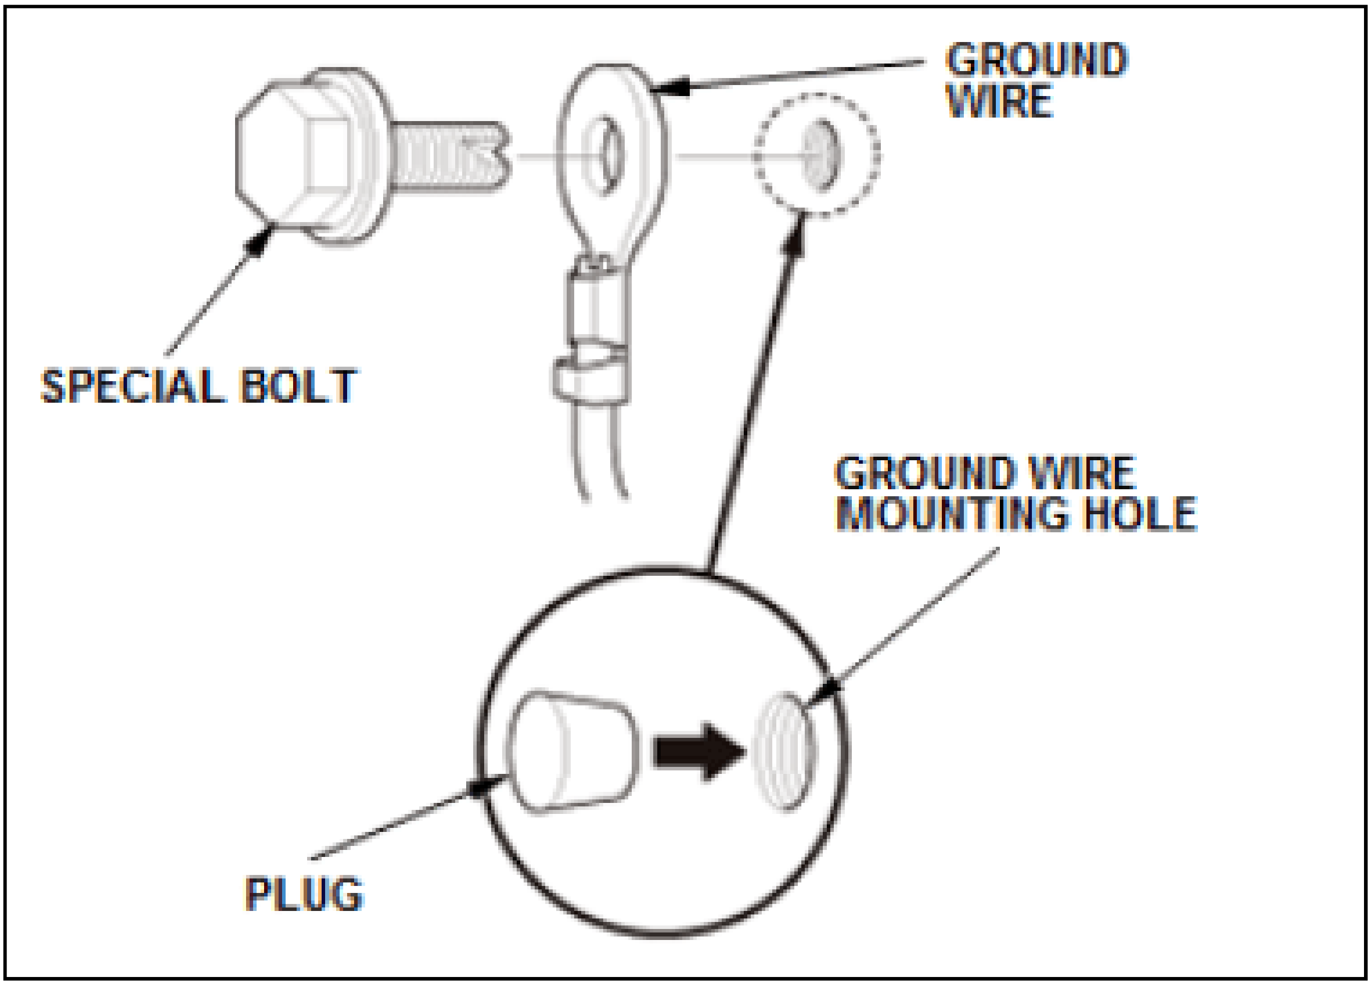


Urethane Foam Repairs

If expandable urethane foam was used in the body instead of traditional acoustic separators, replace any removed foam through holes on the inner body panels as directed in the model specific body repair information. This is required to reduce transmission of road noise into the passenger compartment in specified areas.



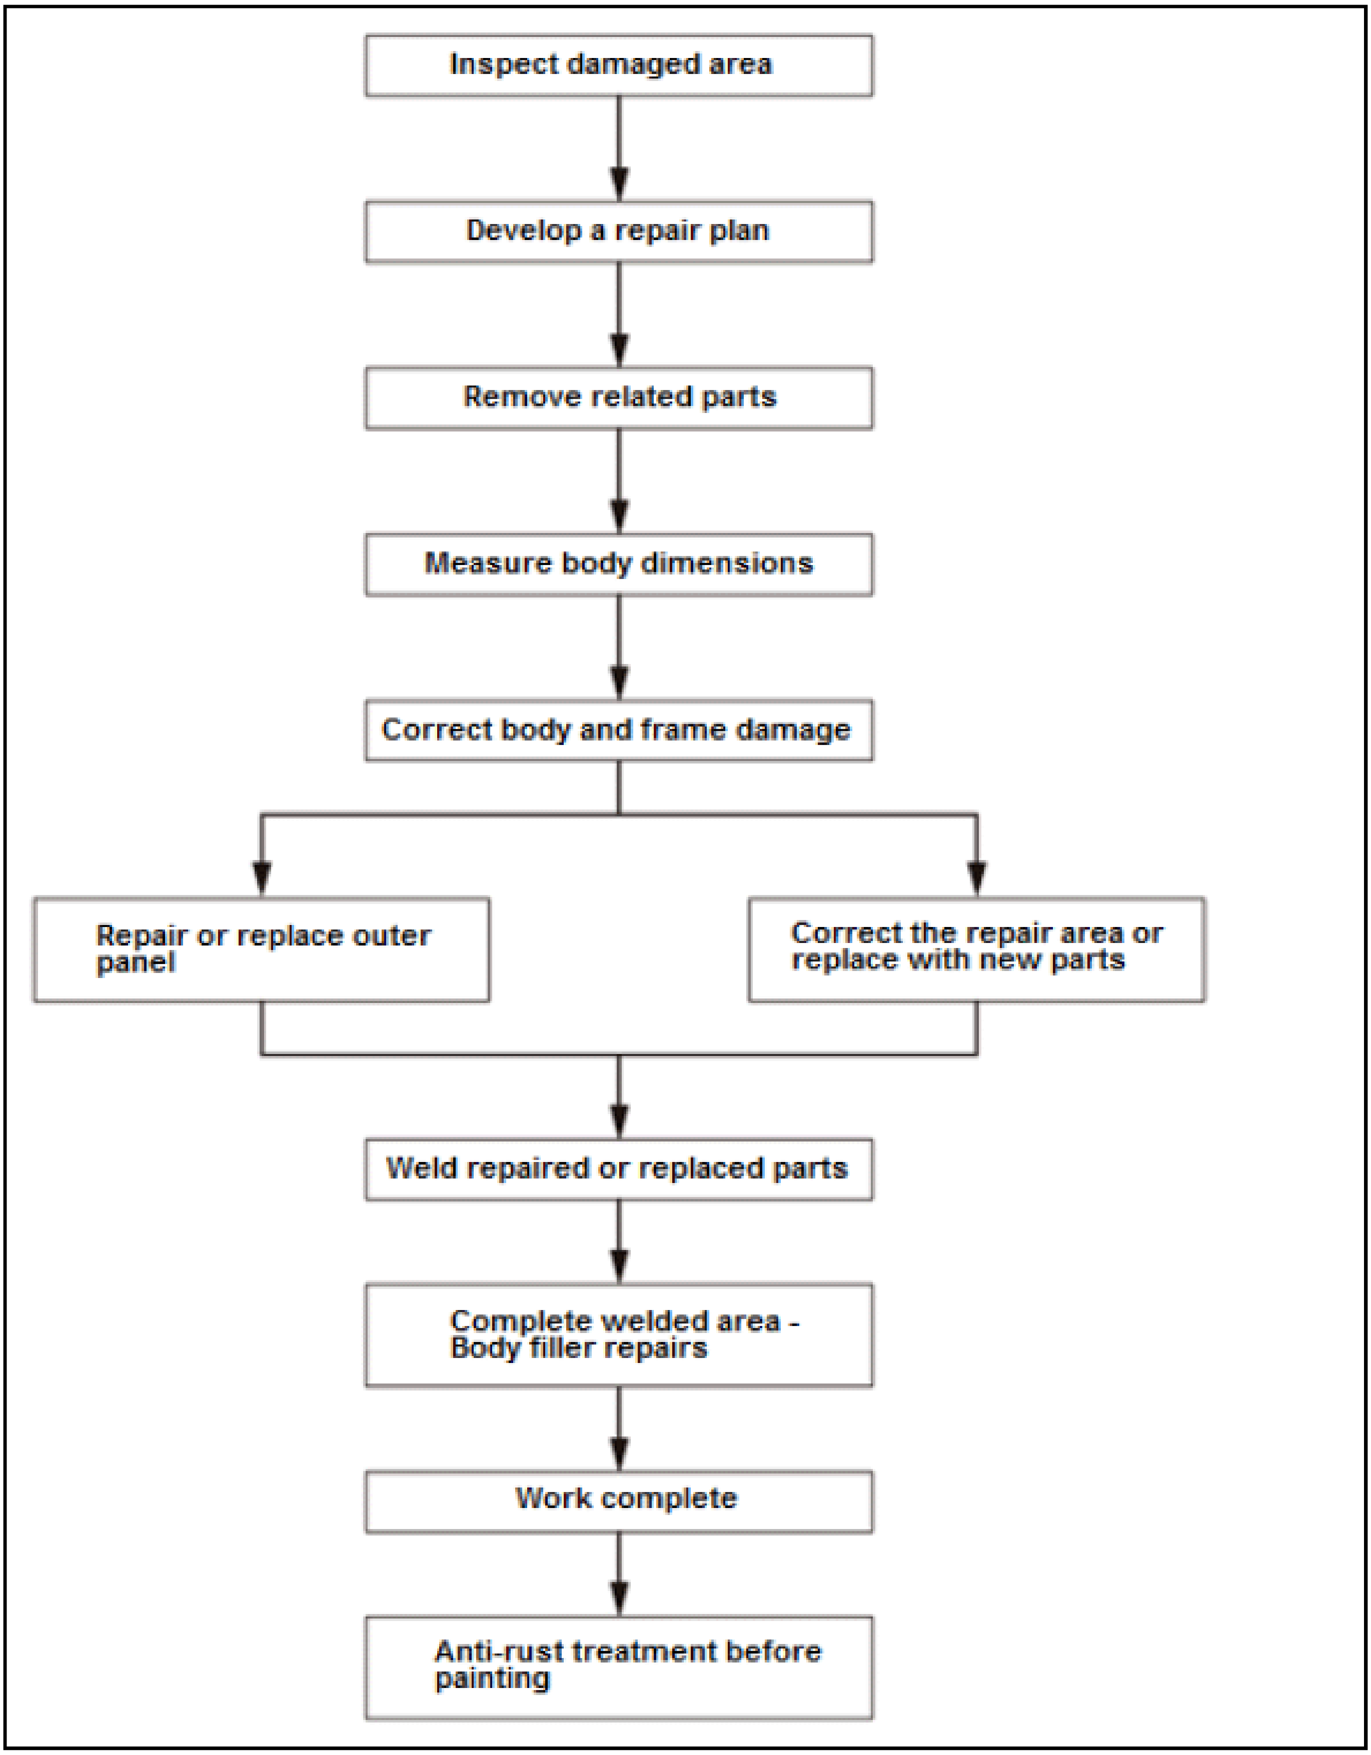
NOTE: When doing paint work, mask the ground wire terminal. Protect the ground wire mounting hole threads with a spare bolt (do not use the actual ground bolt) or a commercially available silicone bolt hole plug.



Basic Work Processes

Some collision damage reaches the body's structural parts, with damage so extensive that core body parts may be bent, twisted and stressed. Therefore, use of body and frame correction equipment is necessary. Outer panels will also need to be repaired or replaced.

During major body damage repairs, it is vitally important to measure the entire vehicle body not just the impact area, to correctly diagnose dispersed damage. The amount of estimated and actual repair hours is heavily dependent upon correct preliminary body damage measurements and diagnosis.



Inspect damaged area
Develop a repair plan
Remove related parts
Measure body dimensions
Correct body and frame damage
Repair or replace outer panel
Correct the repair area or replace with new parts
Weld repaired or replaced parts
Complete welded area - Body filler repairs
Work complete
Anti-rust treatment before painting

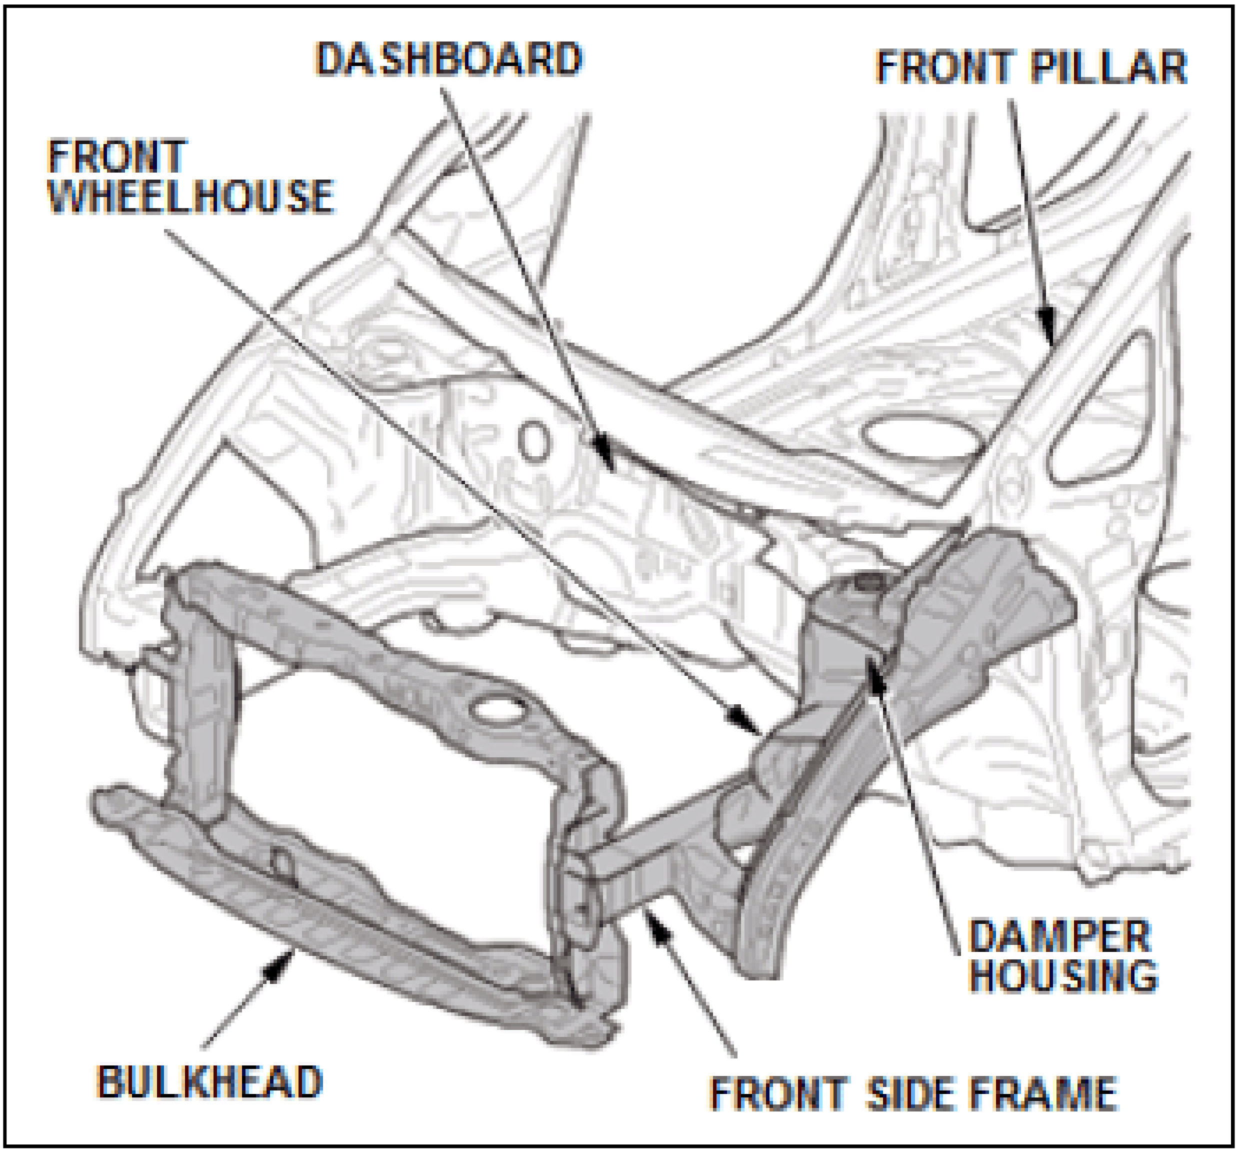
Body And Frame Correction For Front Damage

Front damage example: The side bulkhead, front side frame, and the front wheelhouse are damaged on the left side. The damper housing and dashboard are damaged. Extended damage is also seen on the front pillar, front side frame, and front wheelhouse on the right side. Impact forces were also dispersed into the roof panel causing distortion there as well.

1. Develop a repair plan:
    - Pull out the damaged area to restore both right and left side parts installation points back to near the original dimensions.
    - Repair and reform the installation points for the new replacement parts.

- Remove the damaged part (left side) and install a new part.

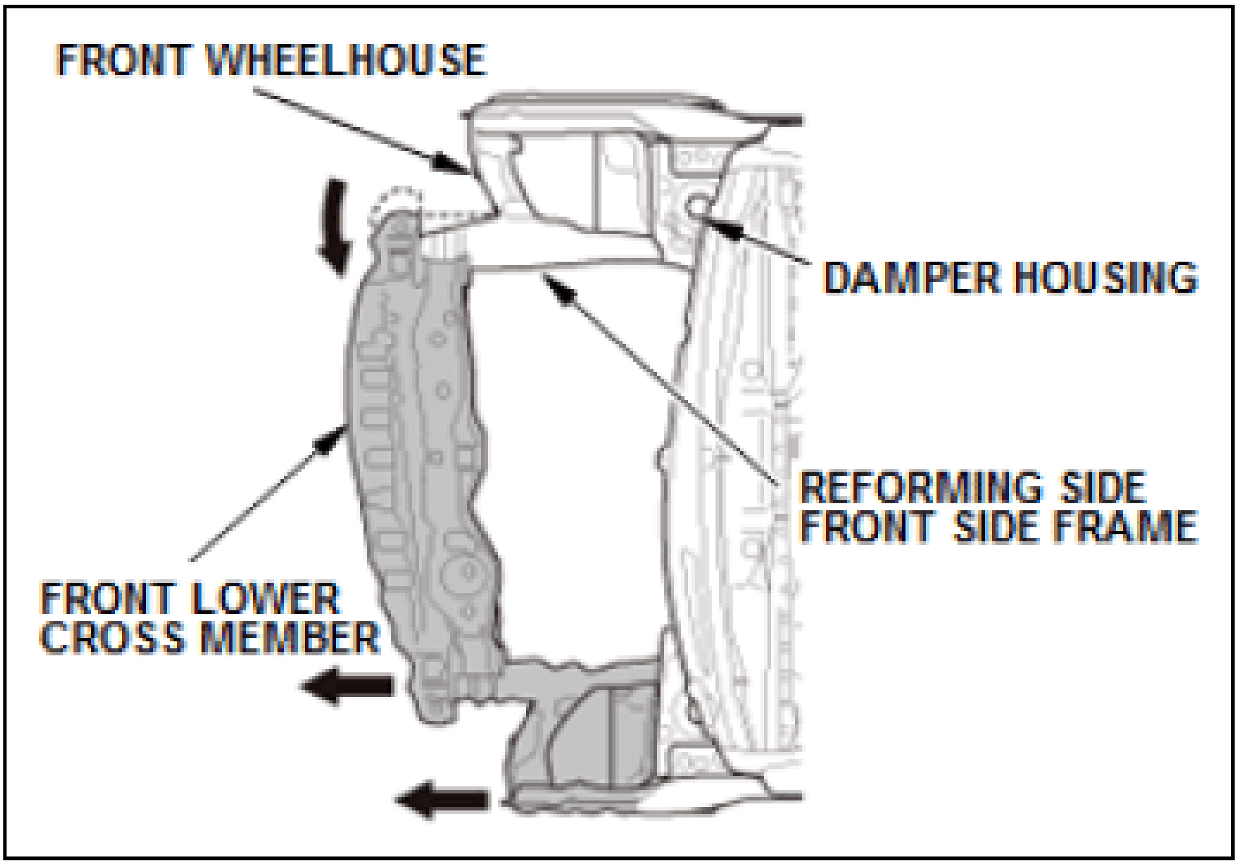
2. Attach the body to the body and frame correction equipment. Firmly attach the vehicle so it does not move during the pulling operation.



DASHBOARD
FRONT PILLAR
FRONT WHEELHOUSE
DAMPER HOUSING
BULKHEAD
FRONT SIDE FRAME

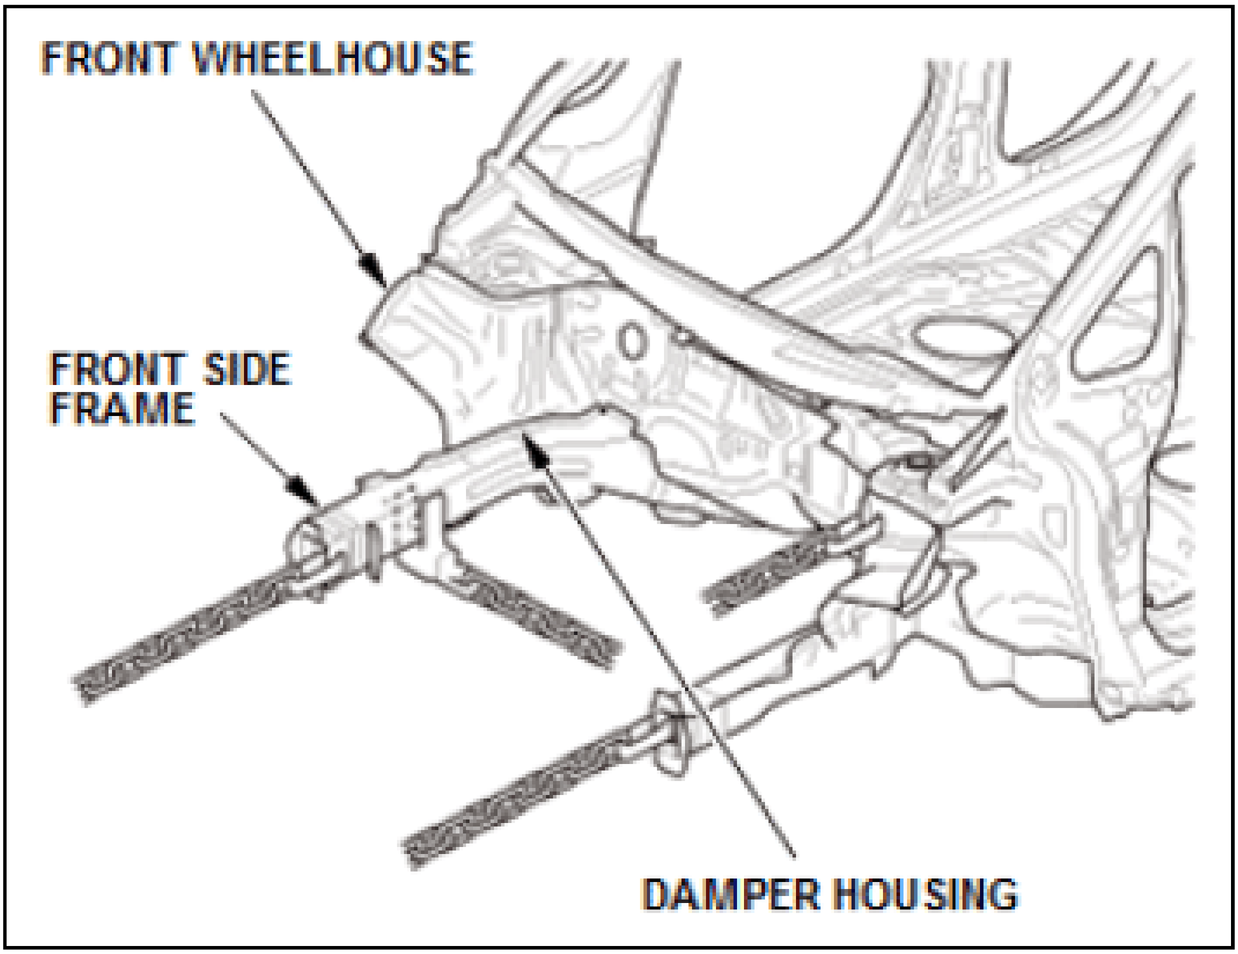
3. Determine the pulling direction, then pull-out slowly and gradually While pulling, repair the joint areas where the replaced parts are installed. At the same time, reform the front side frame, front wheelhouse and the damper housing on the right side.
4. Measure the dimensions and determine the pulled-out position.

   Repeat the pulling operation until each point is back to the correct position.



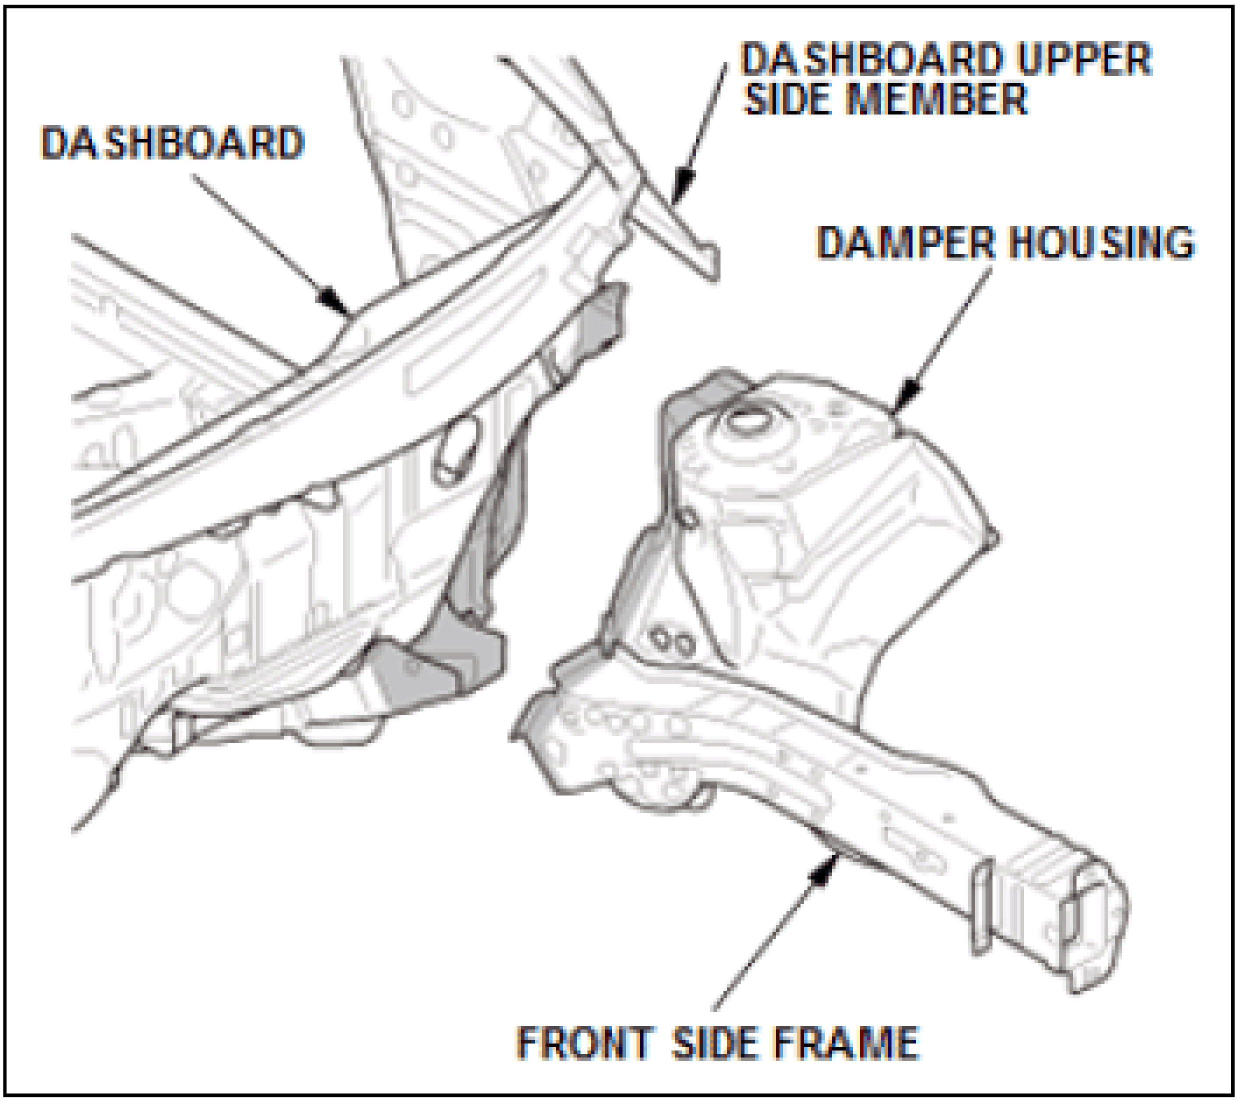
FRONT WHEELHOUSE
DAMPER HOUSING
REFORMING SIDE FRONT SIDE FRAME
FRONT LOWER CROSS MEMBER

5. Repair the front side frame, front wheelhouse and damper housing on the right side and bring them back to the correct position.



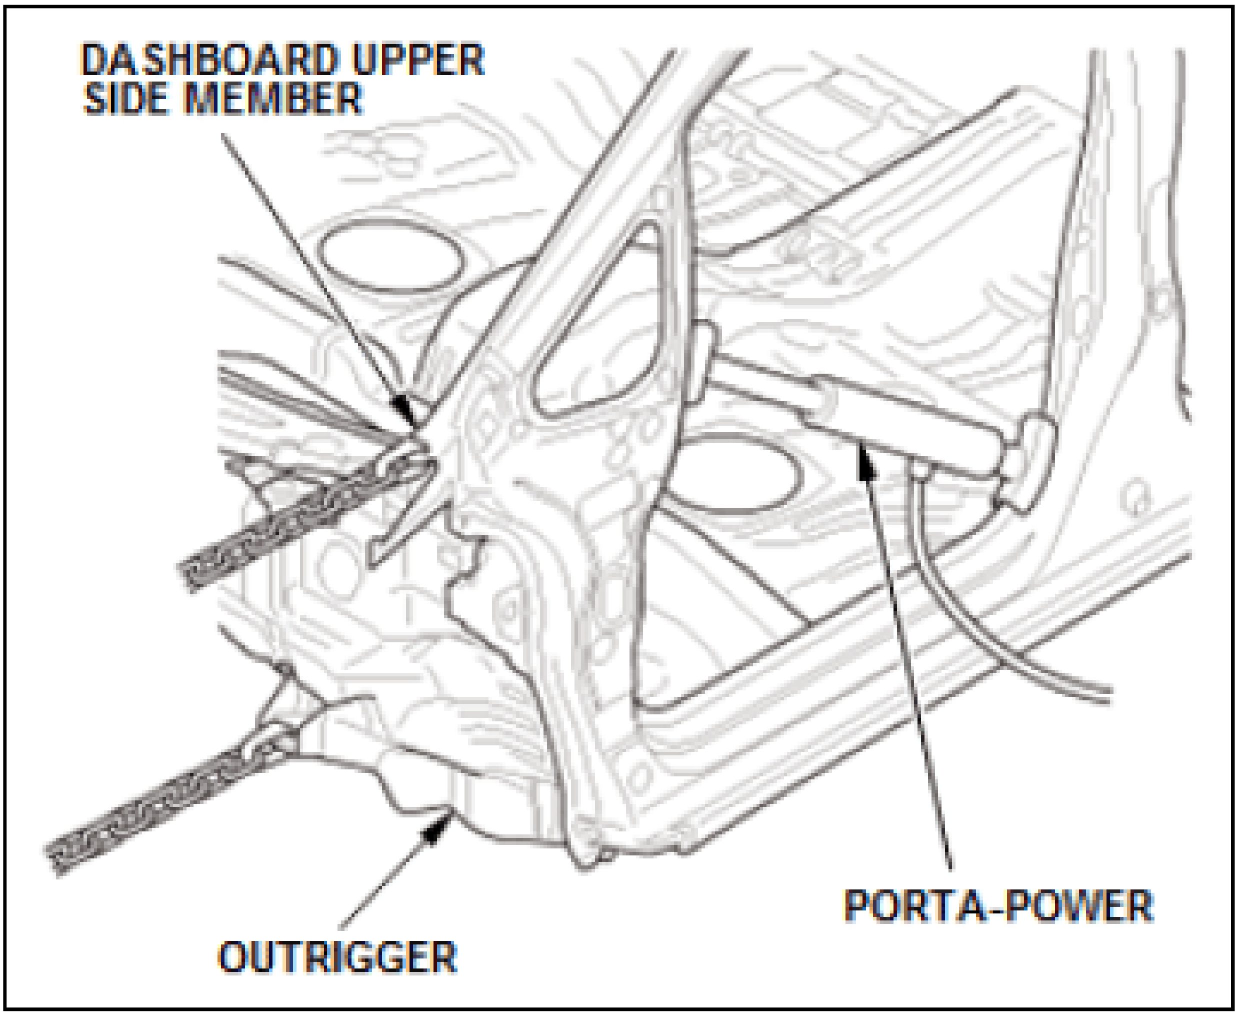
FRONT WHEELHOUSE
FRONT SIDE FRAME
DAMPER HOUSING

6. If the damper housing, dashboard, dashboard upper side member and front pillar on the left side cannot be fully reformed, cut the front side frame and damper housing, and then pull-out the root of dashboard upper side member and front side frame.



DASHBOARD UPPER SIDE MEMBER
DASHBOARD
DAMPER HOUSING
FRONT SIDE FRAME

7. For the front pillar damage, use a porta-power to push it from inside the passenger compartment while pulling in a forward direction.

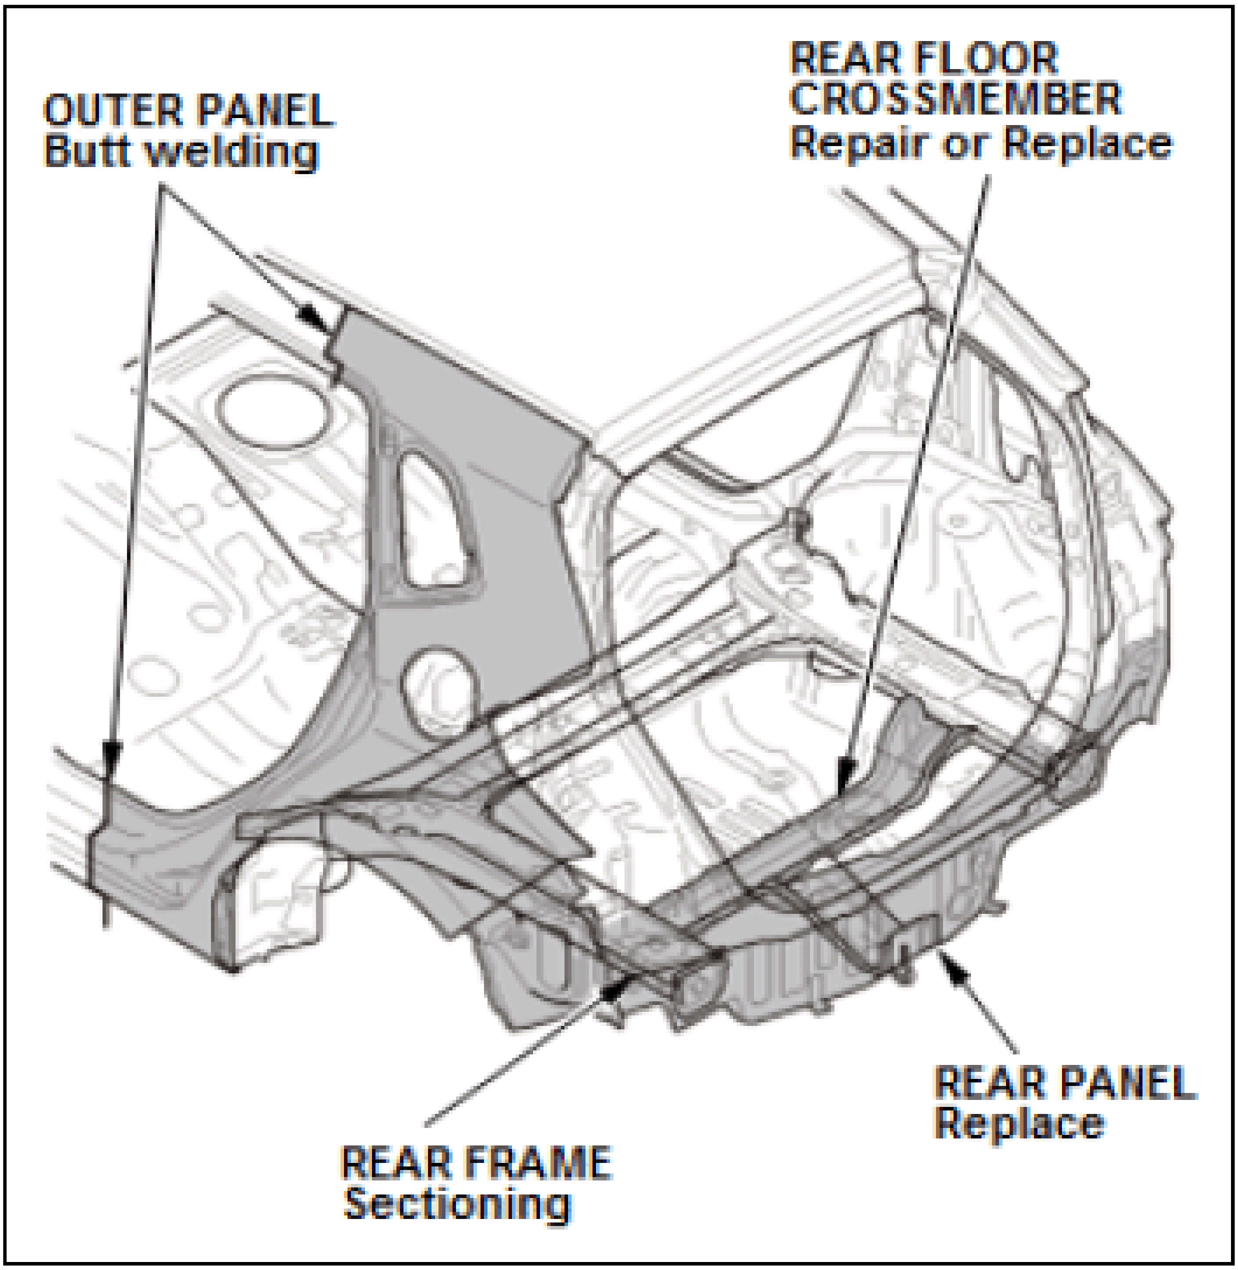


Body And Frame Correction For Rear Damage

Rear damage example: The rear panel, rear outer panel, rear floor and rear frame are damaged. the rear frame is bent due to a concentrated stress.

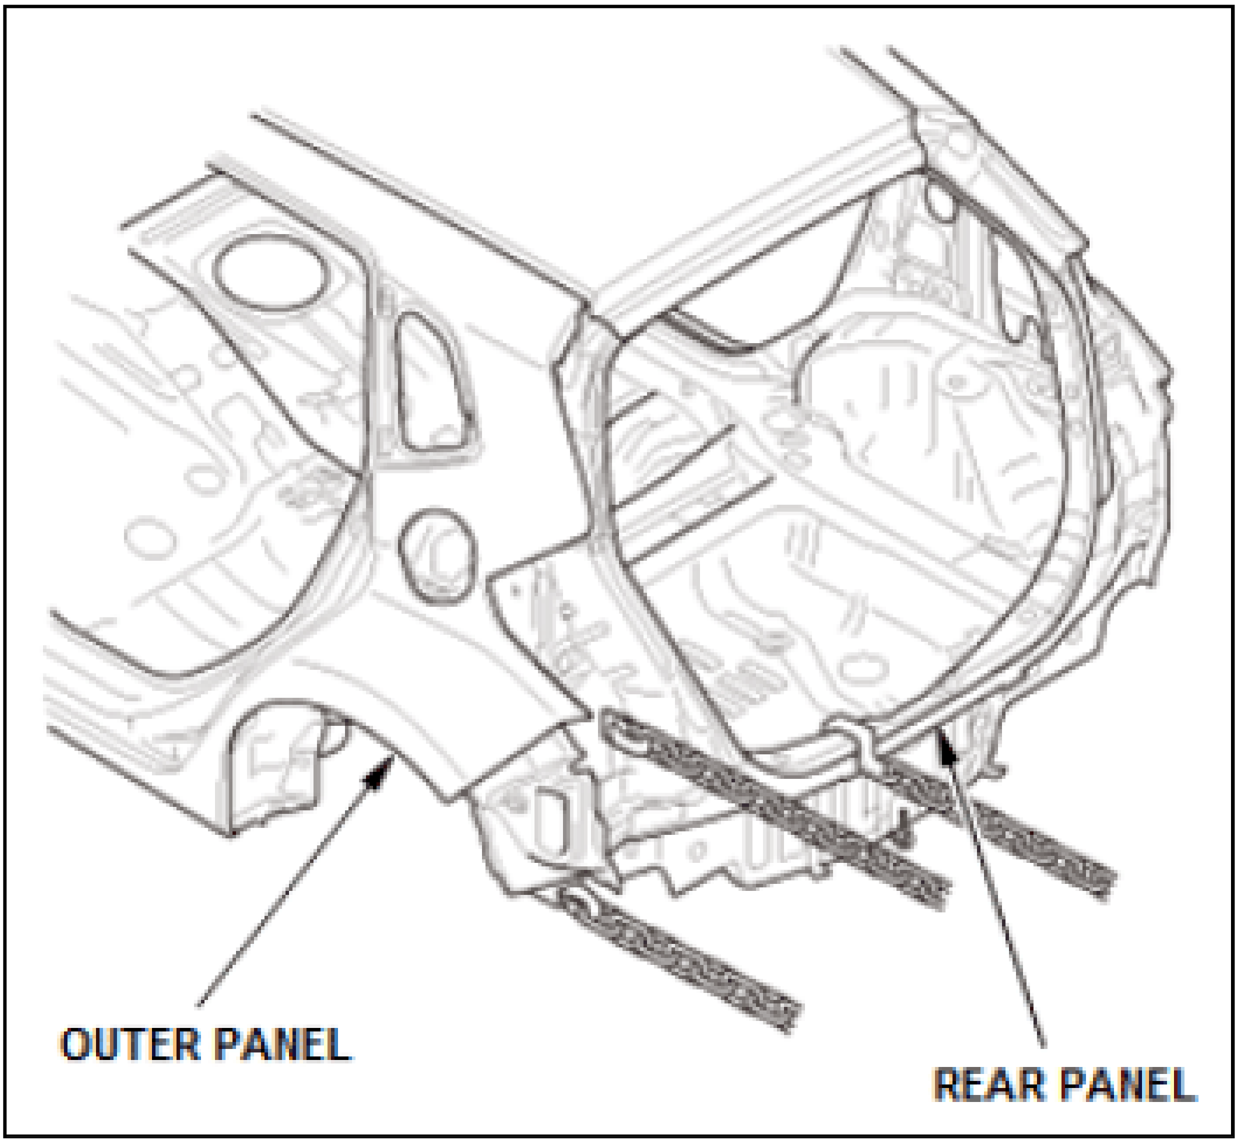
In the upper body damage will disperse as far as the rear wheelhouse, rear inner panel, and rear pillar with distortion also in the roof panel.

1. Develop a repair plan:
   - Pull out the damaged area to restore it to near the original dimensions.
   - Repair and reform the installation points for the new replacement parts.
   - Remove the damaged part (left side) and install a new part.
2. Attach the body to the body and frame correction equipment. Firmly attach the vehicle so it does not move during the pulling operation.



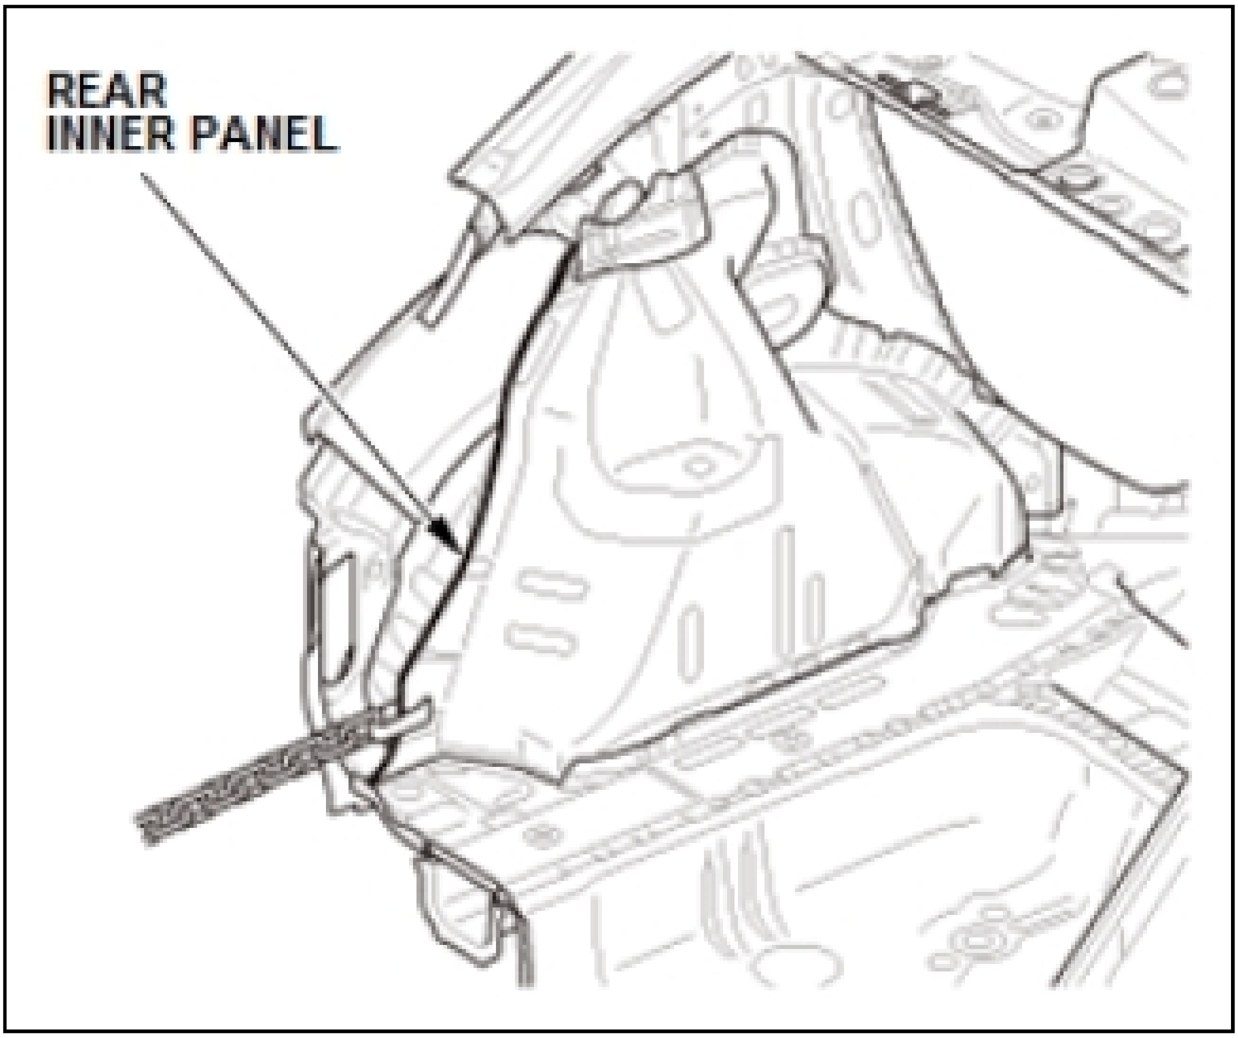
OUTER PANEL
Butt welding
REAR FLOOR
CROSSMEMBER
Repair or Replace
REAR PANEL
Replace
REAR FRAME
Sectioning

3. Determine the pulling direction opposite the impact force, then pull-out slowly and gradually pull out the rear panel, rear floor, and the rear frame. While pulling, repair the rear floor. Do not directly pull on the rear outer panels during repair.



4. If it is impossible to pull it out fully cut the rear panel or rear floor and restore the damaged area by pulling it directly.
5. Measure the dimensions of rear frame, rear wheelhouse, rear damper positions after the repair.

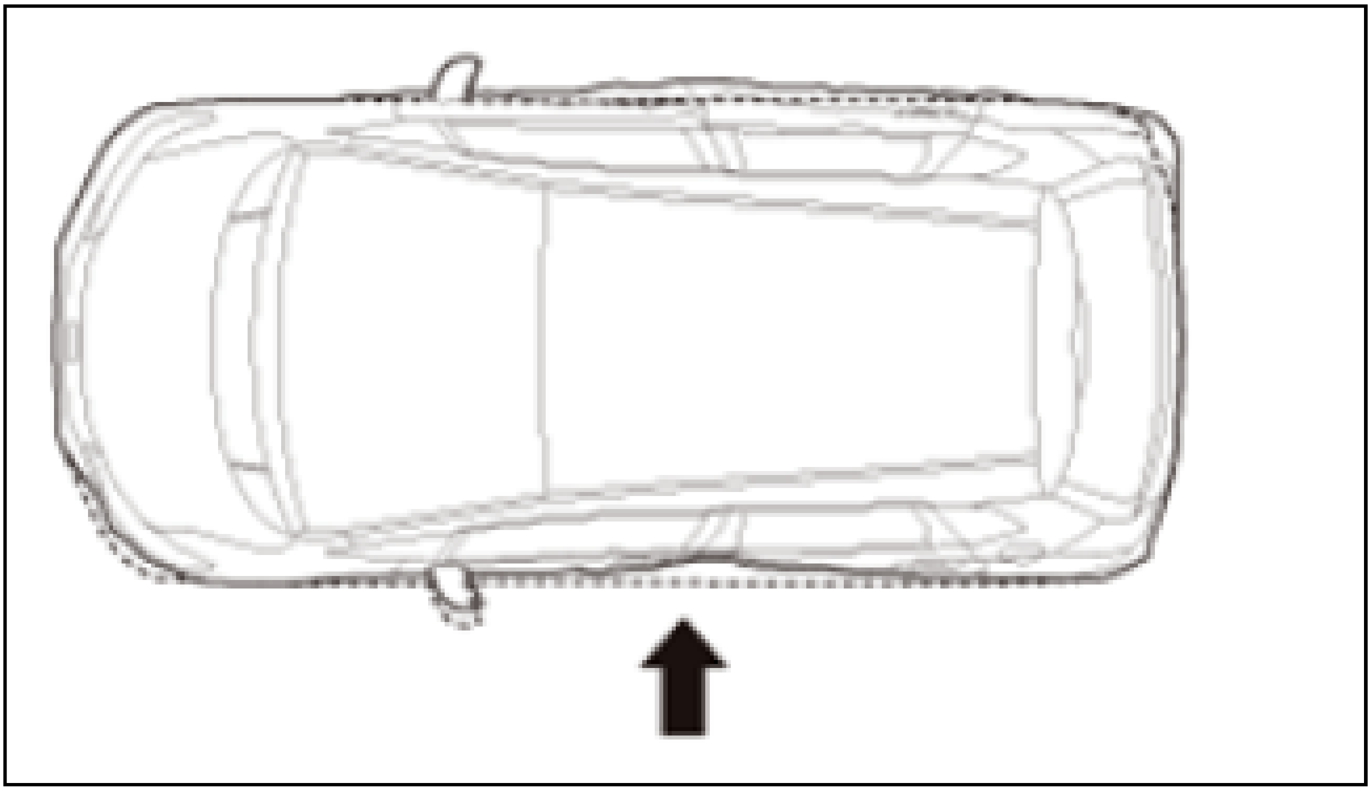
   Also check the clearances between rear doors and rear out side panels.



Body And Frame Correction For Side Damage

An example of damages: Due to the side impact, together with the side sills, the floor is crashed and the center pillar is bent.

The whole body is bent like a boomerang and the wheel base is shrunk.

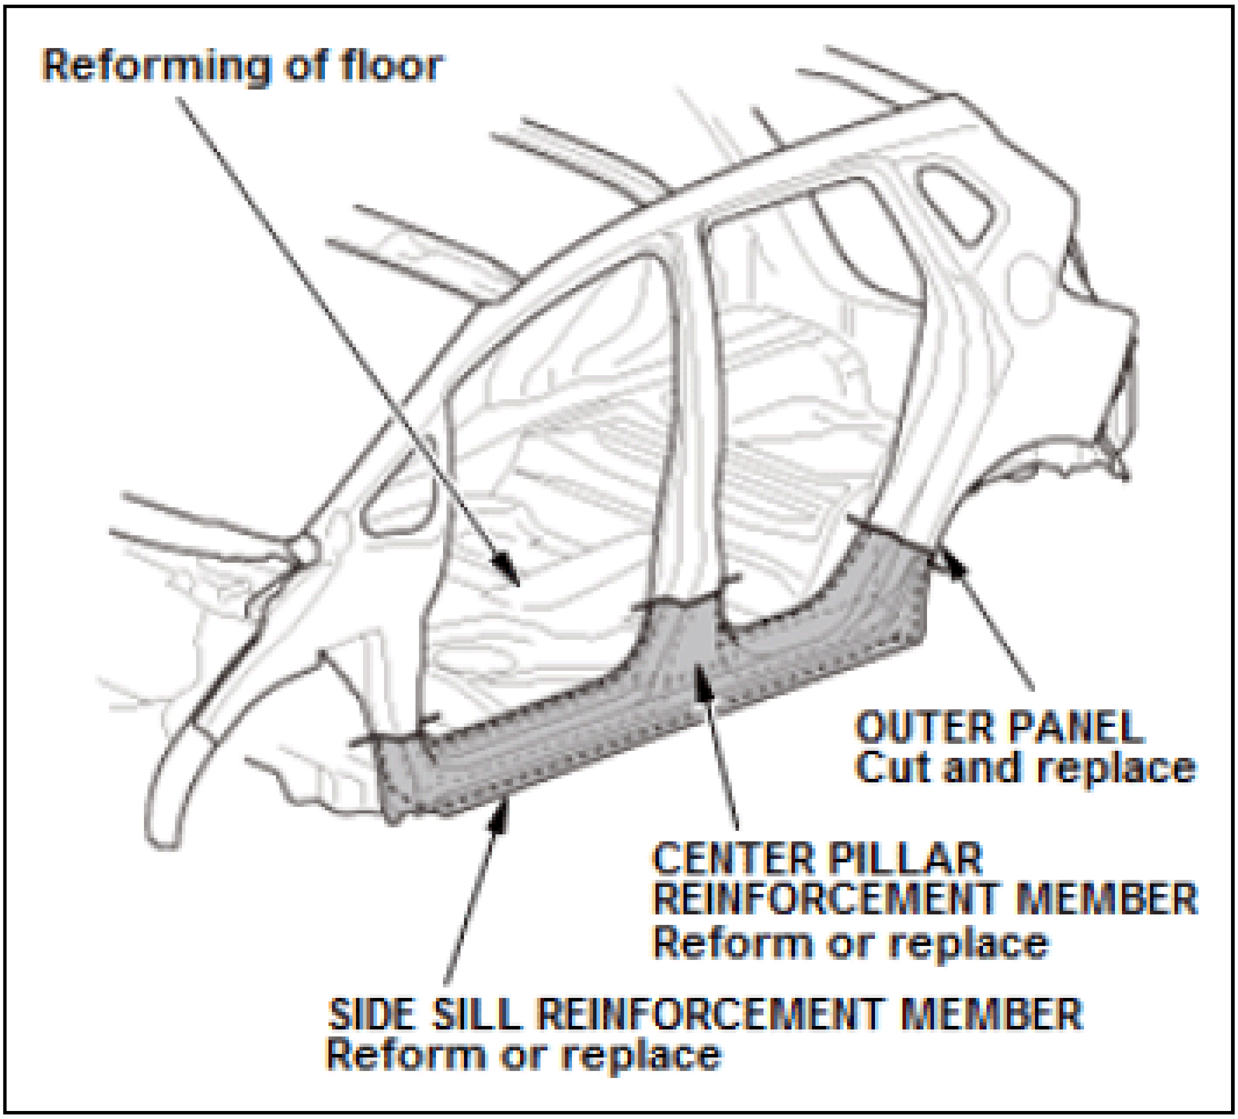


1. Develop a repair plan:

- Pull out the damaged area to restore it to near the original dimensions.
- Repair and reform the installation points for the new replacement parts.
- Remove the damaged part (left side) and install a new part.

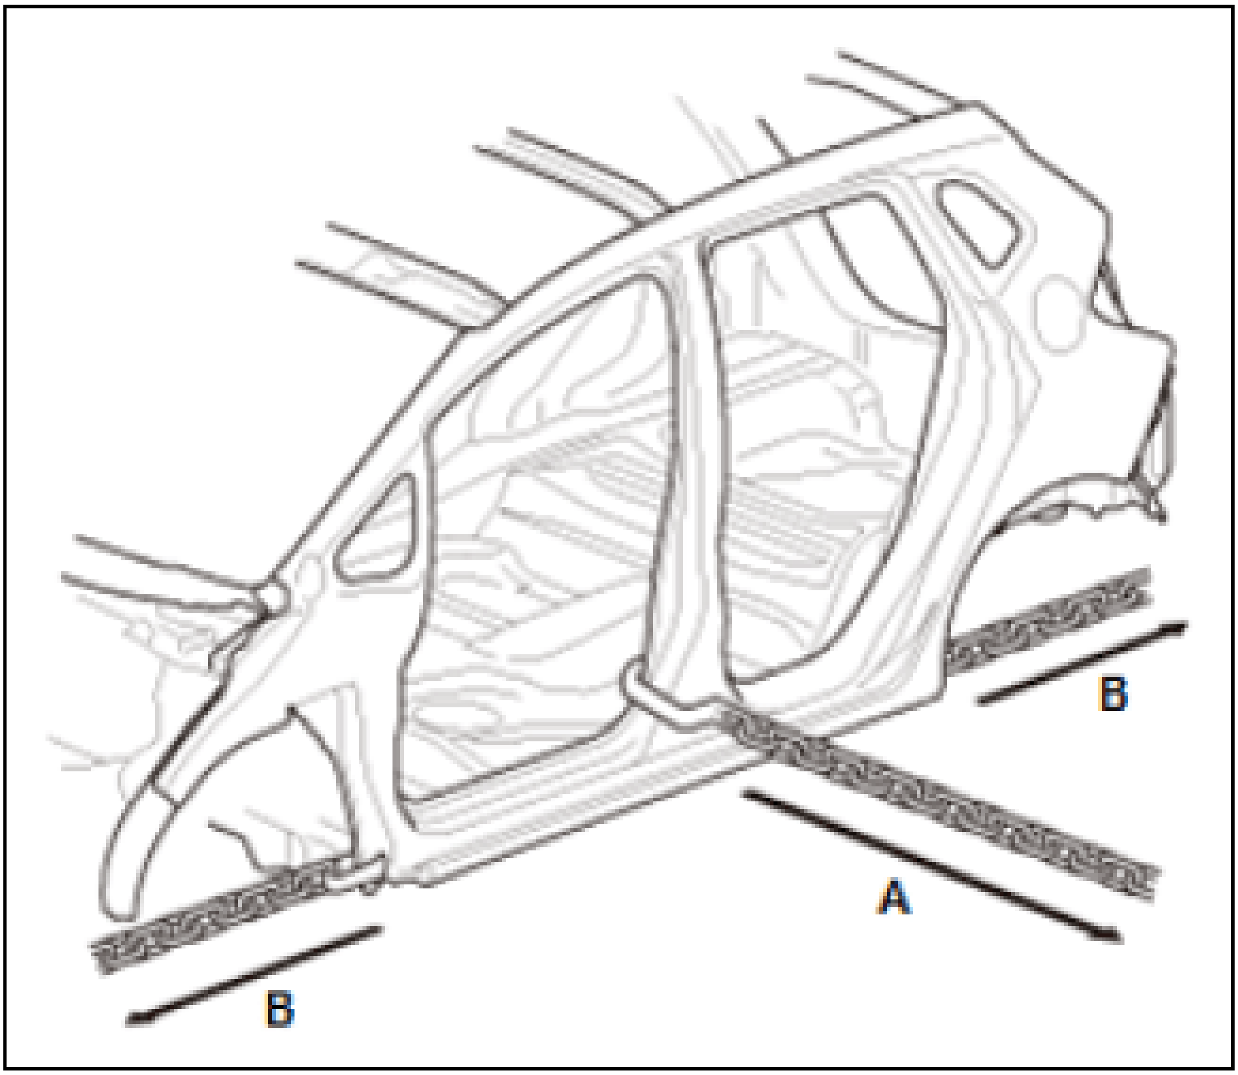
2. Attach the body to the body and frame correction equipment.

   Firmly attach the vehicle so it does not move during the pulling operation.



Reforming of floor
OUTER PANEL
Cut and replace
CENTER PILLAR
REINFORCEMENT MEMBER
Reform or replace
SIDE SILL REINFORCEMENT MEMBER
Reform or replace

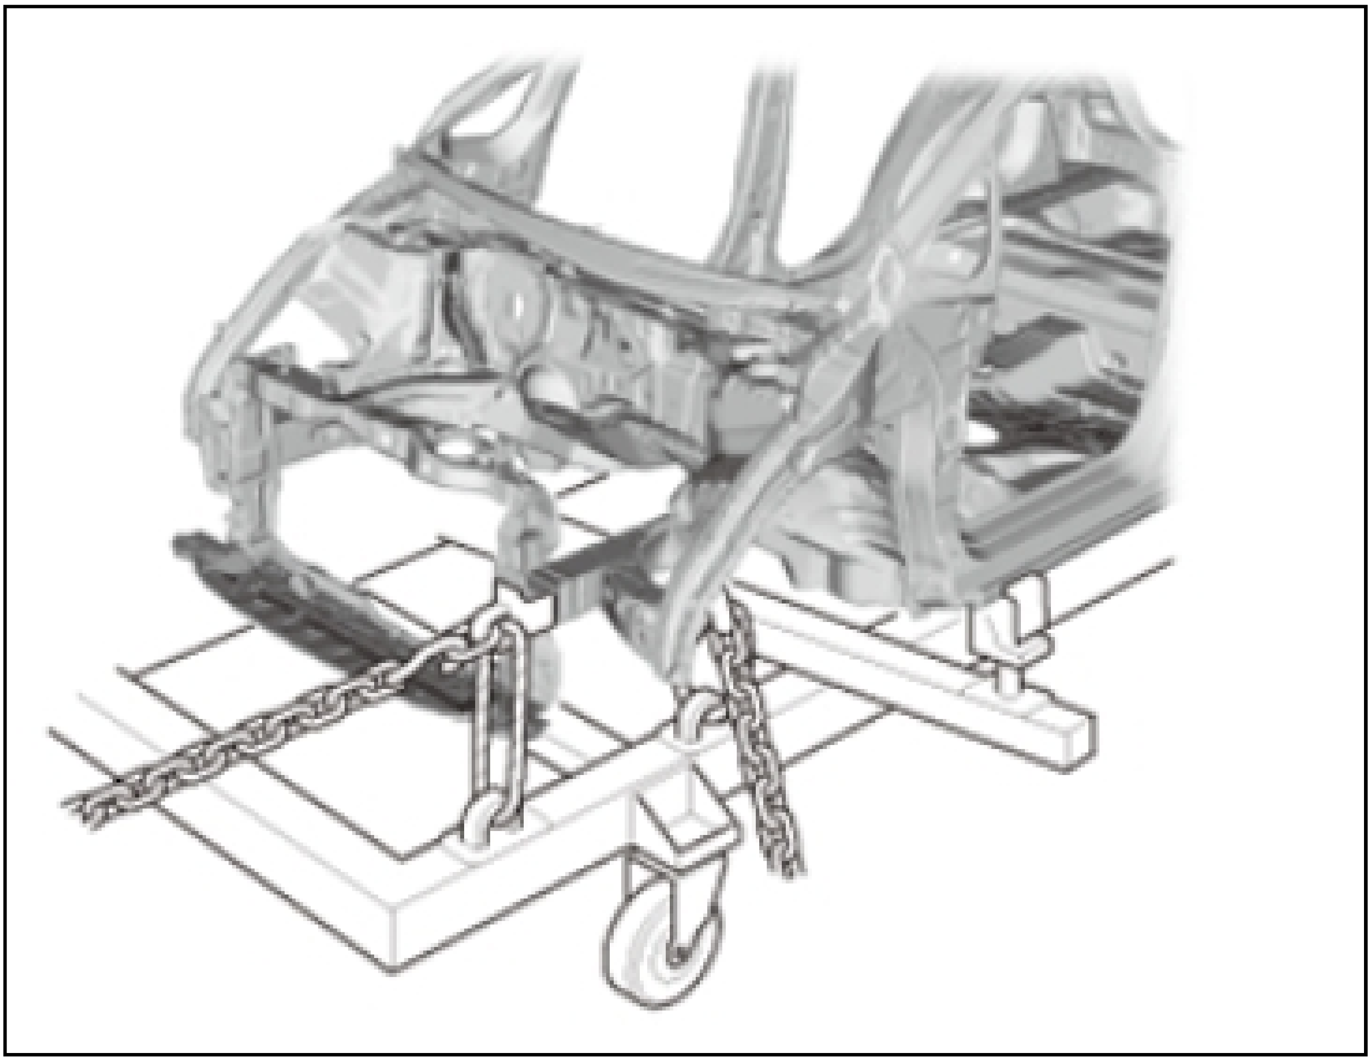
3. The most effective way is to pull it out in three directions. While pulling out the side sill and the center pillar in the direction (A), opposite to the impact force, pull out the side sill in the front and rear direction (B) at the same time. While pulling, repair the floor panel and door opening area.
4. Measure the dimensions and confirm the pulled-out points.



Body And Frame Correction Overview

This work is very important in collision repair. Using body and frame correction equipment, the deformed area of the wrecked vehicle is pulled out nearly to the original shape. In order to complete this work satisfactorily measurements must be made correctly before beginning this work.

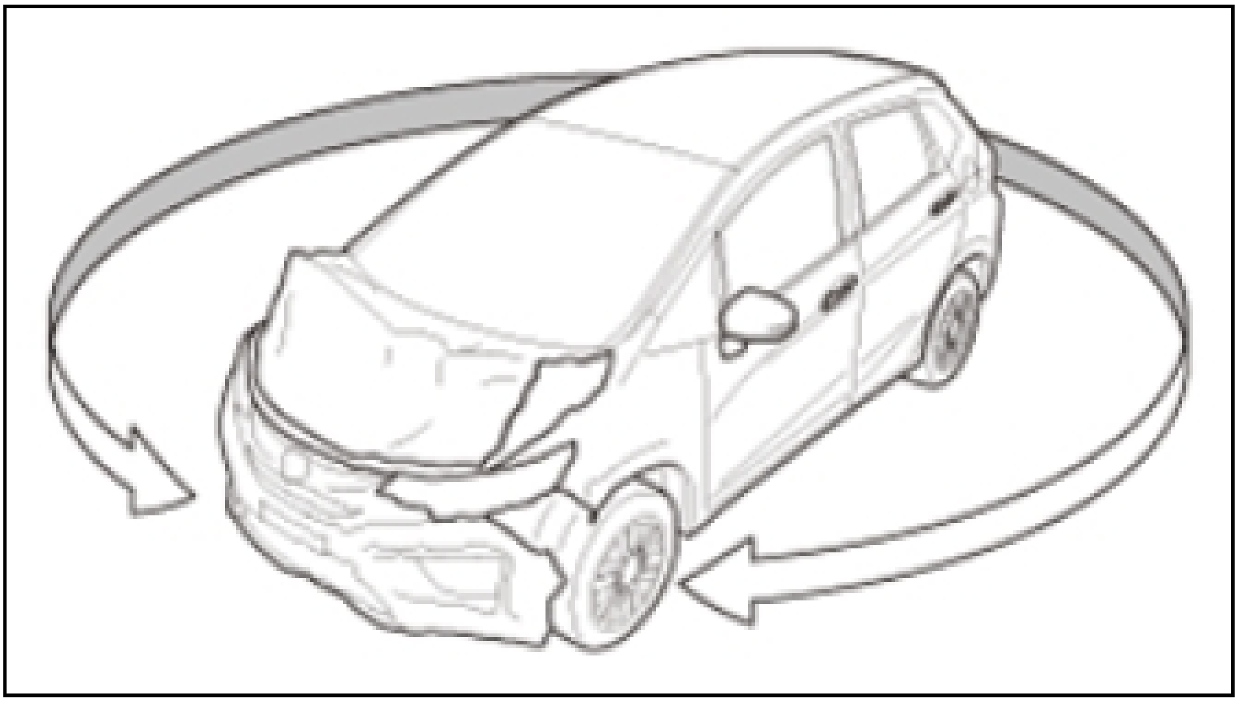
If the body is not correctly restored to the original dimensions, the exterior appearance, driveability steering, handling, and tire wear will be greatly influenced.



Body Damage Inspection

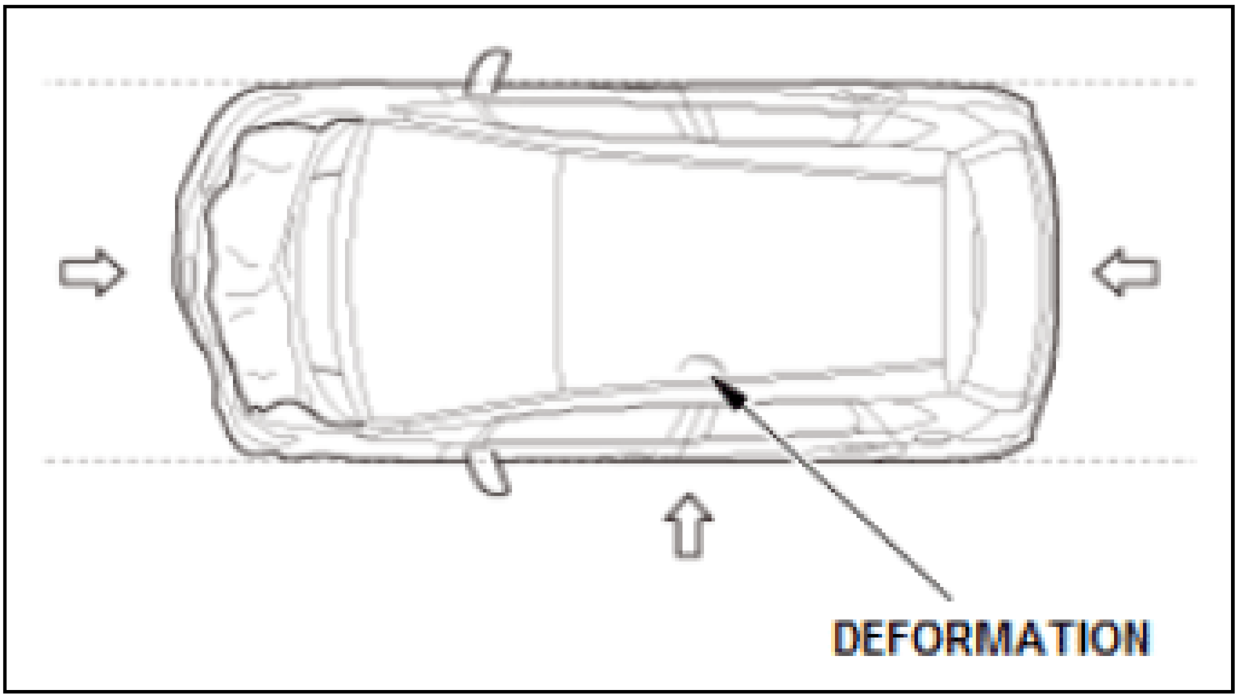
Check the damaged portion of the vehicle visually and by feel to estimate the extent of the collision damage.

1. Observe the entire vehicle and count the number of impacts, evaluate their magnitude and determine the damage sequence.

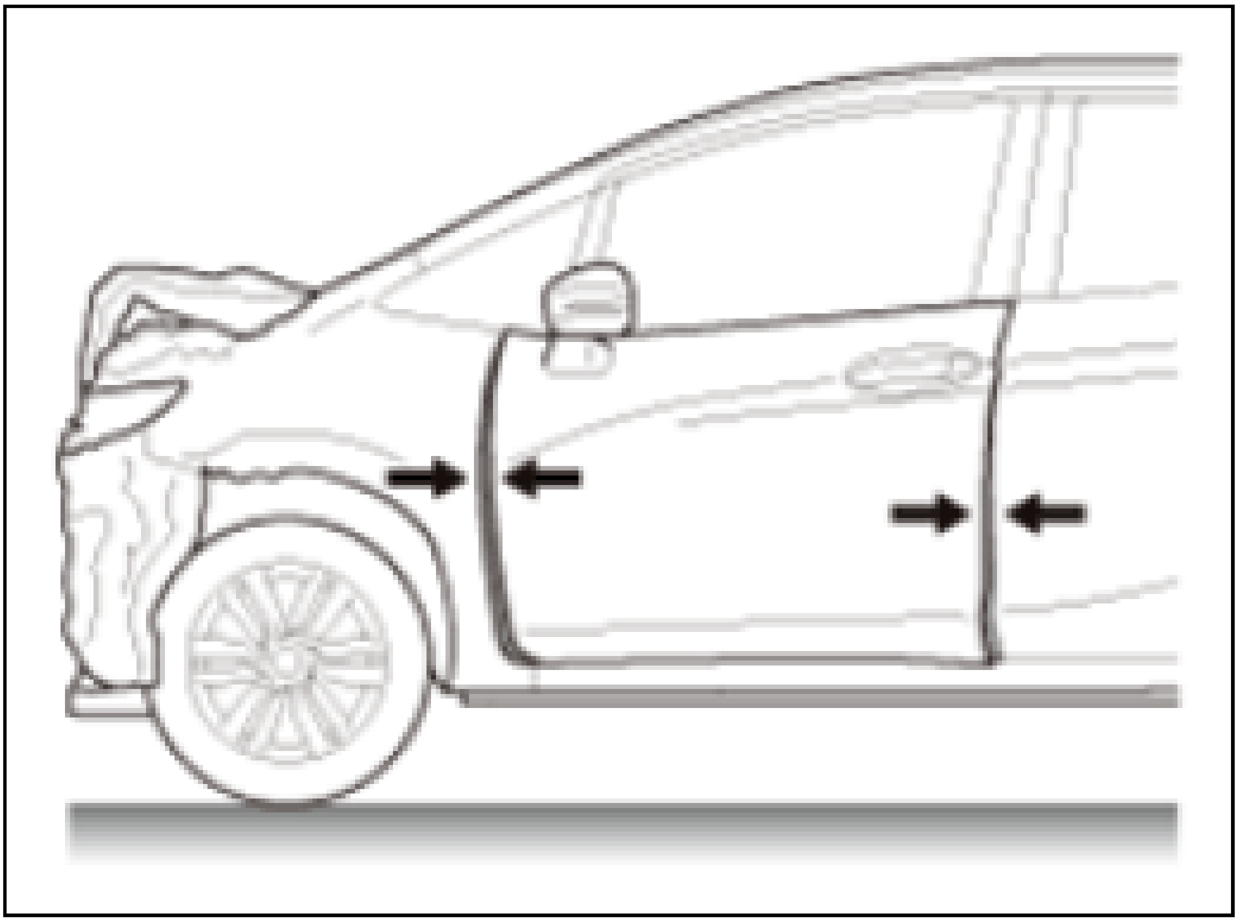


2. Check external damage and deformation

   Observe the vehicle from the front, rear, and sides and check lateral and vertical bends, twists, out-of true lines on the side view, and body high spots or depressions. Also check panel deformation away from the impact areas.

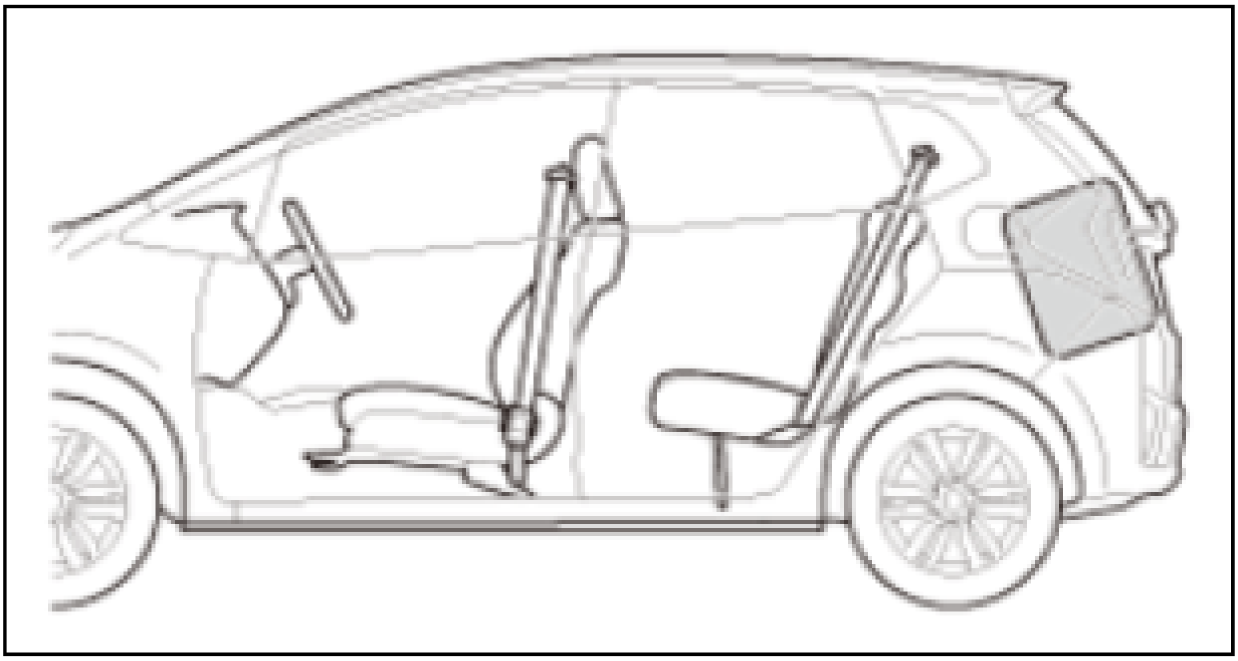


3. Check the alignment (fit/finish) of the exterior body parts Close doors, hood and trunk lid to carefully inspect the gap, steps and clearance against the adjoining panels, and check for any striker contact while opening and closing.

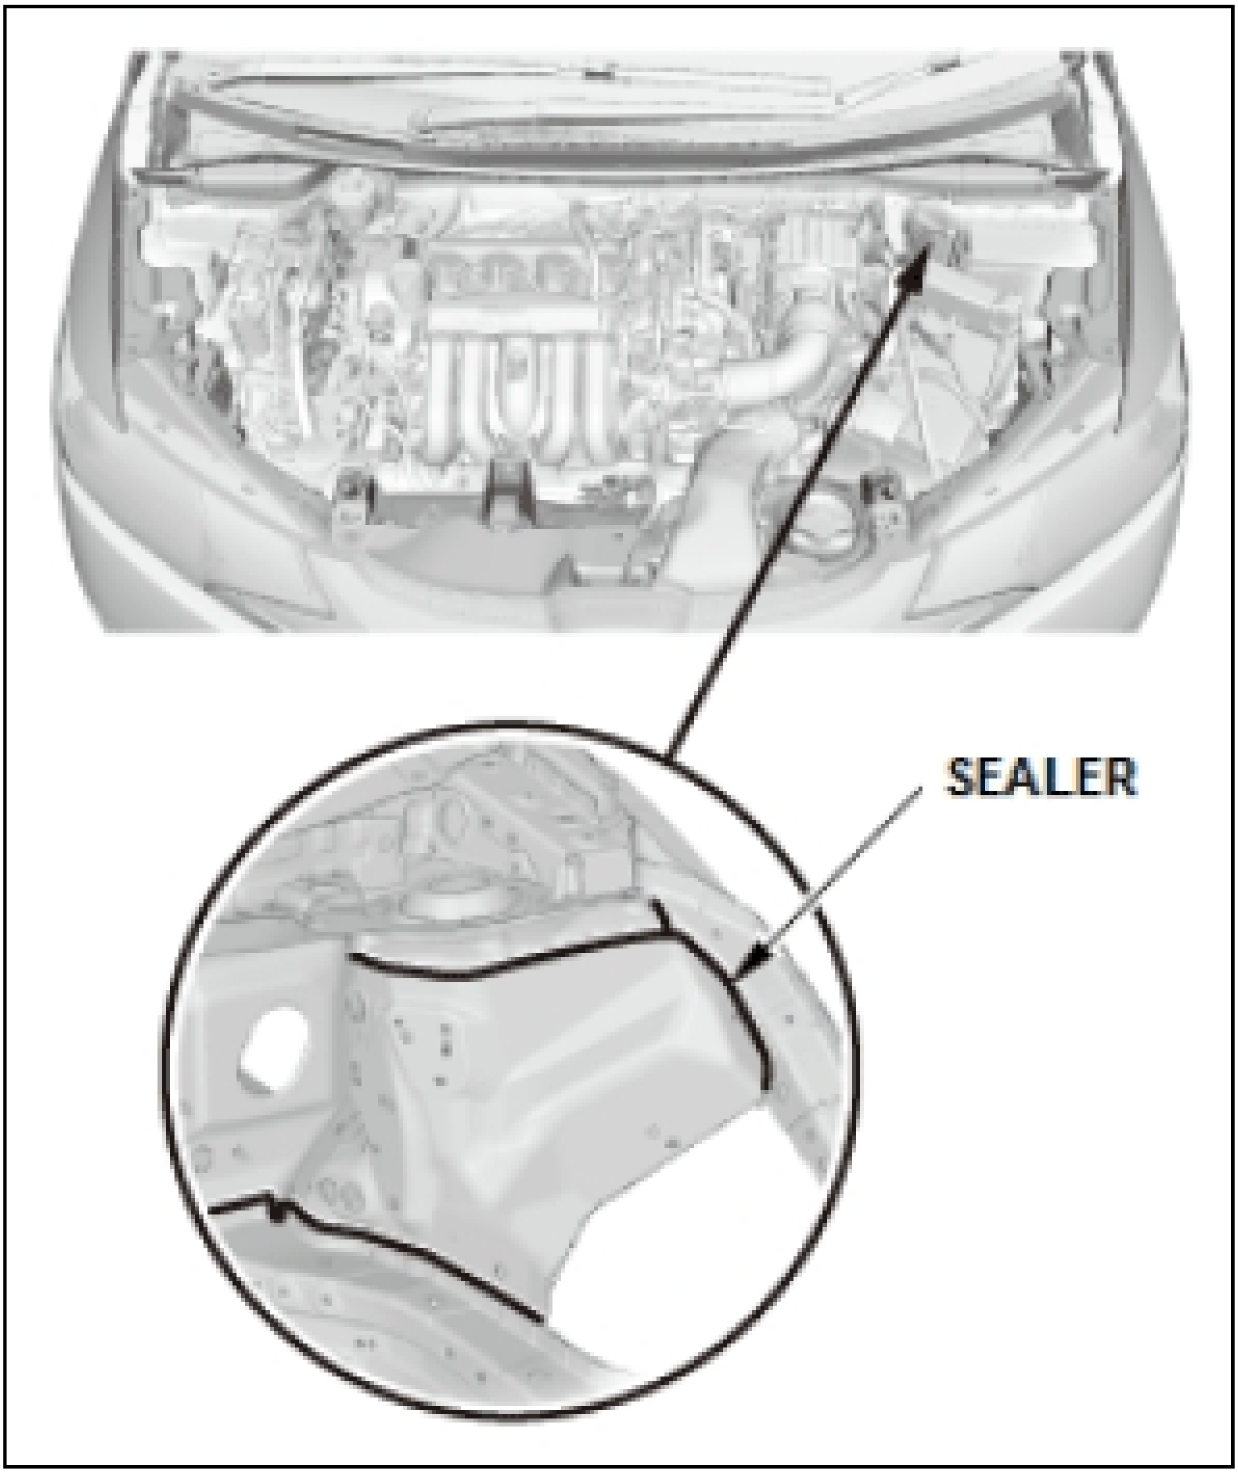


4. Check for damage caused by passengers and cargo:
    - Inspect for secondary damage caused by crash inertia.
    - Inspect the damage to steering, instrument panel, seat and seat belt in the passenger compartment.

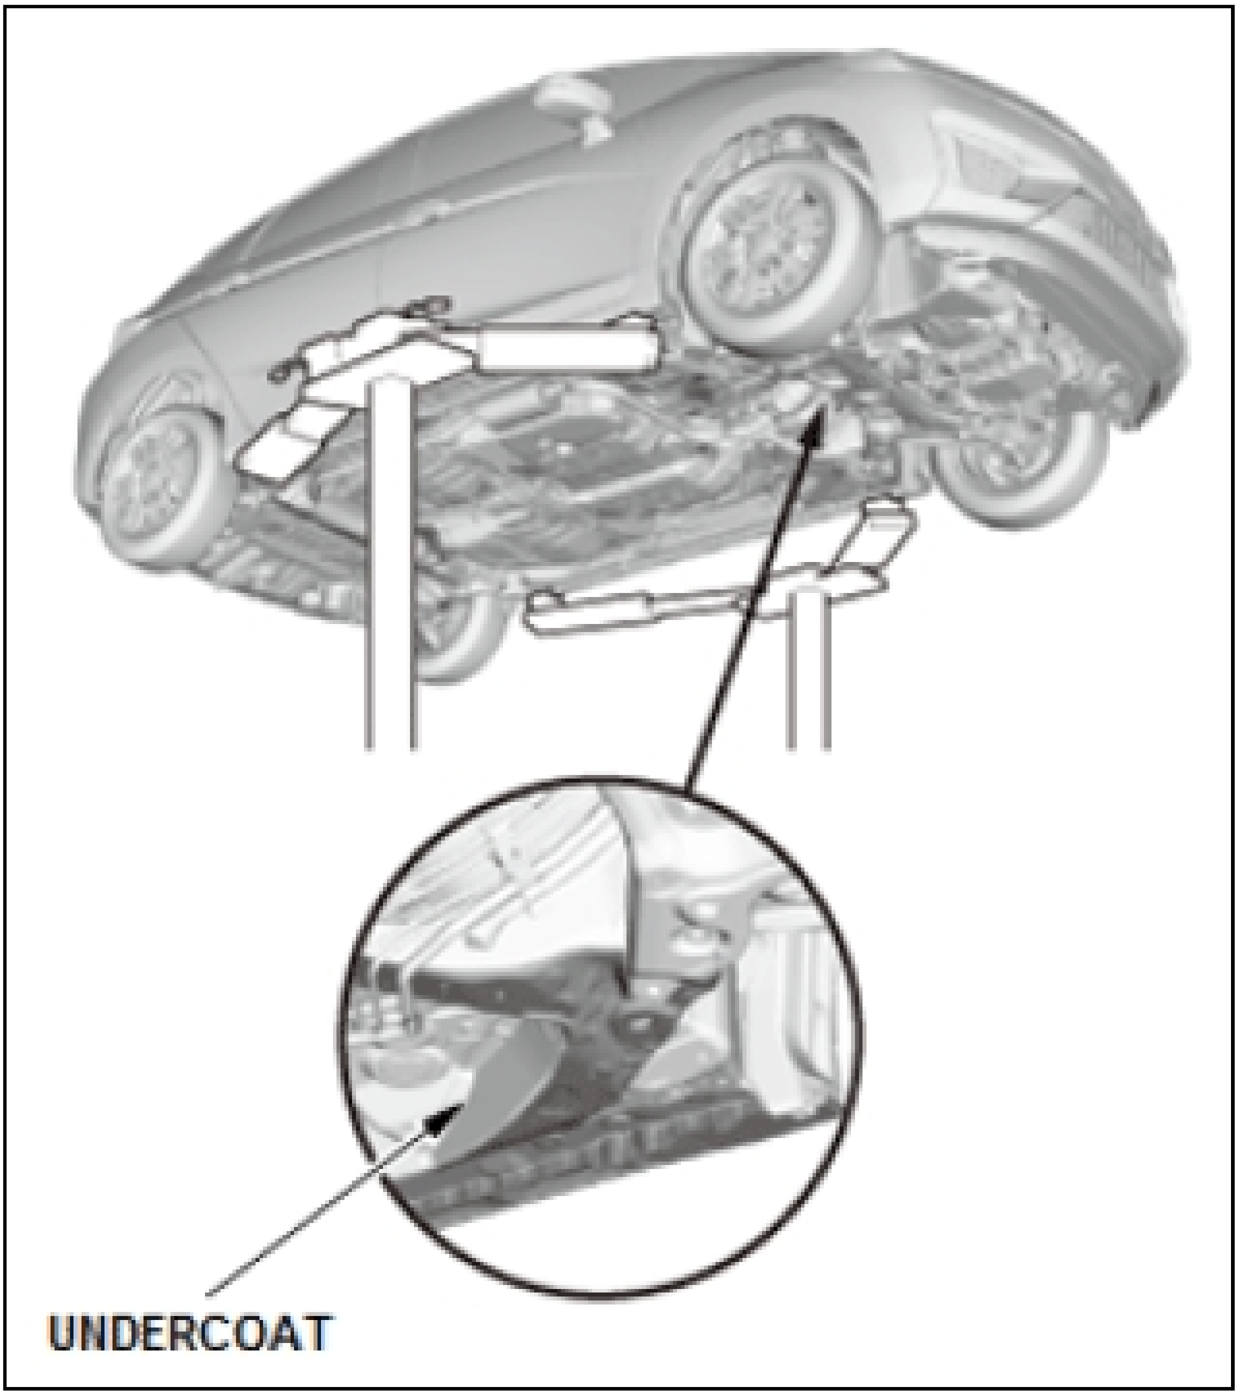
Also inspect the for deformation of body panel in the trunk or cargo area caused shifting cargo.



5. Check the engine compartment:
   - Check deformation or damaged:
     - Engine mounts.
     - Transmission mounts and brackets.
     - Contact between auxiliary systems and the body.
     - Wiring harnesses pinching or damage.
   - Check for deformation in each part of the body and for sealer cracking or peeling from any welded joints.



6. Check the under body.
    - Lift the vehicle and check for damage in the suspension or the sub frame.
    - Check for leakage of engine oil, coolant, transmission and brake fluids.
    - Check for deformation in each part of the body and for sealer cracking or peeling from any welded joints.
7. Check the vehicle system functions:
    - Start the engine and check whether any abnormal vibrations, noise, or contact noise exists.
    - Operate the clutch, brake pedal, parking brake lever and the shift lever to check their function. Operate all electrical lighting and accessory systems to check their function.



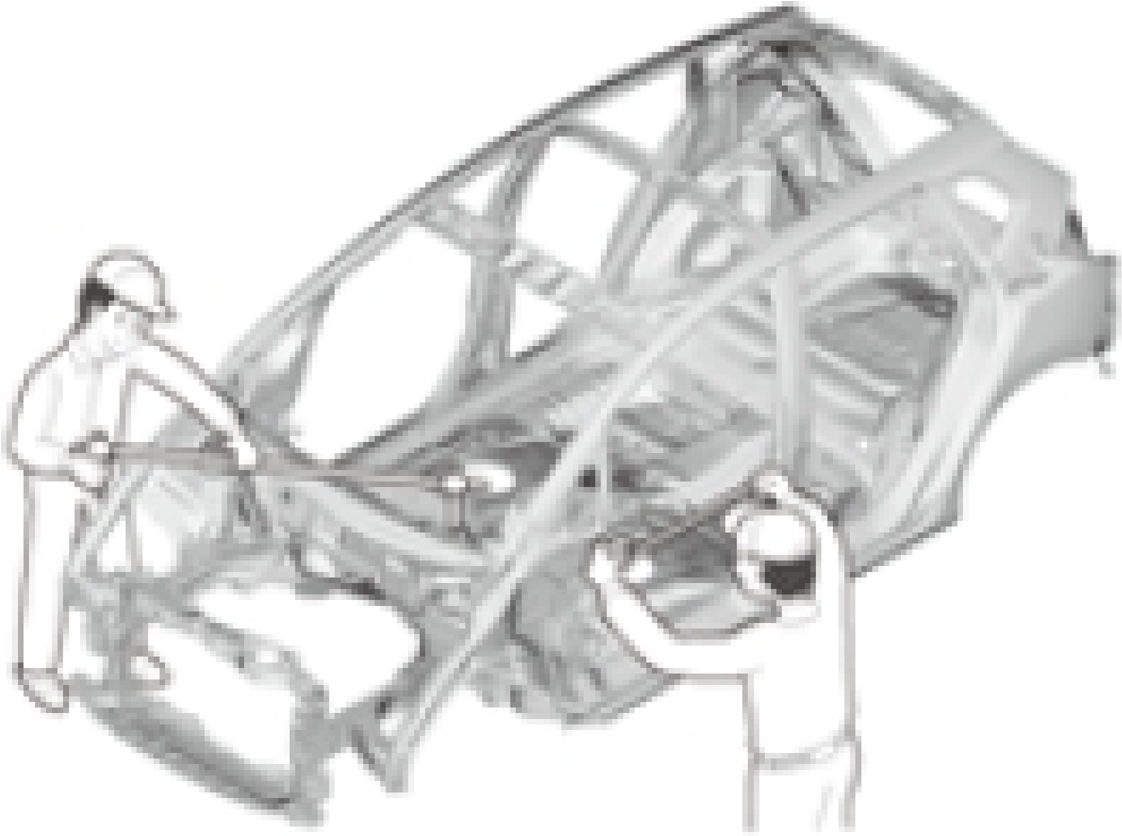
Measuring Dimensions

With reference to the body centerline, measure the major dimensions of the damaged body with the use of measurement equipment. This makes numerical evaluation of to body damage amount possible. Body dimensions that influence wheel alignment are particularly important. Visual inspection alone is not sufficient.

Measurement Method

- Diagonal measurements (X measurements)
- Measure using the body measuring dimensions in the model specific body repair information (Actual measurement figures)
- Measurements with the use of a frame repair chart (flat view data)

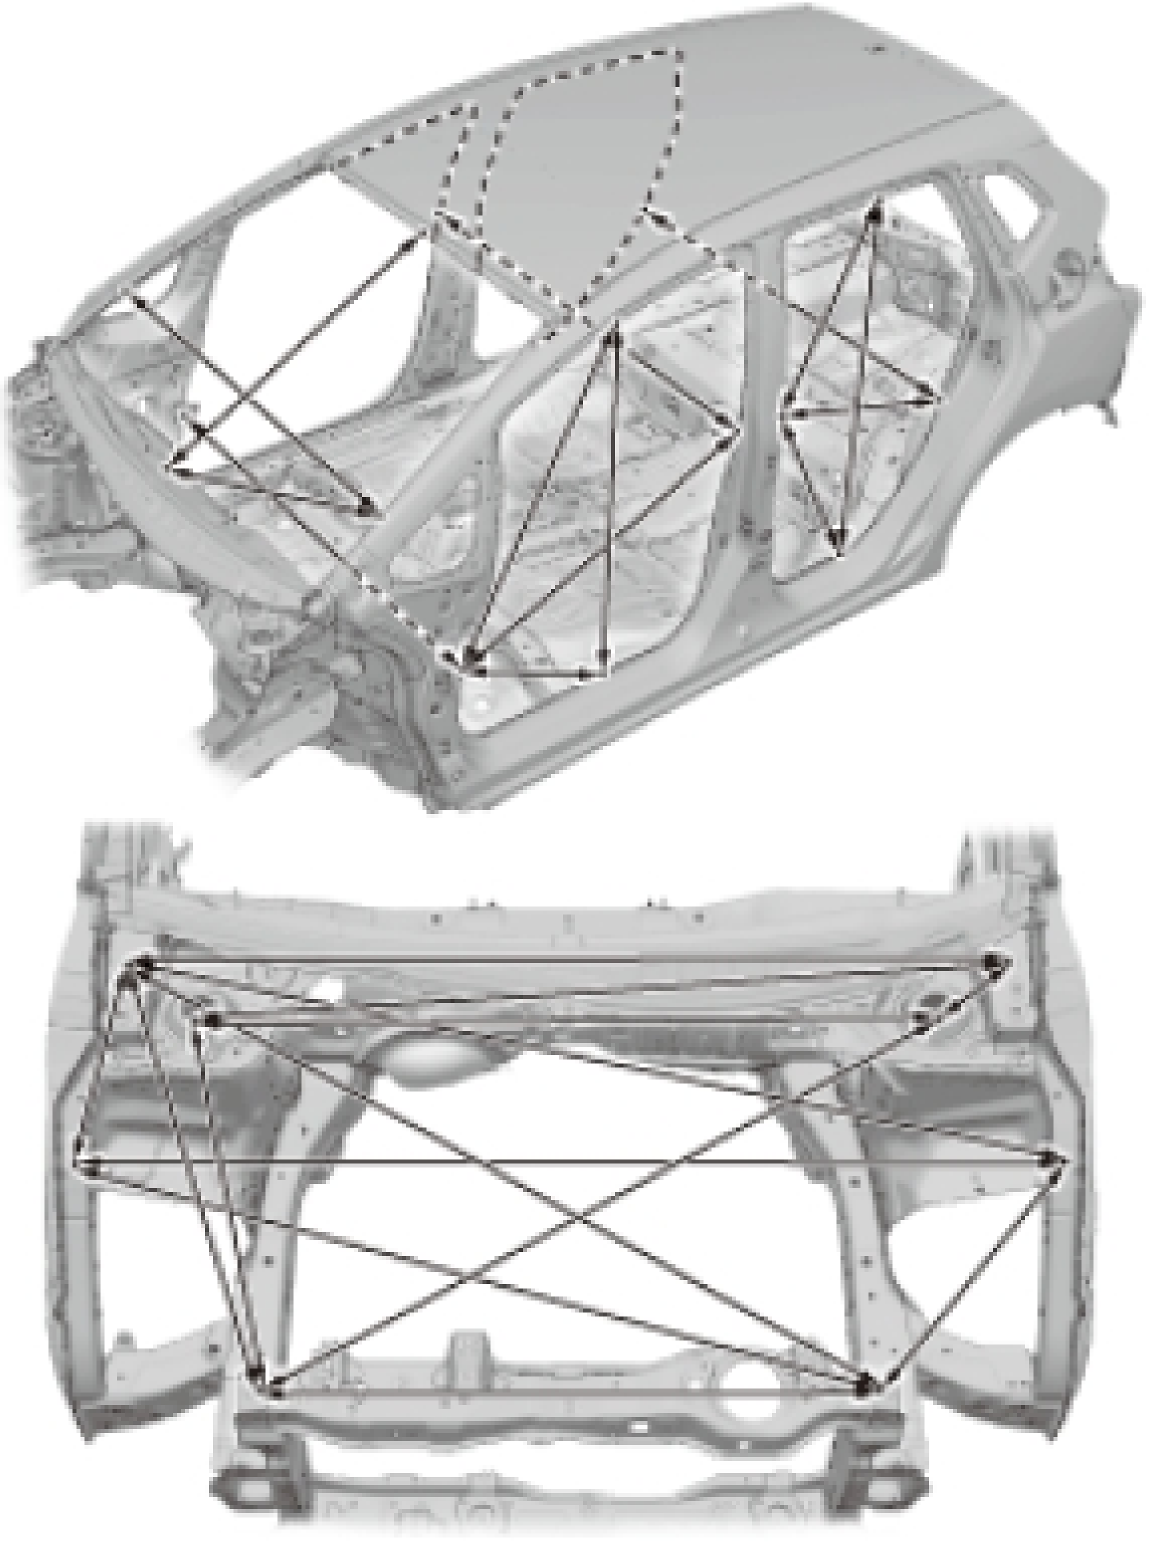
By combining the measurement methods above, diagnosis of the overall body damage level is possible.

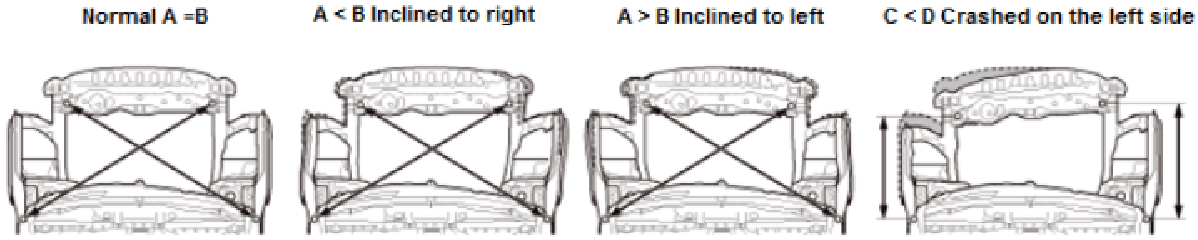


Diagonal Measurements

Using a part installation hole or reference hole, which is one of two symmetrical right and left positions as a measuring point, diagonally measure the lengths of the front body, windows, passenger compartment, trunk or cargo area, tailgate opening, or under body From this data, the deformation of the vehicle as a whole can be judged.

NOTE: **Always combine the diagonal measurement with another measuring method as the diagonal measurement may not show all the deformation that exists.**



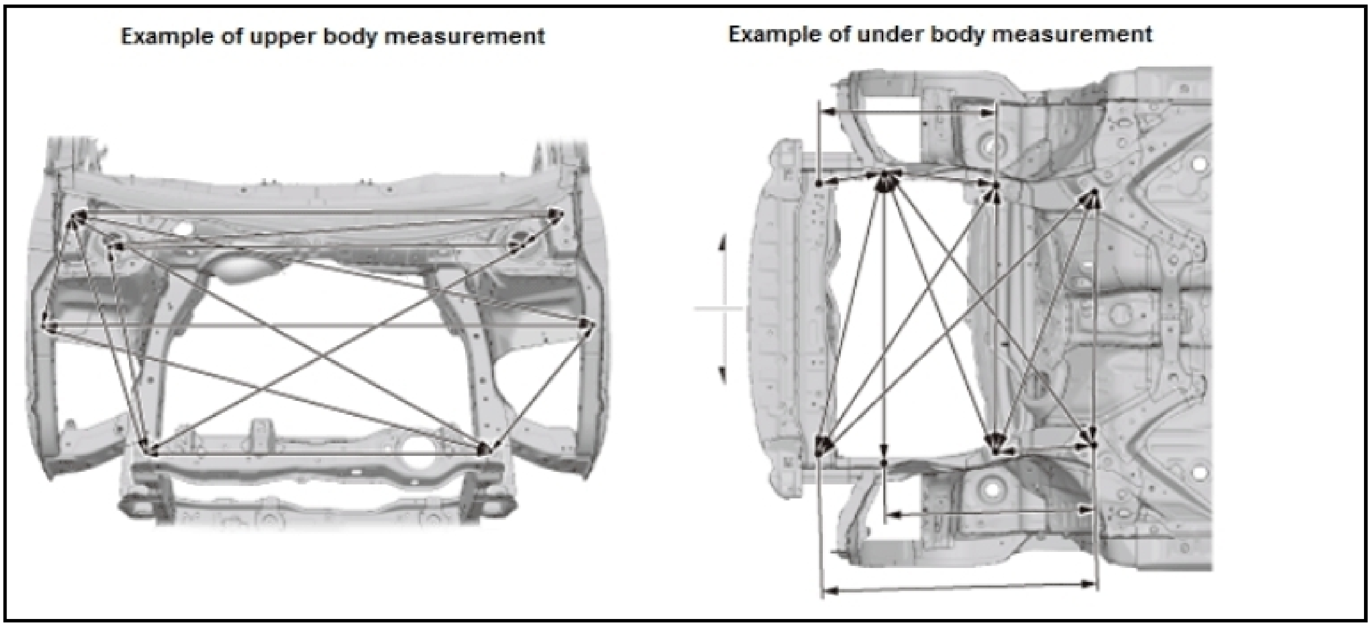


Normal A =B
A < B Inclined to right
A > B Inclined to left
C < D Crashed on the left side

Reference To The Drawing Of Body Dimensions

While referring to the body dimensional drawing shown in the model specific body repair information, measure the corresponding dimensions on the actual vehicle in fore and aft, right and left and diagonal directions to evaluate the damage level.

Depending on the amount of damage, the measurements from the undamaged parts of the vehicle may also be used for to evaluate damage levels.



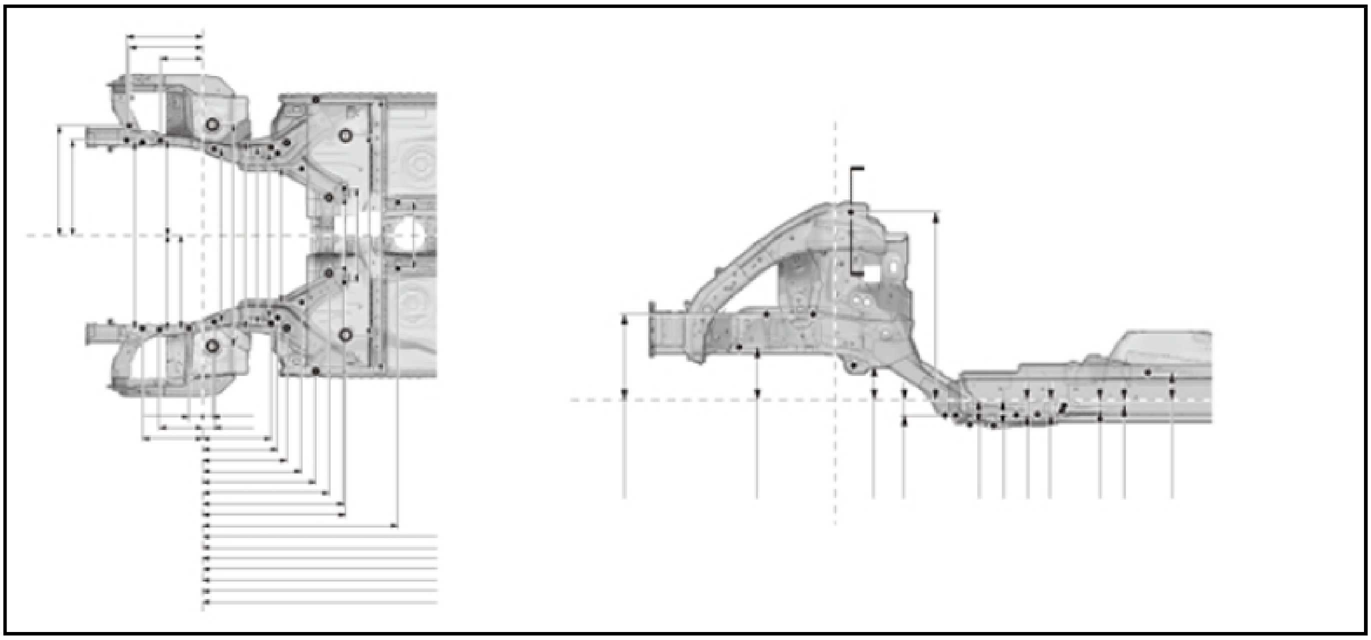
Example of upper body measurement
Example of under body measurement

Measurements According To The Frame Repair Chart

Measure the plain dimensions referring to the frame repair chart of the model specific body repair information.

The measurement points in the repair chart use the installation positions of critical components of a vehicle as datum points; such as the installation holes of the sub frame, engine, transmission, suspension related parts.

NOTE: **Always be sure to use equipment or gauges designed for vehicle body repair.**



Parts Replacement

Parts Replacement

1. Cutting welded joints:
    - Spot welding is mostly used for the mass produced body welding. MAG welding may also be used occasionally.
    - When separating the weld joints, use hole punching and grinding tools according to the joint conditions.

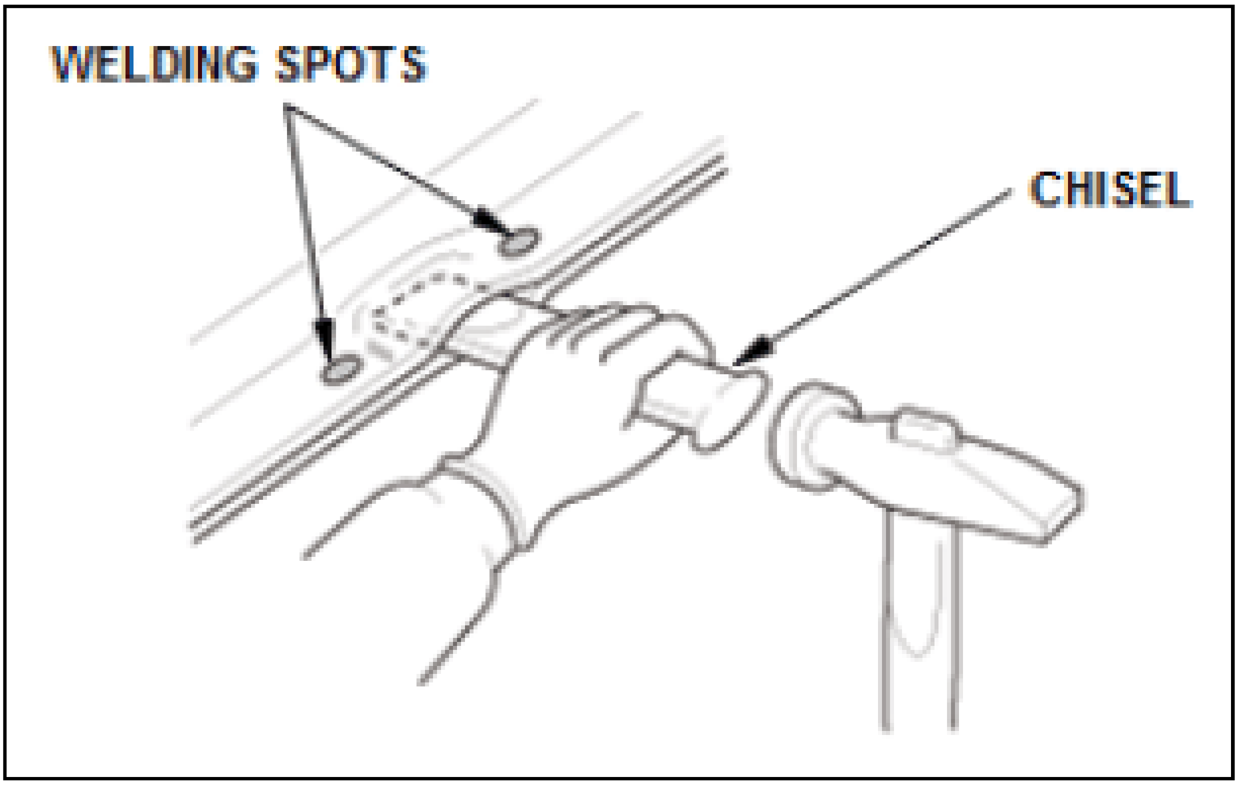
    NOTE: **Confirm the assembly status of the replacement panels and make sure not to damage the parts being reused.**

Cutting spot welded joints:

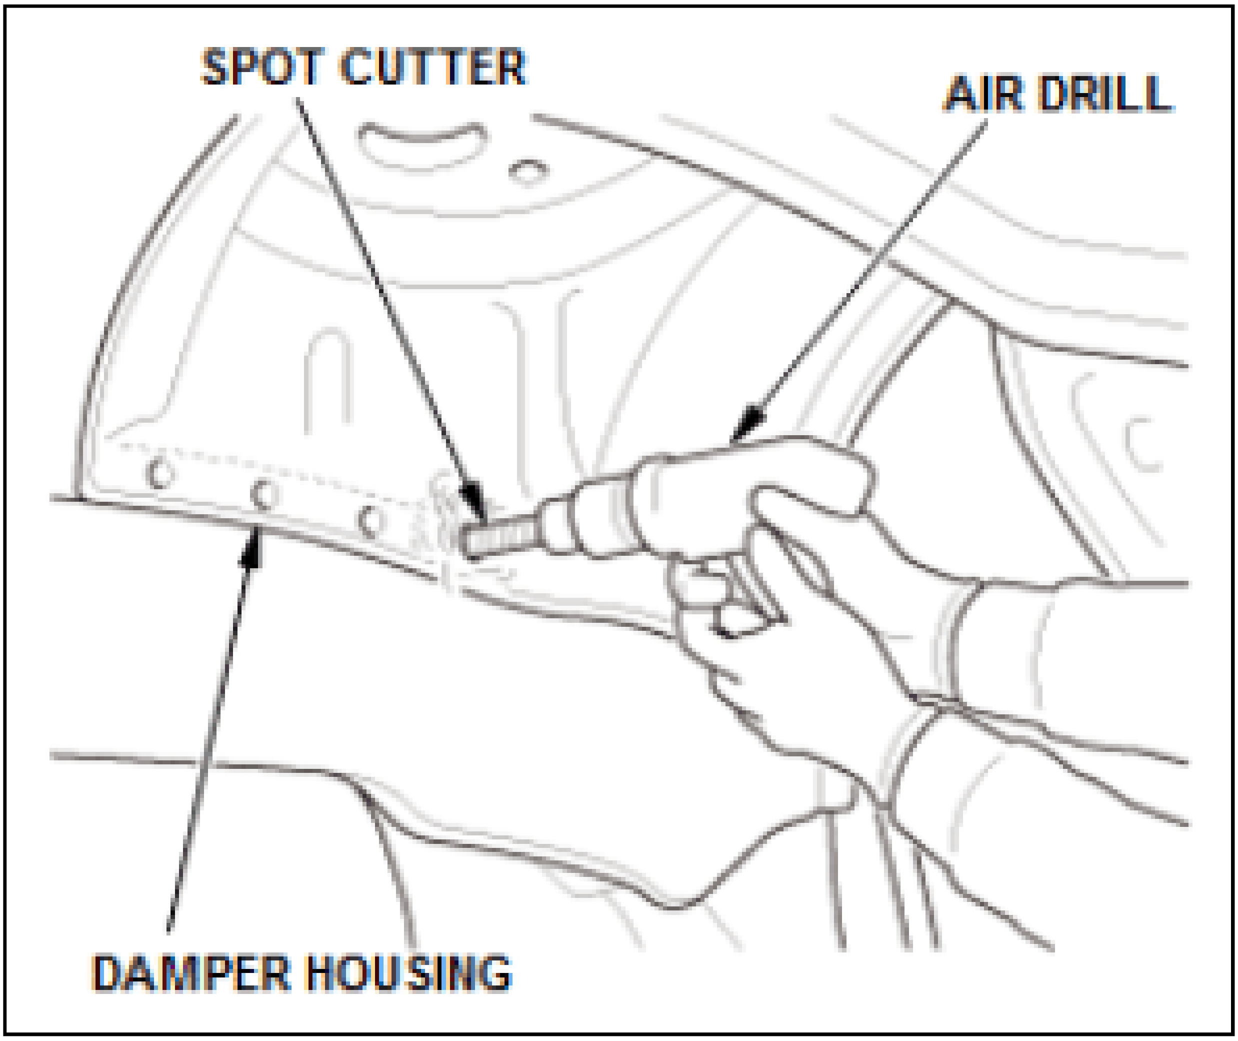
Remove the weld nuggets.

Cutting MAG Welded joints:

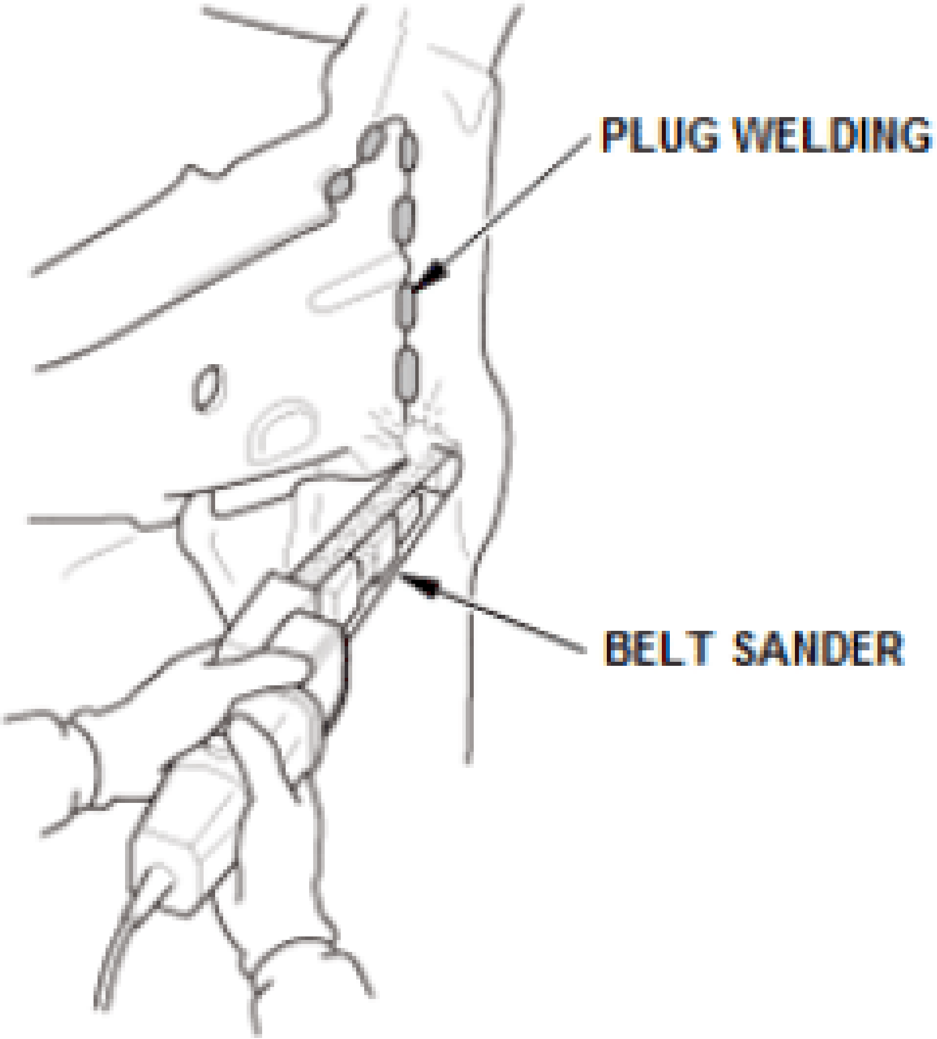
Remove the weld beads and plugs.



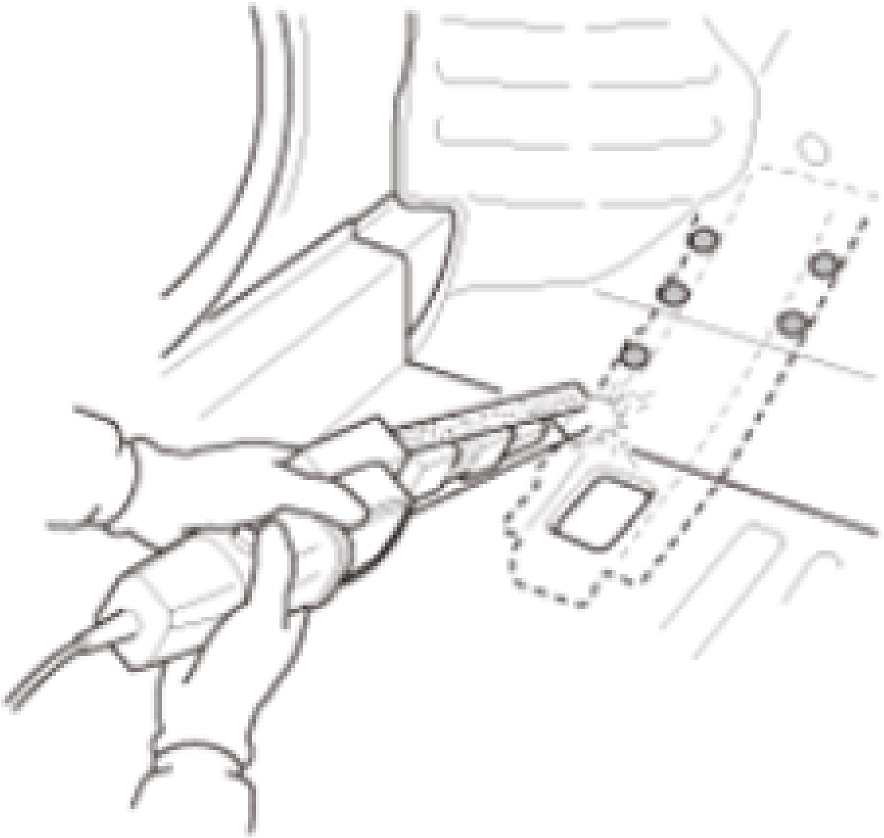
WELDING SPOTS
CHISEL



SPOT CUTTER
AIR DRILL
DAMPER HOUSING



PLUG WELDING
BELT SANDER

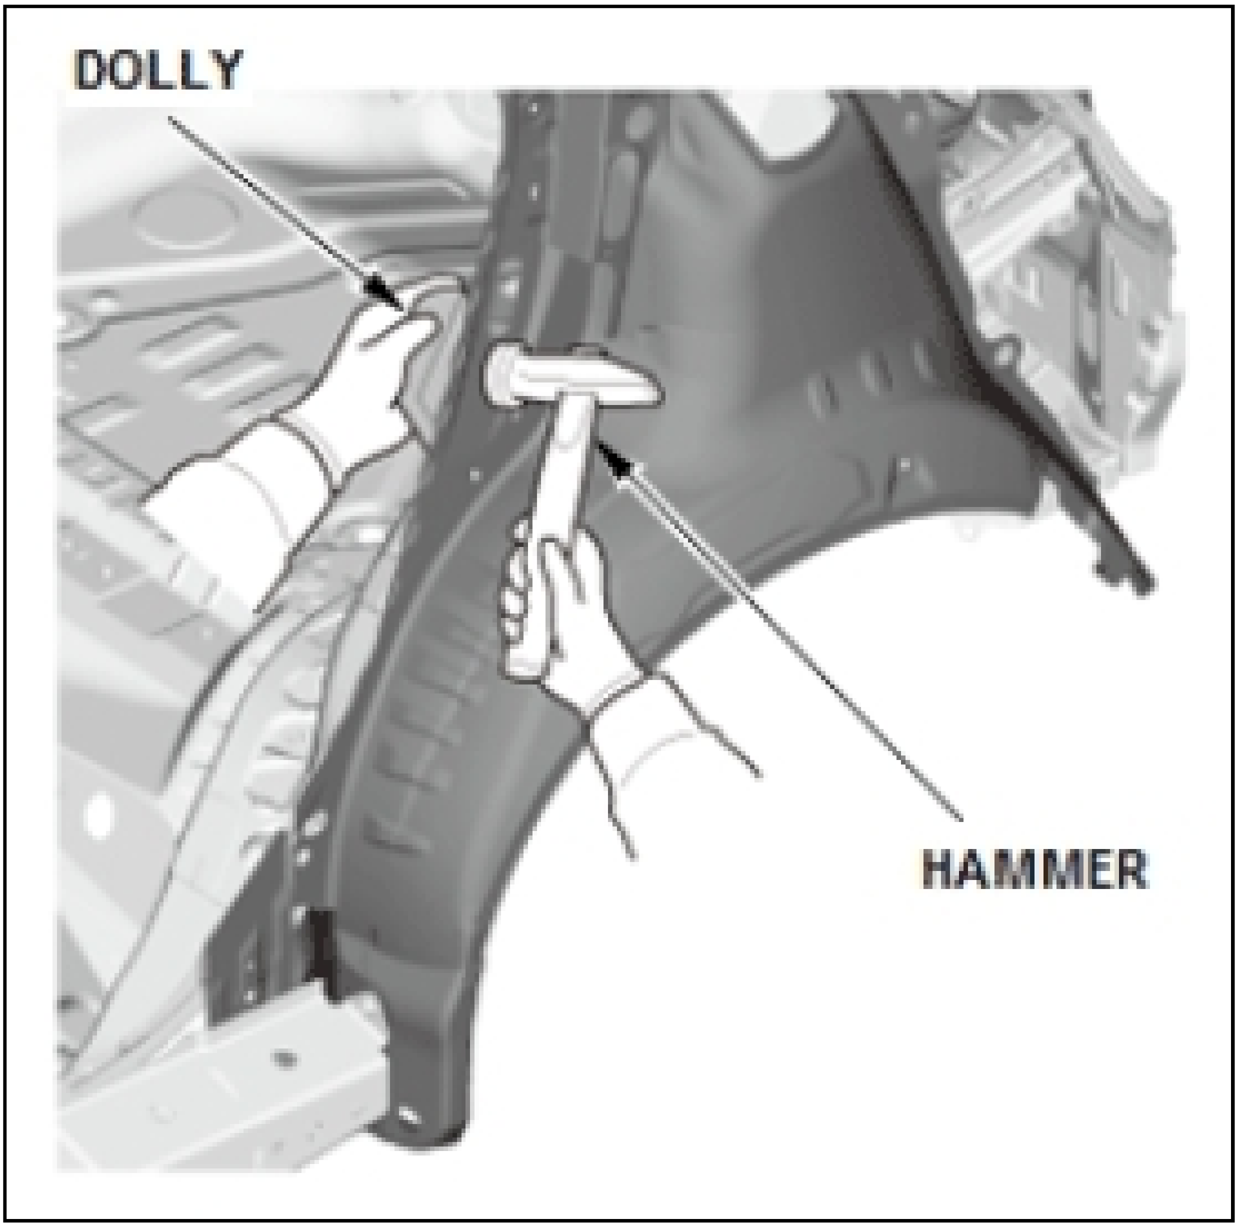


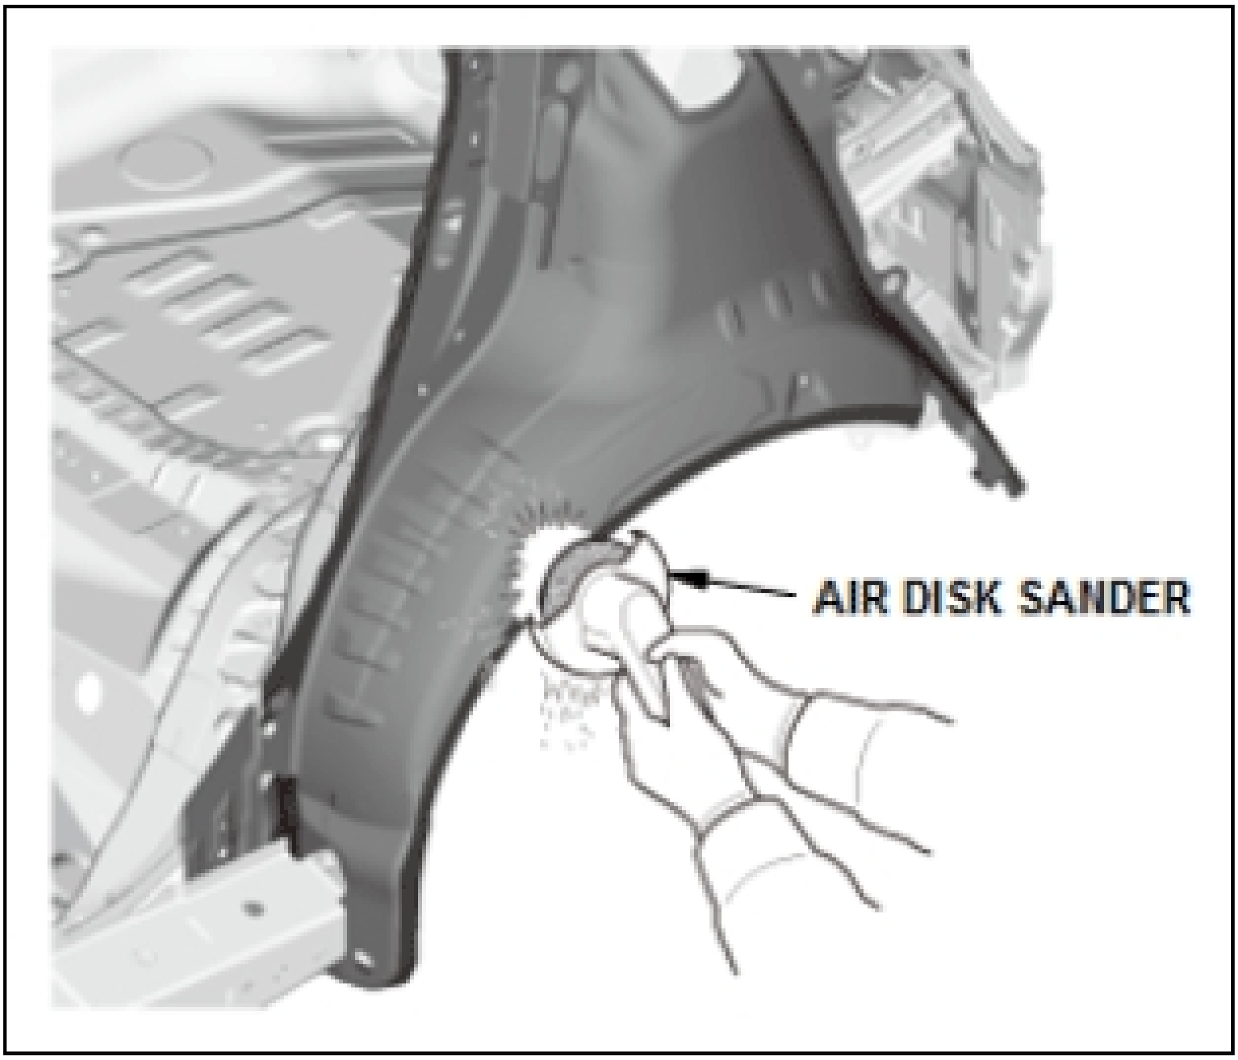
2. Repair the interfacing areas and apply anti-rust treatment.
    1. Reform the weld flange where the new parts will be installed using a hammer and a dolly Repair holes and cracks by welding if the steel grade allows this. Otherwise replace the damaged part.
    2. Sand the both sides of welding area using a belt sander to remove basecoats, rust and contamination.

       NOTE: **Do not over-sand the welding area.**

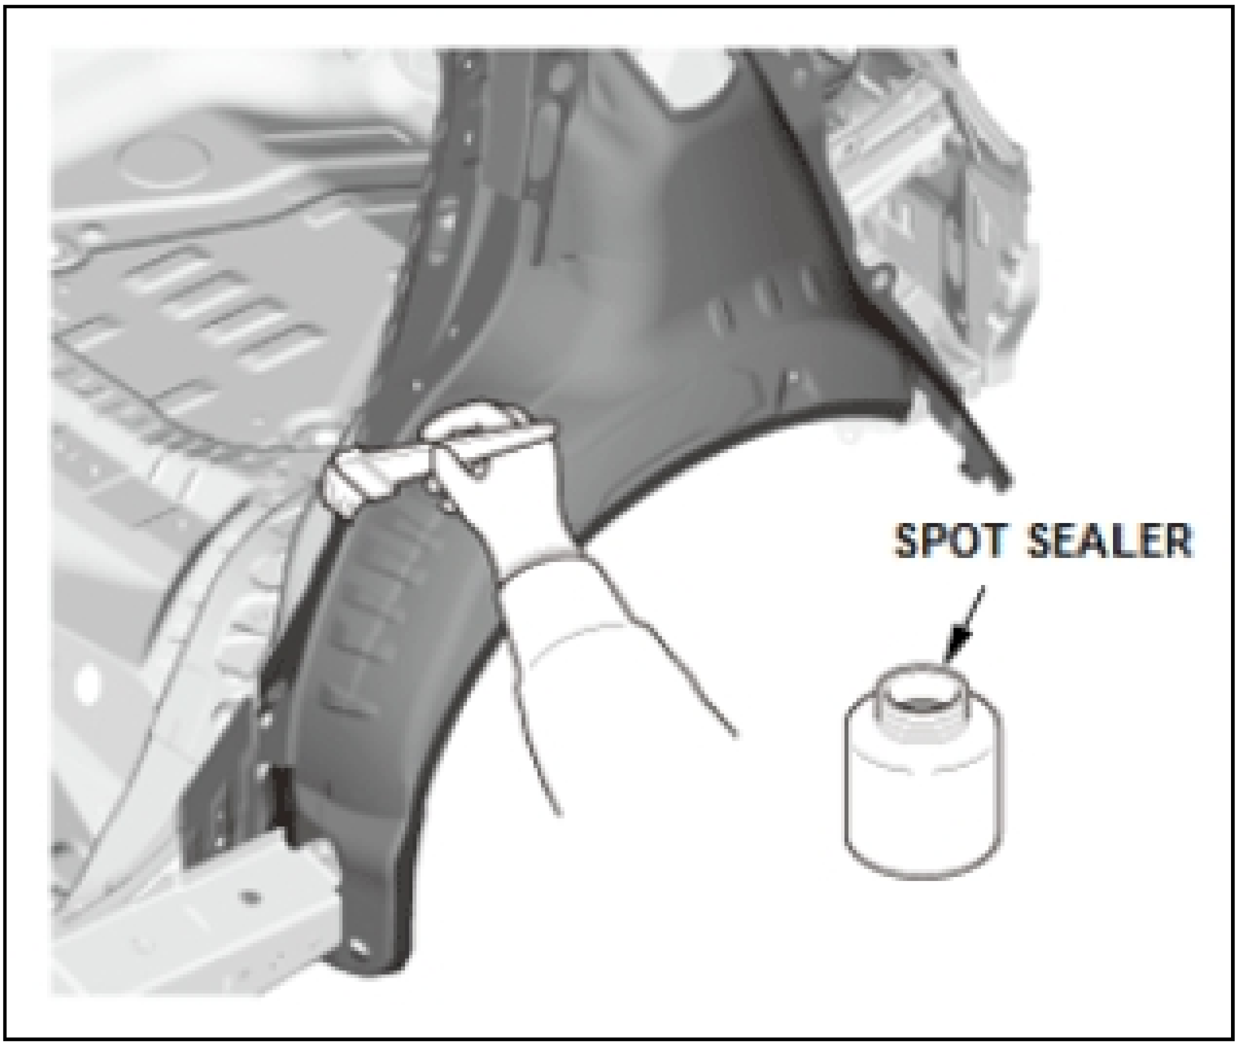
    3. Anti-rust treatment

       Thoroughly apply electrically-conductive weld through primer (spot sealer) evenly on the mating surfaces in the welding area.





AIR DISK SANDER



3. Installing new parts and anti-rust treatment.

   Spot Welding of a New Part:

   1. Remove basecoat (E-coat primer) layer Basecoat (black E-coat primer) is applied to new parts. Completely remove this basecoat in the weld areas prior to welding.

      NOTE: **Do not over-sand the steel panel.**

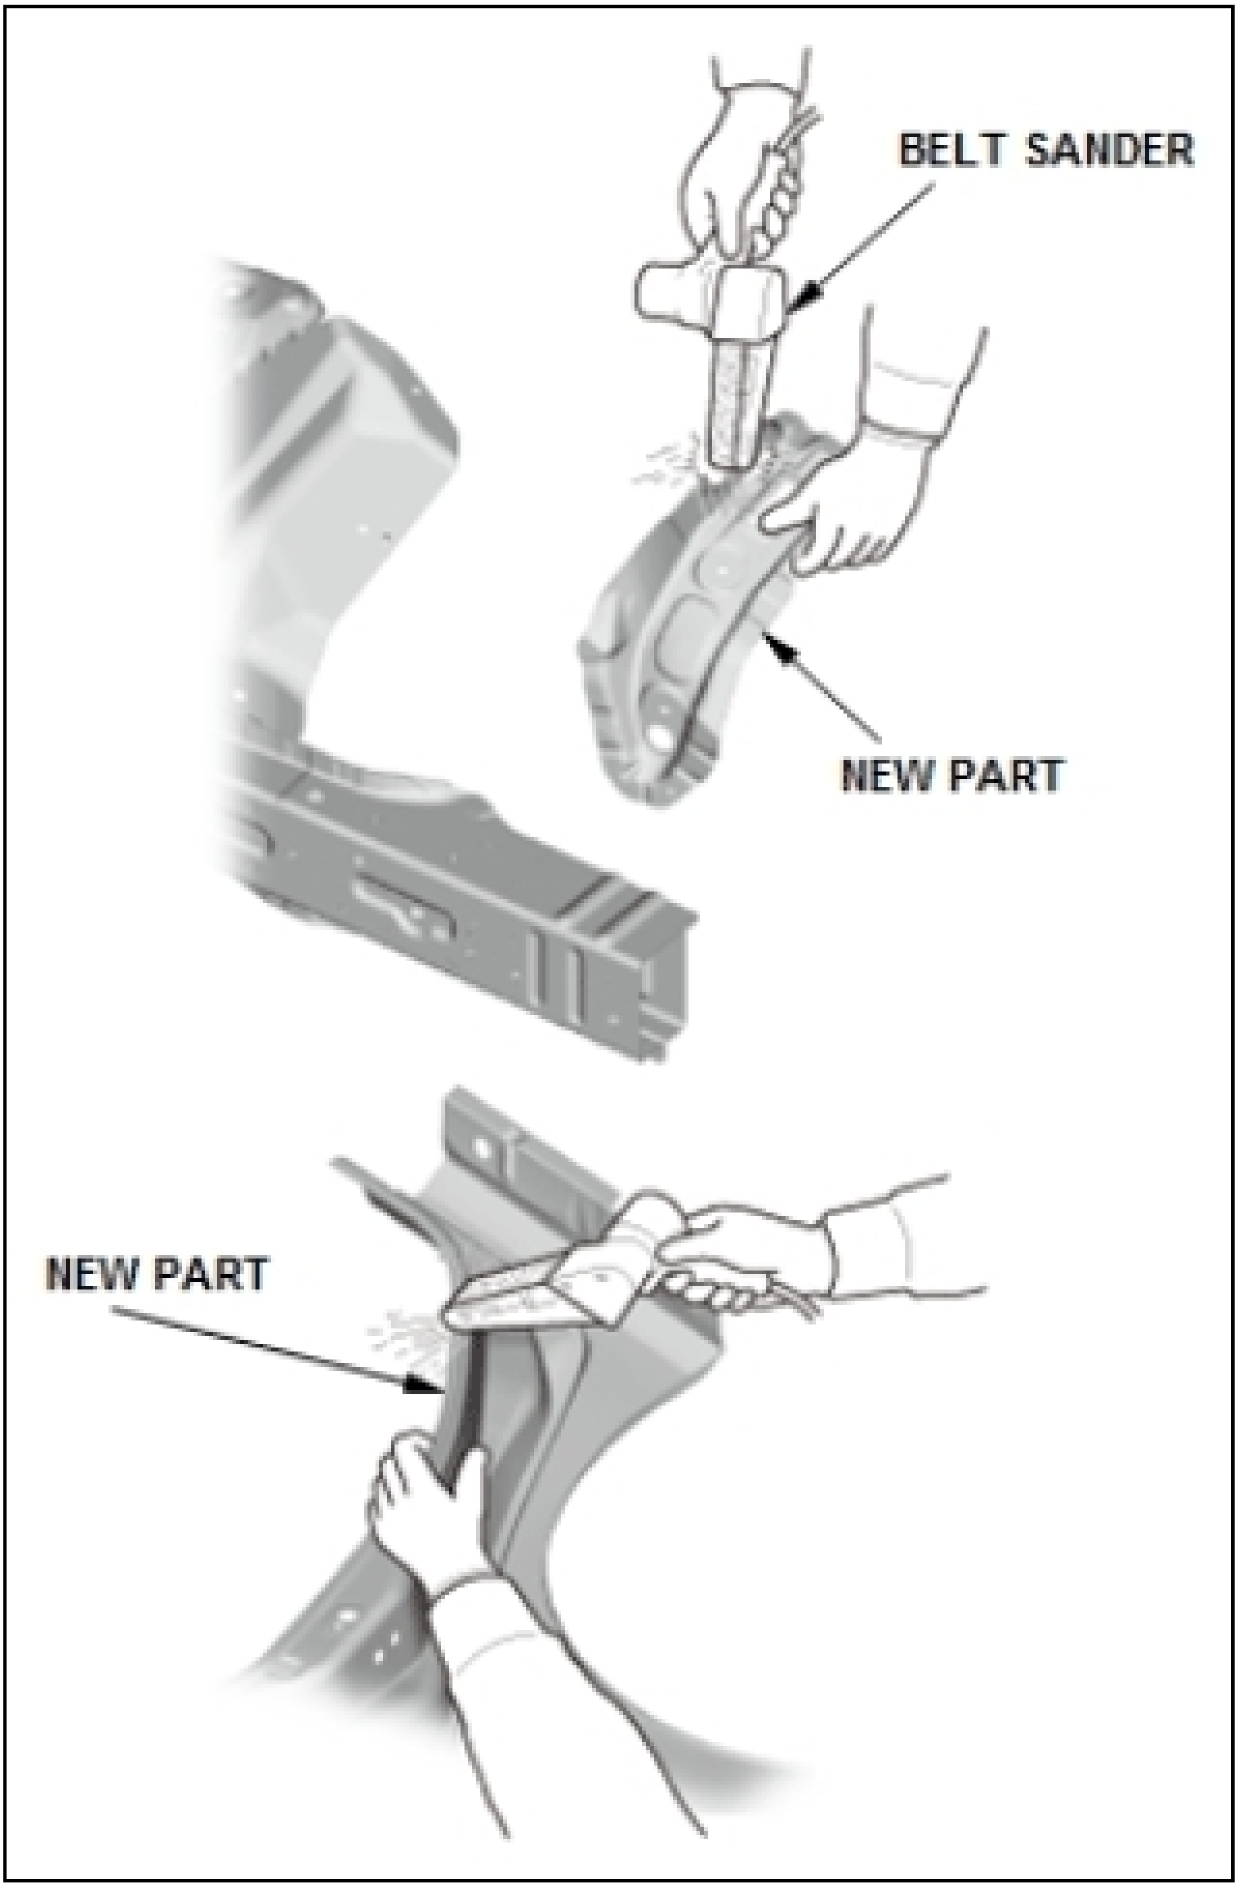
   2. Anti-rust treatment

      Thoroughly apply electro-conductive weld-through primer (spot sealer) evenly on the areas to be spot welded after removing the paint and E-coat.

      Wipe off excess primer.

      Plug Welding a New Part:

      - Place holes for plug welding on the new part using a drill or hole punch.
      - Decide on how many holes to be made according to the mass production body welding drawing in the model specific body service information or the old part.
      - Refer to **Plug Welding** for the appropriate hole diameter as compared to panel thickness.



BELT SANDER

NEW PART
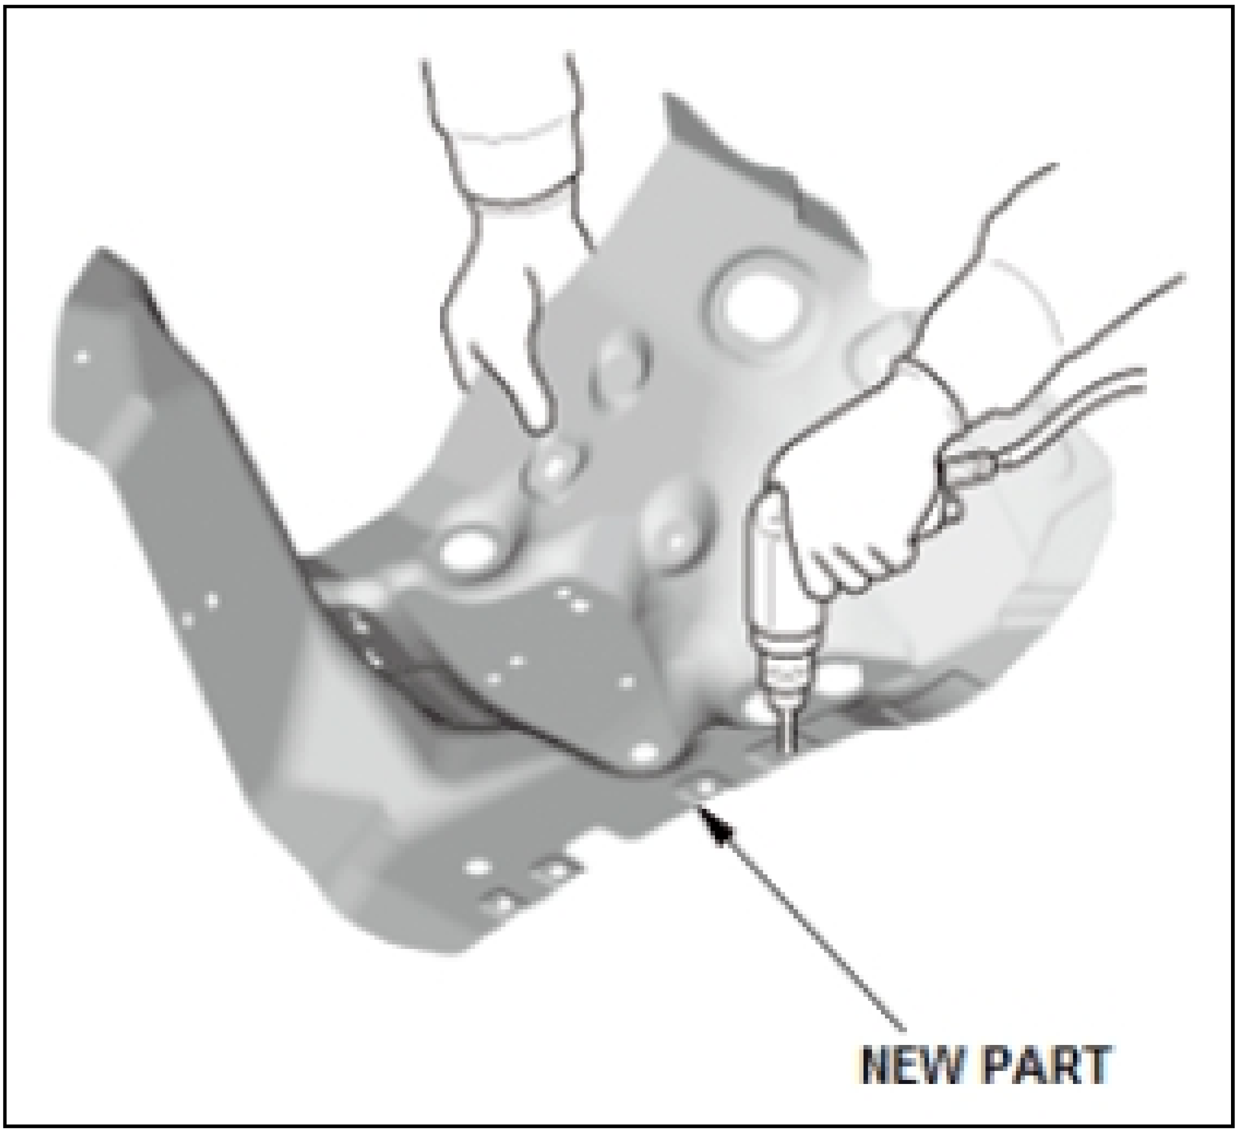
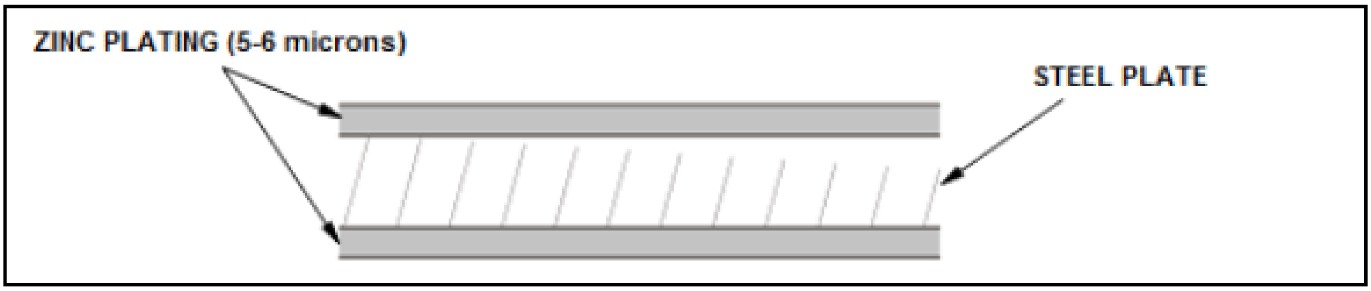
SPOT SEALER



Zinc-Plated Steel Parts Repair

The zinc-plated steel plate used in some panels of the Honda and Acura vehicles requires different repair techniques and personal safety protection than ordinary steel plate. Refer to the model specific body repair information to determine which parts are zinc plated.



WARNING: **Zinc fumes are generated during grinding and welding of zinc-plated steel parts and the application of weld-through primers (spot sealer). This can cause an illness known as "metal fume fever" that causes temporary flu-like symptoms. Additional health problems may result from long-term exposure to zinc fumes. Always use approved respiratory protection that provides zinc fume protection when working around zinc plated steel and weld-through primers (spot sealer).**

1. Before spot welding the zinc-plated steel, remove the paint or E-coat from both sides of the flanges being welded. Apply weld-through primer (spot weld sealer) to the flanges before welding.

   NOTE: **Seal the sanded surfaces thoroughly to prevent rust.**

2. Before applying body filler or putty to zinc-plated steel, sand the zinc plating thoroughly Apply epoxy primer to promote adhesion and prevent blistering.

NOTE: **Use body filler and putty (one part filler/putty, one part harder), that are compatible with zinc-plated steel and follow the manufacturer's specifications.**

Parts Installation

1. Sectioning the new part (cut and joint replacement).

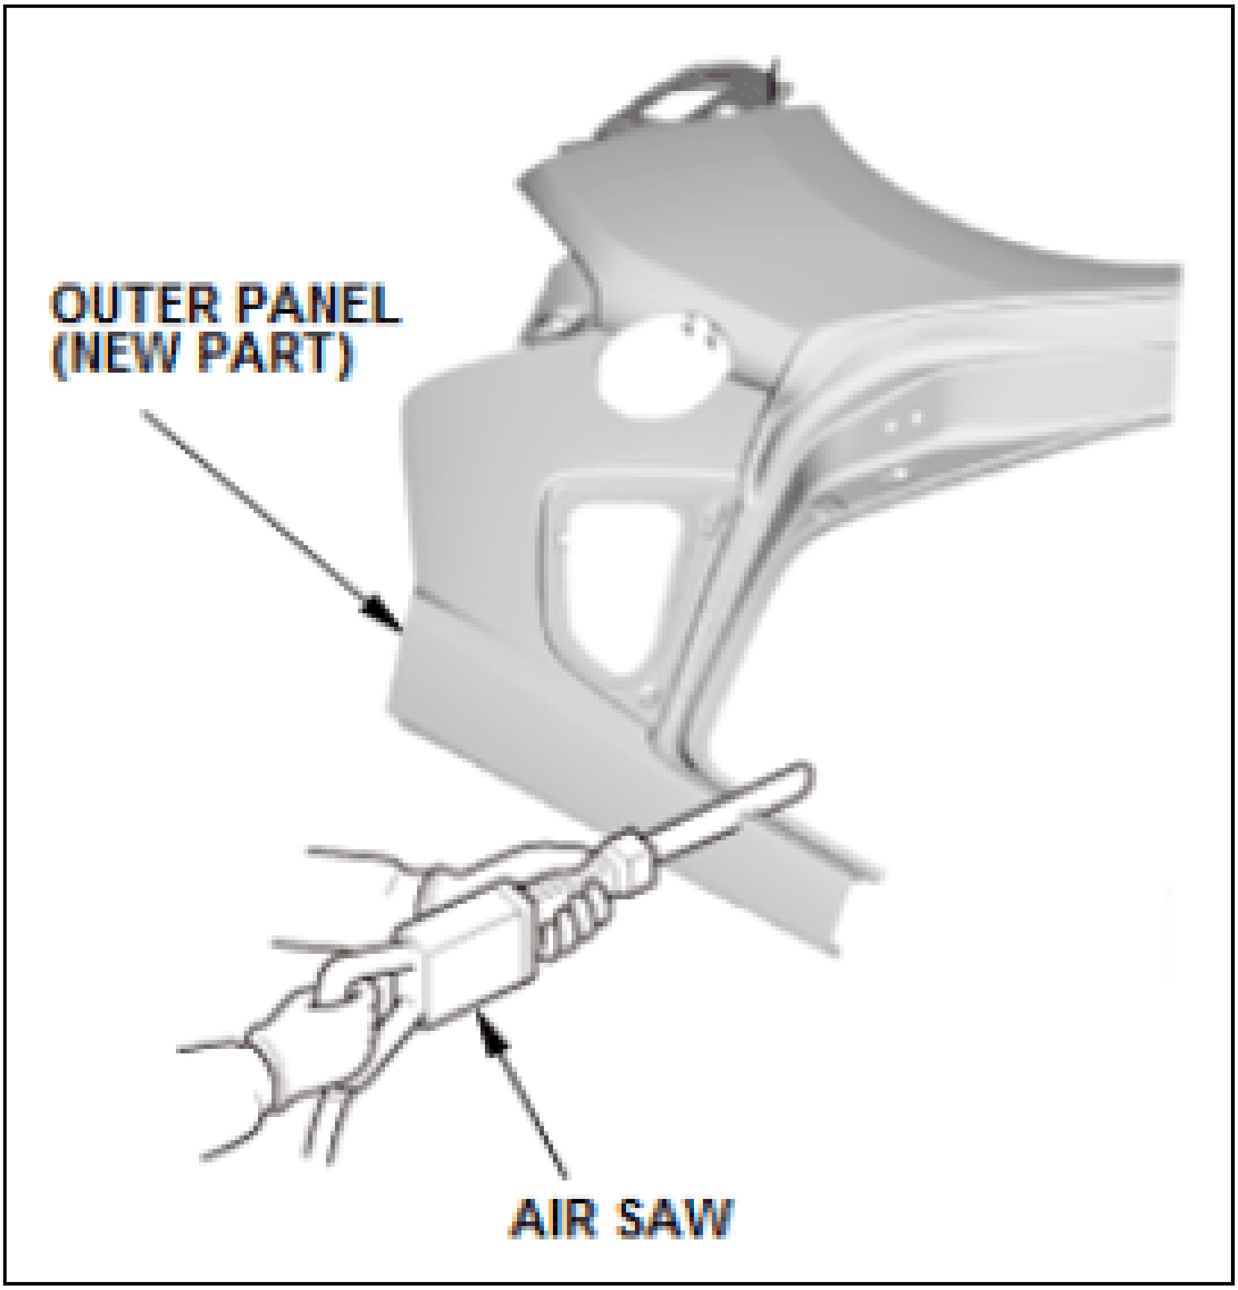
WARNING: **Before sectioning any part, refer to Parts Sectioning Guidelines - Cut And Join for important information.**

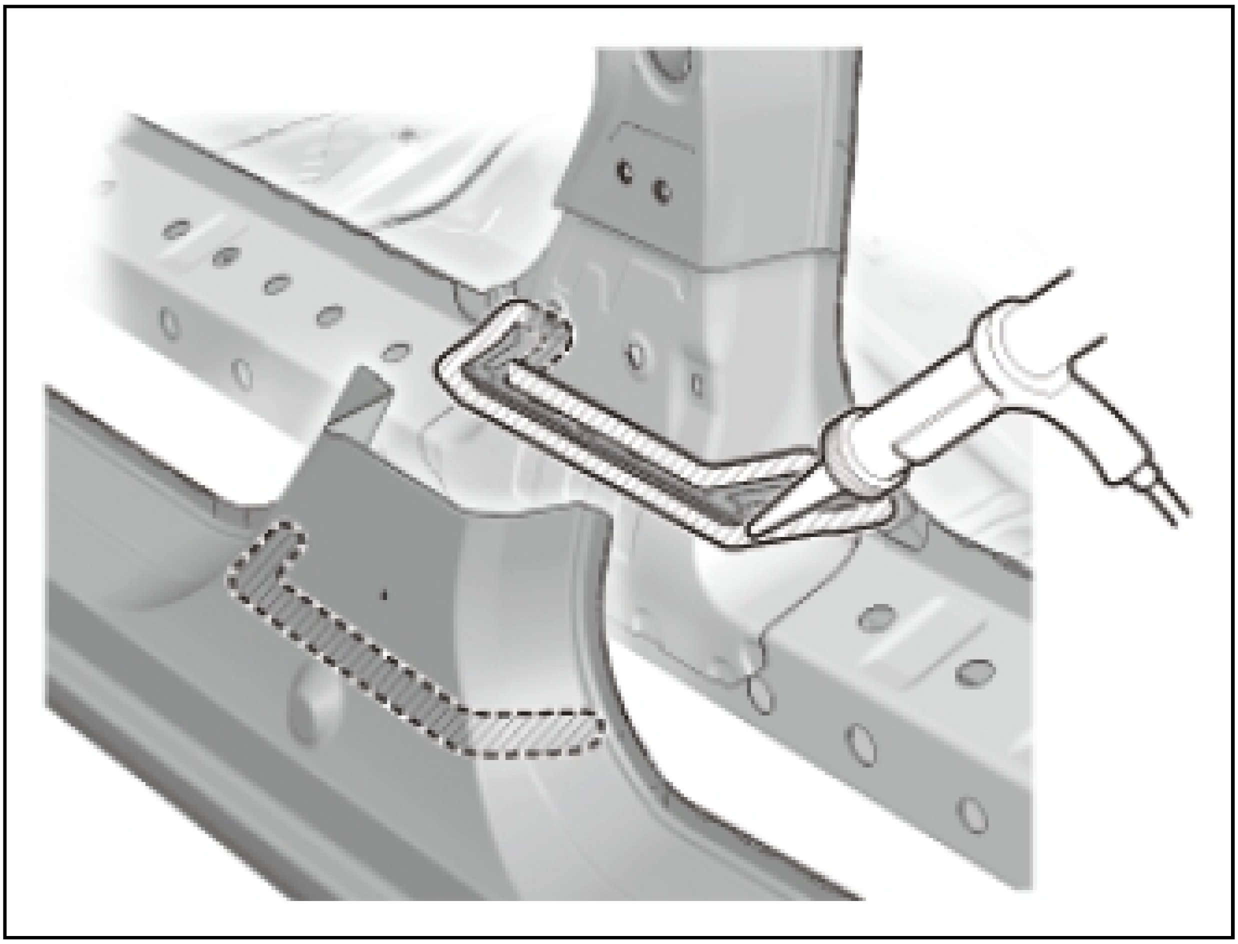
- If a new part, such as an outer panel, is being sectioned, cut the old and new parts using an air saw or grinder, so that the joint area can be overlapped about 20-30 mm (0.79-1.18 in).

When there is an acoustic separator on the panel mating surface:

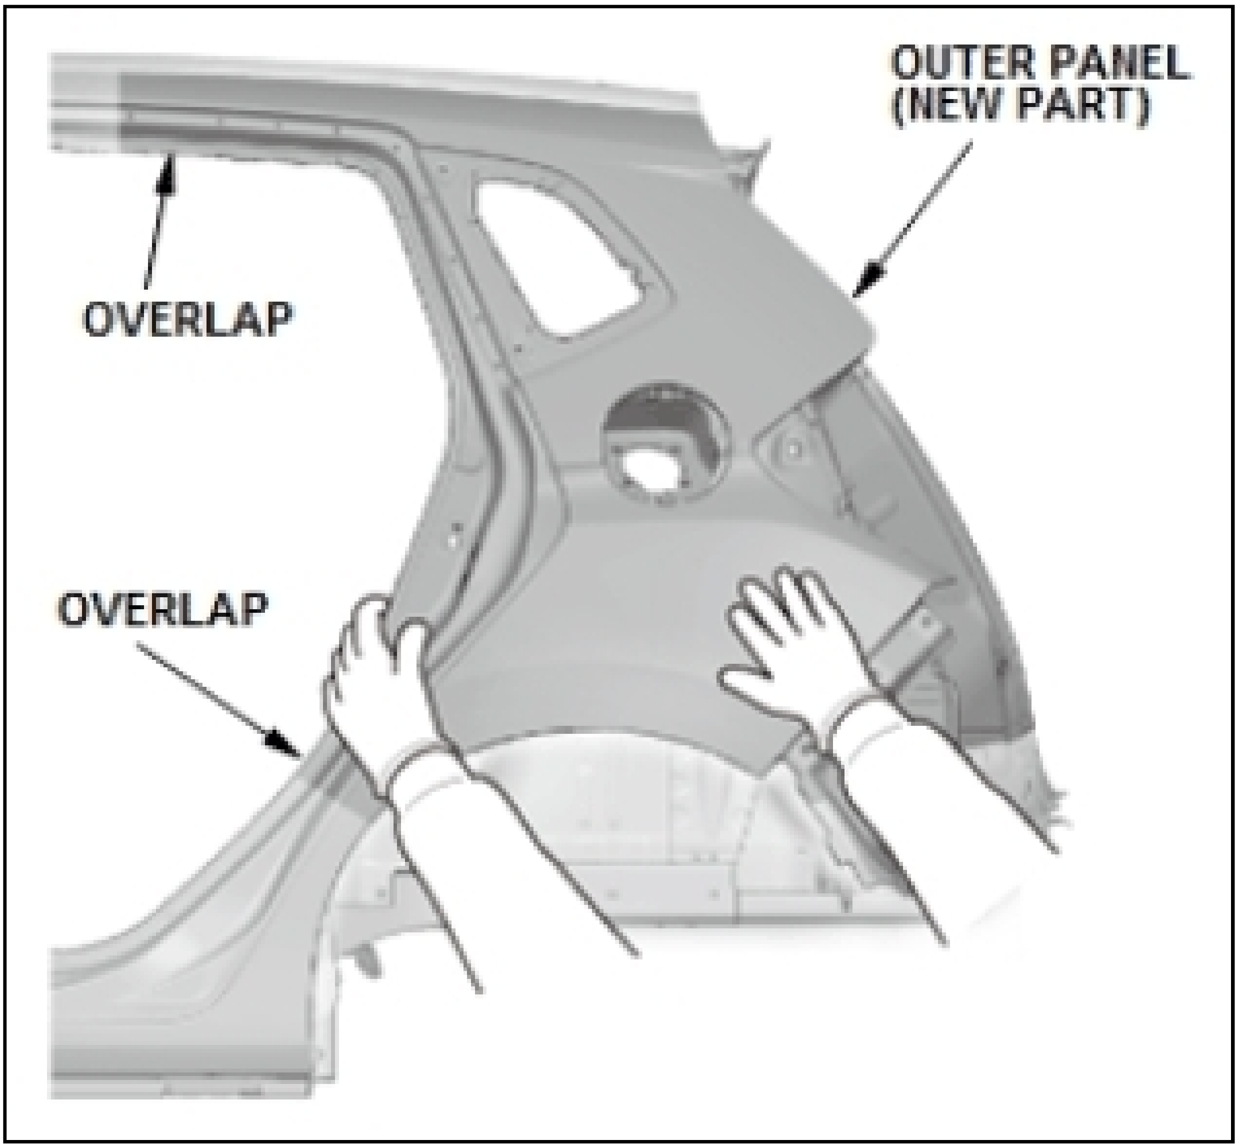
- Damaged separators should be replaced with a new one. The replacement separator does not include the heat-activated expandable foam used in production. Apply body sealer around the separator to fill in the gaps between the separator and body panels.

NOTE: **If you make your cuts with too much body overlap, it will be difficult to position the replacement panel for fit and finish.**

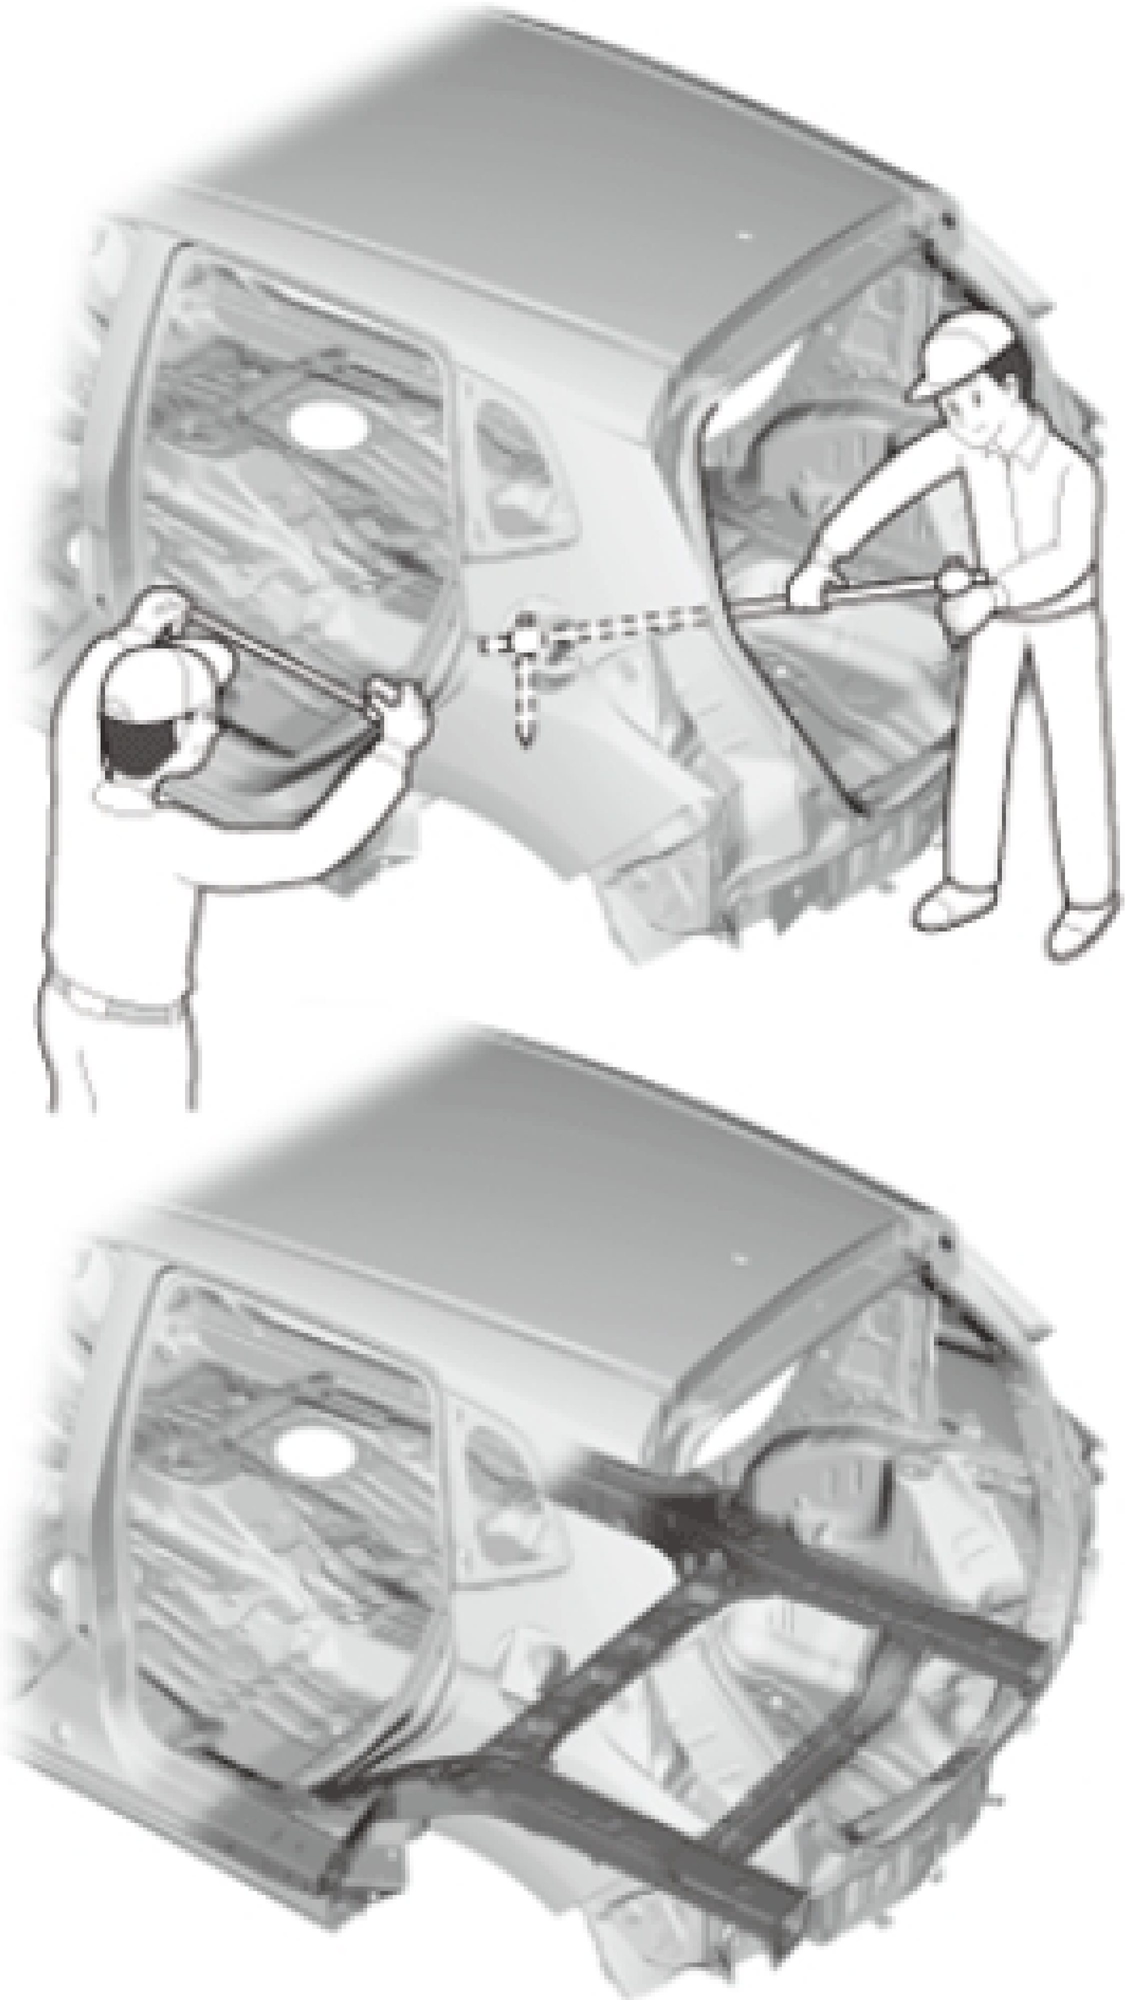




2. Positioning the new part:
   - Align the new part to body reference holes, or old part position and attach it to the body using clamps, vise-grip type pliers, or other commercially available panel attachment tools.
   - If these tools are not available, attach the new part using bolts or self-tapping screws.
   - Measure the body dimensions to confirm panel positioning.
   - It is extremely important to attach the frame and damper housing parts to the correct positions because they directly affect wheel alignment. (It is recommended to use jig-type body and frame correction equipment or those with built-in measurement systems for greater accuracy.)
   - Fit and finish of exterior parts is also extremely important as it will greatly impact the exterior appearance. Make sure to install all exterior parts for a final confirmation before permanent attachment.



OUTER PANEL
(NEW PART)
OVERLAP
OVERLAP



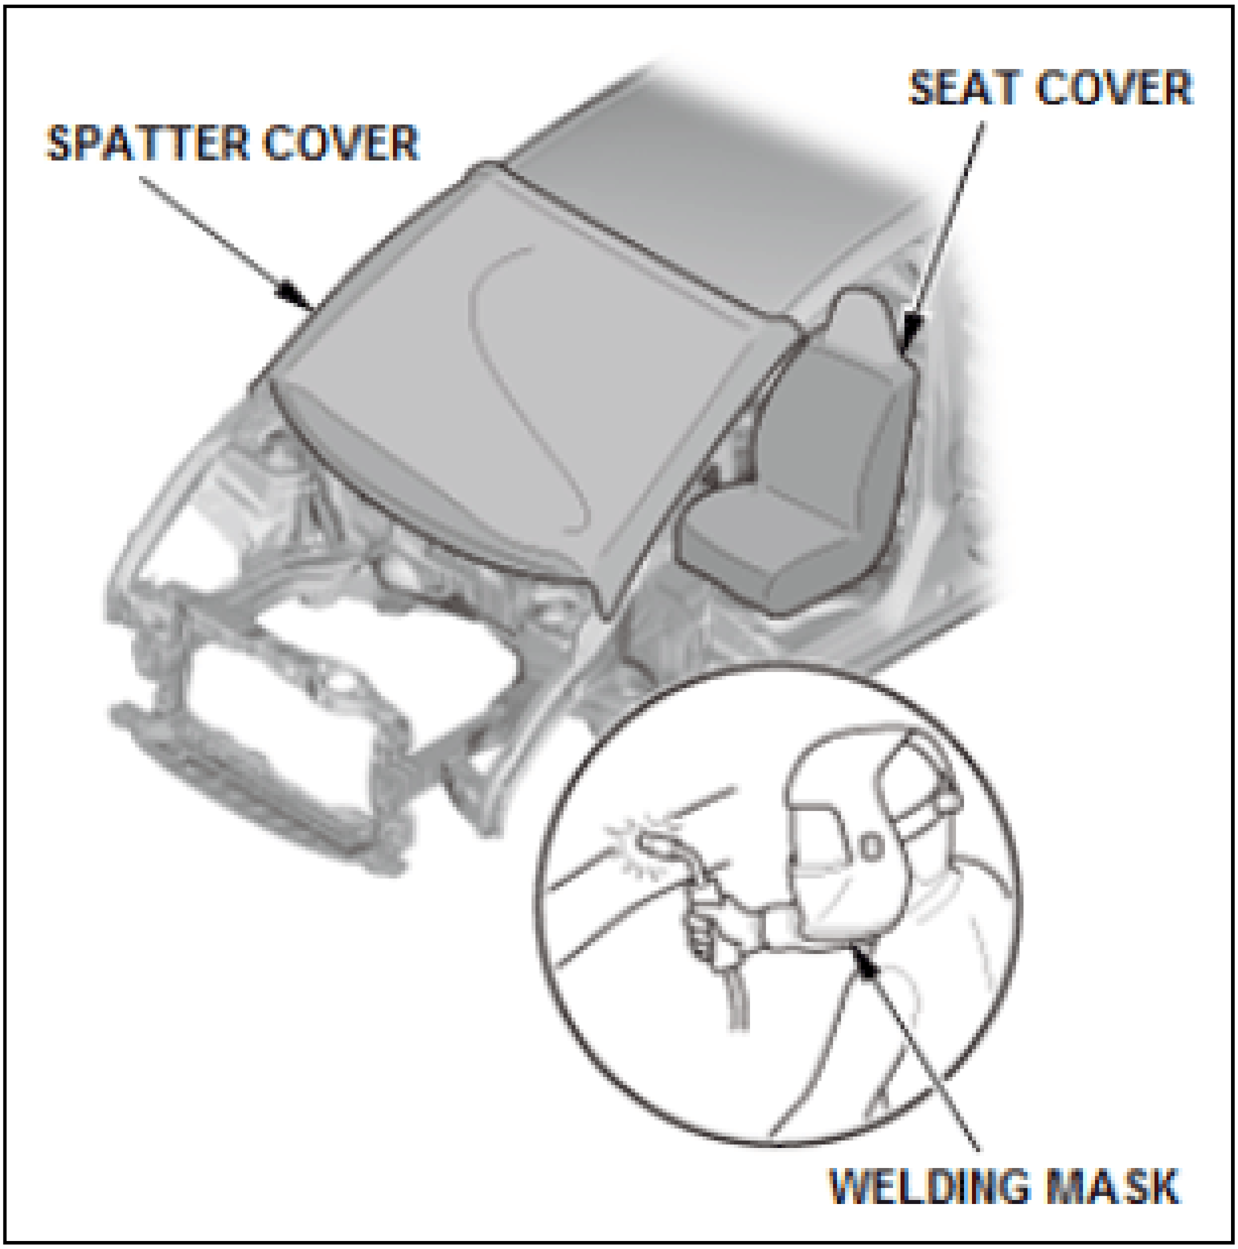
3. Welding the new part.

NOTE: **Cover the interior accessories, glasses and body painted surfaces with the heat-resistant inflammable cover (welding blankets) to protect them before welding.**

Key Points For Spot Welding:

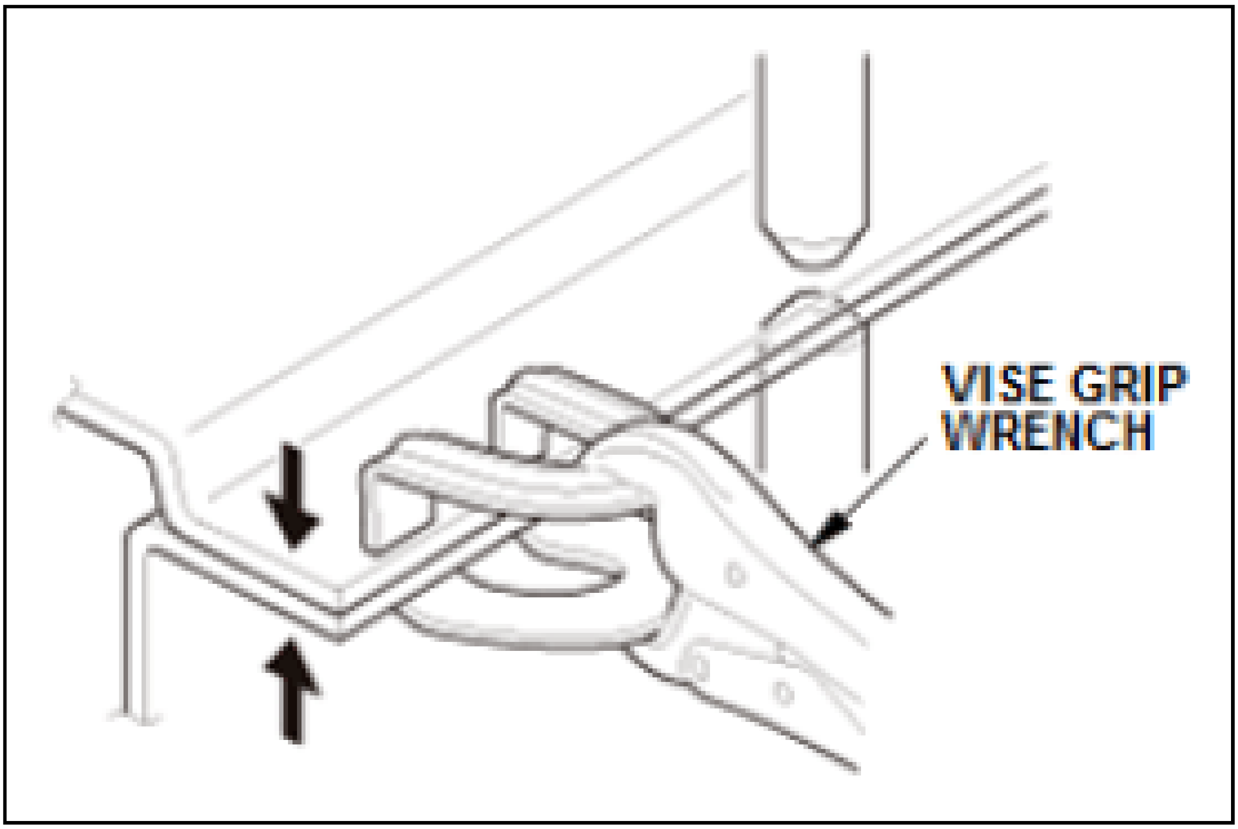
- Using vise grip type pliers or similar tools, clamp the welding areas tightly with no gaps.
- Try to avoid the old spot welds as much as possible and place them with an even pitch.
- For the areas that cannot be spot welded, use MAG welding or MIG brazing instead if permitted. Always follow the welding instructions for high strength steel parts in **Overview**.
- Dress the spot welder electrode tips to maintain their condition using a tip cutter. Replace the tips when dressing them no longer restores proper appearance and function.
- When welding, refer to the specifications in the manual issued by the welding equipment manufacturer.

Key Points For MAG Welding:

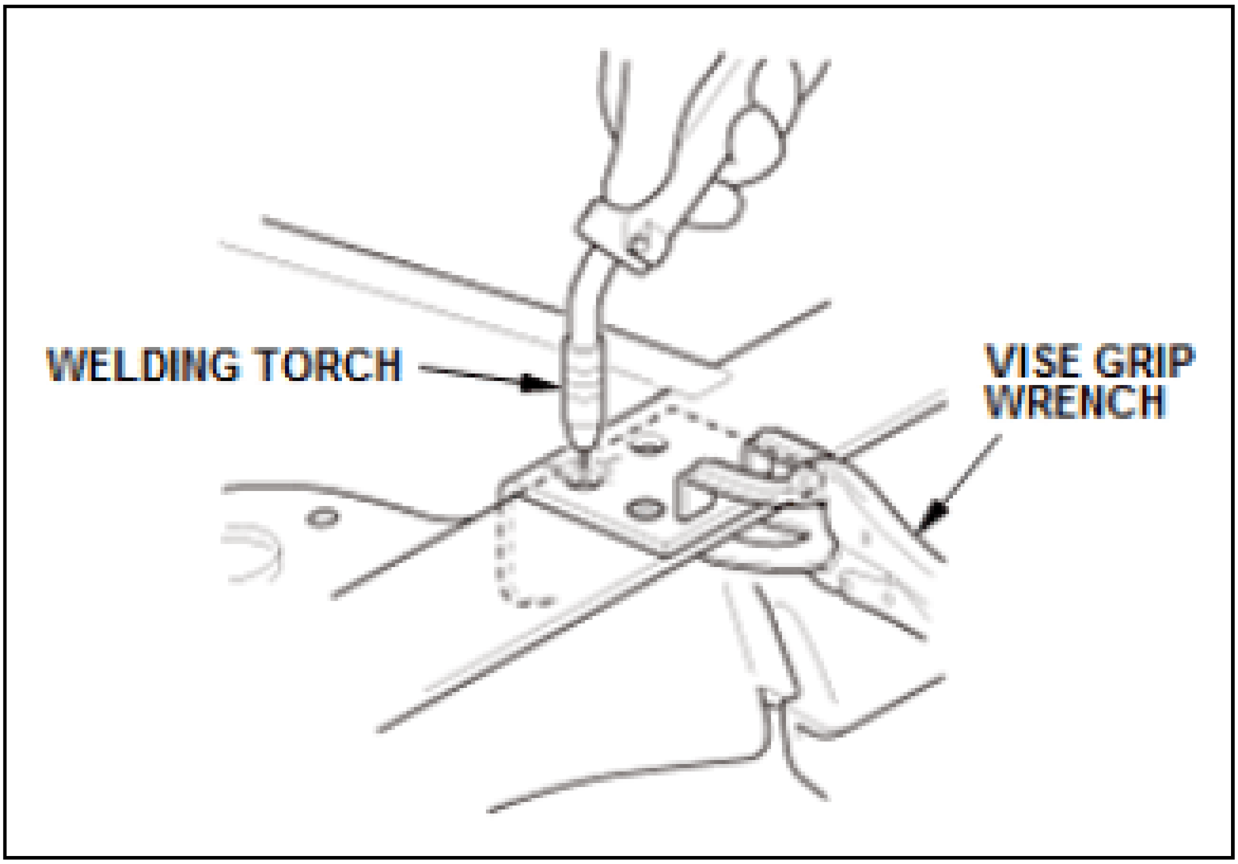


NOTE: **Be sure to attach the welder's ground cable as close as possible to the welding area.**

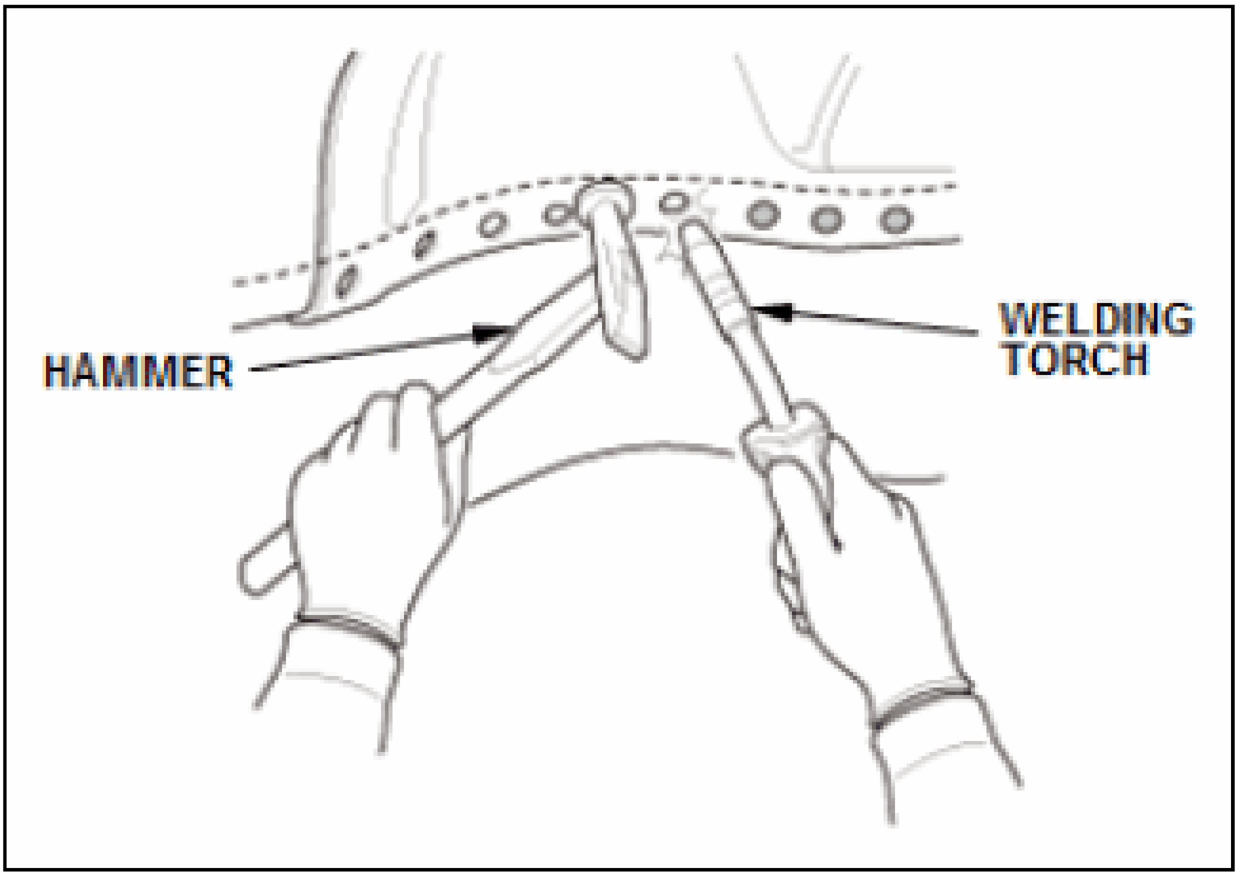
- Using vise grip type pliers or similar tools, clamp the welding areas tightly with no gaps.
- If these tools cannot be used because of space limitations, use a hammer and dolly to make tight contact.



VISE GRIP WRENCH



WELDING TORCH
VISE GRIP WRENCH



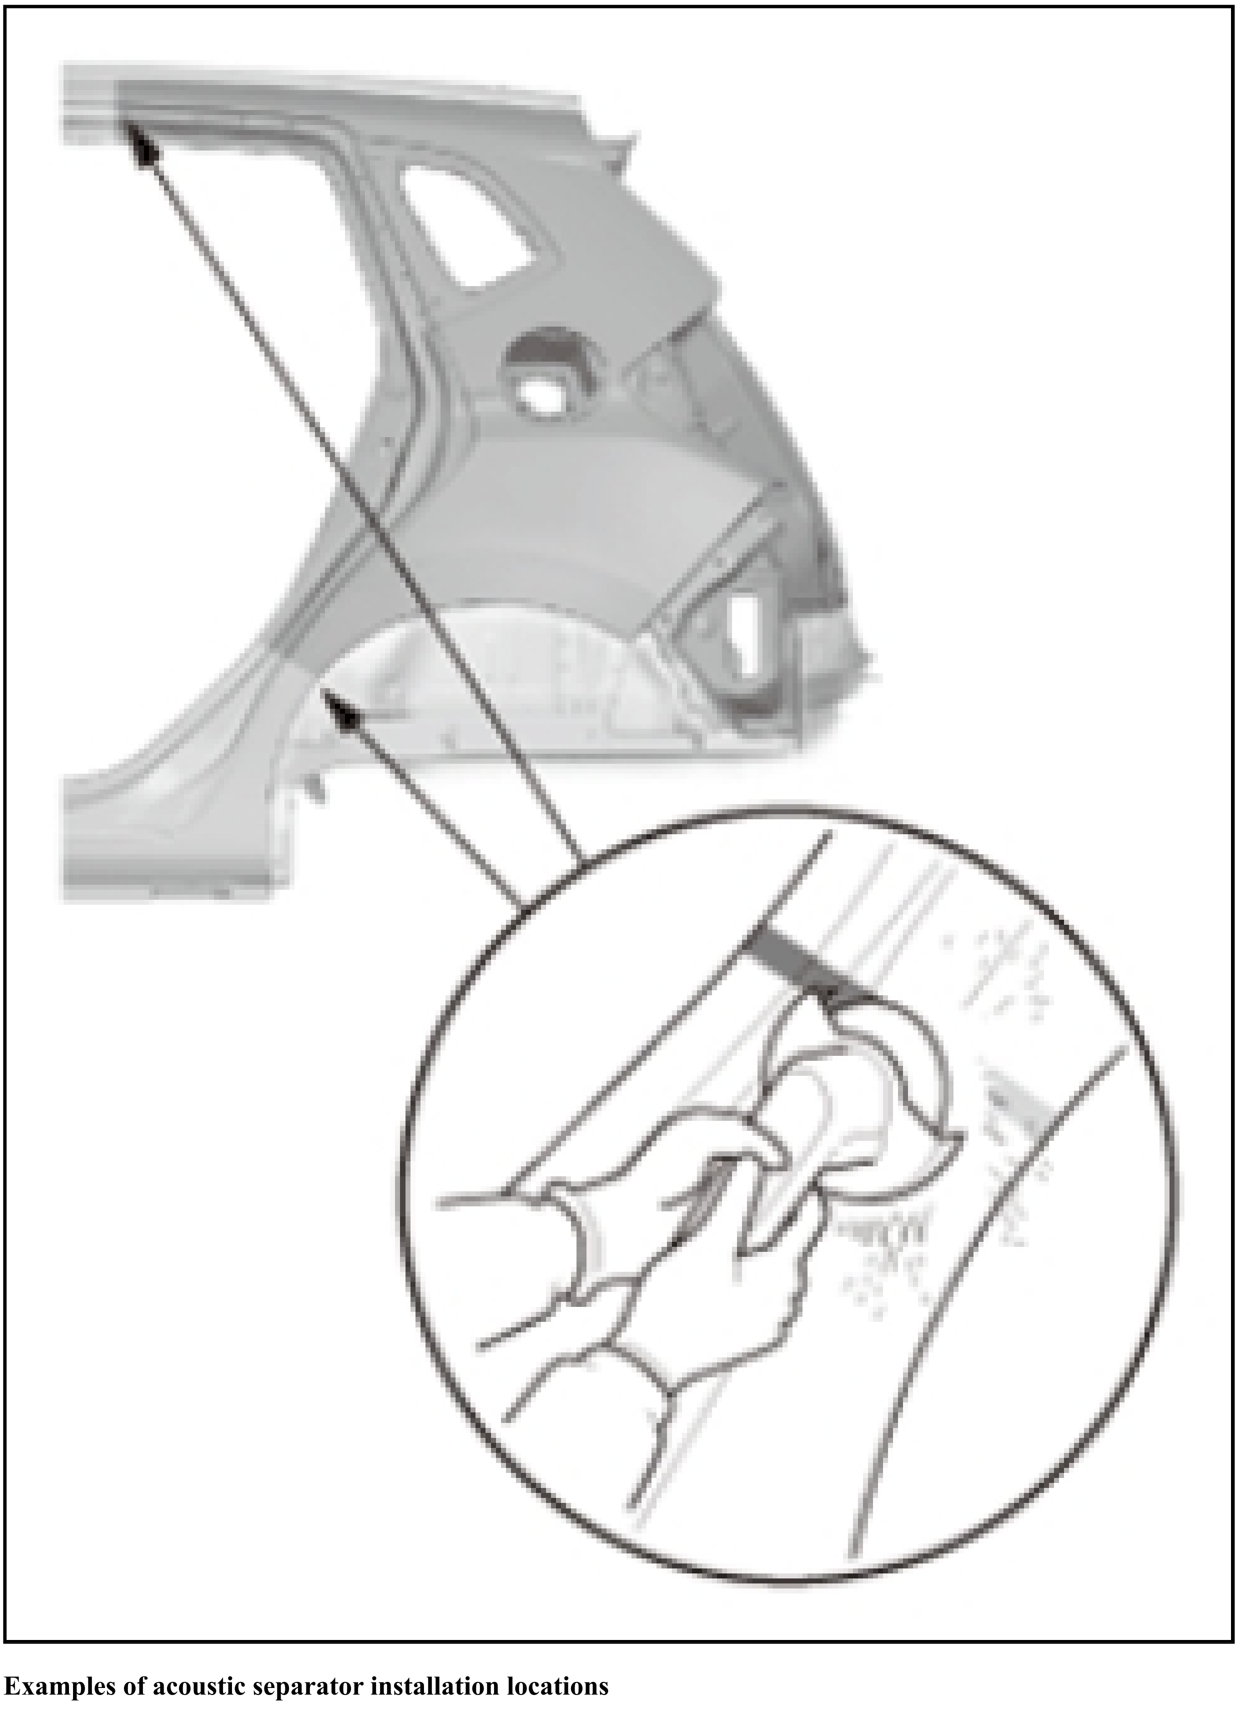
4. Inspect the welded area

   Thoroughly inspect the welded area to ensure all required welding operations are completes before finishing.

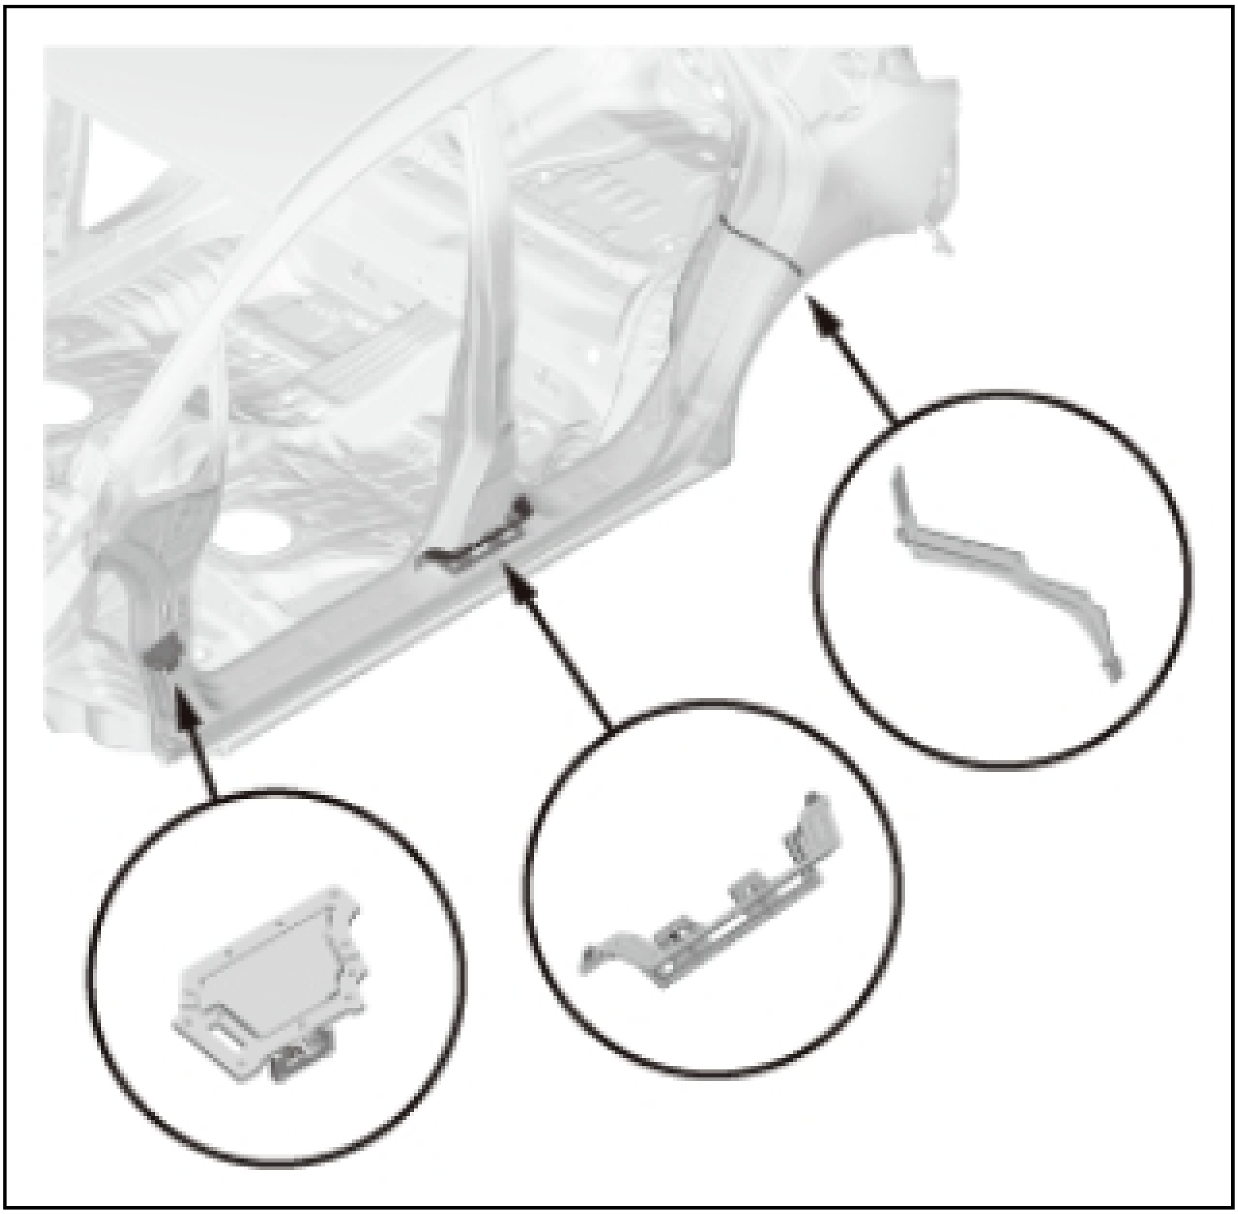
5. Finishing the welding:
   - To finish, grind the plug or joint welded area with an angle grinder or equivalent.
   - Do not over-grind to prevent weakening the welds.
   - In glass contacts areas, completely remove any steps or projections.
   - Apply body filler to finish butt welded areas.

NOTE:

- **Avoid separator installation points when repairing, cutting and welding panels. If the separator's urethane foam is damaged (peeled or burnt), restoration is not possible.**
- **Damaged separators should be replaced with a new one. The replacement separator does not include the heat-activated expandable foam used in production. Apply body sealer around the separator to fill in the gaps between the separator and body panels.**



Examples of acoustic separator installation locations



Preparation For Body And Frame Correction

Attachment of Body

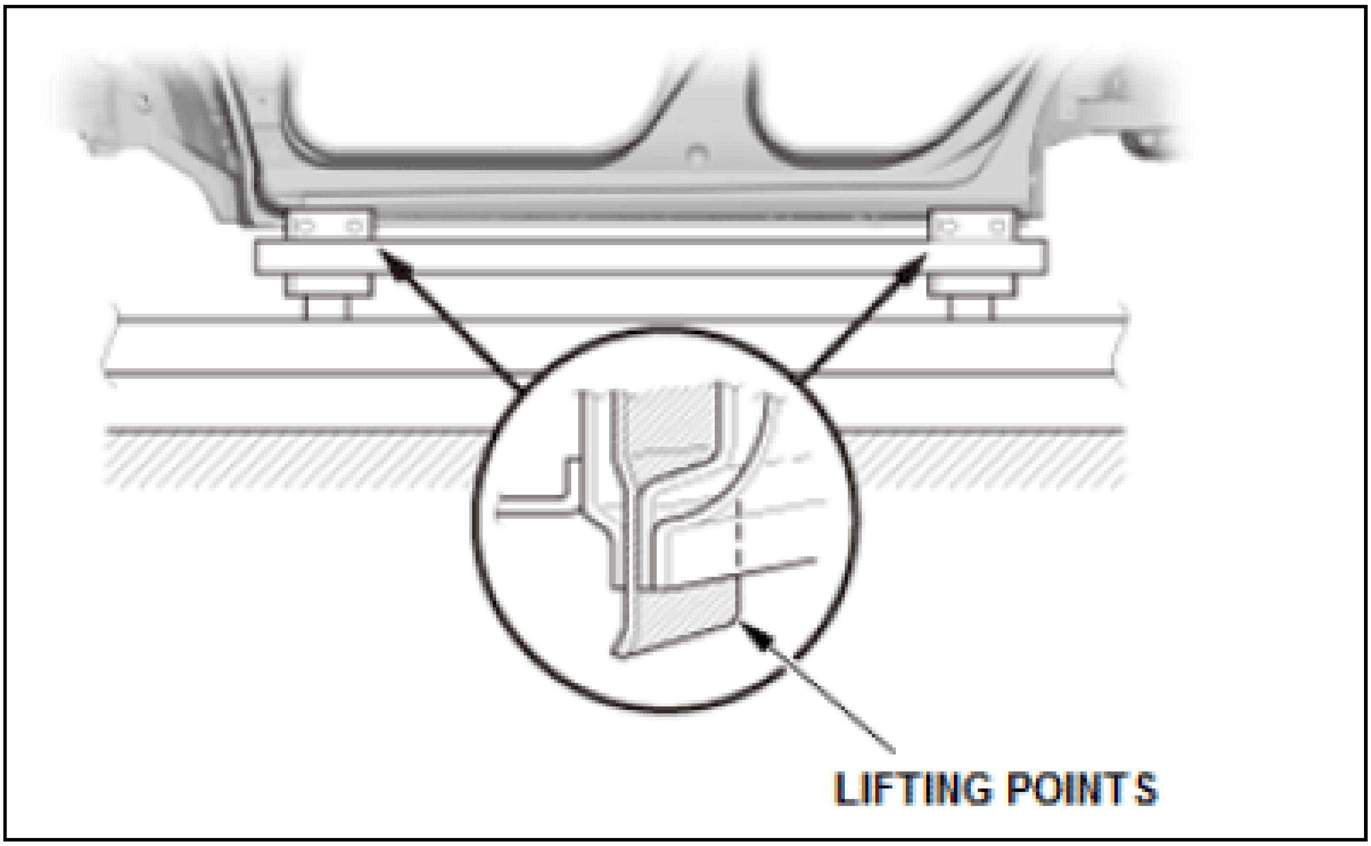
During body and frame correction, it is extremely important to firmly attach the vehicle's body to the repair equipment. Depending upon the damage level, it is usually necessary to pull out the body from more than one direction.

Basic anchor points

While different attachment points may be necessary depending upon the damage level, the preferred attachment locations are the reinforced lifting points located under the side sills in the pinch weld area.

Auxiliary anchor points

Depending on the correction forces and direction, auxiliary anchor points may need to be added to prevent further distortion of the undamaged body parts. Because there are many different equipment and attachment designs, always consult the manufacturer of your body and frame correction equipment for their recommendations about anchoring methods and points.



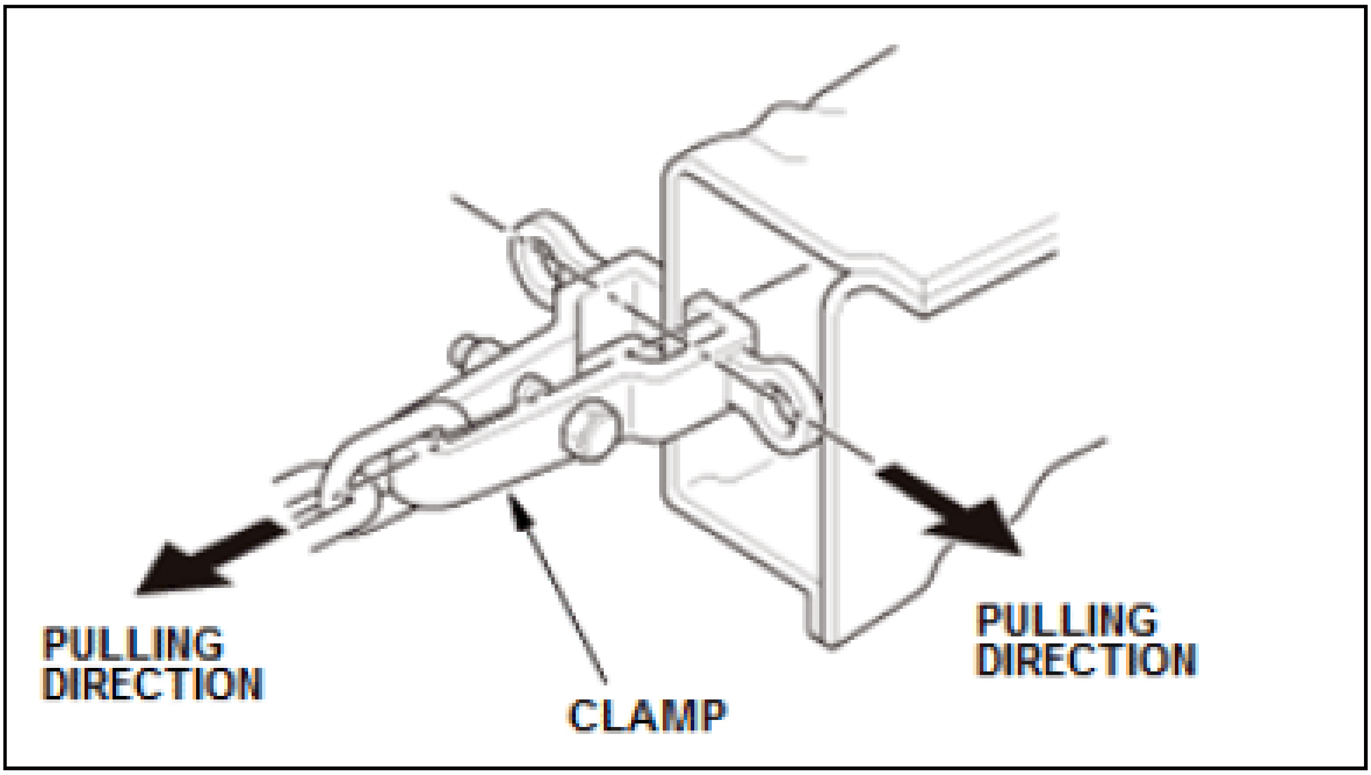
LIFTING POINTS

Setting Pulling Clamp

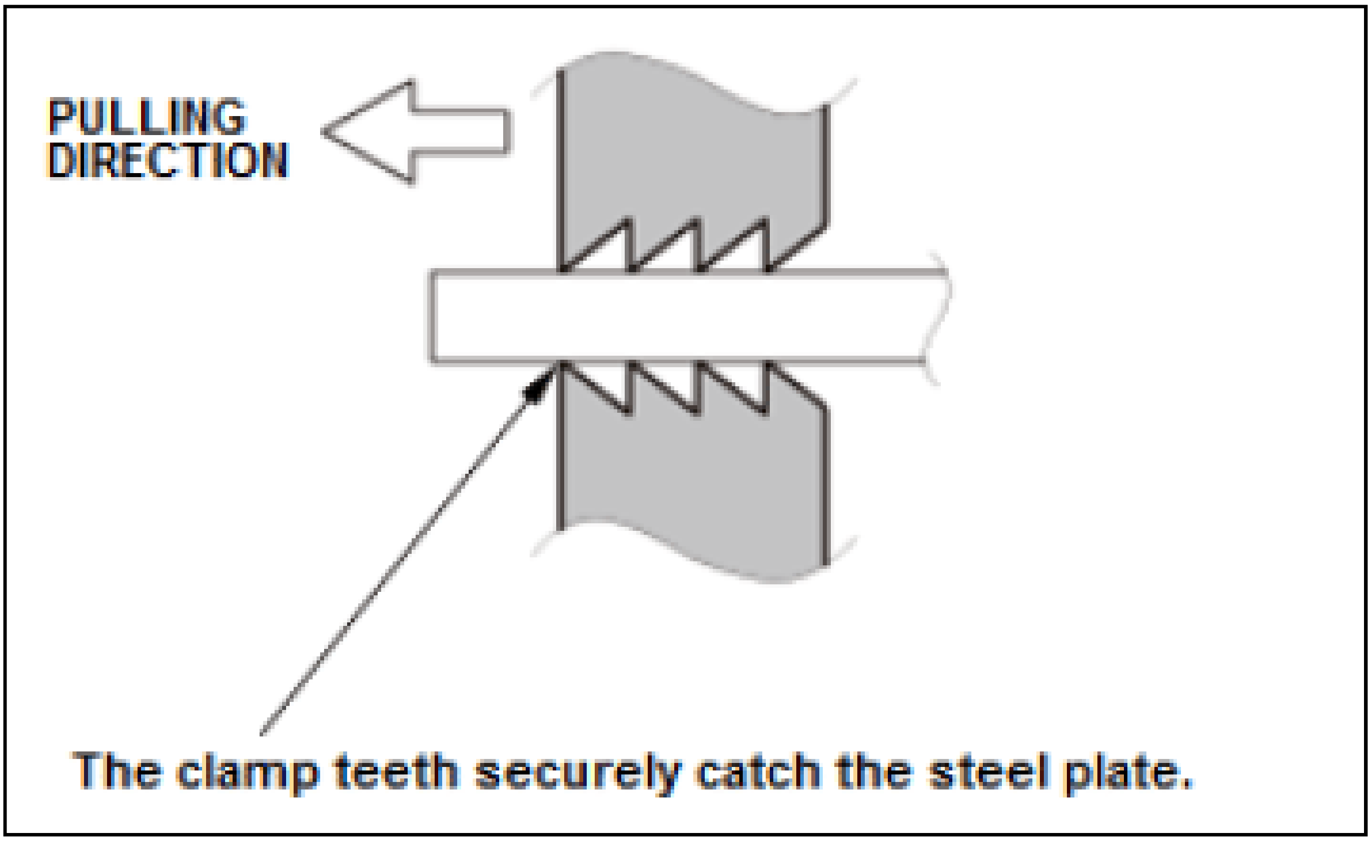
When installing clamps at the pulling points, align the extended line of the pulling direction to the center of the clamp.

WARNING: **If the clamp is out of alignment, the clamp may disengage violently during a pull, which is very dangerous.**

NOTE: **Be sure there is no contamination on the clamp's teeth.**



PULLING DIRECTION
CLAMP
PULLING DIRECTION

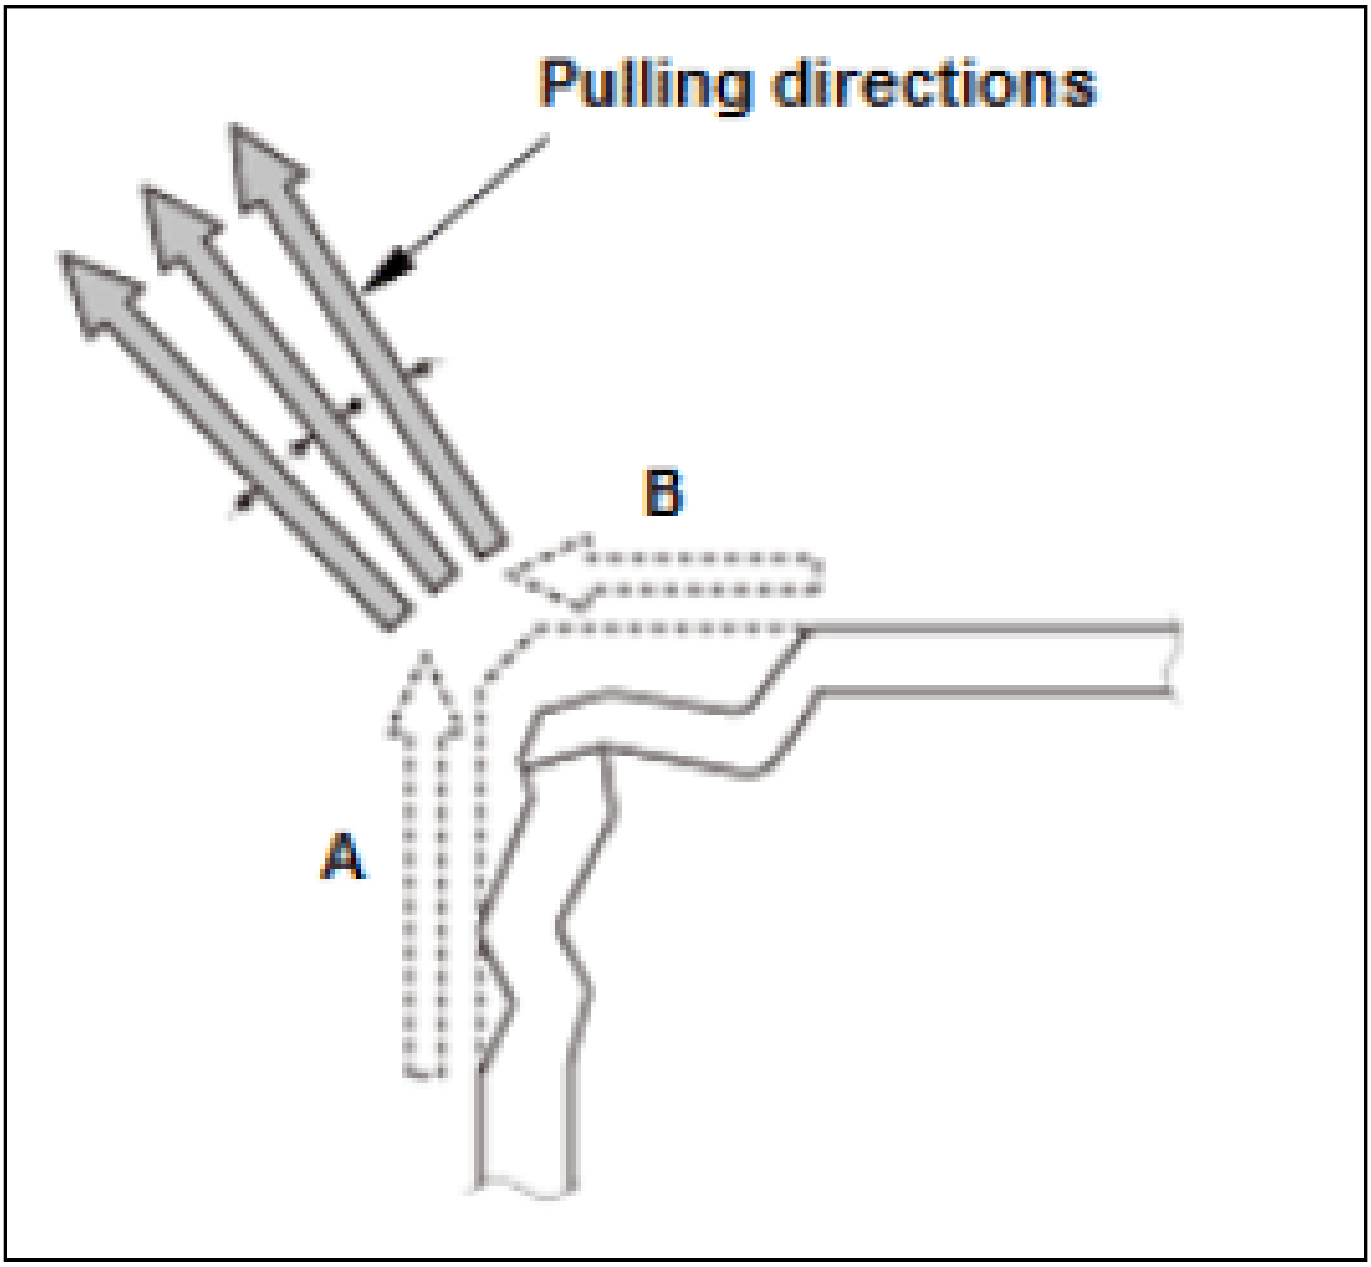


PULLING DIRECTION
The clamp teeth securely catch the steel plate.

Pulling Direction

Diagonal Pull-out

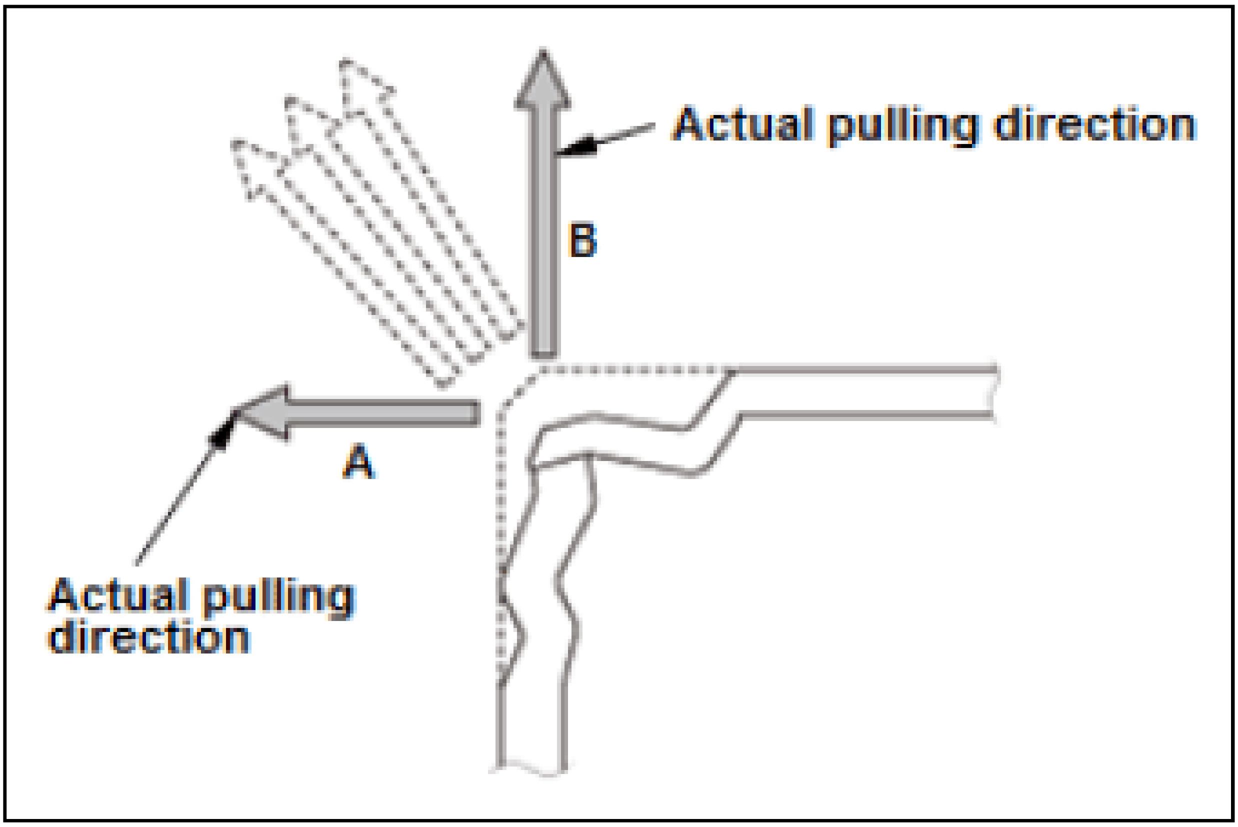
Adjust the pulling force of (A) and (B) by changing the pull angles.



Pulling directions
B
A

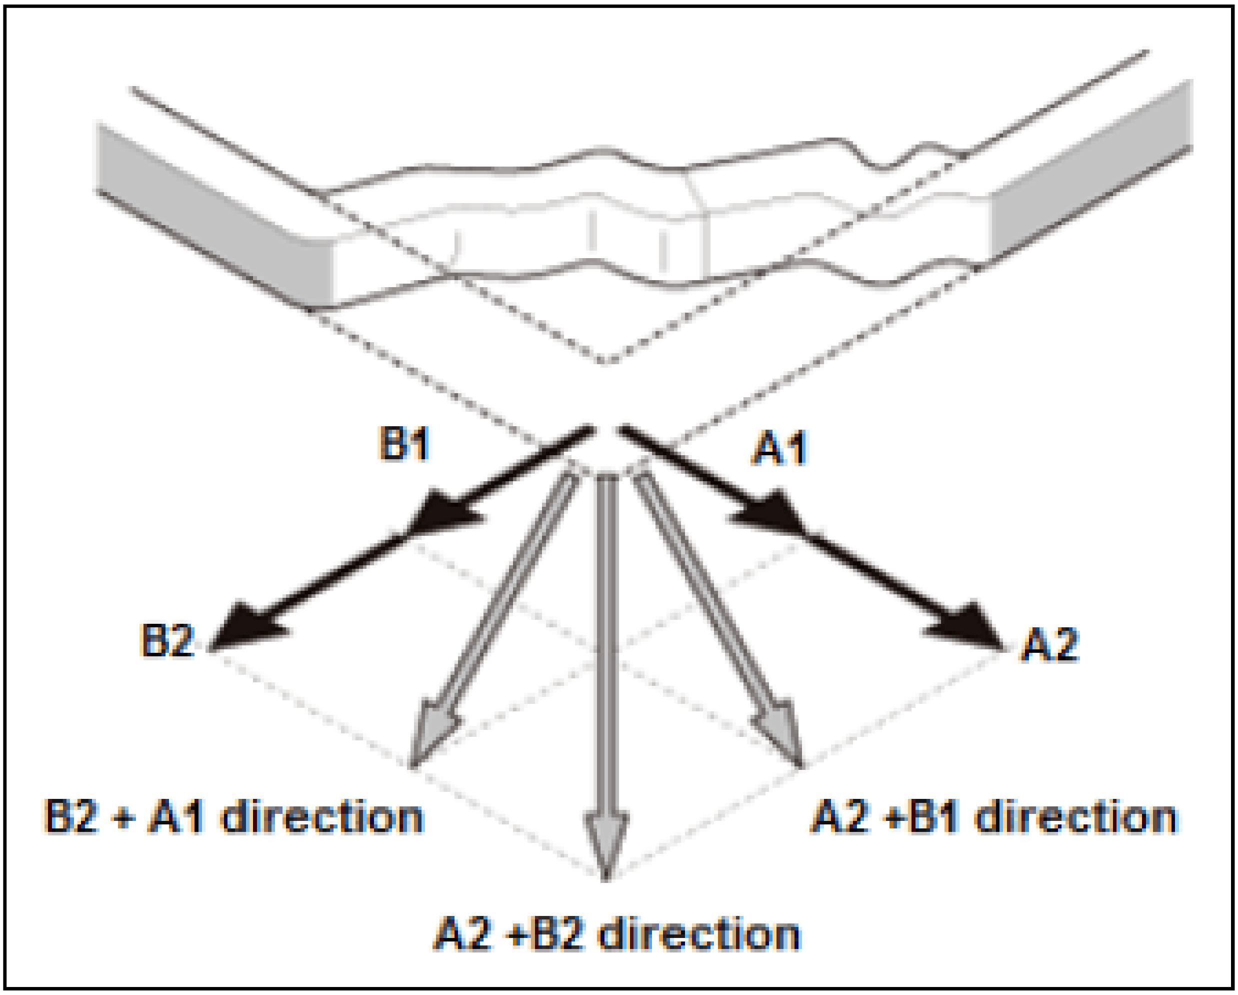
Perpendicular Pull-out

- Add the pulling forces (A) and (B) perpendicularly while adjusting their magnitude.



Actual pulling direction
B
A
Actual pulling direction

- By pulling the body from two perpendicular directions, it is easier to control the change of direction of the composite force. This allows easier, step by step body dimensional restoration while confirming restoration progress.

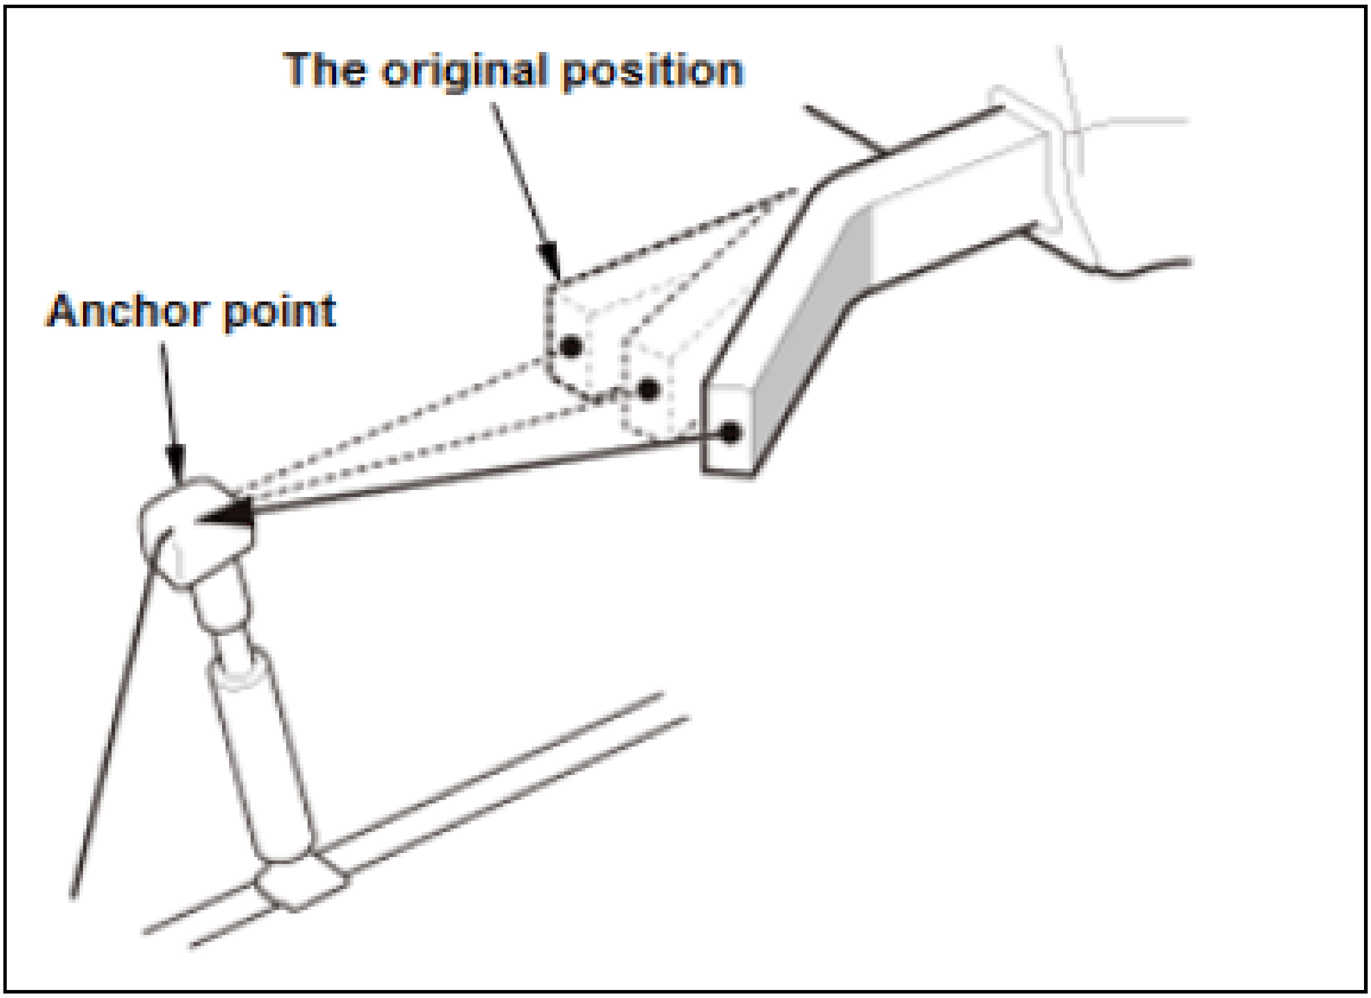


B1
A1
B2
A2
B2 + A1 direction
A2 +B1 direction
A2 +B2 direction

- When estimating the restored shape of the body set the pulling anchor point on an extended line in the required direction. By gradually pulling that part of the body, the damaged section is eventually restored to the proper shape.

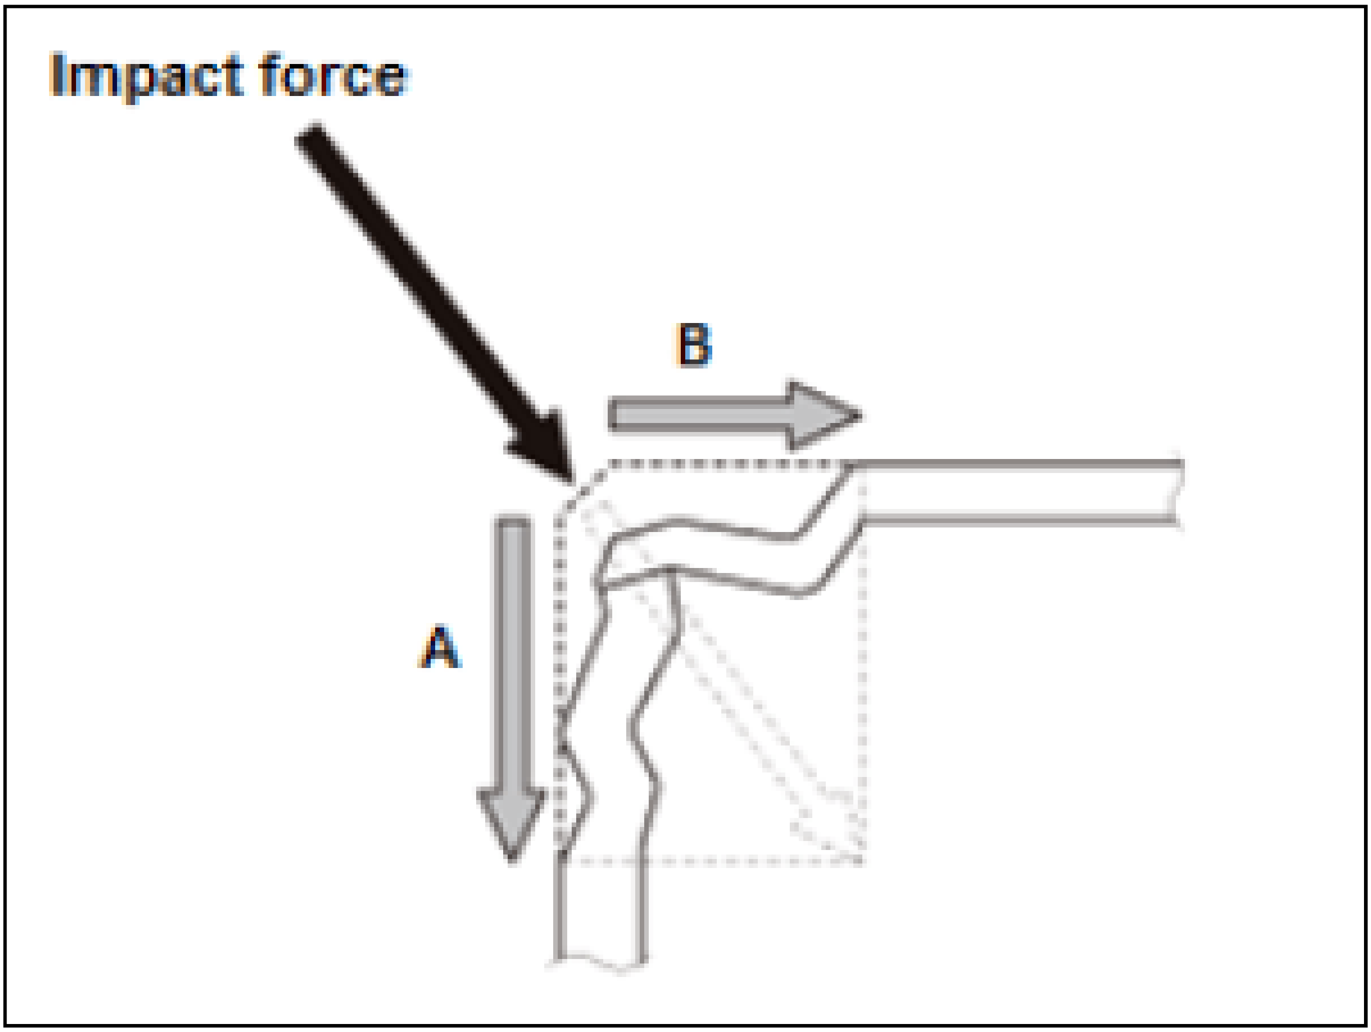
The pulling directions should be determined based on the skill level of the operators and/or the characteristics of the body and frame correction equipment used.

NOTE: **Refer to the manual issued by the body and frame correction equipment manufacturer for detailed specifications and information.**



Impact Force Direction

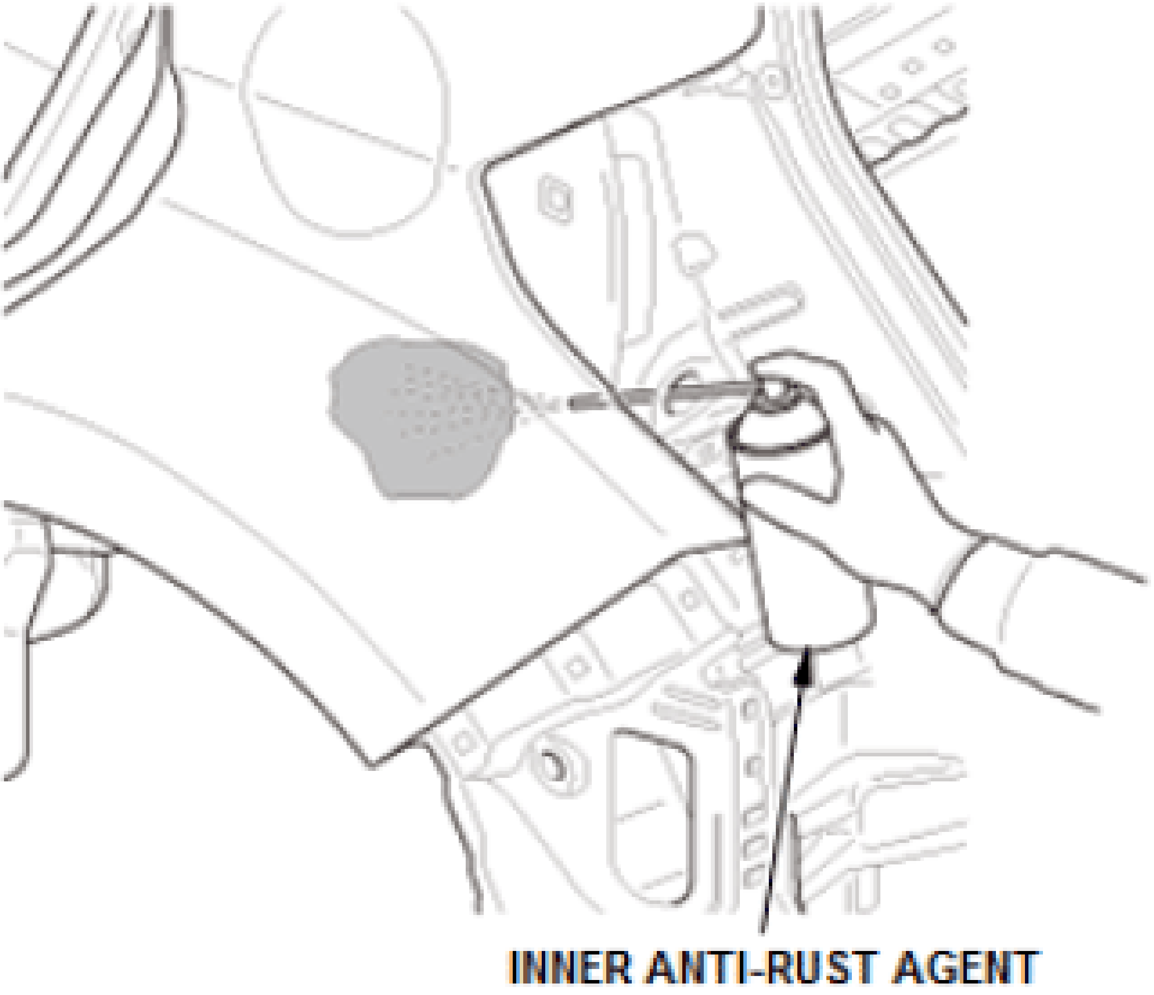
1. The impact force deforms the body through the divided elements of (A) and (B). Apply an equivalent or greater force to the body from the opposite direction to pull-out and restore the deformed shape back to original as much as possible.
2. As the body stiffness varies from section to section, it is necessary to adjust the pulling forces and directions accordingly. The shape may not be restored completely by pulling only in the opposite direction.



REPAIRING MINOR BODY DAMAGE

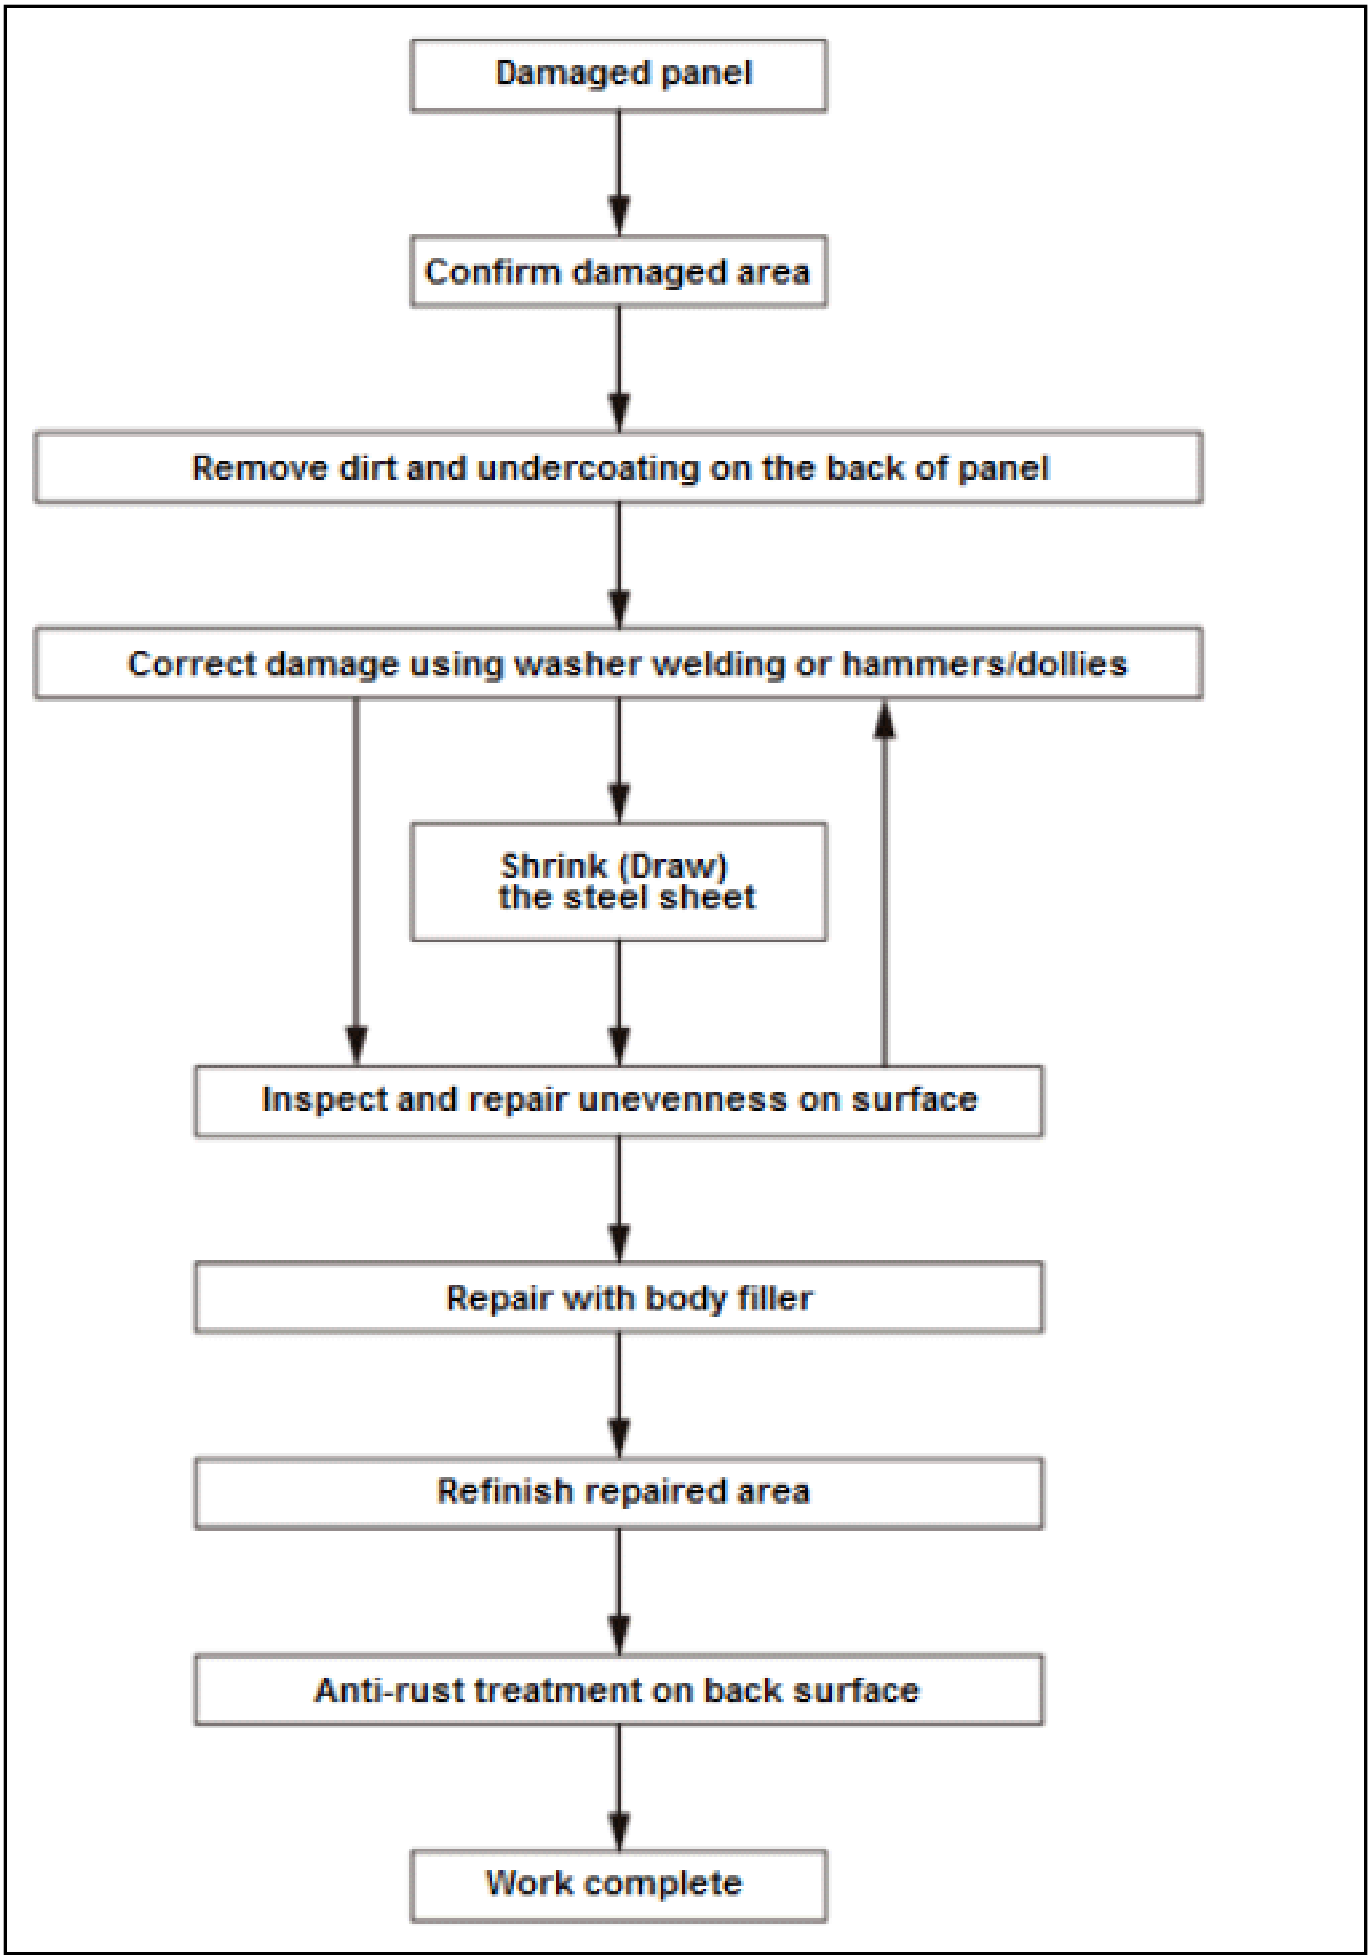
Anti-Rust Treatment

- Apply anti-rust treatment to the inside surface of the panel because the paint layer will be damaged due to heat from the previous repair processes.
- Apply anti-rust agent to the inside of the repair area through the interior or exterior parts installation holes or through body openings.



Basic Work Processes

Minor body damage usually involves correction of outer panels or externally installed parts. This kind of work is usually done by correction using hammers and dollies or washer welding. Both of these methods require body filler repairs to restore the original body contours. The best way of repairing body panels is to correct the damage as close as possible to the original contours using a hammer-out or washer welding method, then applying the minimum amount of body filler.



Damaged panel
Confirm damaged area
Remove dirt and undercoating on the back of panel
Correct damage using washer welding or hammers/dollies
Shrink (Draw) the steel sheet
Inspect and repair unevenness on surface
Repair with body filler
Refinish repaired area
Anti-rust treatment on back surface
Work complete

Body Filler (Putty) Repairs

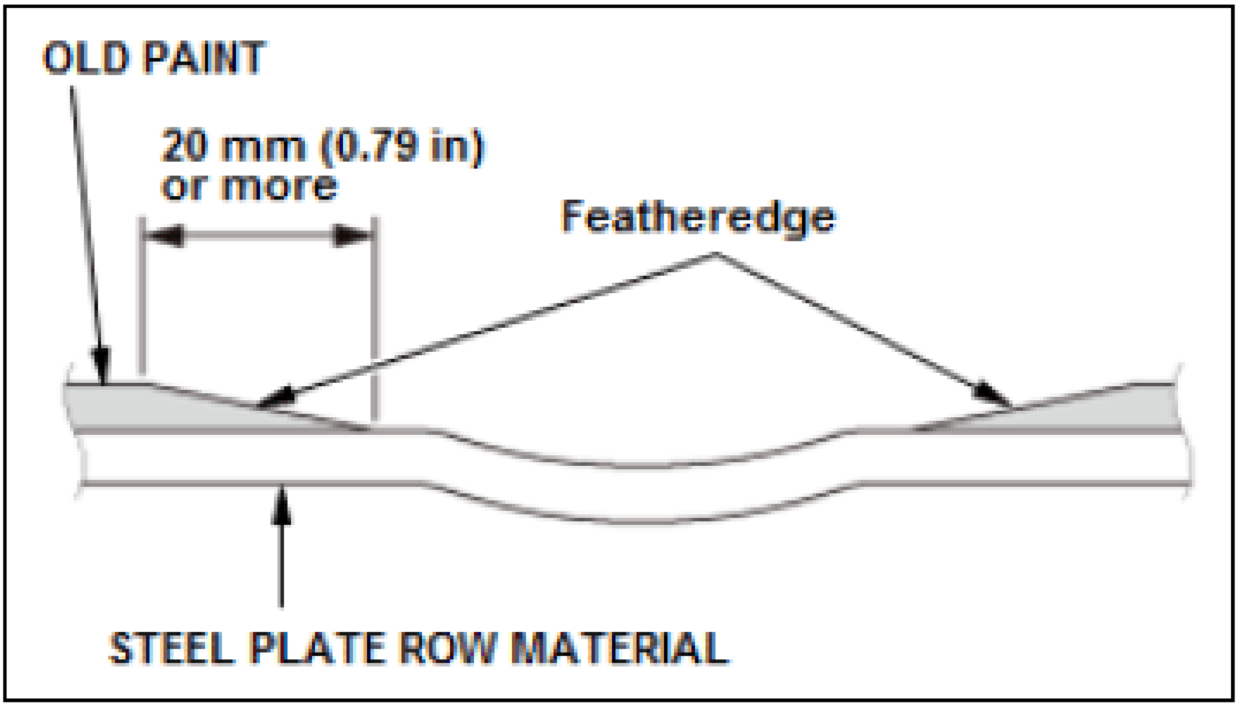
Selection of Putty

- For body filler repairs, it is extremely important to select the most appropriate type of filler or putty for the work.
- The filer type determines the resulting appearance or the repair time required. To select the most appropriate product, it is vitally important to know the technical characteristics of panel putty, intermediate putty, polyester putty, lacquer putty, etc.
- For a depression deeper than 3 mm (0.12 in), begin with panel or intermediate filler, form the surface with polyester putty, then apply paint primer surfacer. Use spot or lacquer putty to remove fine scratches. Save time by using polyester putty as much as possible.

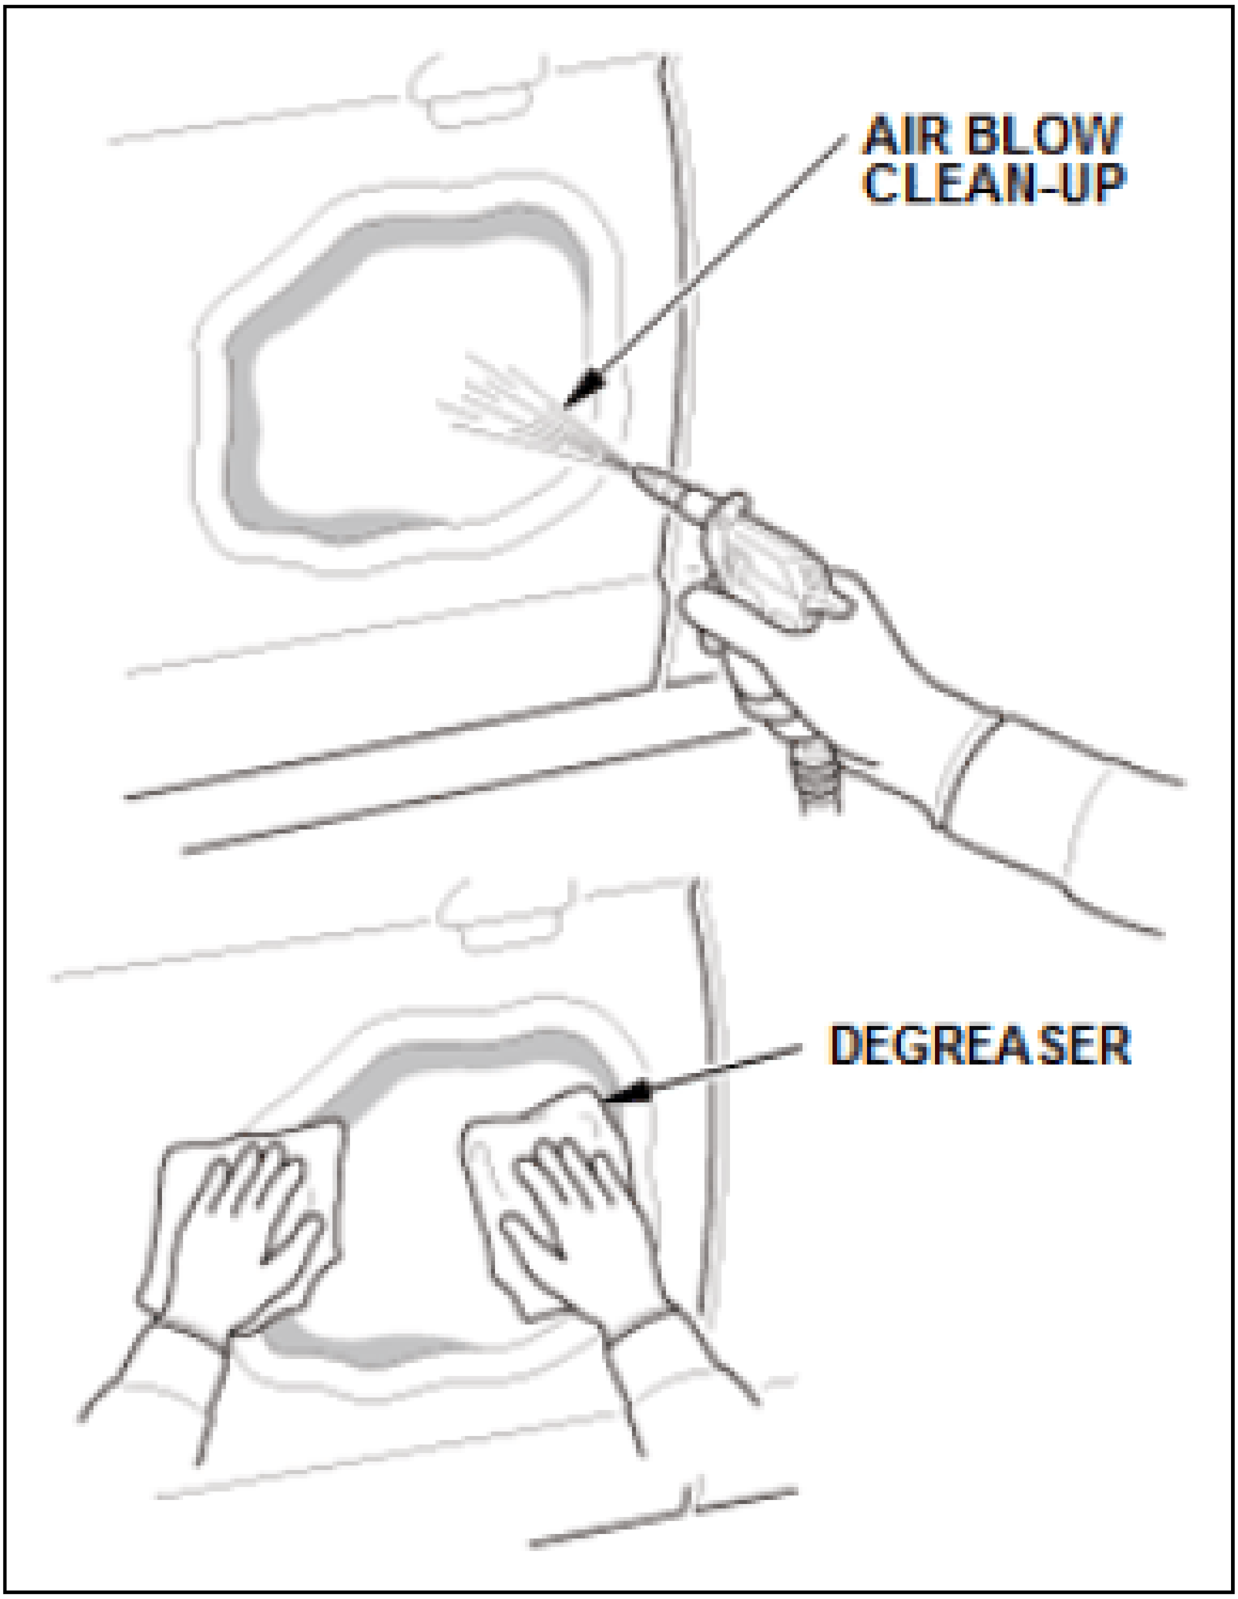
NOTE: **Repairs where filler is applied directly over old paint layers may be easier, but care must be taken. Some paint layers types don't accept filler well and will crack or peel when filler is applied. Always check the old paint layer type and condition. Do not apply filler directly over degraded or lacquer paint layers.**

Filler Application Steps

1. Remove paint layers on steel panel and clean:
    - Remove the paint layer to bare metal from a slightly wider area than the immediate filler application area using a disc sander. Make sure to completely remove old paint layer and any rust. Smooth the surface to make a gradual blend it with the surrounding painted areas.
    - Sand using a double action sander with P80 to P120 sandpaper to smooth out the surface between the bare steel panel and old paint layers. Make a featheredge of 20-30 mm (0.79-1.18 in) while removing fine scratches.



2. Clean and degrease the filler application area:
    - Use compressed air to remove dust, dirt, and water. Remove oils with a degreaser.
    - In rainy or humid weather, warm the surface with an infrared heater to eliminate moisture.
    - On very cold days, preheating the panel makes body filler easier to spread and reduces drying time.



3. Mix the filler and hardener.

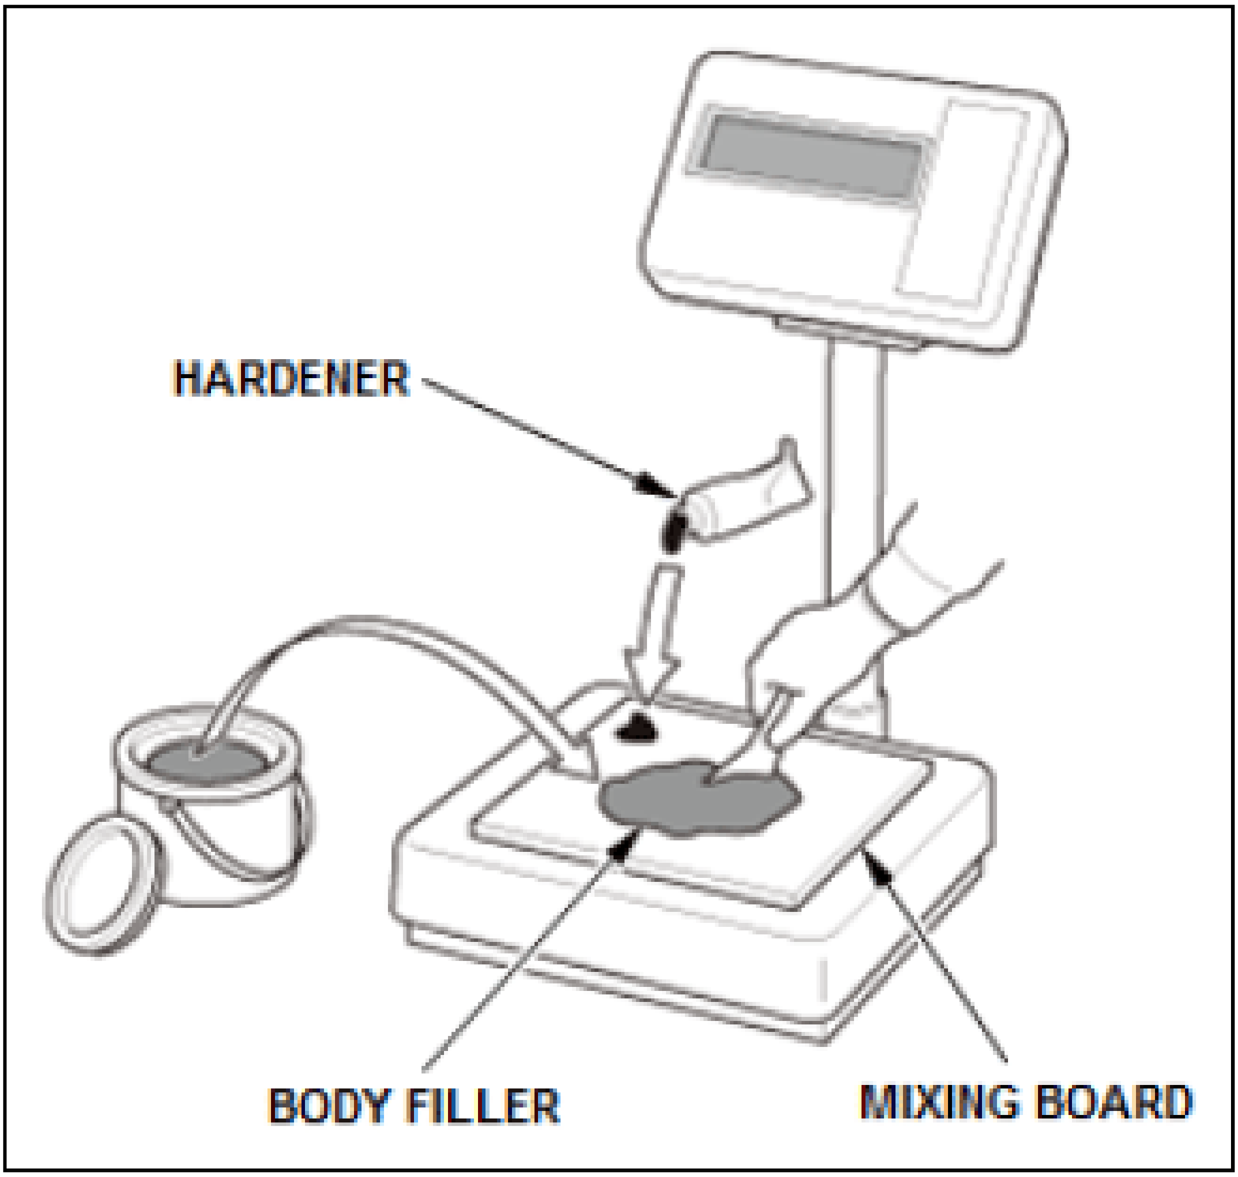
   Using a plastic or wooden body filler scoop, remove the necessary amount of filler from the can. Add the filler and specified ratio of hardener to the mixing board.

   NOTE: **Check the appropriate mixing ratio in the product specifications issued by the filler manufacturer.**

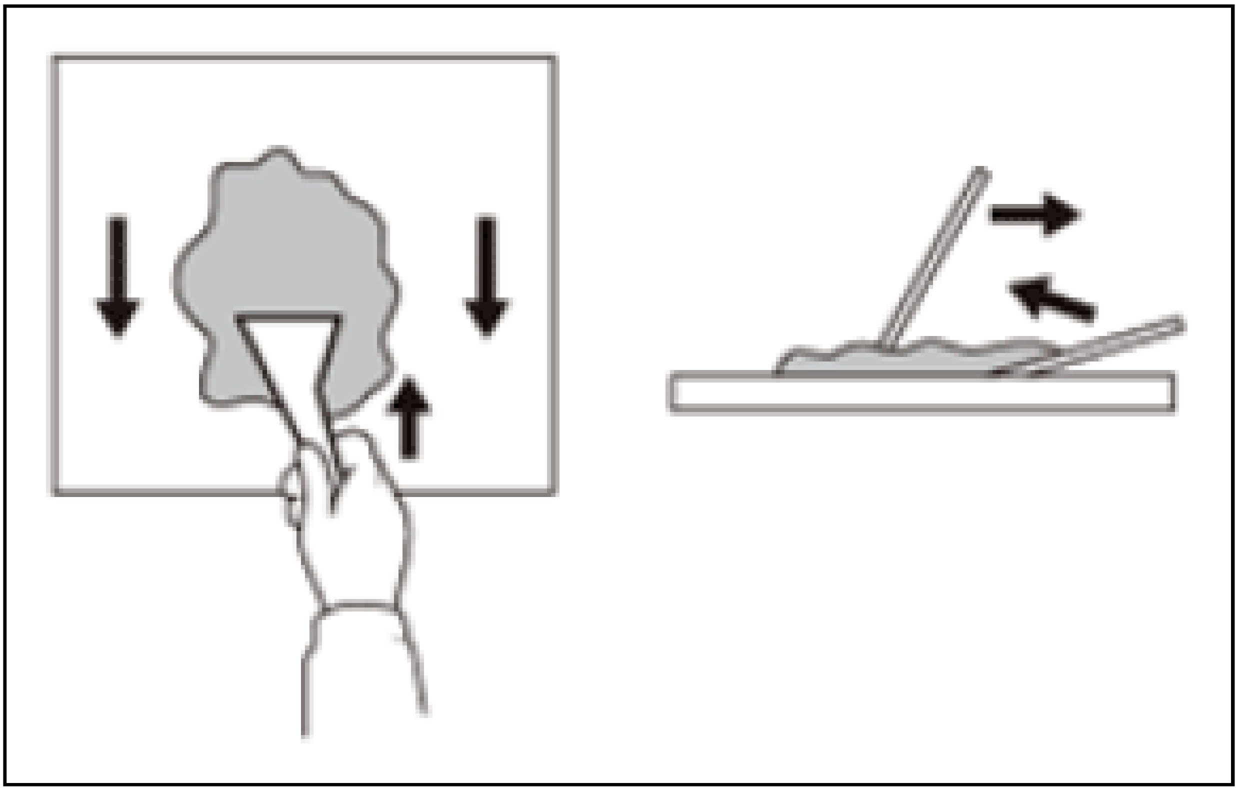
   To prevent air bubbles, knead the filler until the color becomes even while twirling the scoop or spreader.

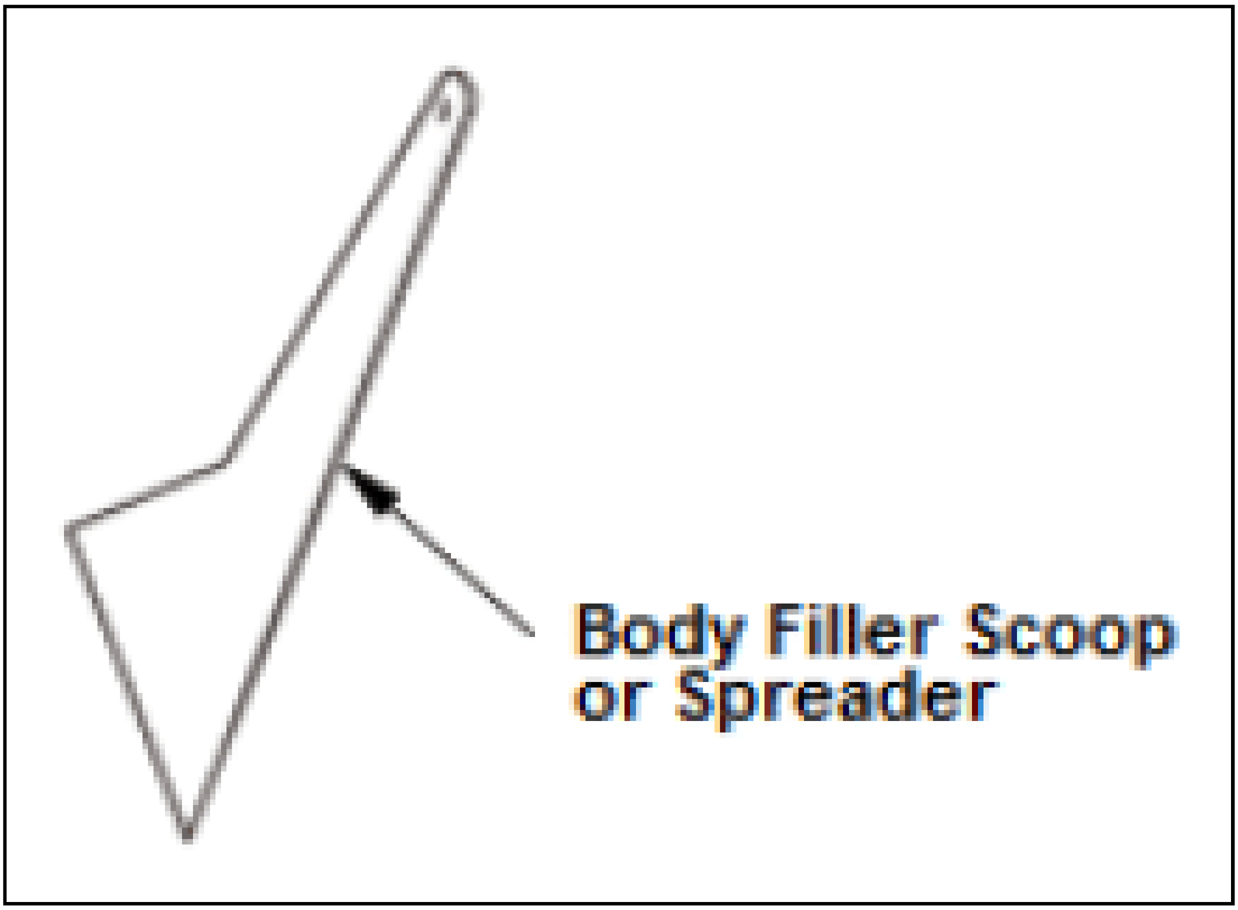
   NOTE: **Do not attempt to mix a large amount of filler at one time because it may harden during application. When a large amount is needed, mix and apply the filer in small quantities.**

   Body filler scoop and spreader maintenance. Straighten the end of body filler scoops or spreaders using sandpaper and allow a slight bow. Completely remove hardened filler and keep the tools clean at all times.



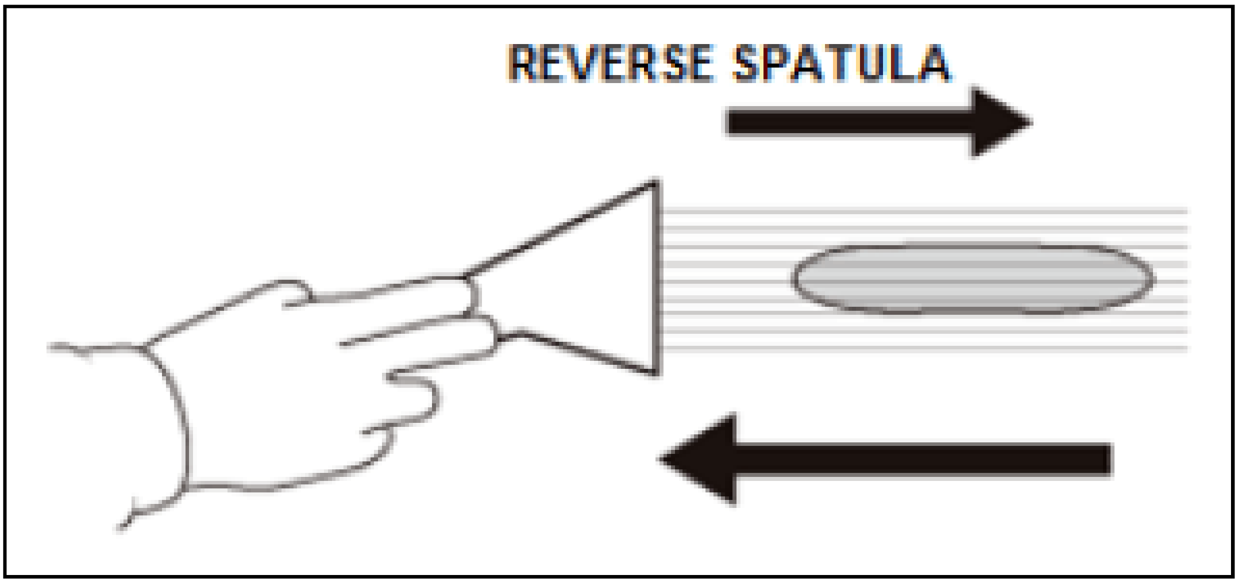
HARDENER
BODY FILLER
MIXING BOARD





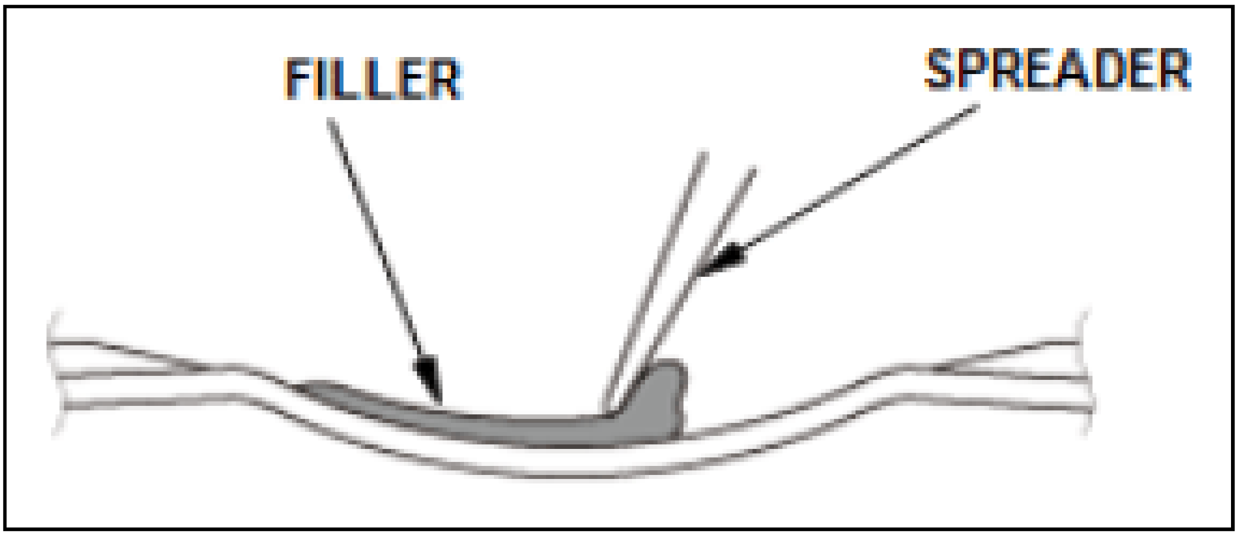
4. Using a body filler spreader

   When the filler application area is rectangular, move the spreader in a long direction.

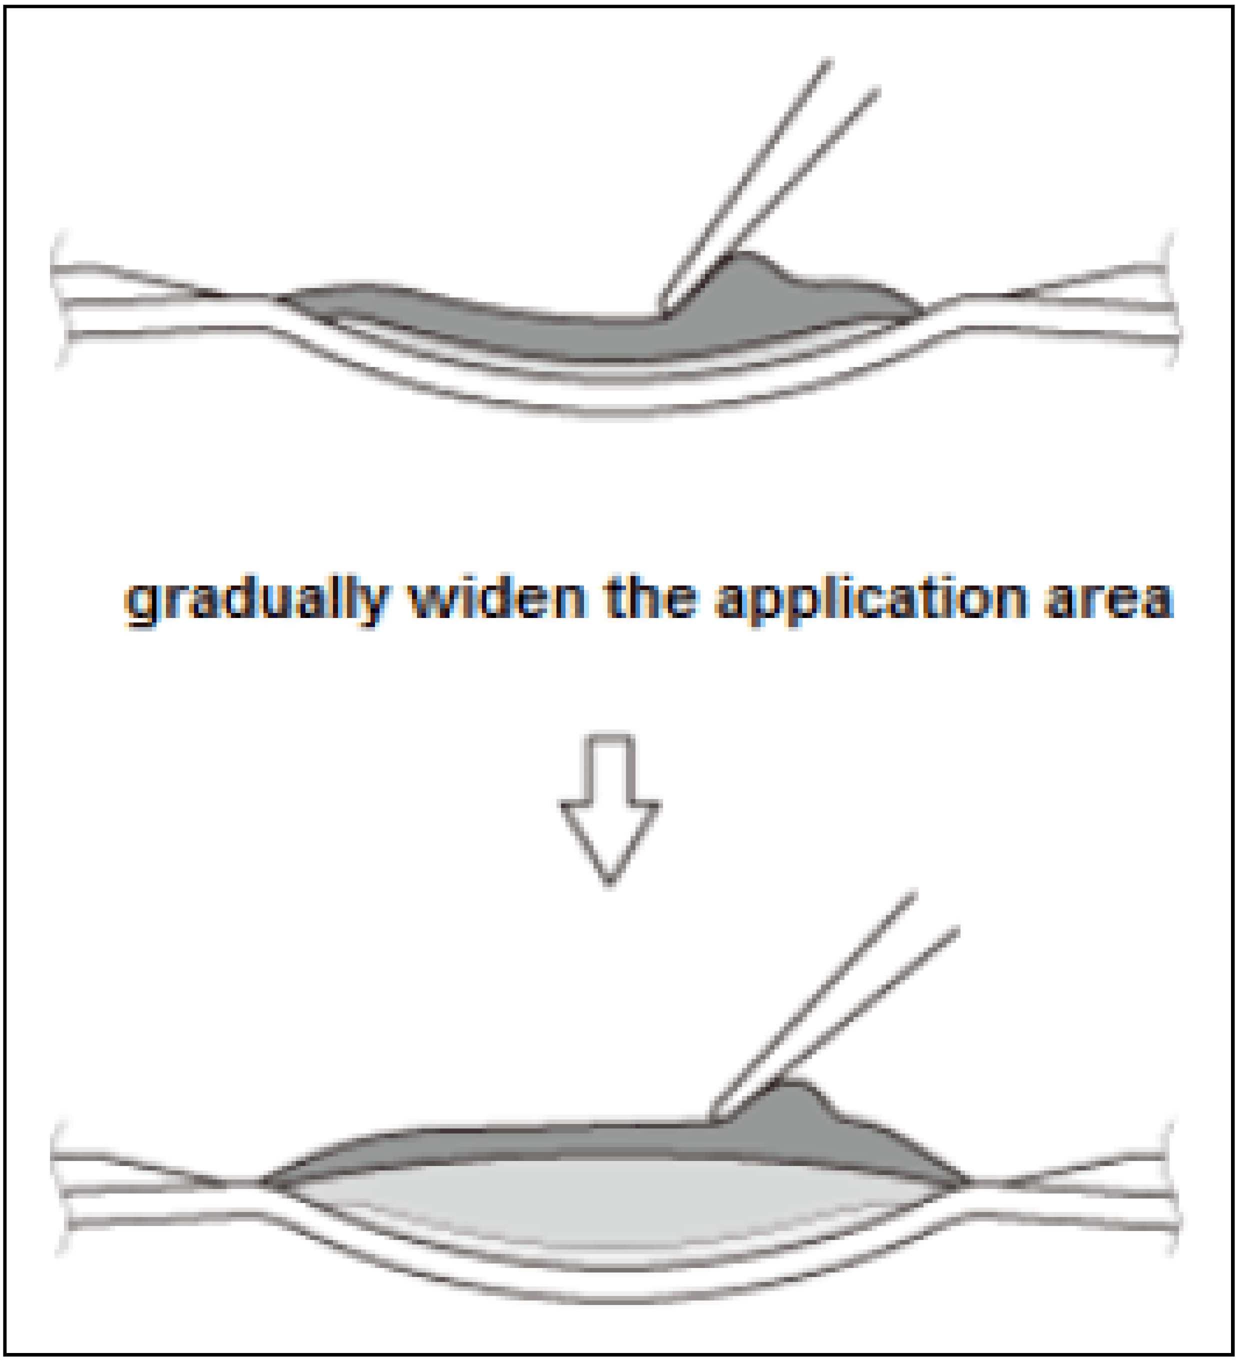


5. Basic filler application
   1. The initial layer of filer should be applied to remove sanding scratches. Hold the spreader almost vertically and apply a thin layer of filler while pressing down slightly.
   2. Apply slightly more filler than necessary in light coats to prevent cavities in the filler caused by air bubbles.
   3. The final layer of filler should be applied to smooth out the surface by laying the spreader down closer to the surface.

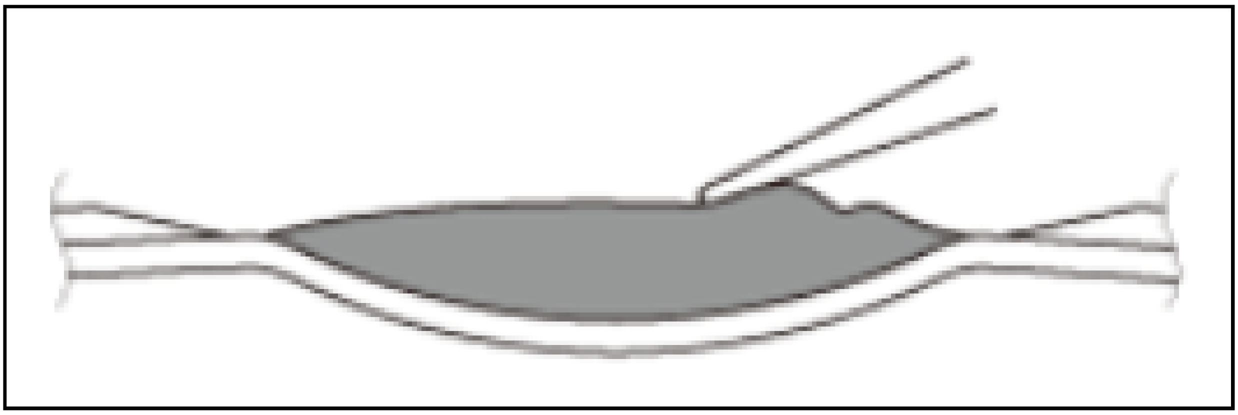
NOTE: **Sanding becomes much easier if filler is used to restore the original shape as much as possible.**



FILLER
SPREADER

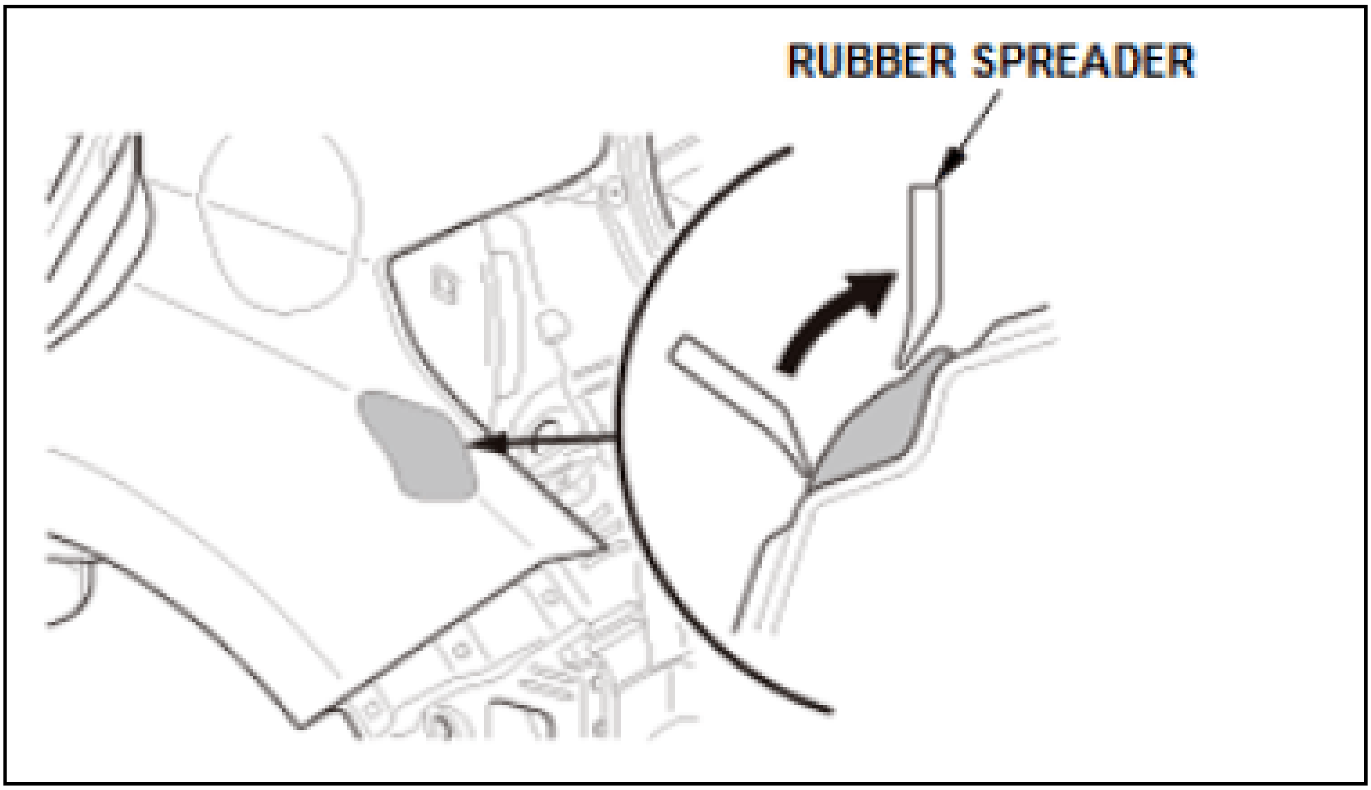


gradually widen the application area



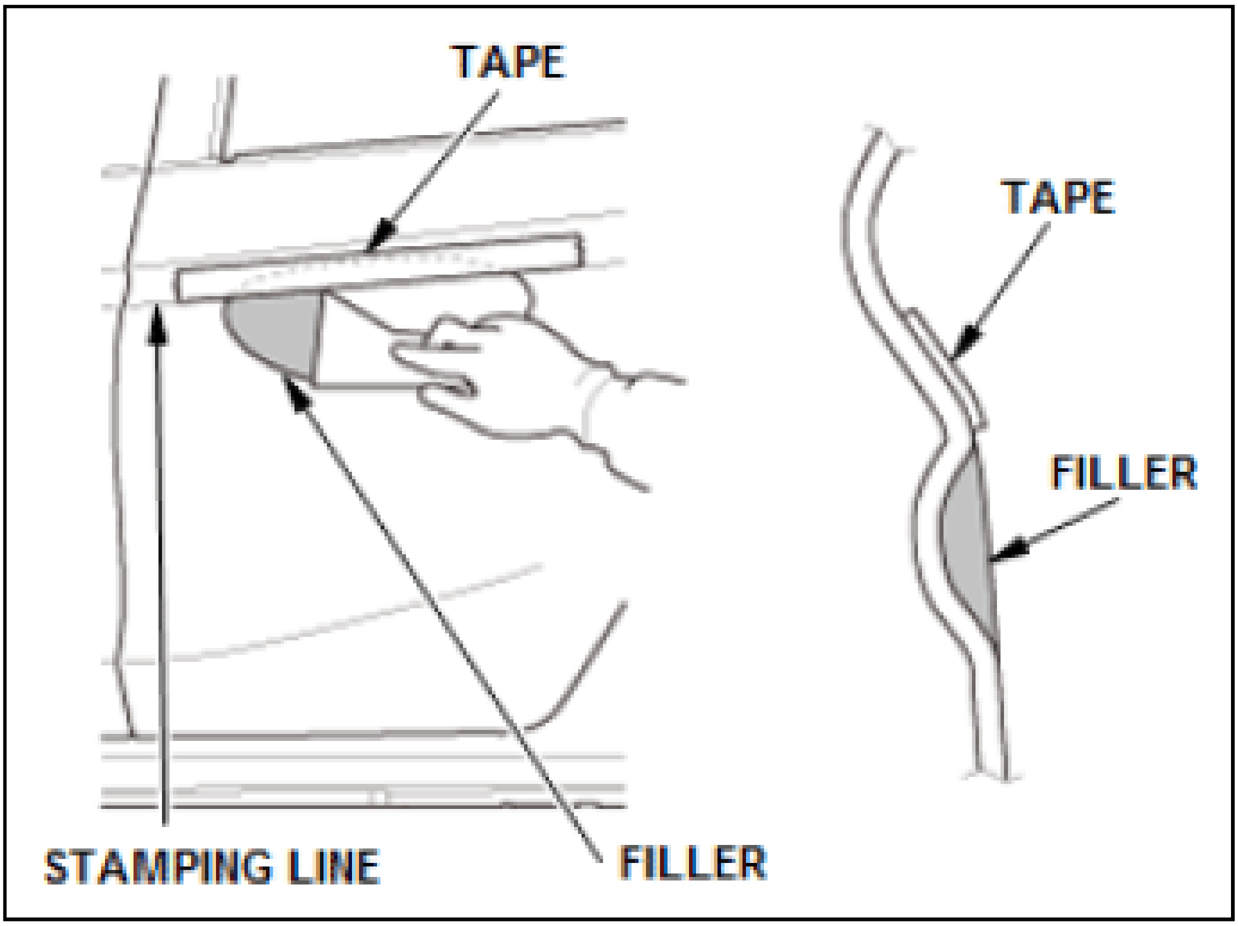
Applying Filler at Body Corners

Using a flexible rubber spreader, apply body filler along the corner area. Apply enough filler to account for sanding required to restore the body contours.



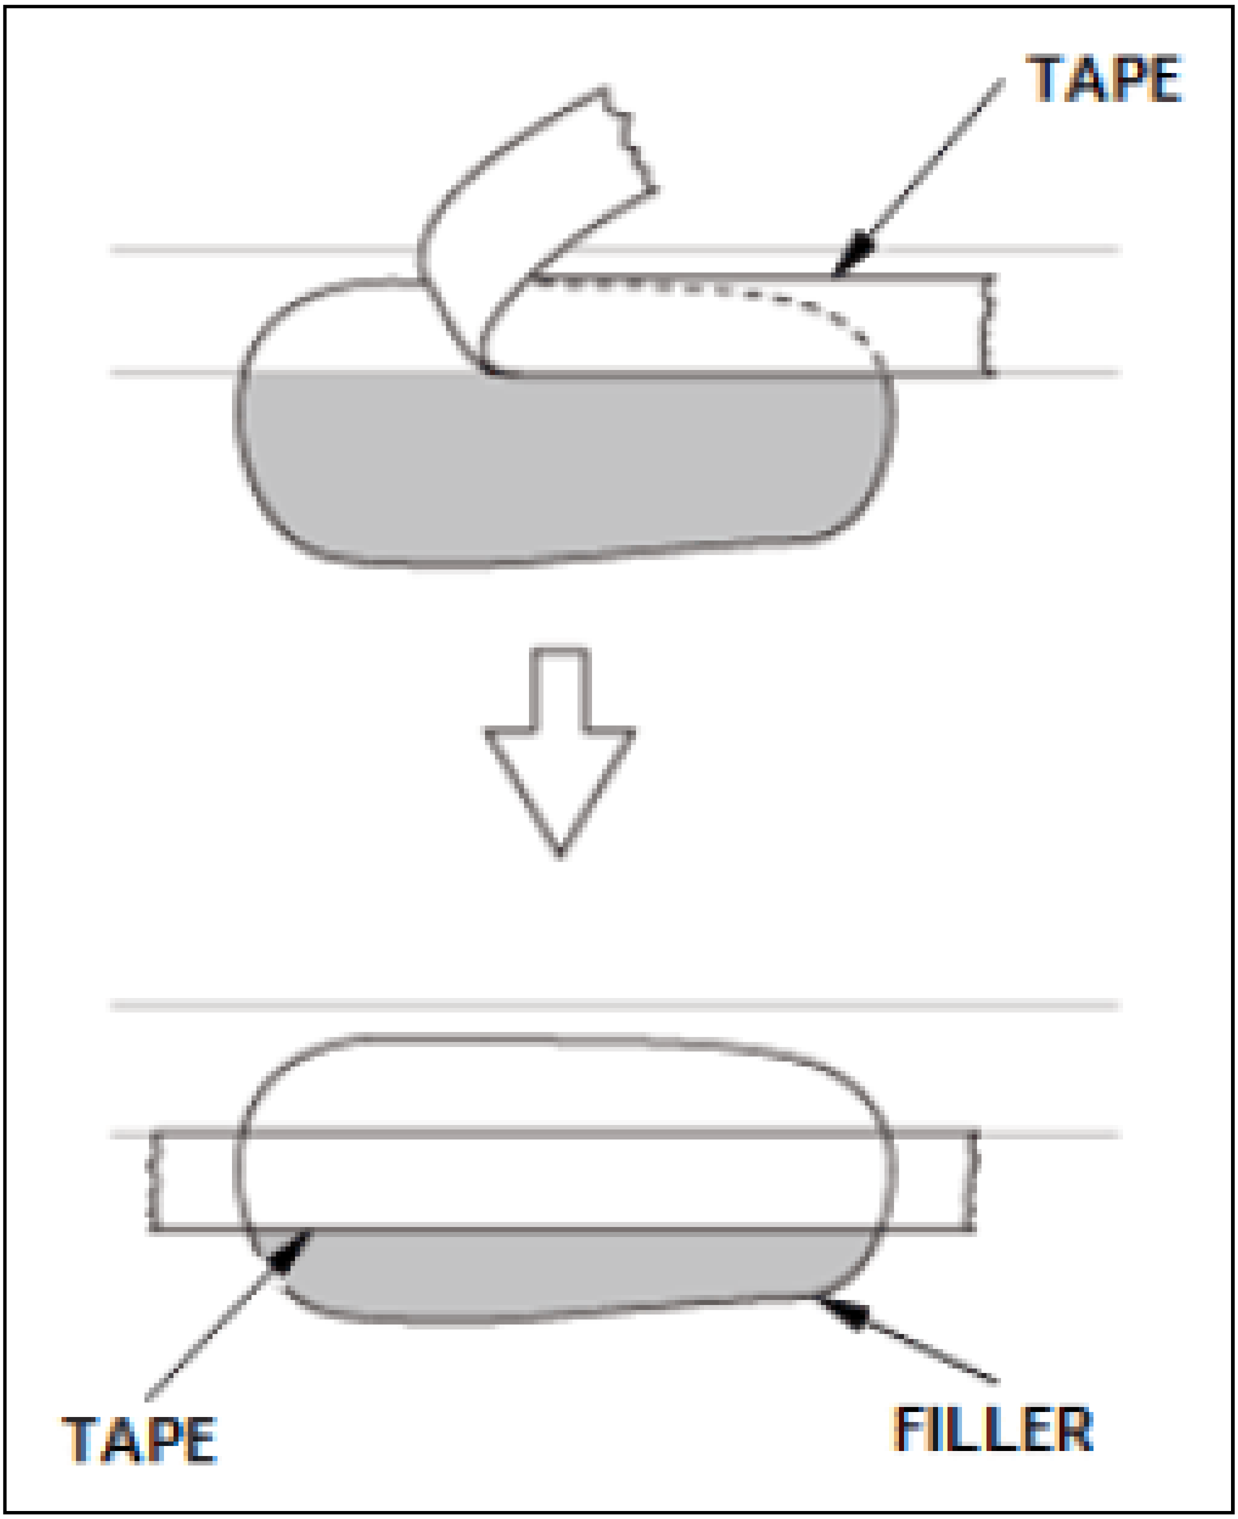
Applying Filler at Stamping Line

1. Apply masking tape along the stamping line and apply body filler to the lower side.



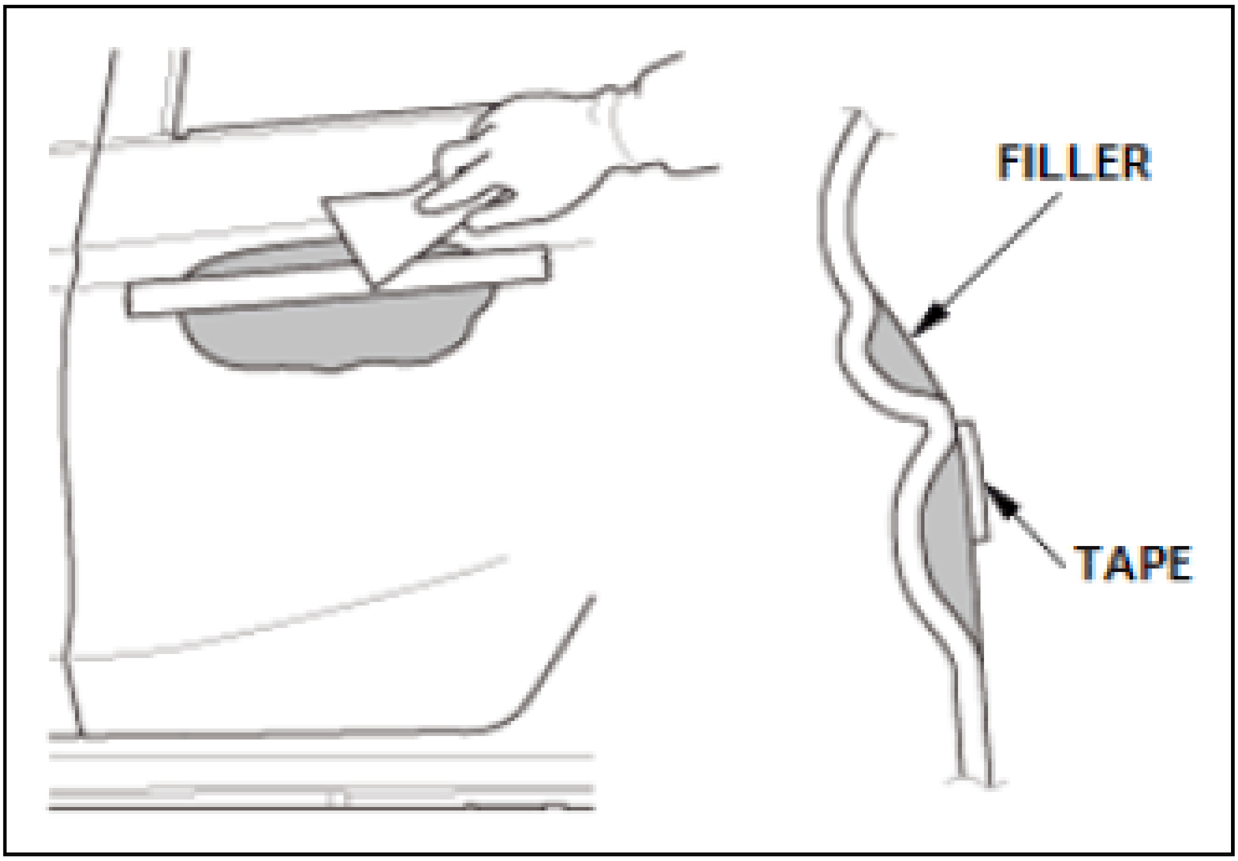
TAPE
TAPE
FILLER
STAMPING LINE
FILLER

2. After the filler is halfway set (dried), remove the tape.
3. Apply tape along the filler line previously applied.



TAPE
TAPE
FILLER

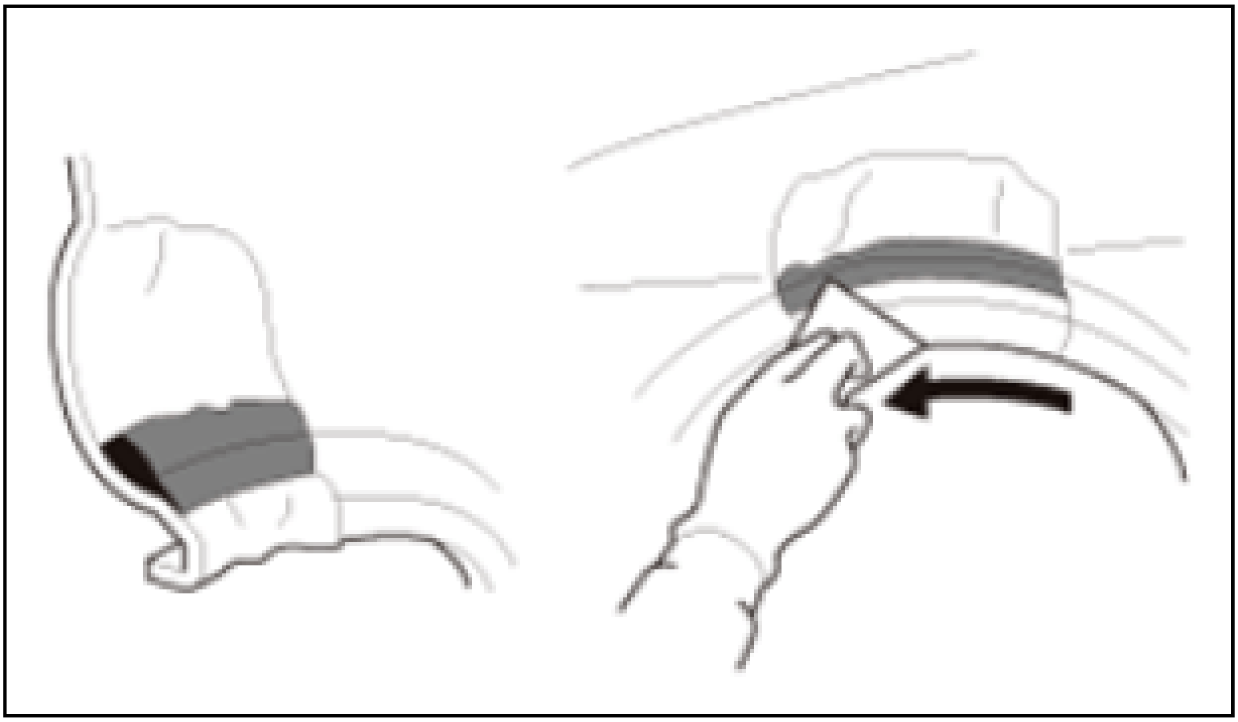
4. Apply filler on the upper side of the tape.



Applying Filler On Combined Surface

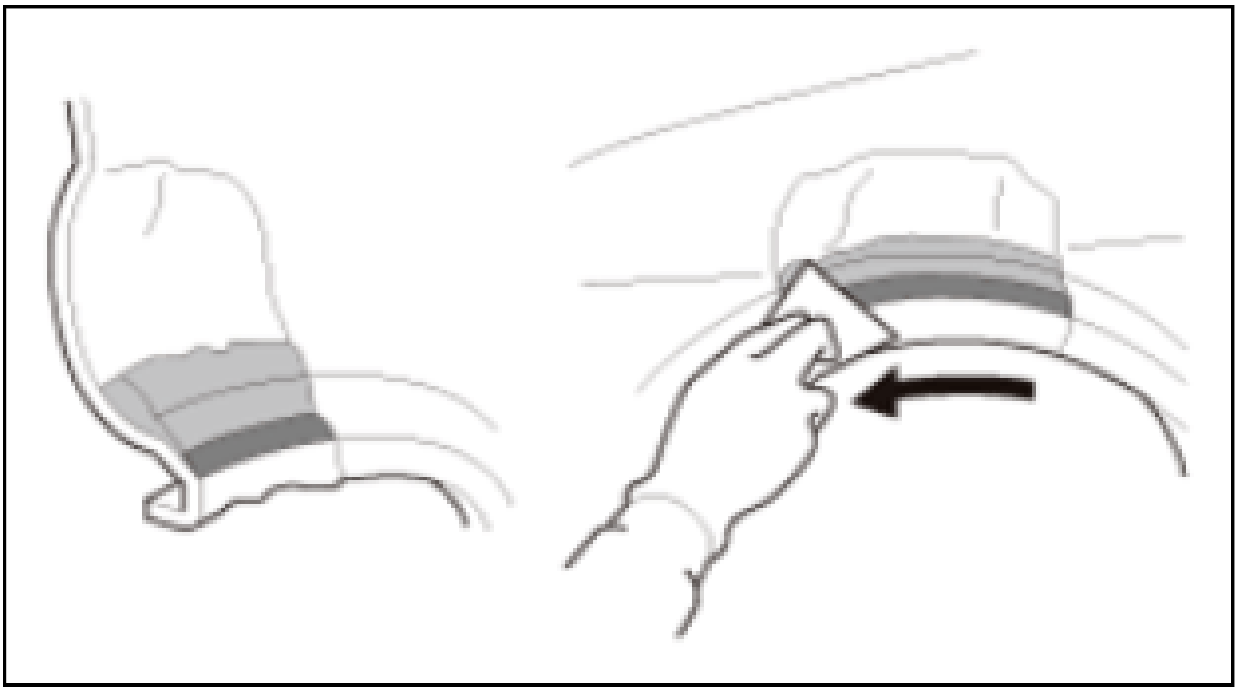
On a combined surface area such as a fender wheel arch, where there are both flat and curved surfaces, correct the body contours with filler as much as possible. Otherwise, sanding and polishing time will be increased.

1. Apply filler on the upper side of rounded panel area. To make the surface flat, spread the filler from the edge sideways.

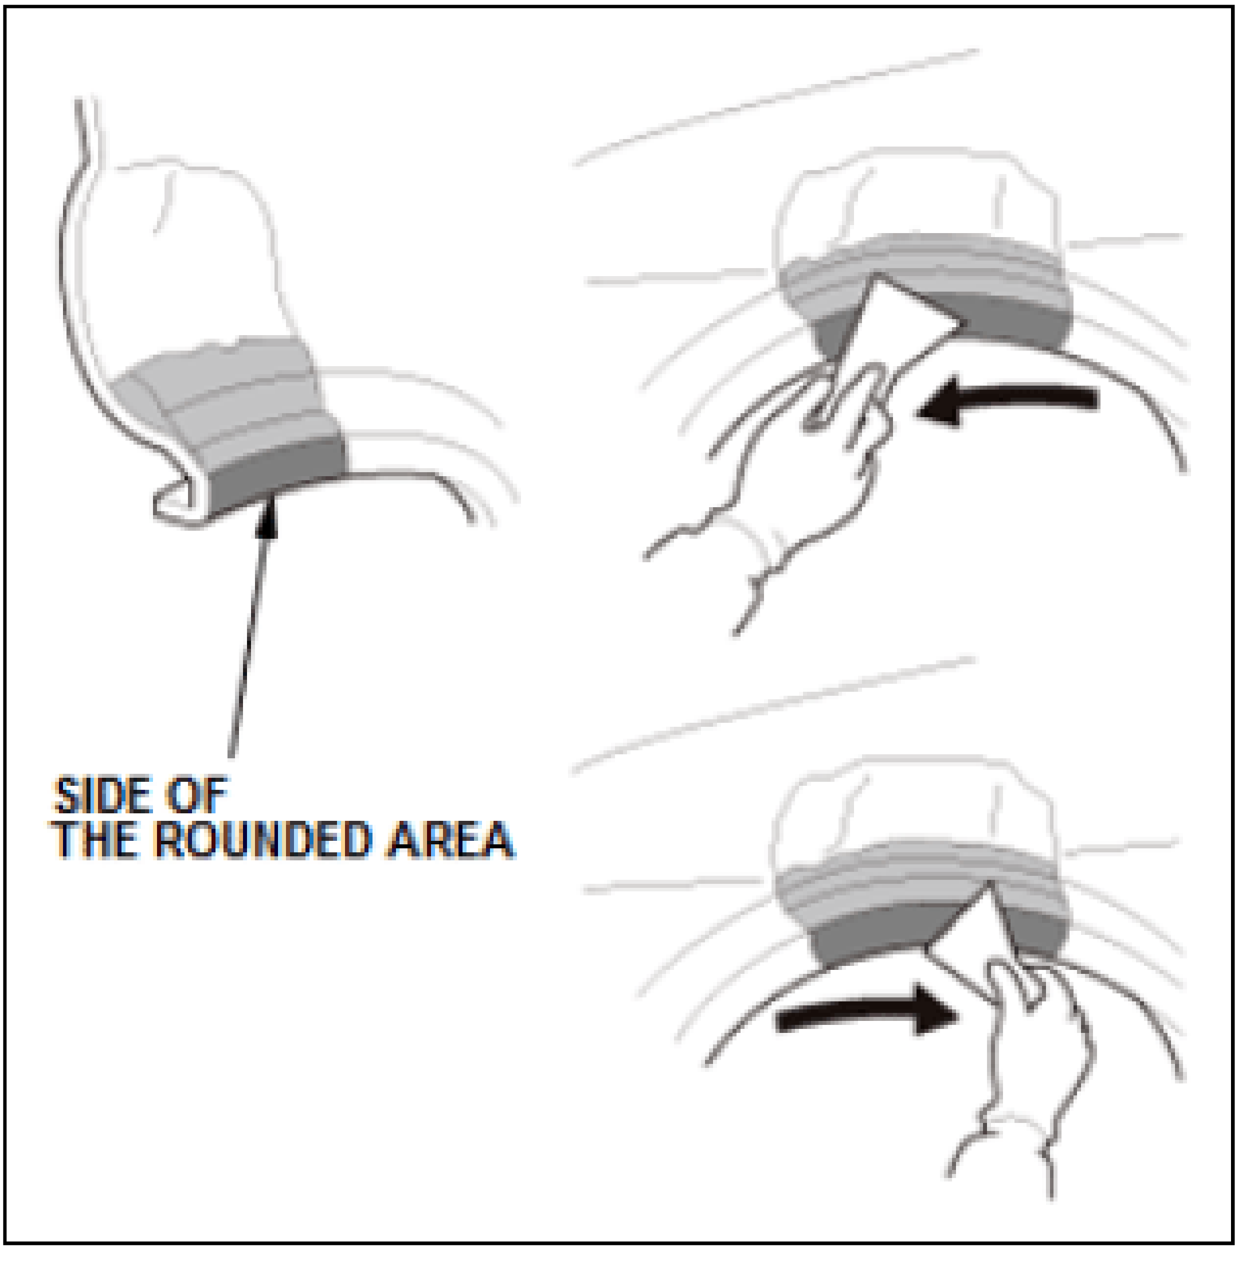


2. Apply filler on the lower side of the rounded area.

   To make the surface flat, spread the filler from the edge sideways.



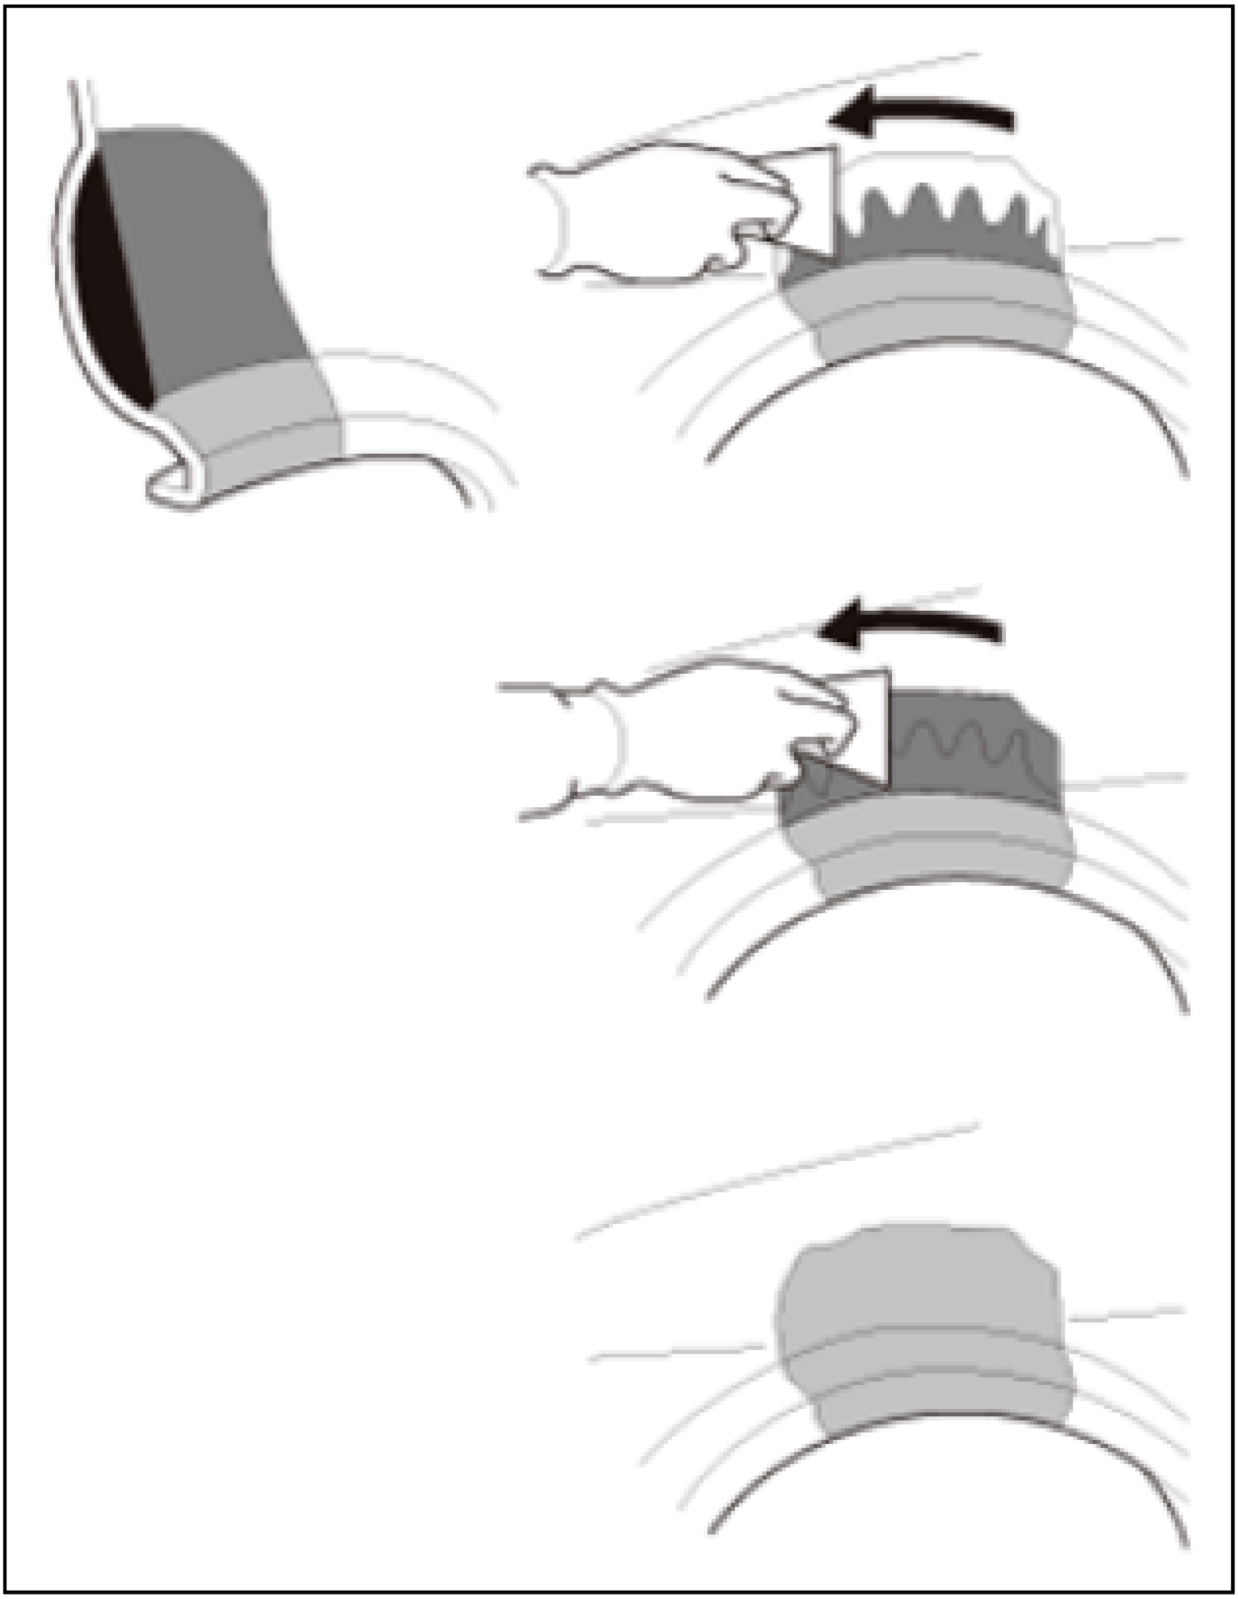
3. Apply the necessary amount of body filler on the side surface of the rounded area. Use a spreader to move the filler sideways. Repeat for the other side of the rounded area.



SIDE OF
THE ROUNDED AREA

4. Apply filler on sides:

- Apply necessary amount of filler on the side plane.
- Smooth the surface by moving the spreader sideways while avoiding the curved area.
- Smooth the entire surface with repeated motions of the spreader.



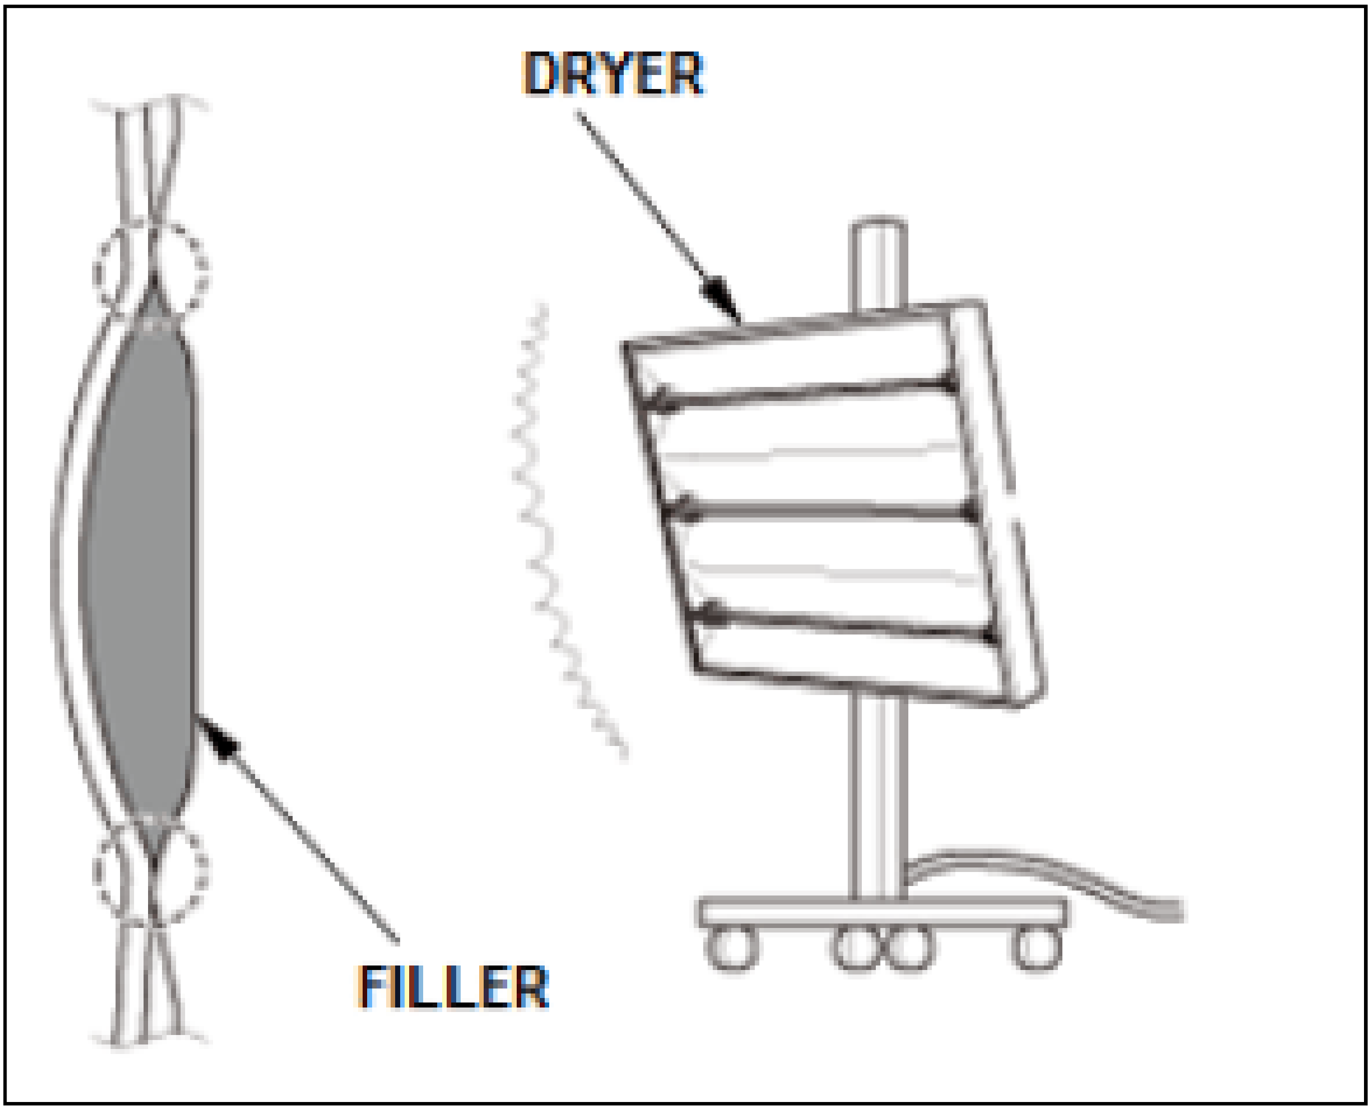
Drying Body Filler

- Body filler hardens enough to be sanded in 20 to 30 minutes at 68 Â°F (20 Â°C) after application. Low temperatures or high humidity will increase the hardening time required. Forced drying may be used to reduce repair time.

NOTE: **Rapid or excessive temperature changes will cause body filler to blister, crack or detach from the repair area.**

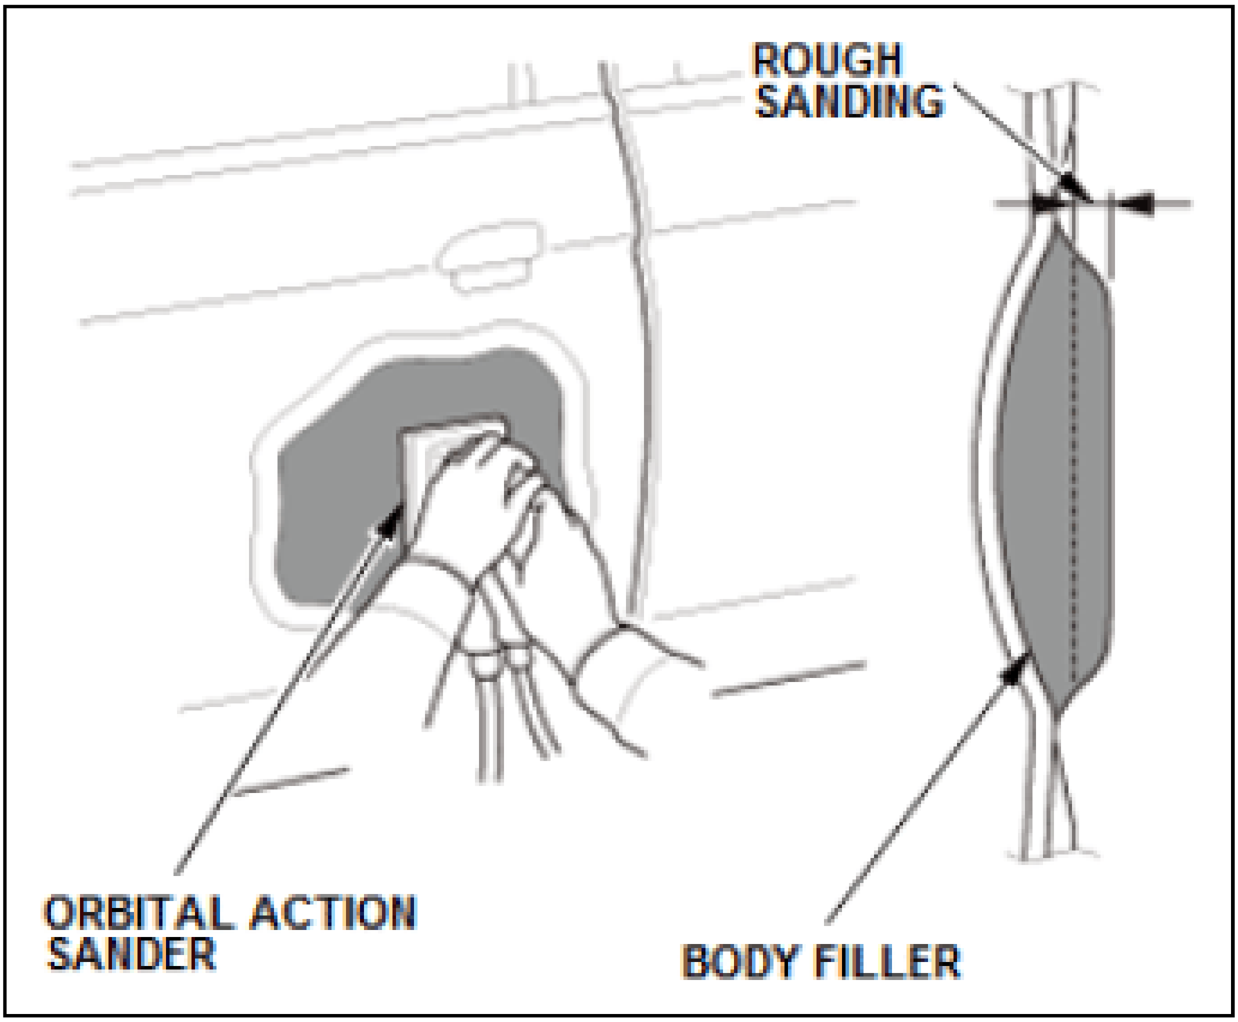
- The hardening speed depends on the filler's thickness. A thick filler application will dry faster than a thinner one.

NOTE: **Follow the body filler or putty manufacturer's instructions for drying time.**

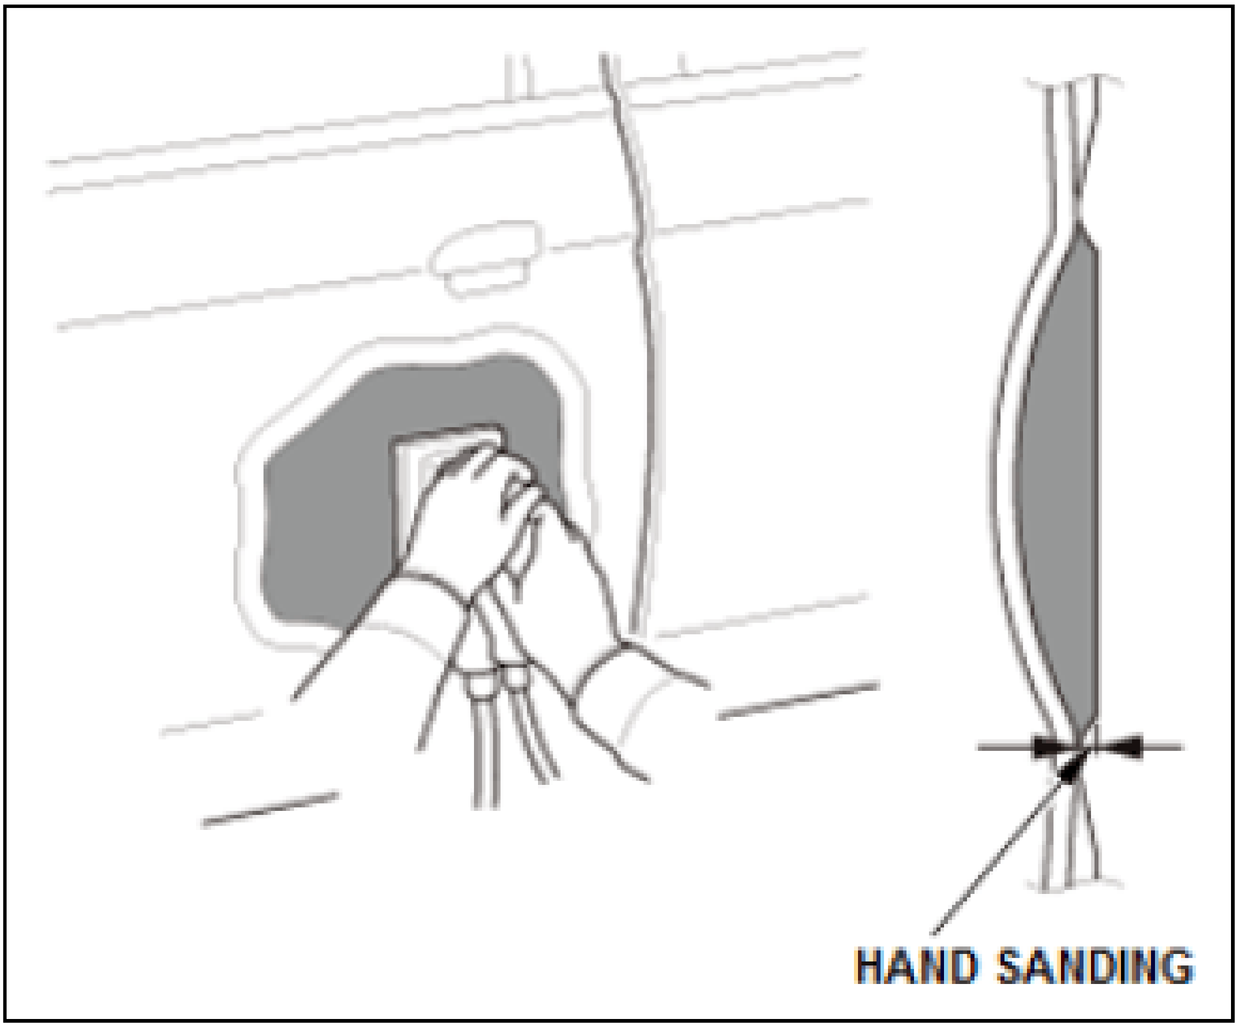


Sanding Body Filler

1. Rough sanding
    1. Rough sand on the entire filler surface until it is smooth.
    2. When the filler is completely hardened, sand its surface until almost flush with the body surface. Do not over sand! Leave a finishing margin for hand sanding.



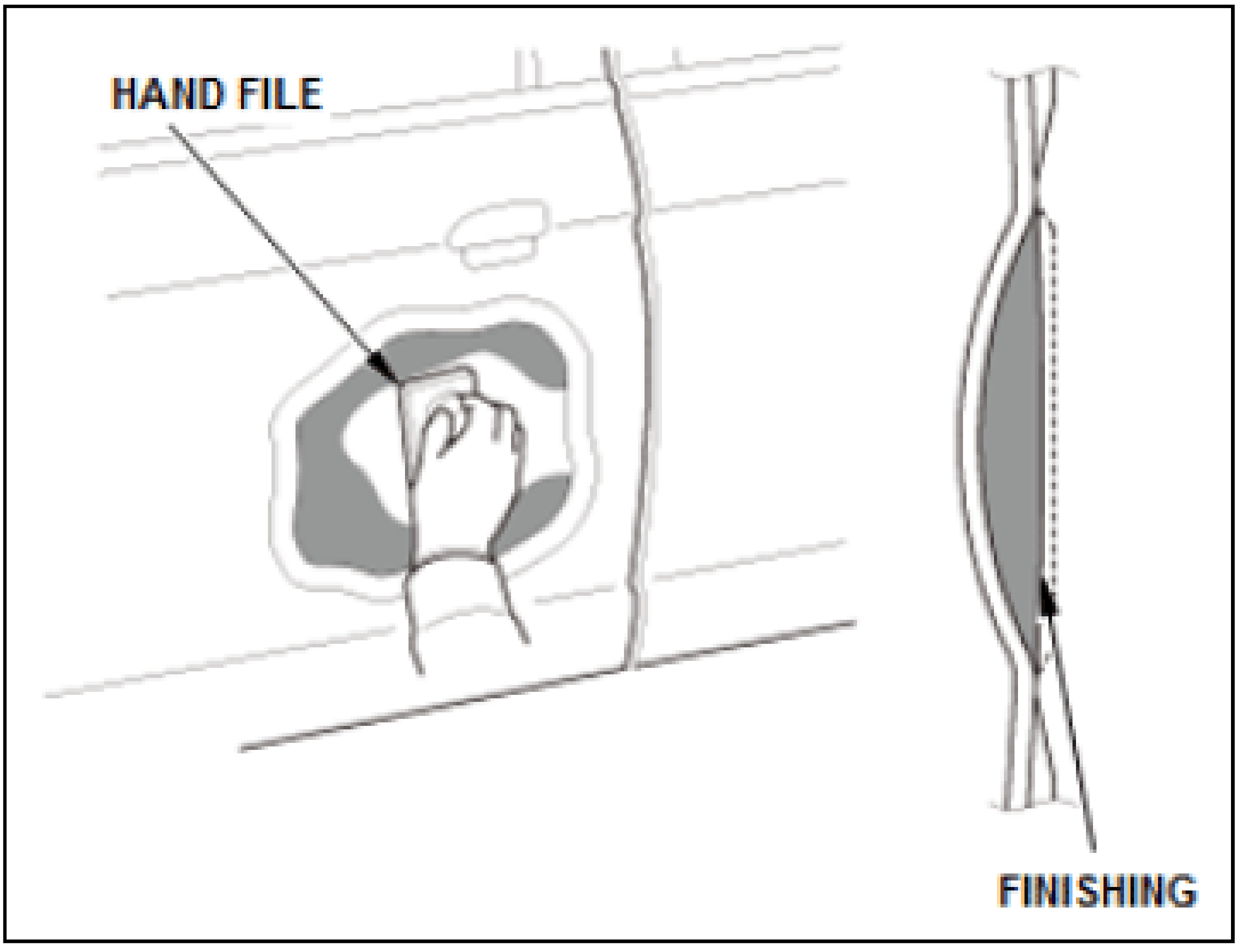
ROUGH SANDING
ORBITAL ACTION SANDER
BODY FILLER



HAND SANDING

2. Finishing

Hand sand the filler surface to match the surrounding panel surface using a hand file.

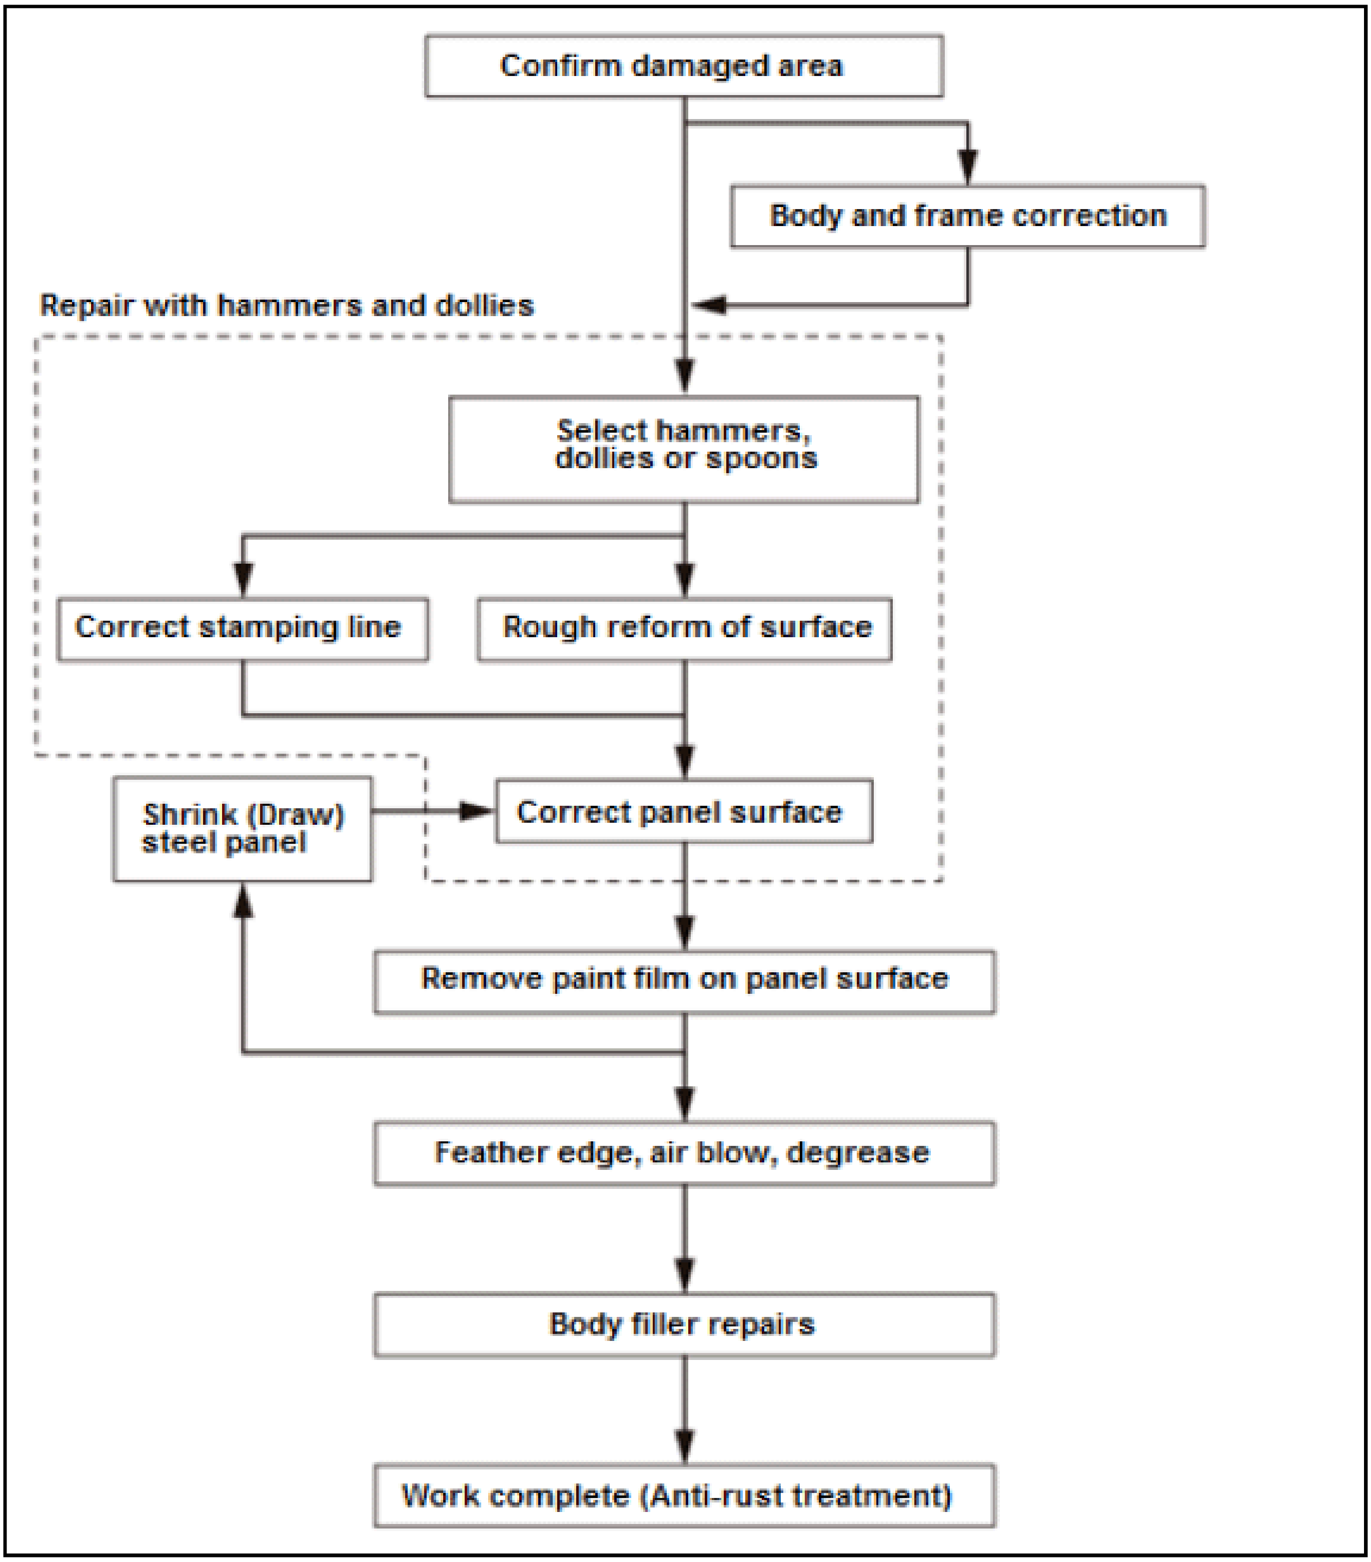


Hammer And Dolly Panel Repair

Hammer And Dolly Panel Repair Diagram

Reforming body contours using hammers and dollies can be done by hand without employing any special equipment, but because it requires high expertise, the quality of the work depends on the technician's workmanship.

With hammers and dollies, it is extremely difficult to finish the repair work to the same level of its undamaged pressed part. So, parts replacement may be necessary depending on the level of the damage. Collision repairs require a variety of handwork that is not difficult individually. If the damaged areas can be easily accessed, hammer and dolly use is recommended because it can be done easily and in a short time.



Confirm damaged area
Body and frame correction

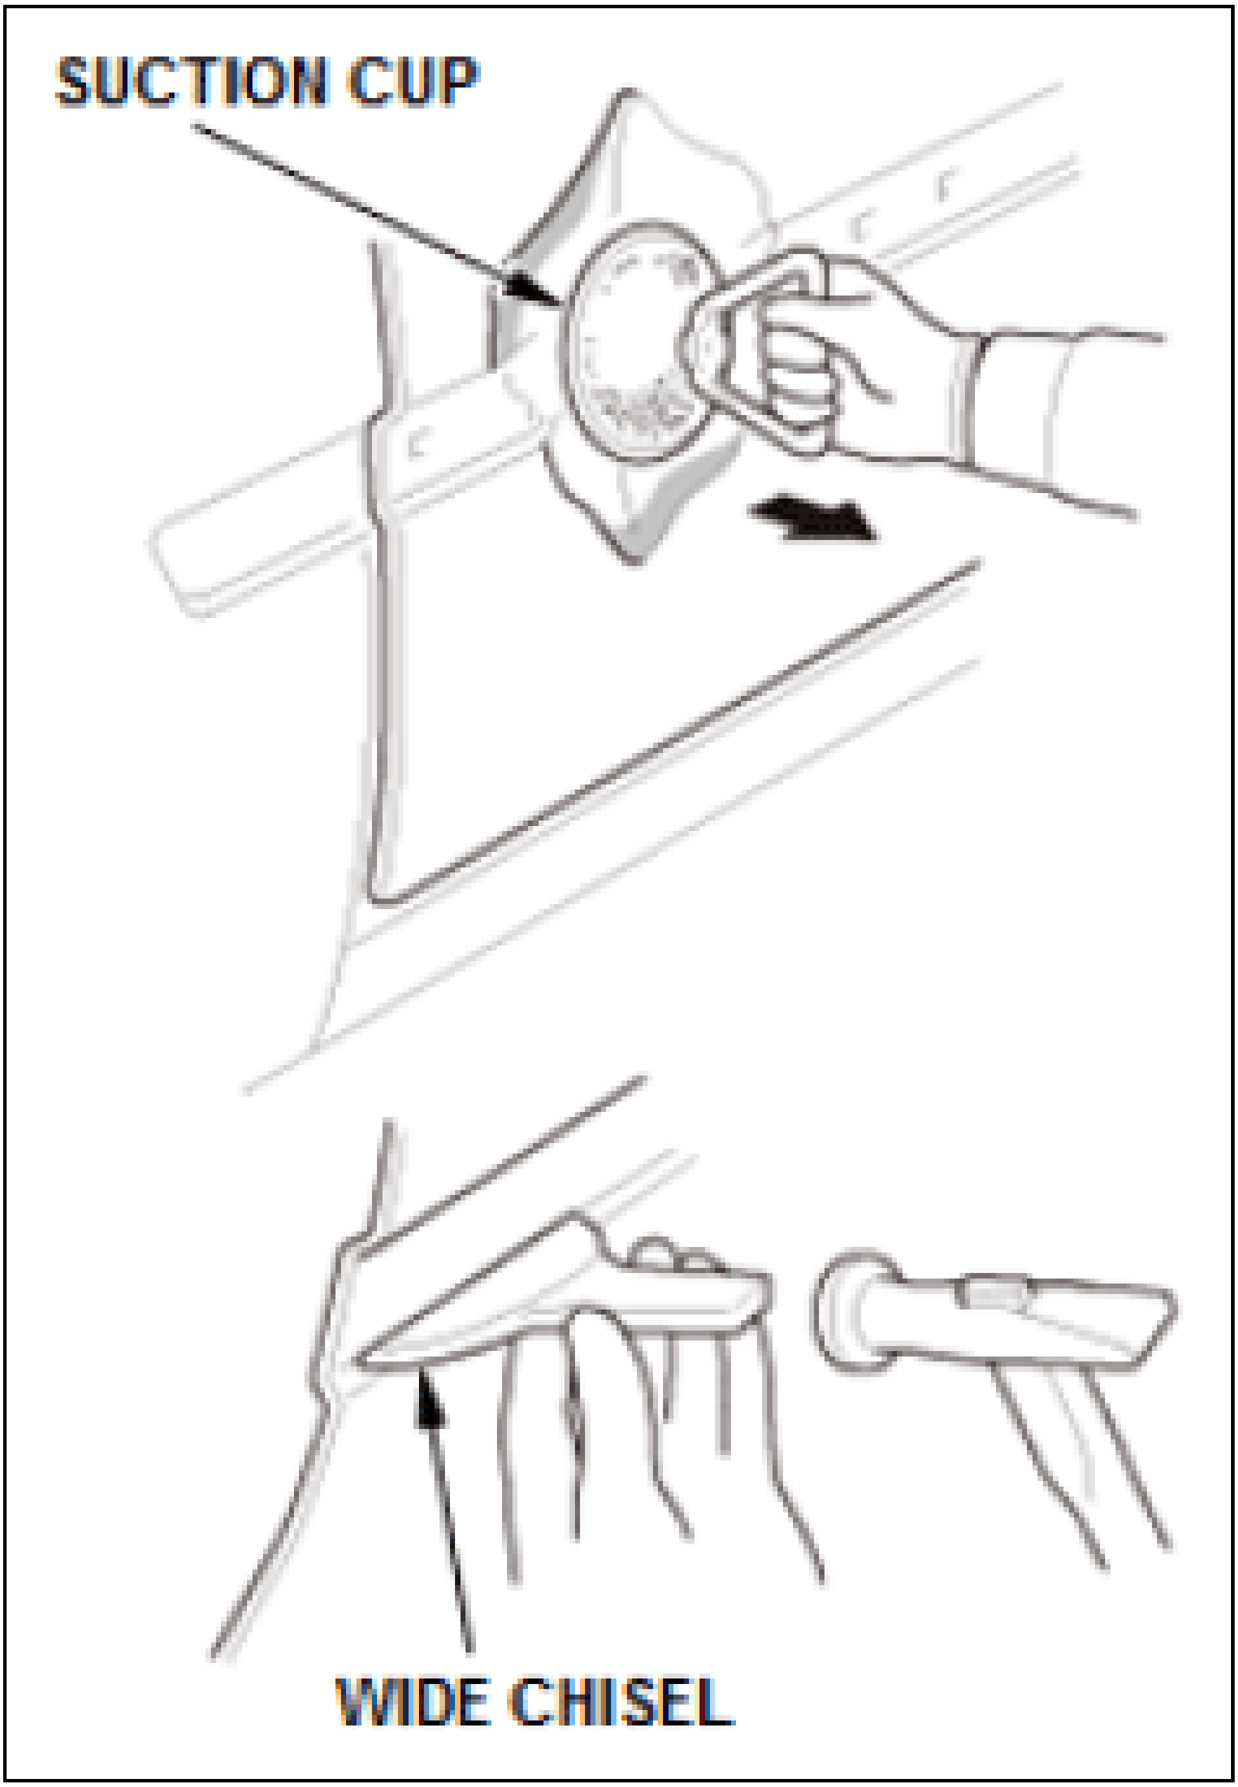
Repair Steps

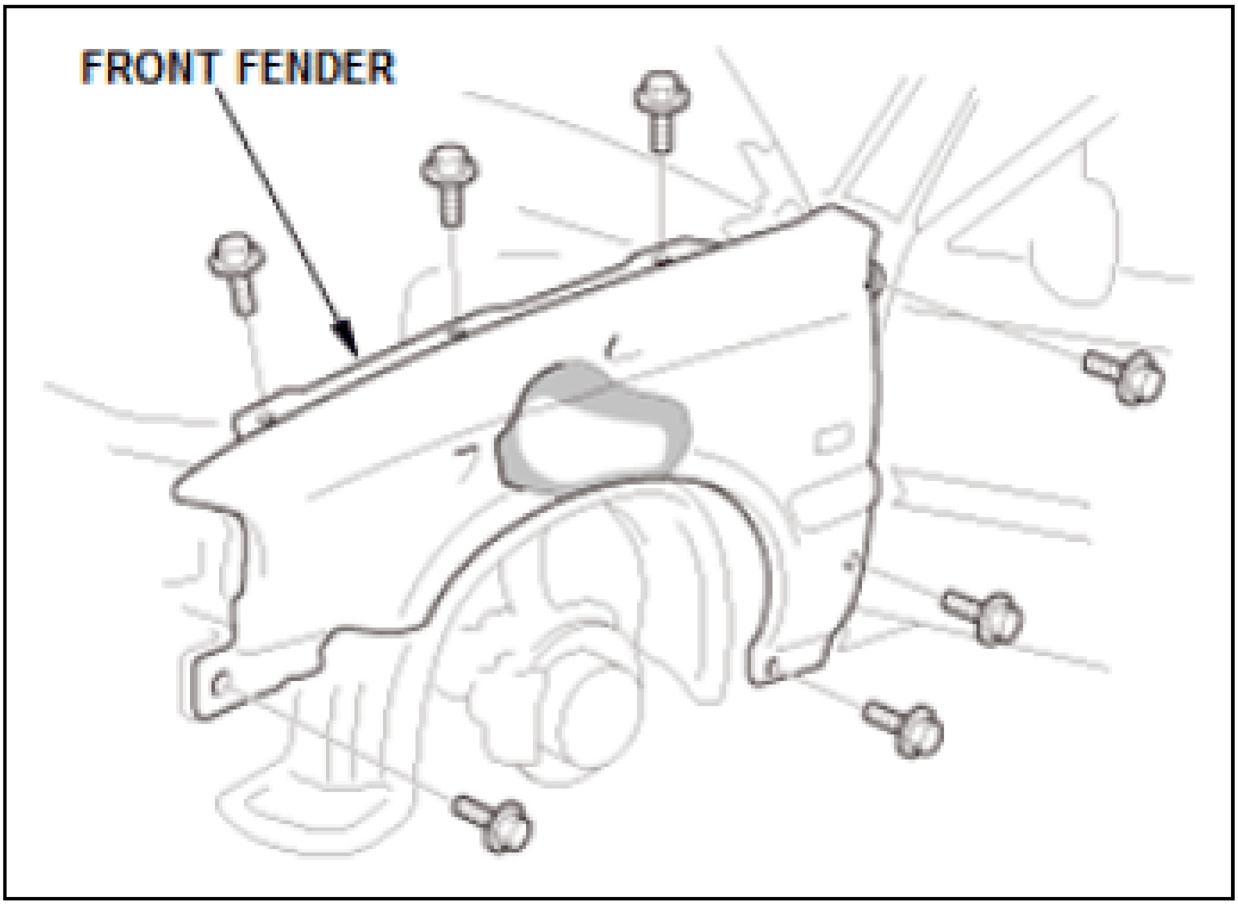
1. Confirm damaged area:
    - Before starting the repair work, make sure to confirm the deformation of the damaged area.
    - Use visual and feel inspection methods for minor body damage.
    - Some obvious damage only requires a visual inspection. Other damage is more difficult to spot and requires projected light to identify damage by reflection. For these types of damage, it is important to check the damaged areas from multiple angles.
    - Gently touch the damaged areas with your hands to judge the damage by feel. Wear cloth gloves or put a thin cloth between the surface and hand when touching to improve the sensitivity. Move your hands in m any directions for an accurate inspection.

    (Reference)

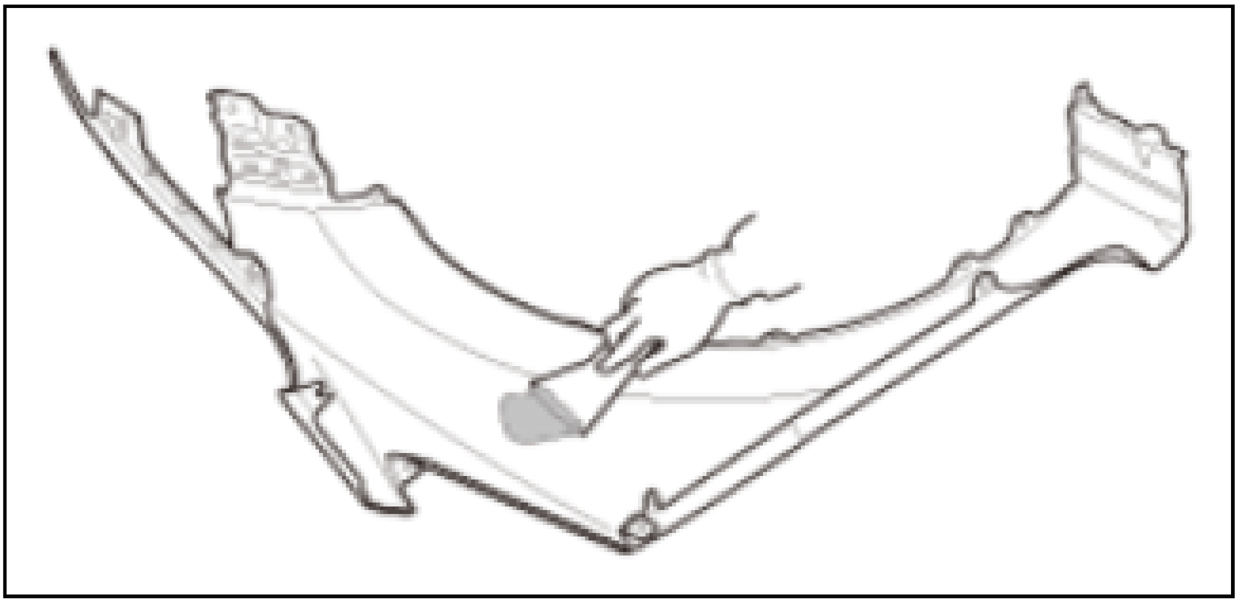
    Bent or swelled installed parts, such as a front fender, may sometimes be returned back to the original shape by removing their installation fasteners (bolts).



SUCTION CUP
WIDE CHISEL



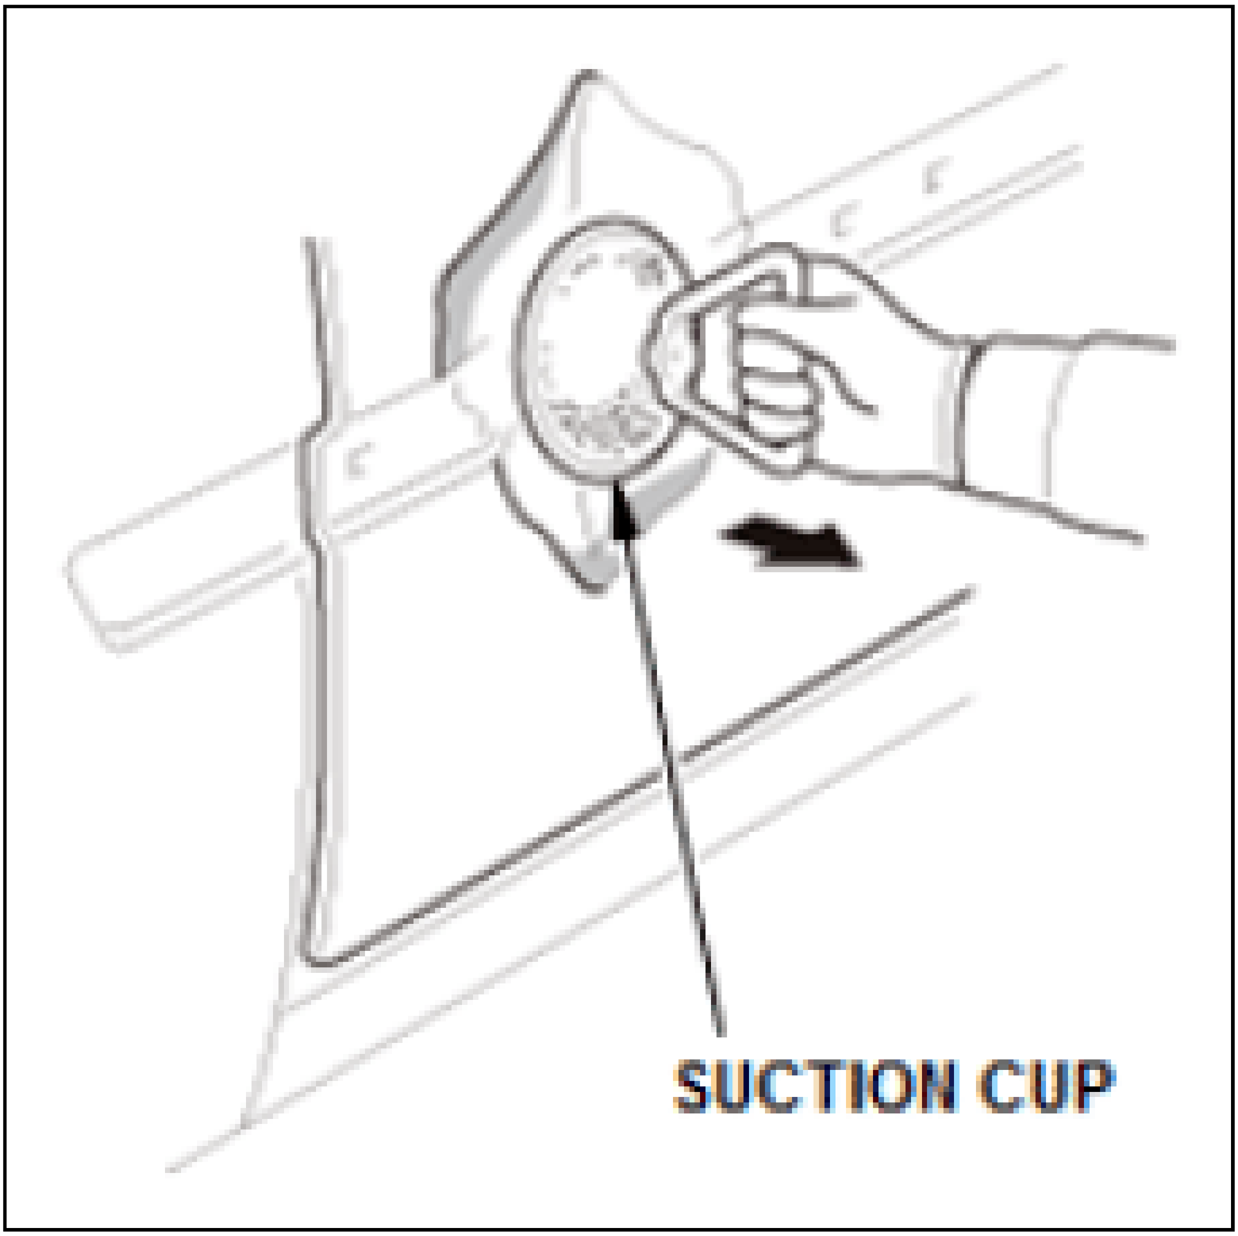
2. Remove foreign materials adhered to the backside of the panel Remove all the foreign materials such as undercoat, sealer, and clay adhered to the rear surface with a scraper etc. so that the dolly or spoon can directly contact the actual steel back surface.



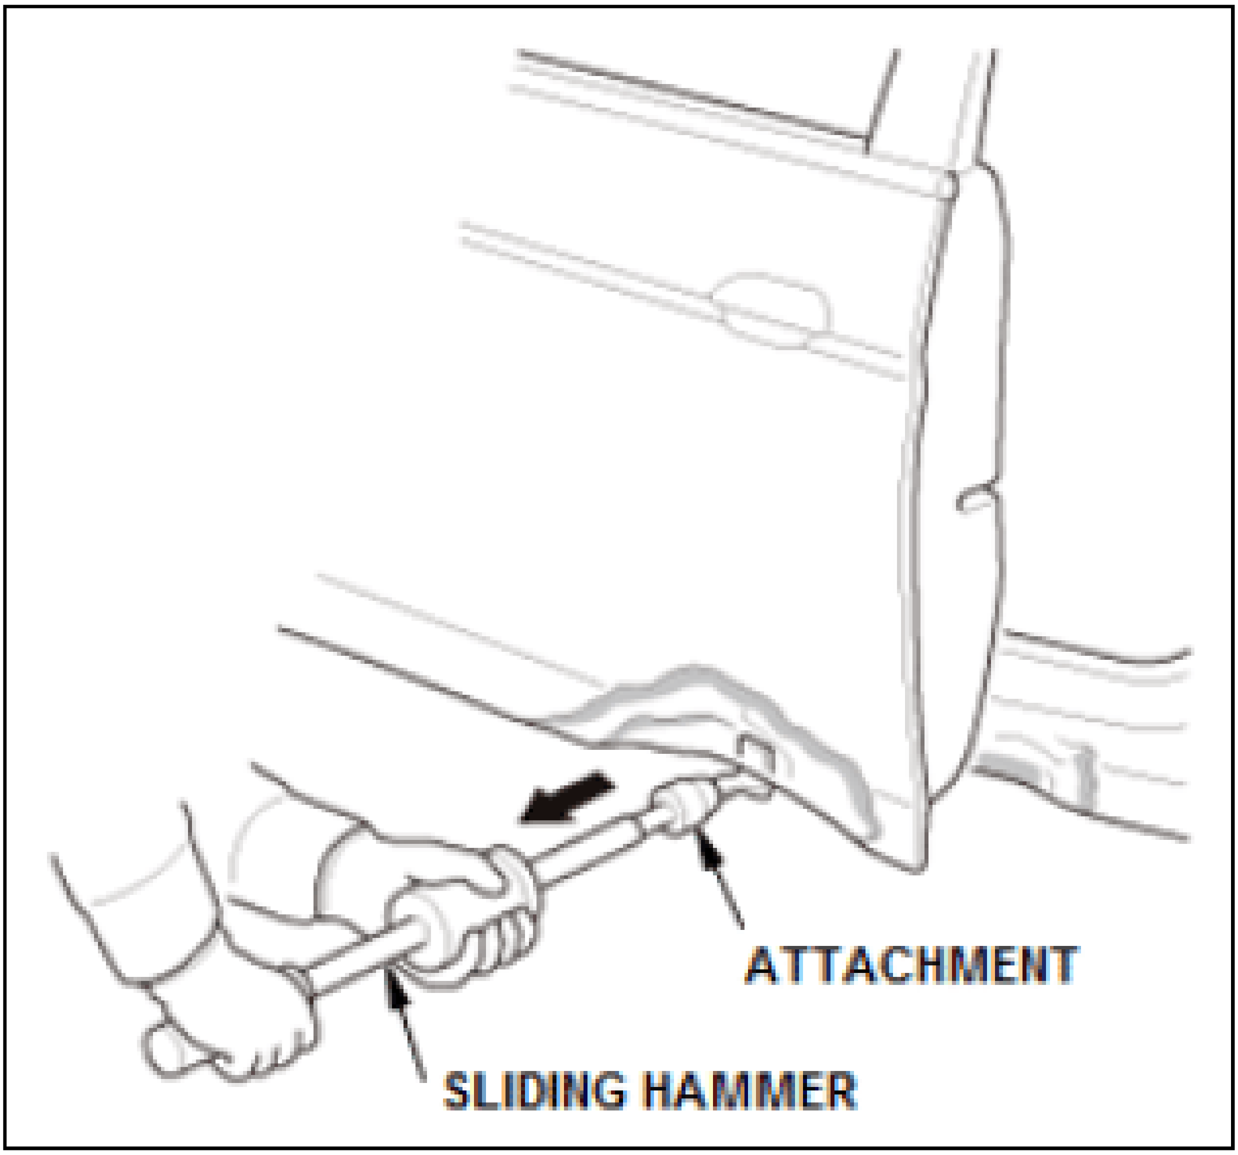
3. Rough panel correction

   Pull-out the damaged area using a body puller.

   Using the body puller with a variety of attachments, a variety of parts can be pulled-out.



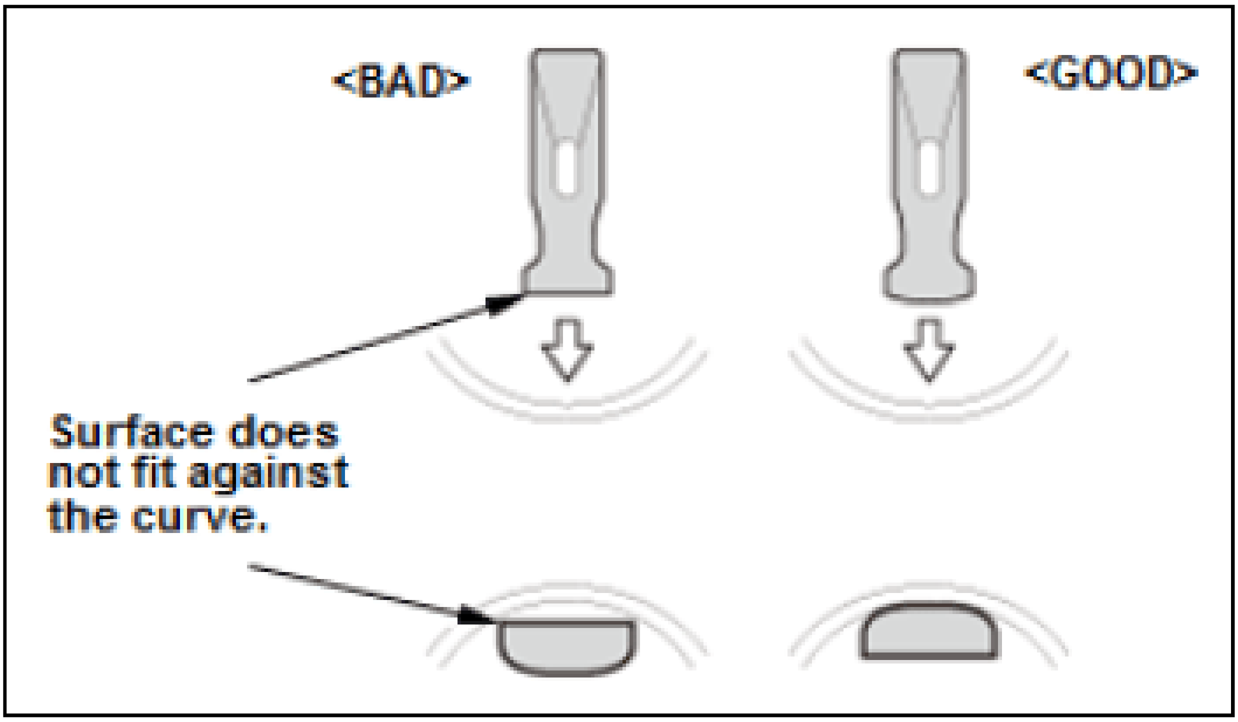
SUCTION CUP



4. Select hammers, dollies or spoons:
   - Select the most appropriate hammers, dollies, and spoons to the curves on the repaired panel.
   - If the curves of the damaged part of the panel do not perfectly fit to any of those of the dollies or spoons available, select dollies or spoons of which curves are smaller than those of the panel dam aged area.

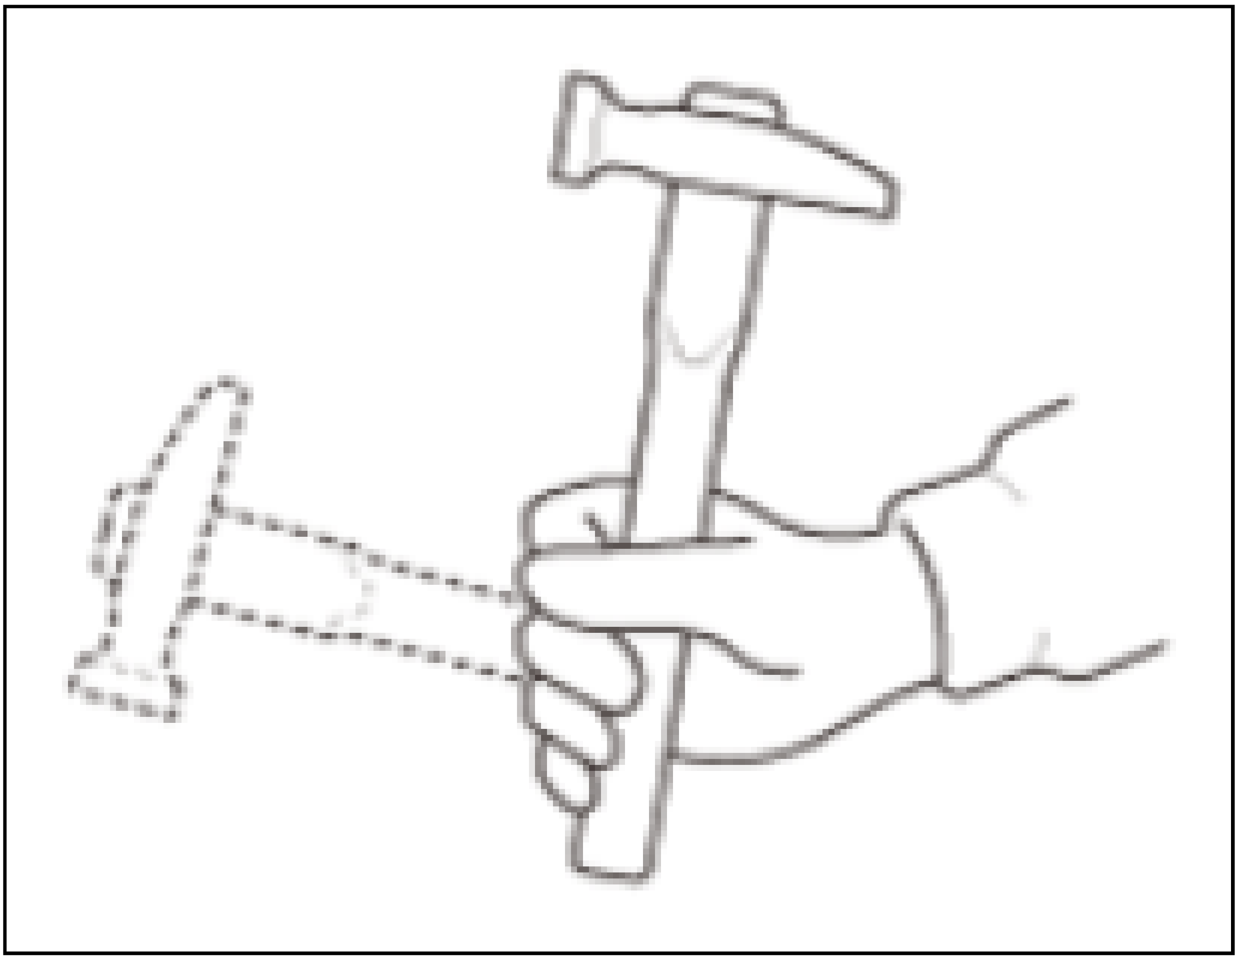
NOTE: **Make the surface of hammers, dollies and spoons are smooth so they don't cause any damage or scratching of the repaired surface.**

5. Hand contour repair using a hammer



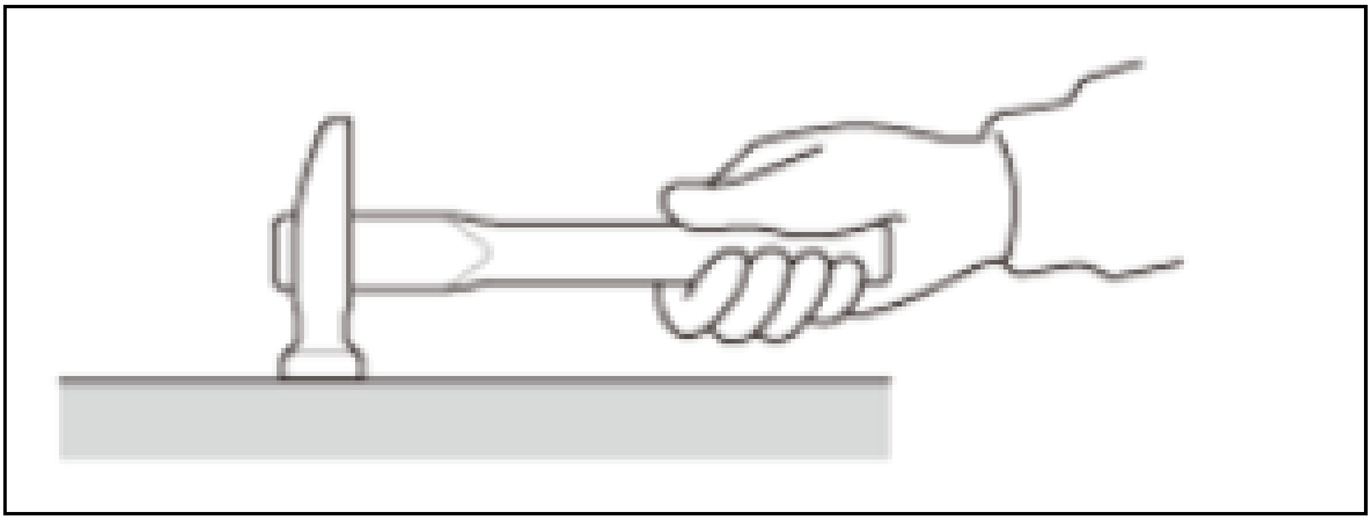
Hammer Technique

- Lightly hold the hammer near the end of the handle and swing it using your wrist.



- When striking with a hammer, the hammer face must always make flat and even contact with the panel surface.

NOTE: **When striking with a hammer, the hammer face must always make flat and even contact with the panel surface. If the edge of the hammer face contacts the surface, a crescent shaped mark or dent will be left on the panel that is very difficult to remove. Do not use too much force. Strike the panel as if you were bouncing the hammer. If the panel is struck with too much force, it will be elongated and require shrinking (drawing) work later.**



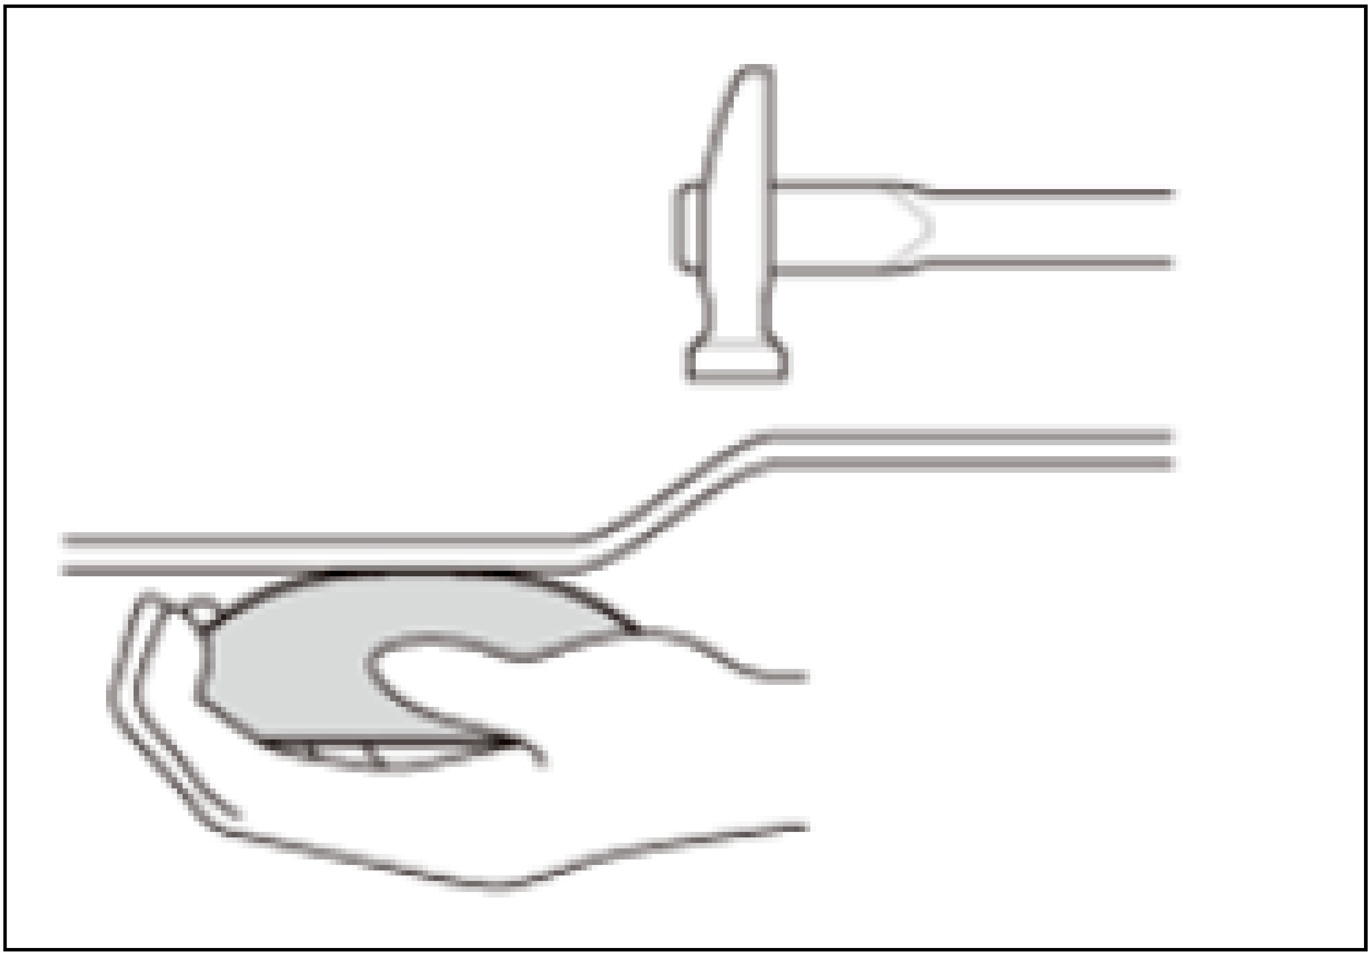
Hammering Off Dolly And Hammering On Dolly

Hammer off dolly

- Hammering off dolly is used to correct comparatively large unevenness. The recess is stricken out with a dolly. Hold the dolly right beneath the depressed area and strike the raised areas around it using the hammer.

  The raised areas will be gradually lowered by the hammer impact and the depressed area will be raised by the dolly contact, due to the reaction of the hammer impact.

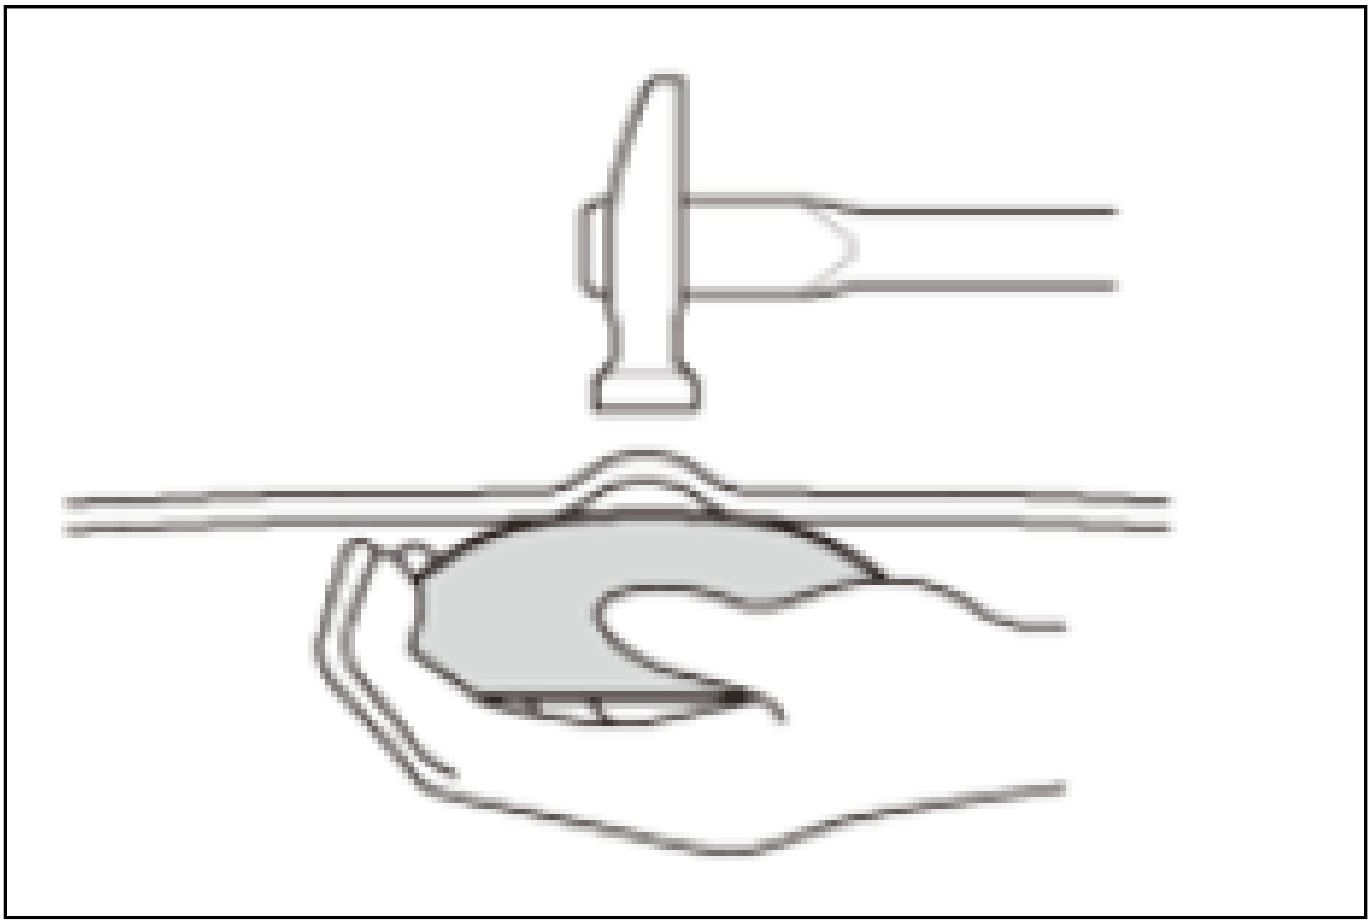
  It is very important to maintain a good balance between the hammer impact and holding force to keep the dolly in position.



Hammer on dolly

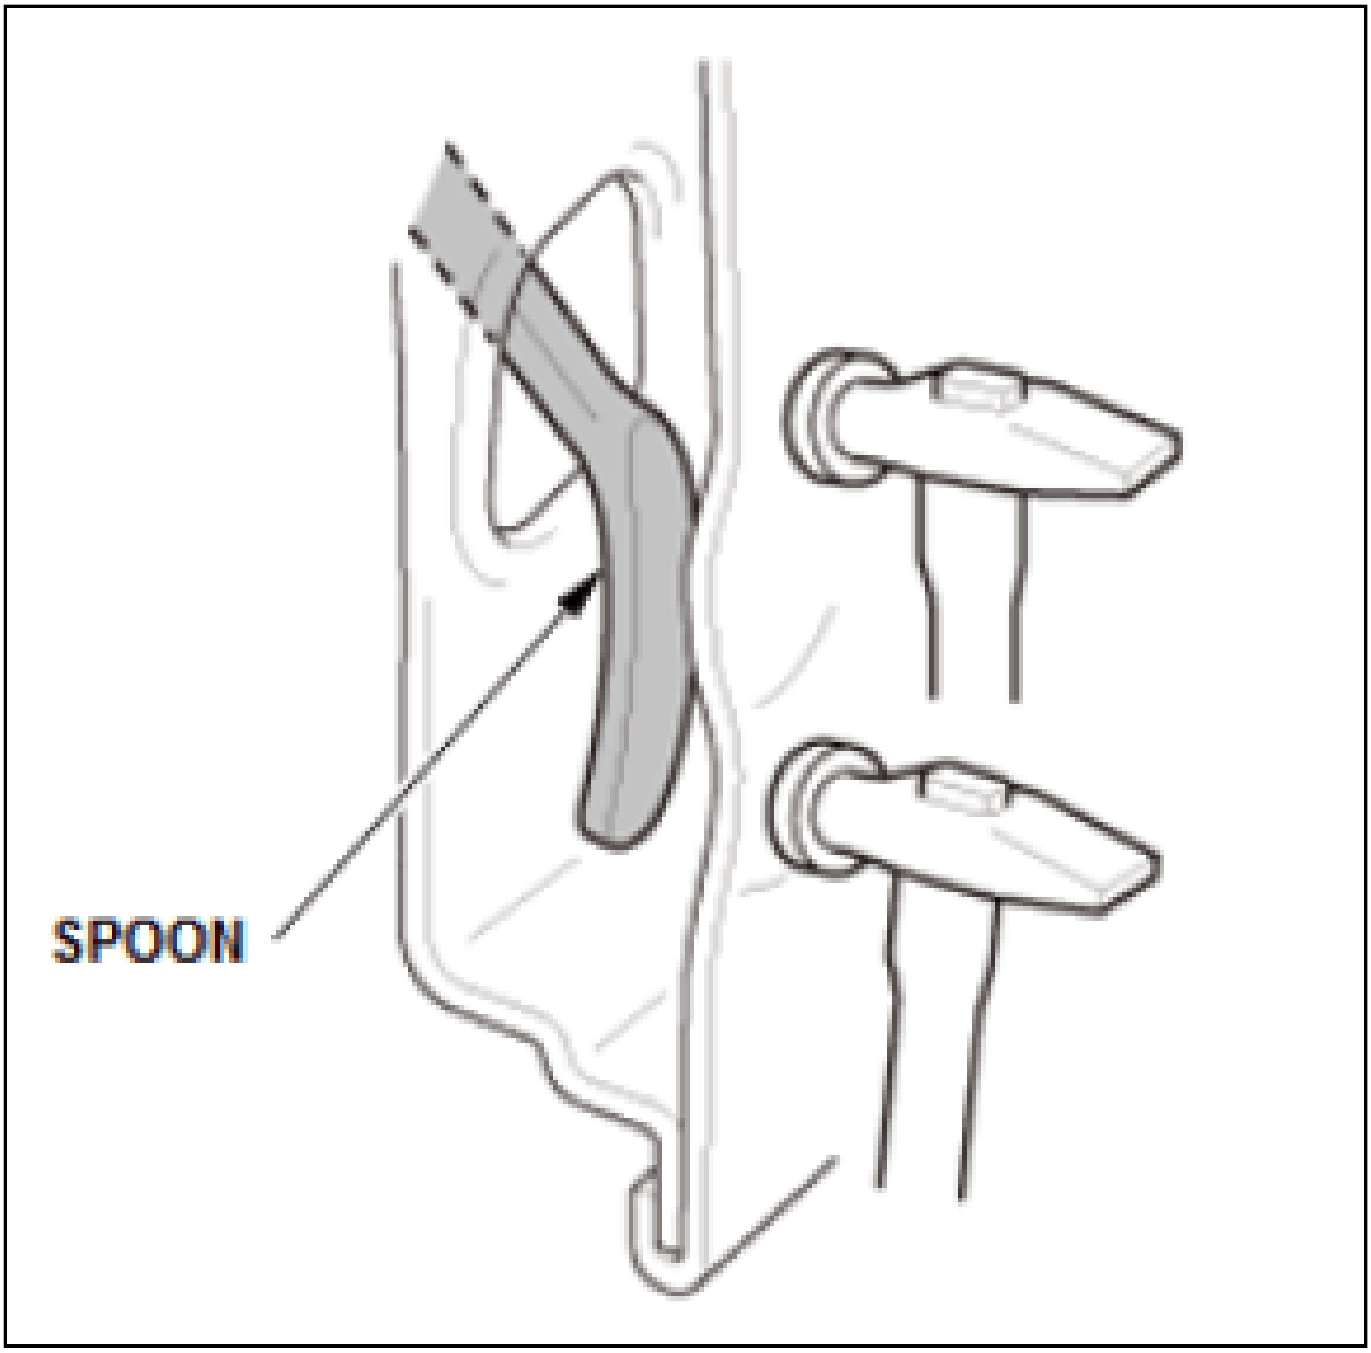
- Hammering on the dolly is used to correct small raised areas on the repair surface.

  Place the dolly directly under the raised area and strike the area from above with a hammer. While the hammer impact is flattening the raised area, the dolly rebounds due to the hammer impact. To completely flatten the area, repeat this work along the repaired panel surface while moving the hammer and dolly.



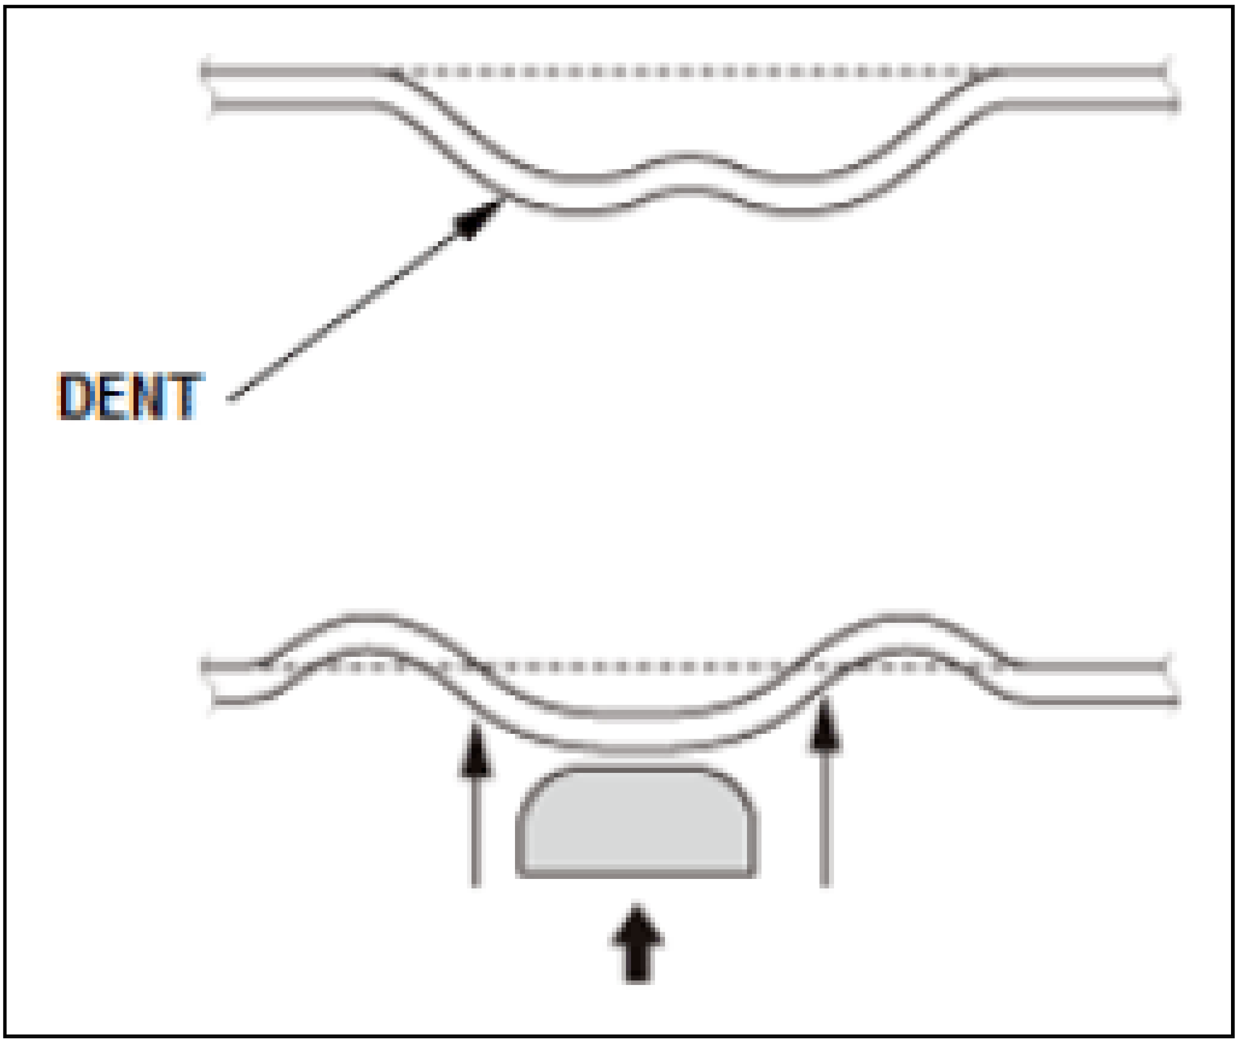
Using A Body Spoon (Example)

While pushing against the inside of the panel using a spoon, strike the outside of the panel with a hammer. Use this technique for difficult to access areas such as door panels, rear wheelhouse, etc.

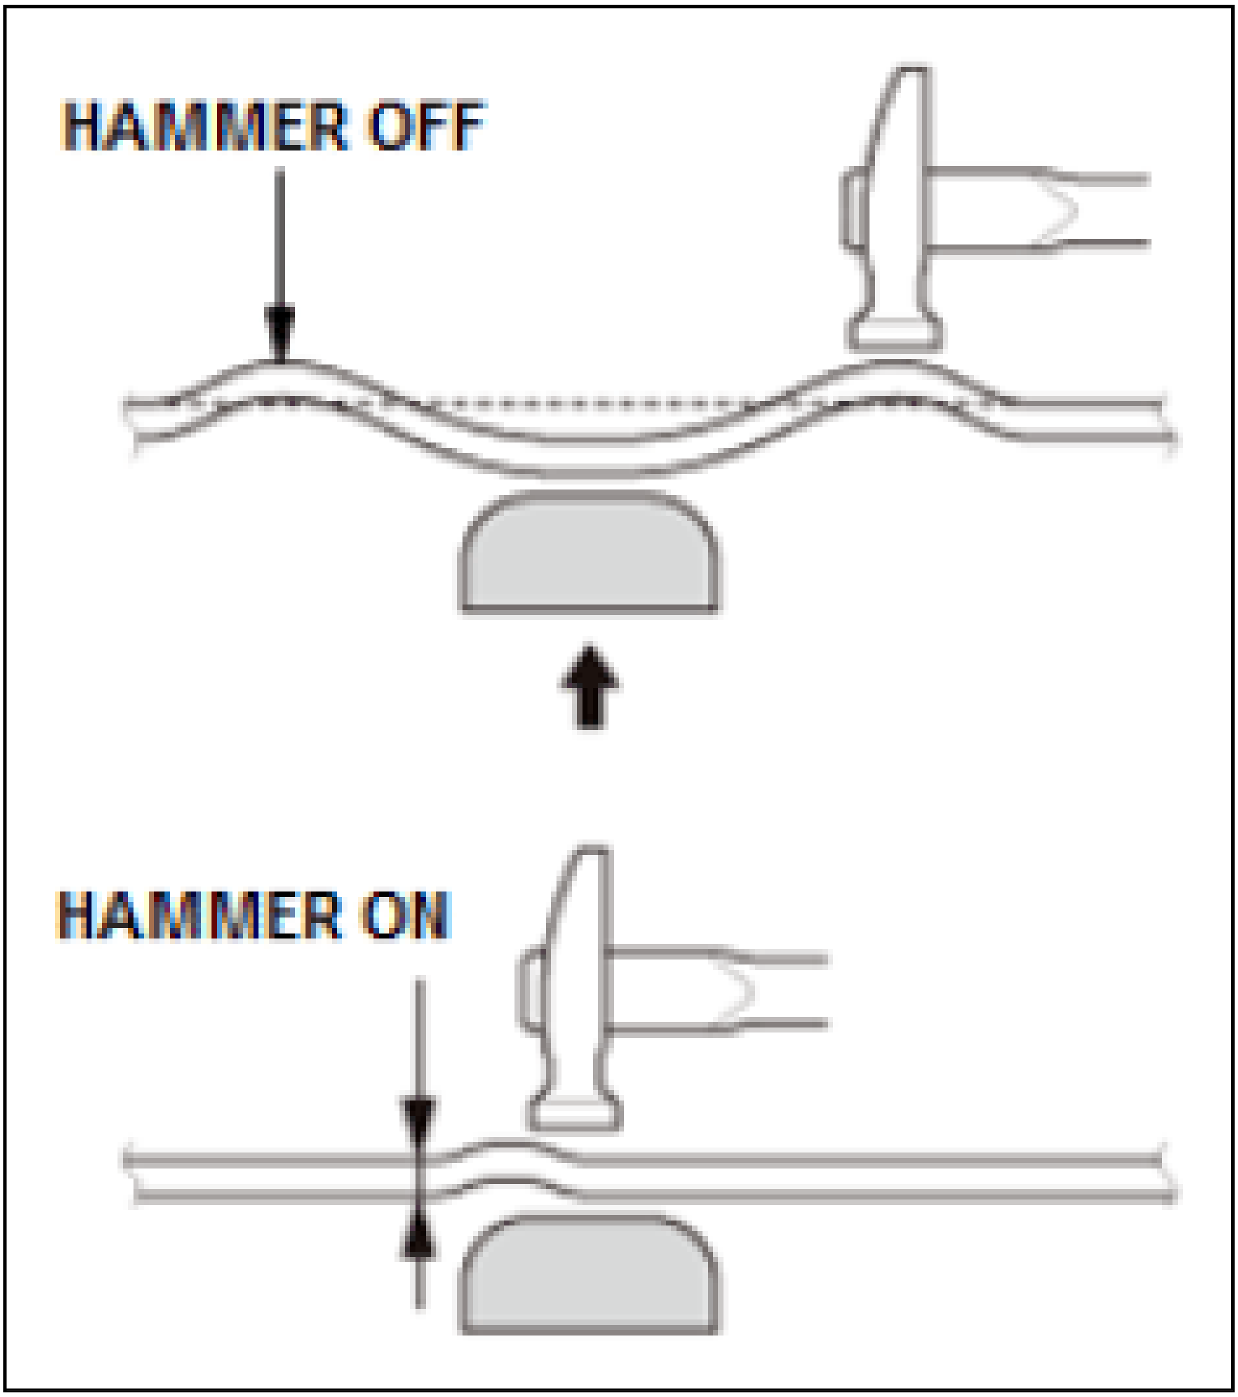


Deep Dents

1. Correct the depressed area of the part using a dolly from inside.

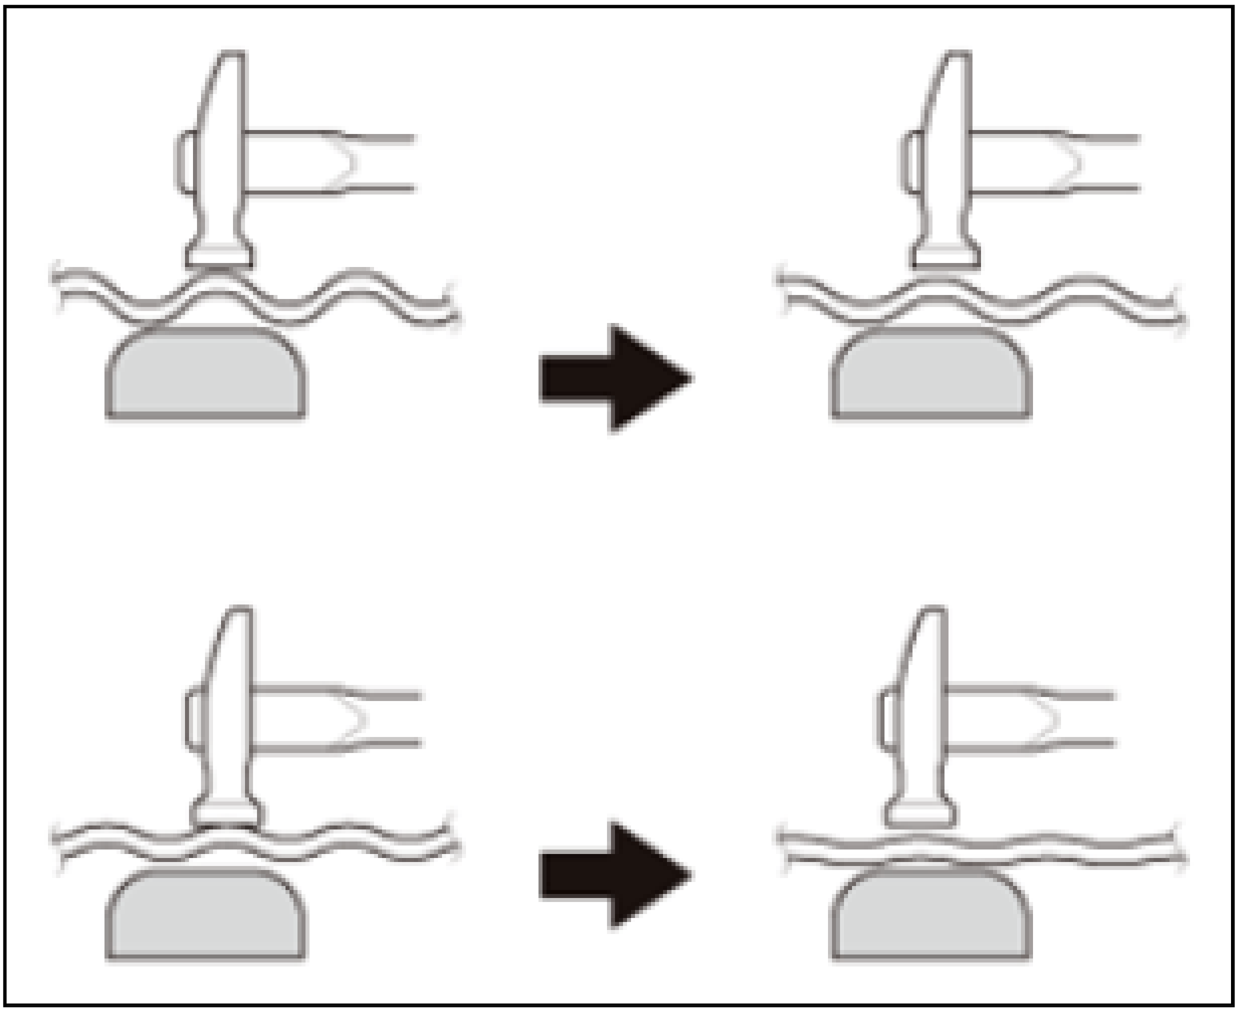


2. Flatten by alternately repeating hammer off dolly and on dolly techniques.

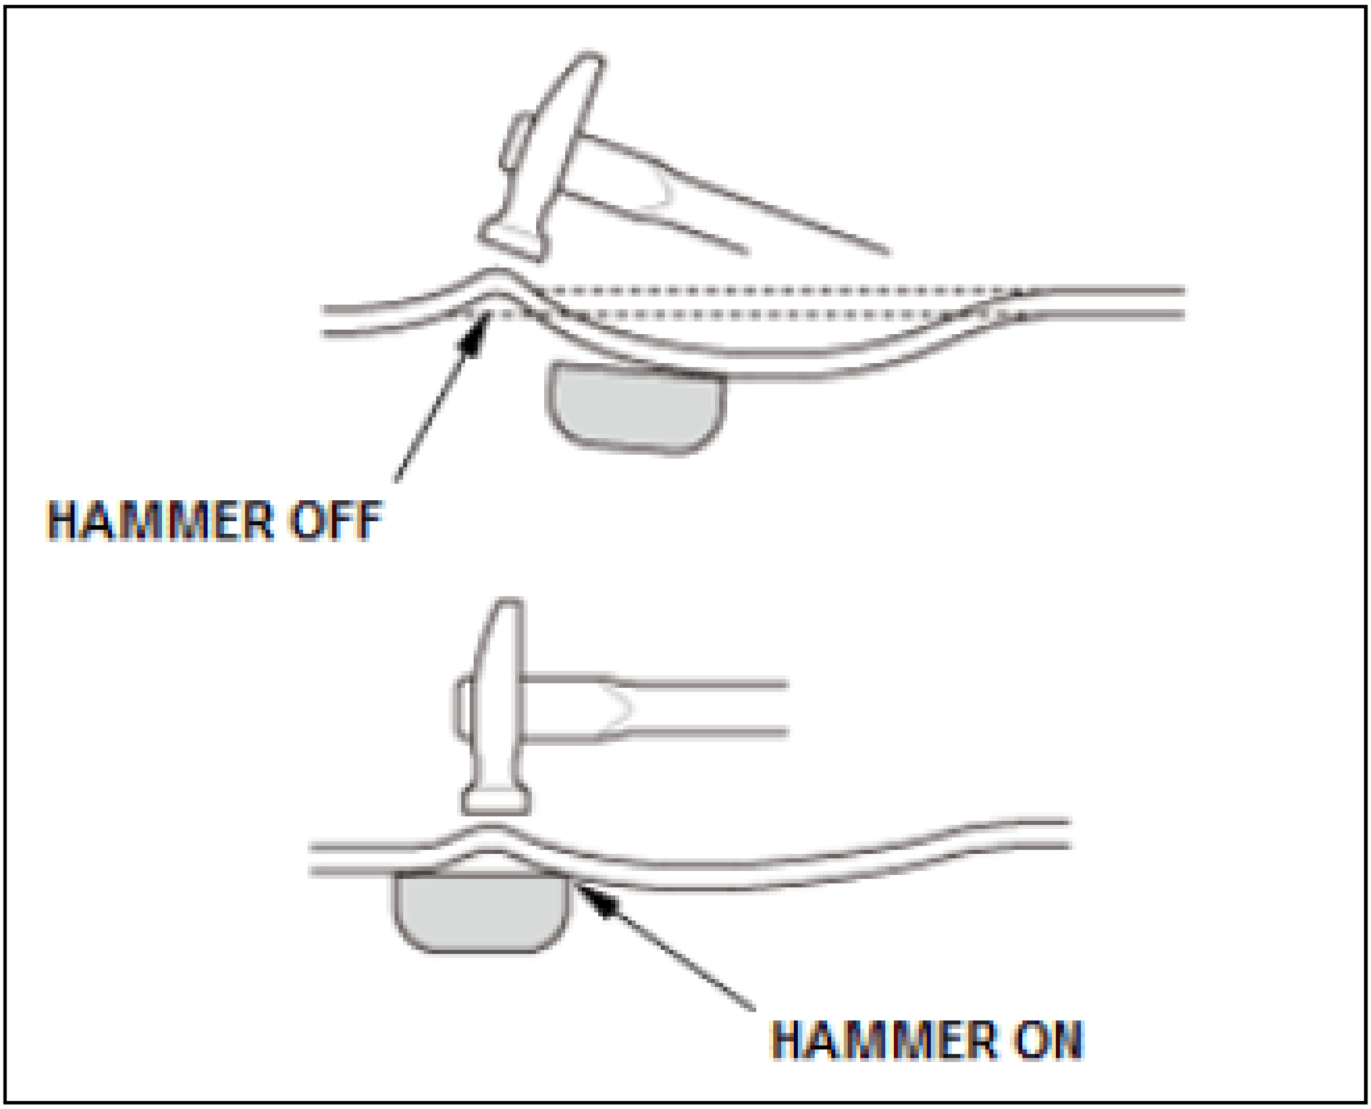


Continuous Small Deformation

1. Press the dolly against the rear of the depressed area and strike the raise area from above with a hammer.
2. Repeat the step above while moving the hammer and dolly together along the panel surface, repeat the work.

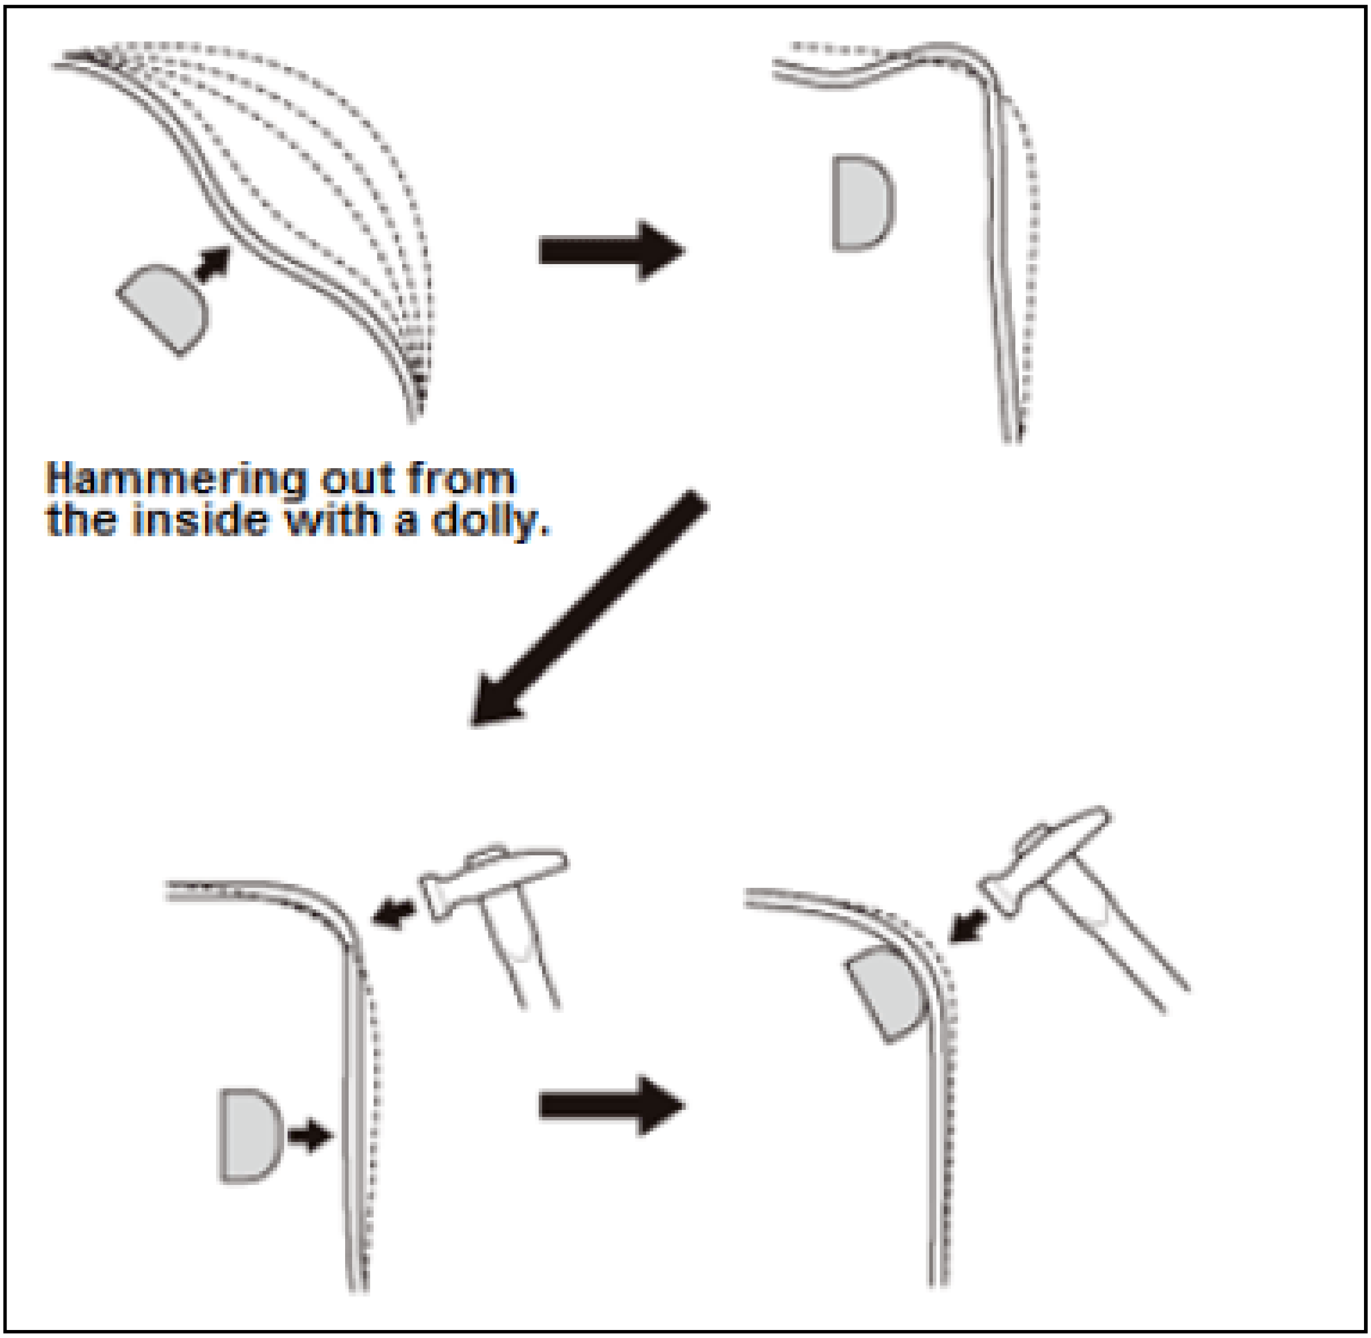


Partial Plastic Deformation



Deformation At Corner

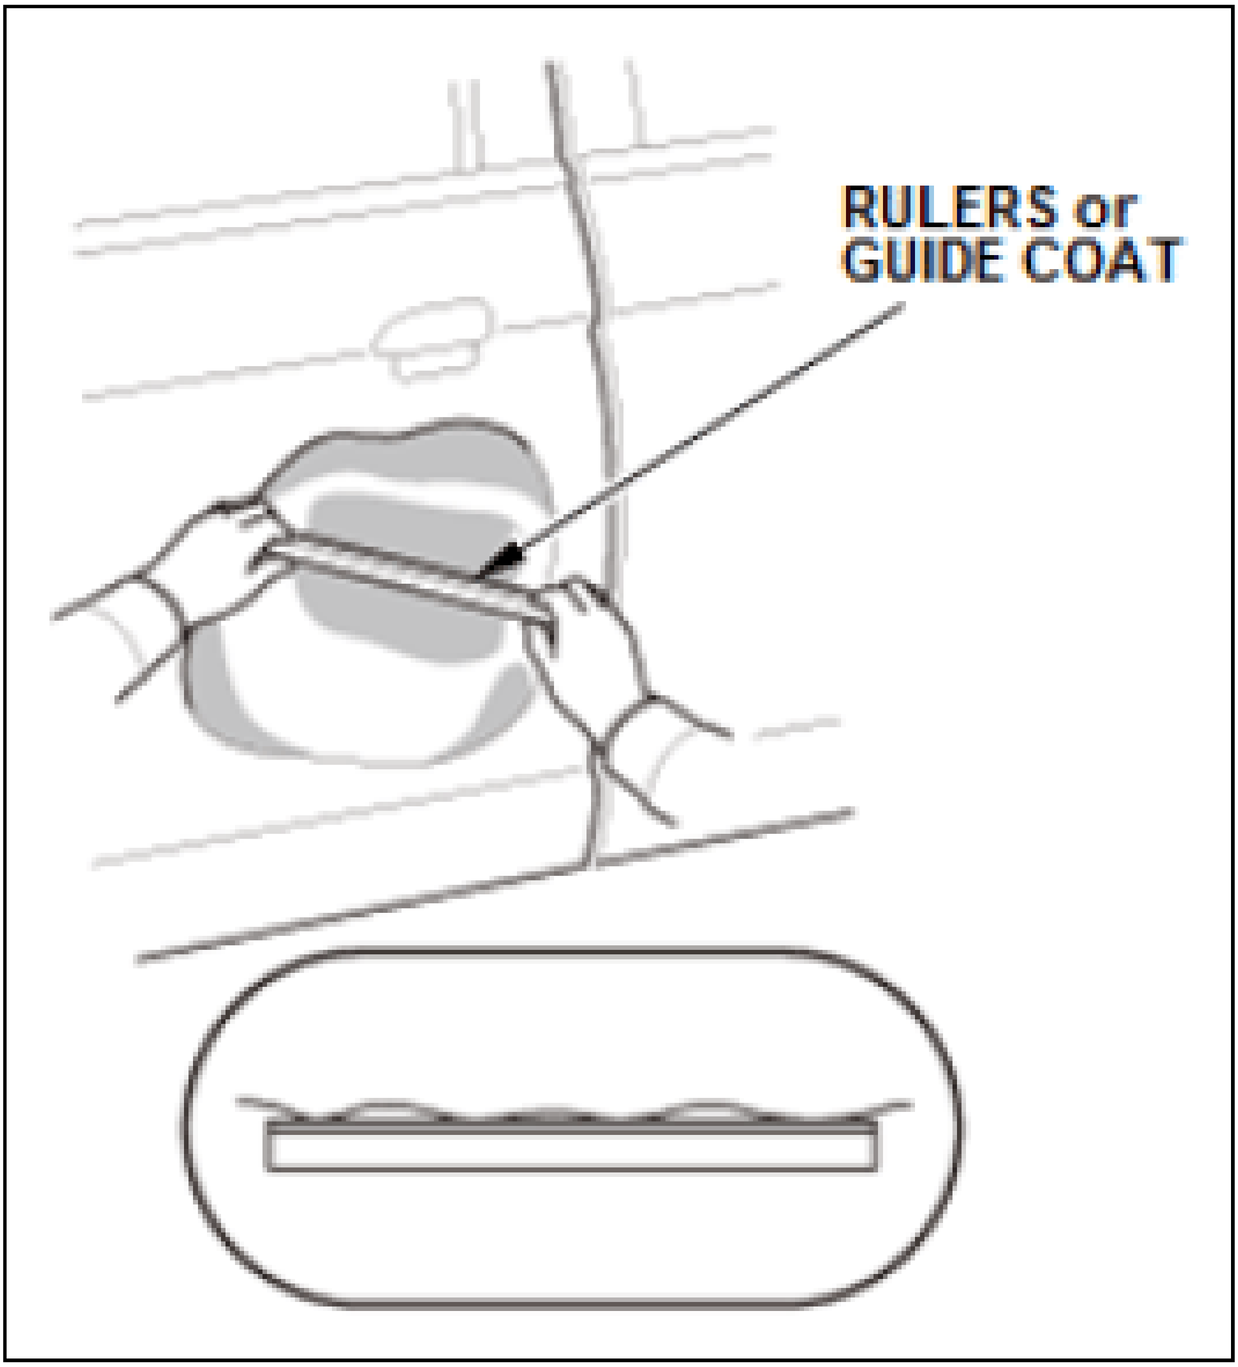
- Flat strike the uneven or depressed area with a dolly bring the surface back towards its original shape.
- A way to repair dents on a sharply curved area. Alternate using the hammer and dolly.



Hammering out from the inside with a dolly.

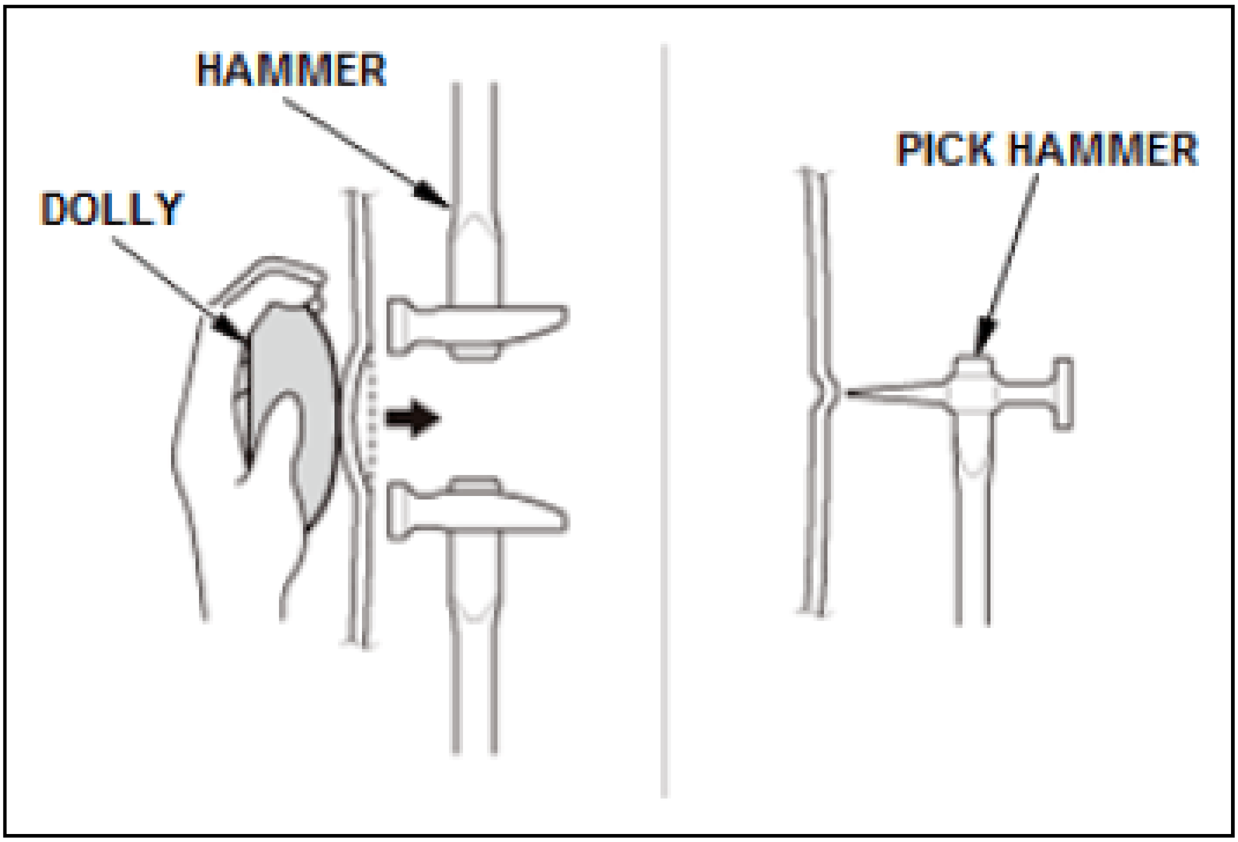
Inspection And Repair After Sheet Metal Work

1. Use hands, rulers or guide coat to check the contours of the repair area.



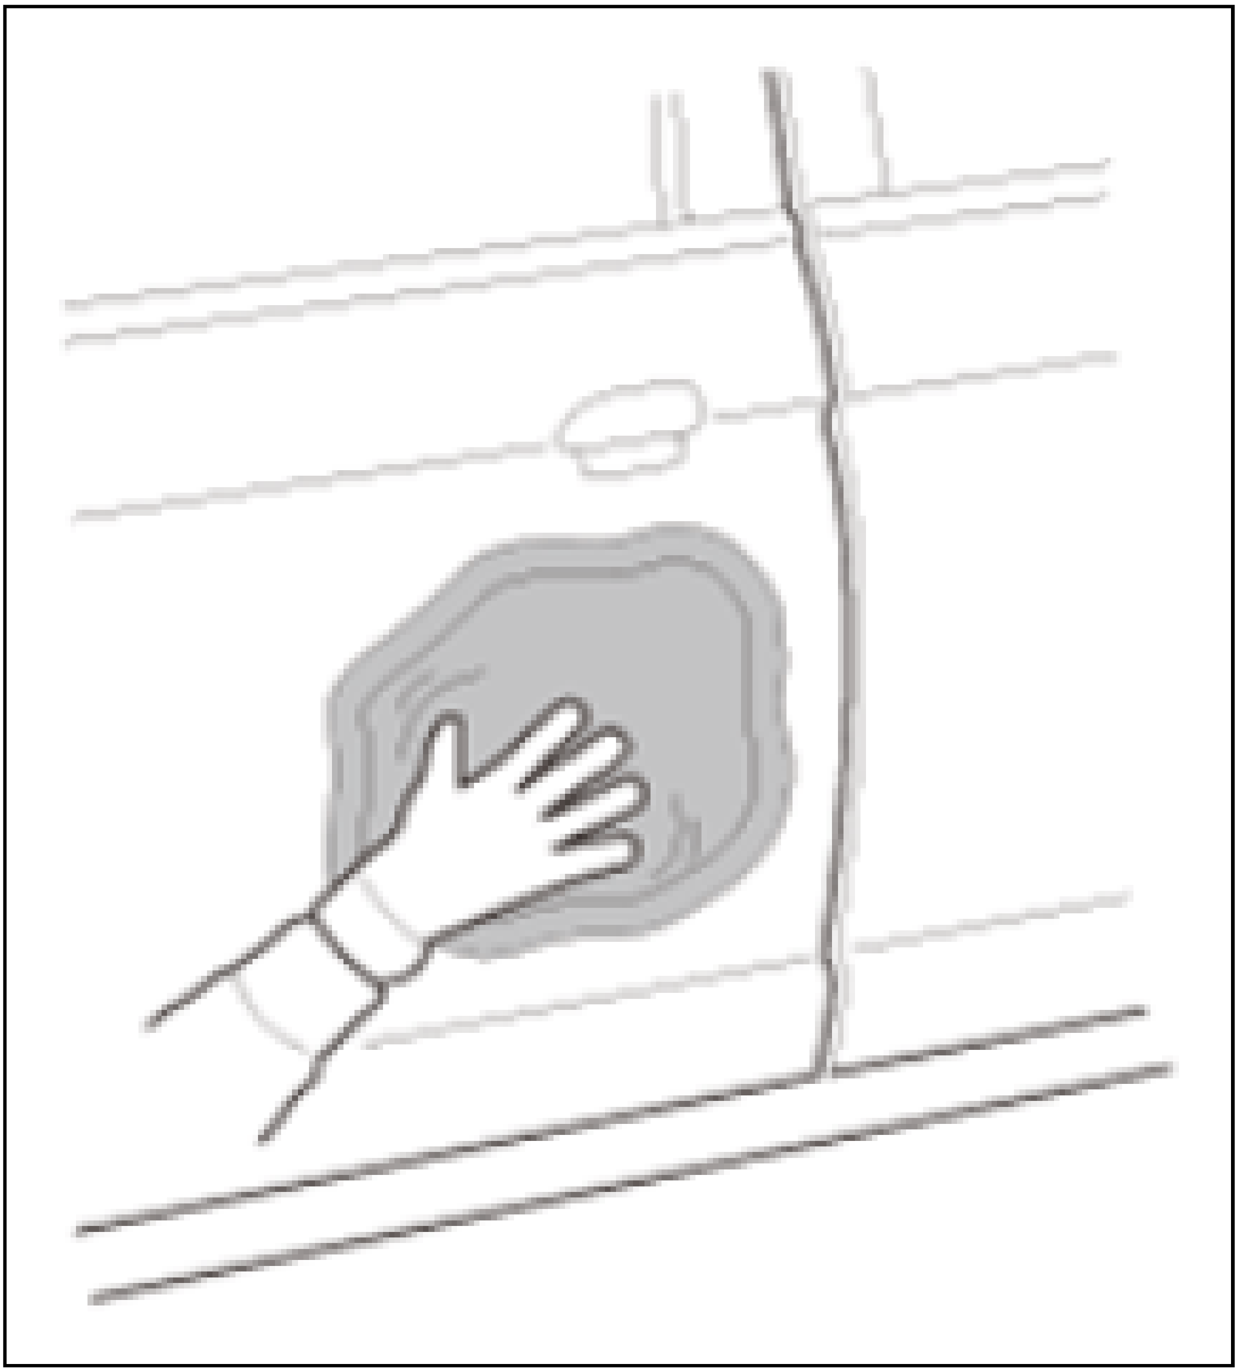
RULERS or
GUIDE COAT

2. If the repaired area will requires excessive body filler, raise the depressed area using a hammer or dolly Correct high spots by lightly hitting them with a pick hammer.



HAMMER
DOLLY
PICK HAMMER

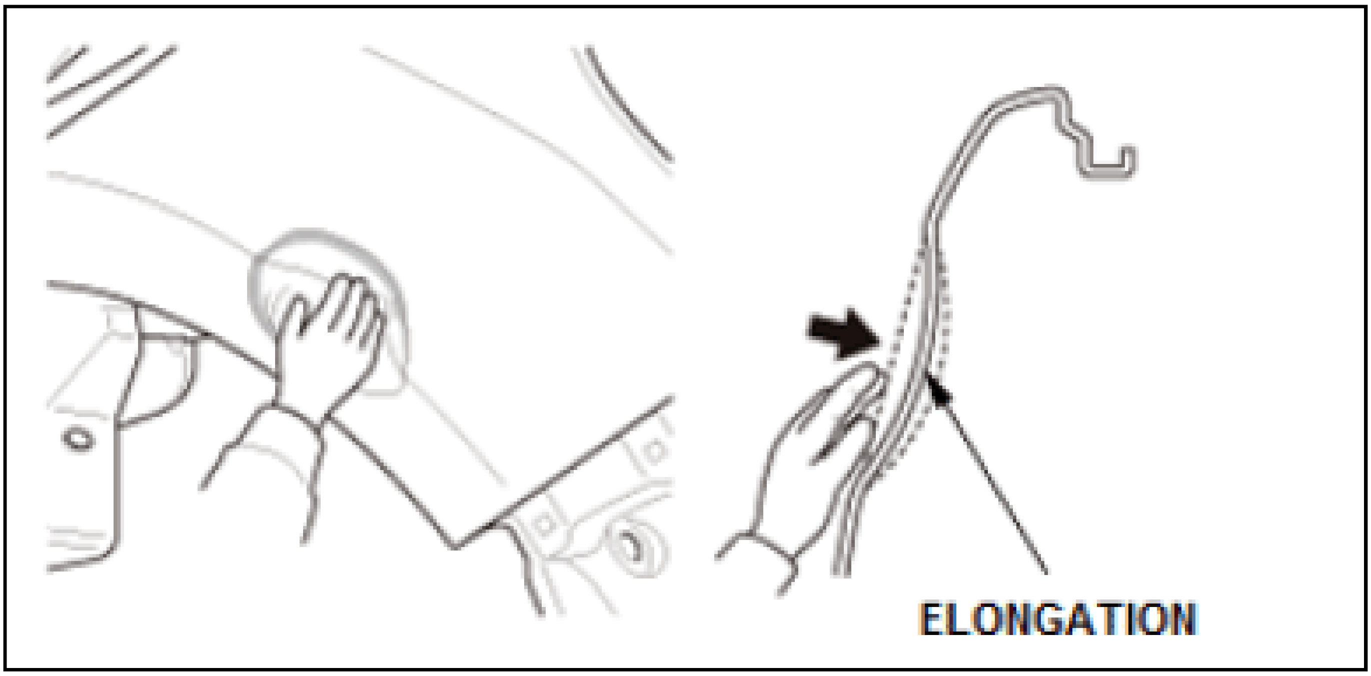
3. To inspect the final repair, use gloved hands. Touch the surface gently to check for any unevenness.



Shrinking (Drawing) Steel Sheet

If stress and unevenness remain after the panel repair, shrink the elongated area to their original shape.

The shrinking (drawing) process is possible by heating and cooling cycles, along with use of a hammer or dolly.



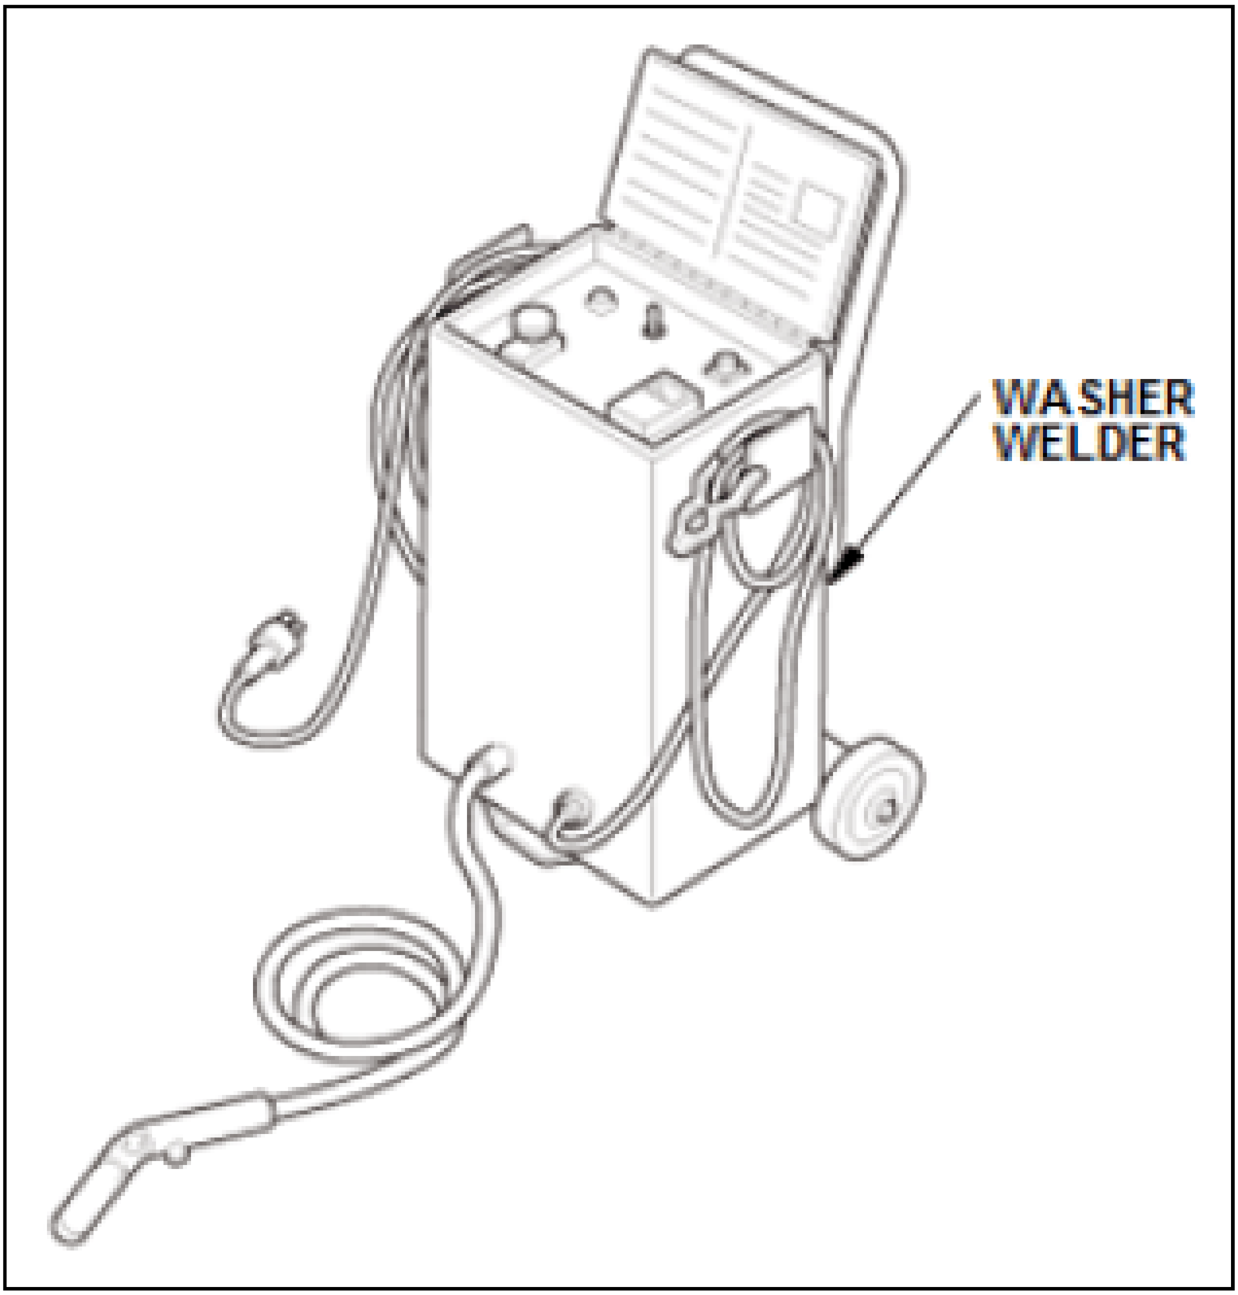
Shrinking By Heating And Cooling

If an area on the steel sheet is heated, that heated area expands. If heating is continued, elongation becomes constrained by the surrounding unheated area and further expansion becomes difficult. The surrounding area constrains and compresses the expansion. The expansion is contained to the vertical direction in the heated area. When this area is quickly cooled with water, the steel shrinks.

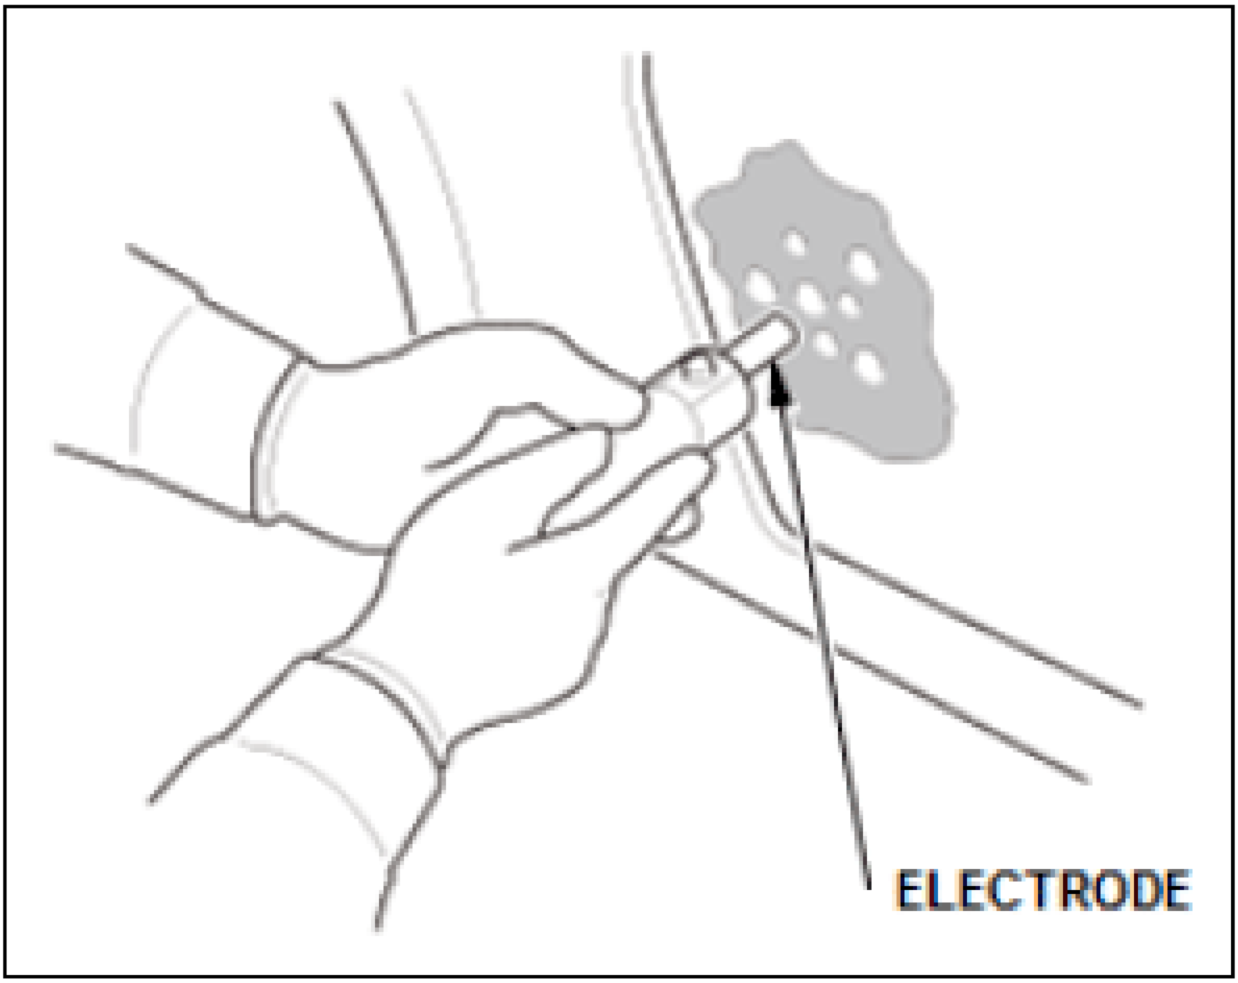
NOTE: **Do not use a torch for shrinking during actual collision repairs, because the heat is difficult to control.**

Drawing By Electric Resistance

- This method makes it possible to shrink panels from the outside when full access is difficult or requires additional disassembly.
- This method suitable for relatively wide and shallow damage repair.
- Replace the washer welder's electrode before use.

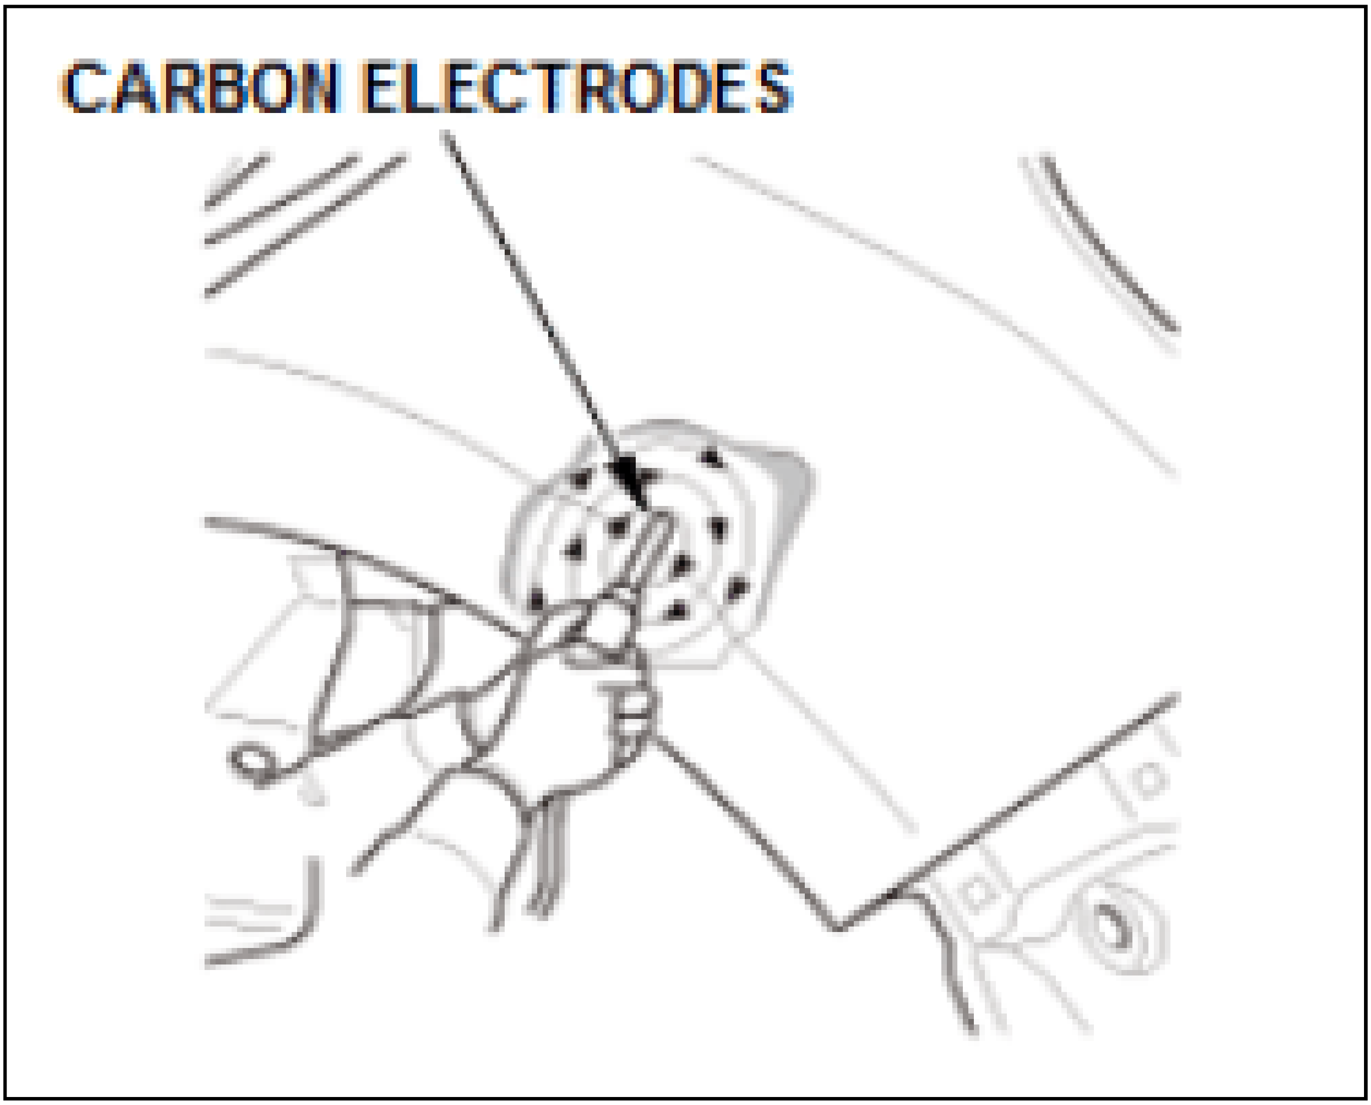


- Press the electrode against the center of the stressed area, and turn on the switch. Shrink by moving the electrode to heat from the center of the damage outward.
- Remove any warpage caused by the shrinking process by hitting lightly with a hammer and dolly.



- When a carbon electrode is used, heat the stressed area in a spiral pattern moving outside toward the center as illustrated. Then air cool the area.
- Remove any warpage caused by the shrinking process by hitting lightly with a hammer and dolly.

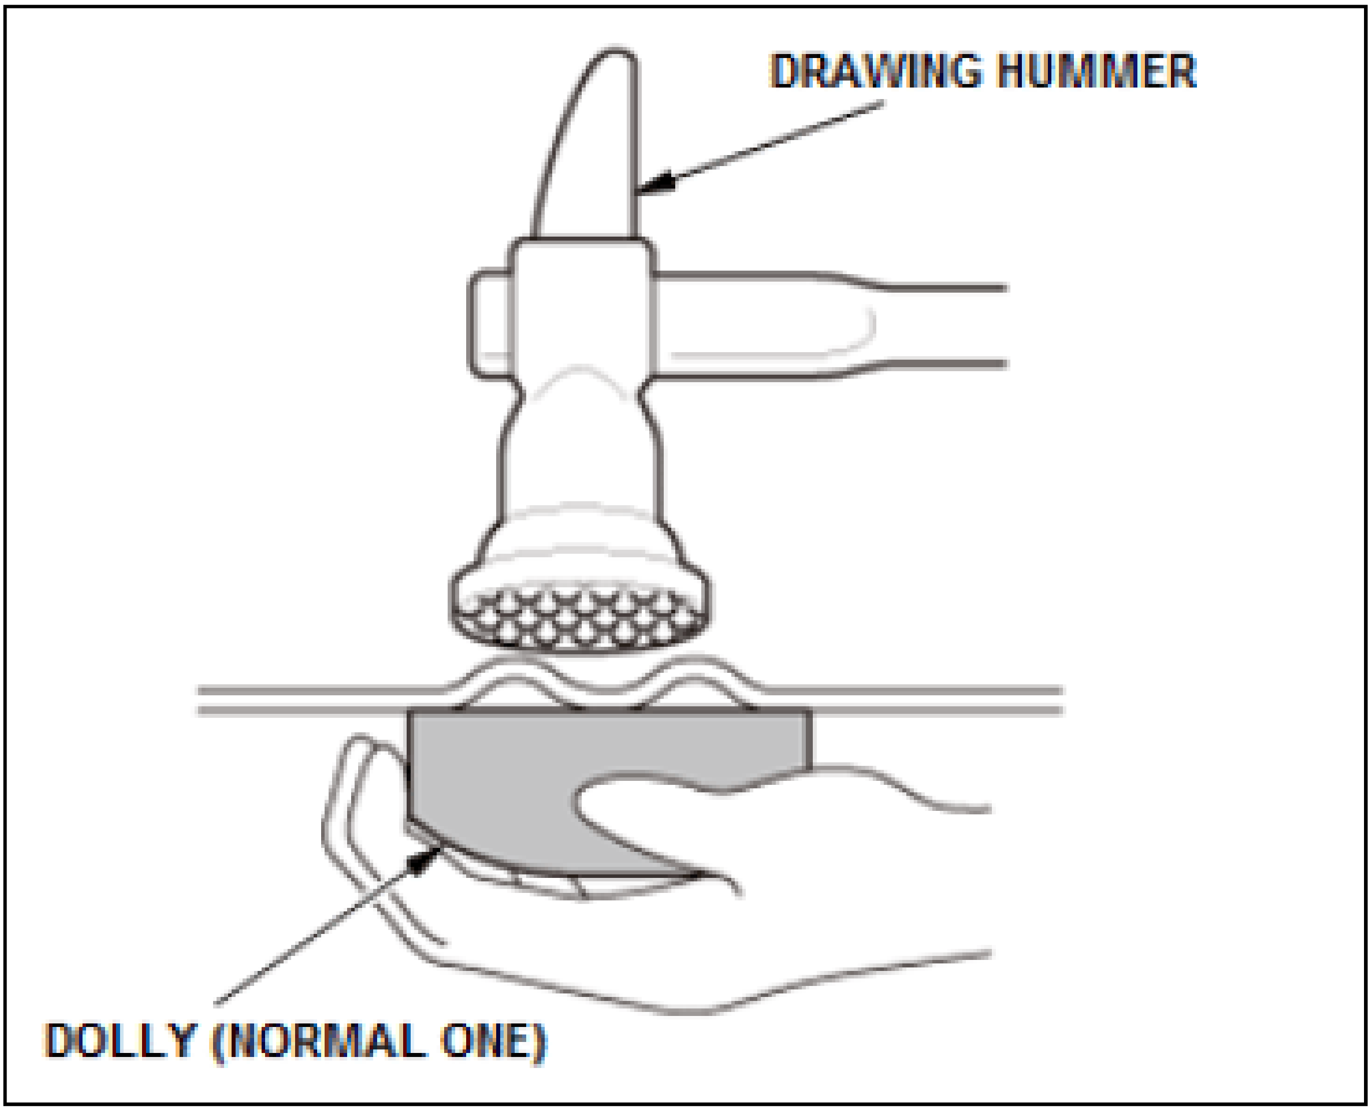
NOTE: **Flatten using light hammer force. If excessive force is applied, the shrunken area will be elongated again.**



Using A Shrinking Hammer And Dolly

- Using a hammer or dolly that has a grid of pyramidal projections on the striking surface, hit the damaged area. When the panel is hit, tiny expansions take place, but the panel shrinks as a whole.
- This method is used to repair rather small damage areas that don't require heating.

NOTE: **Do not use the shrinking hammer and dolly at the same time. If a shrinking hammer or dolly is used, the counter tool must be a non-shrinking type.**



Washer Welding Repair

- This repair method is used to repair recessed areas where the back side of the damaged cannot be easily accessed such as a door panel, pillar, side sill, or rear wheel arch.
- Because the heat generated while welding washers will damage the paint or anti-rust coating inside the panel, it is necessary to treat the area with anti-corrosion materials after the repair.
- A related repair method uses welded on studs instead of washers, but the processes are similar.

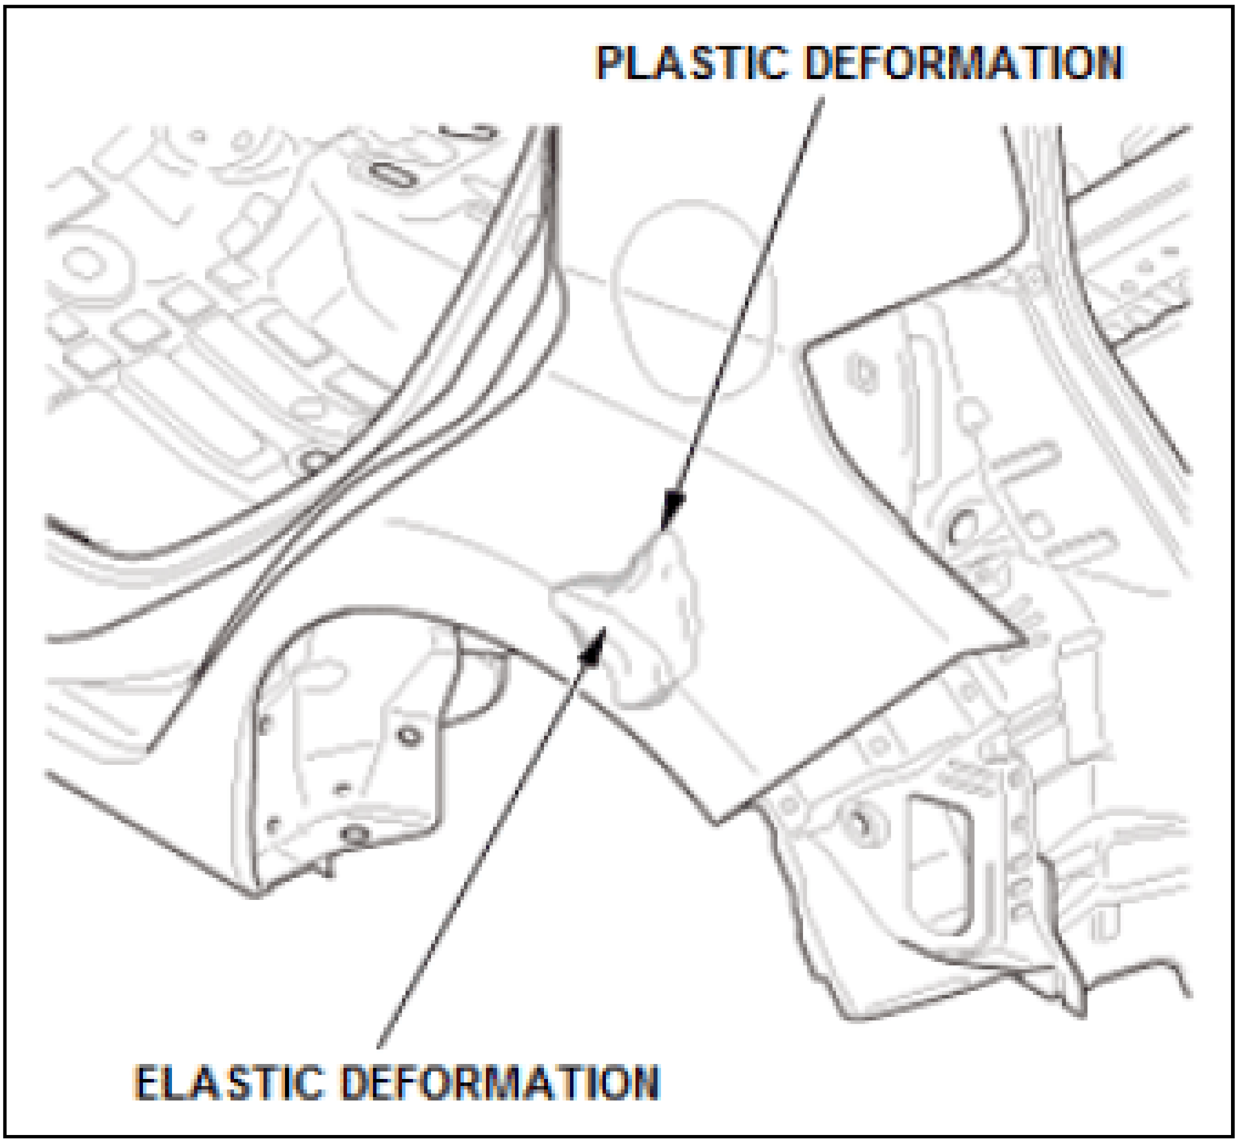
Repair Steps

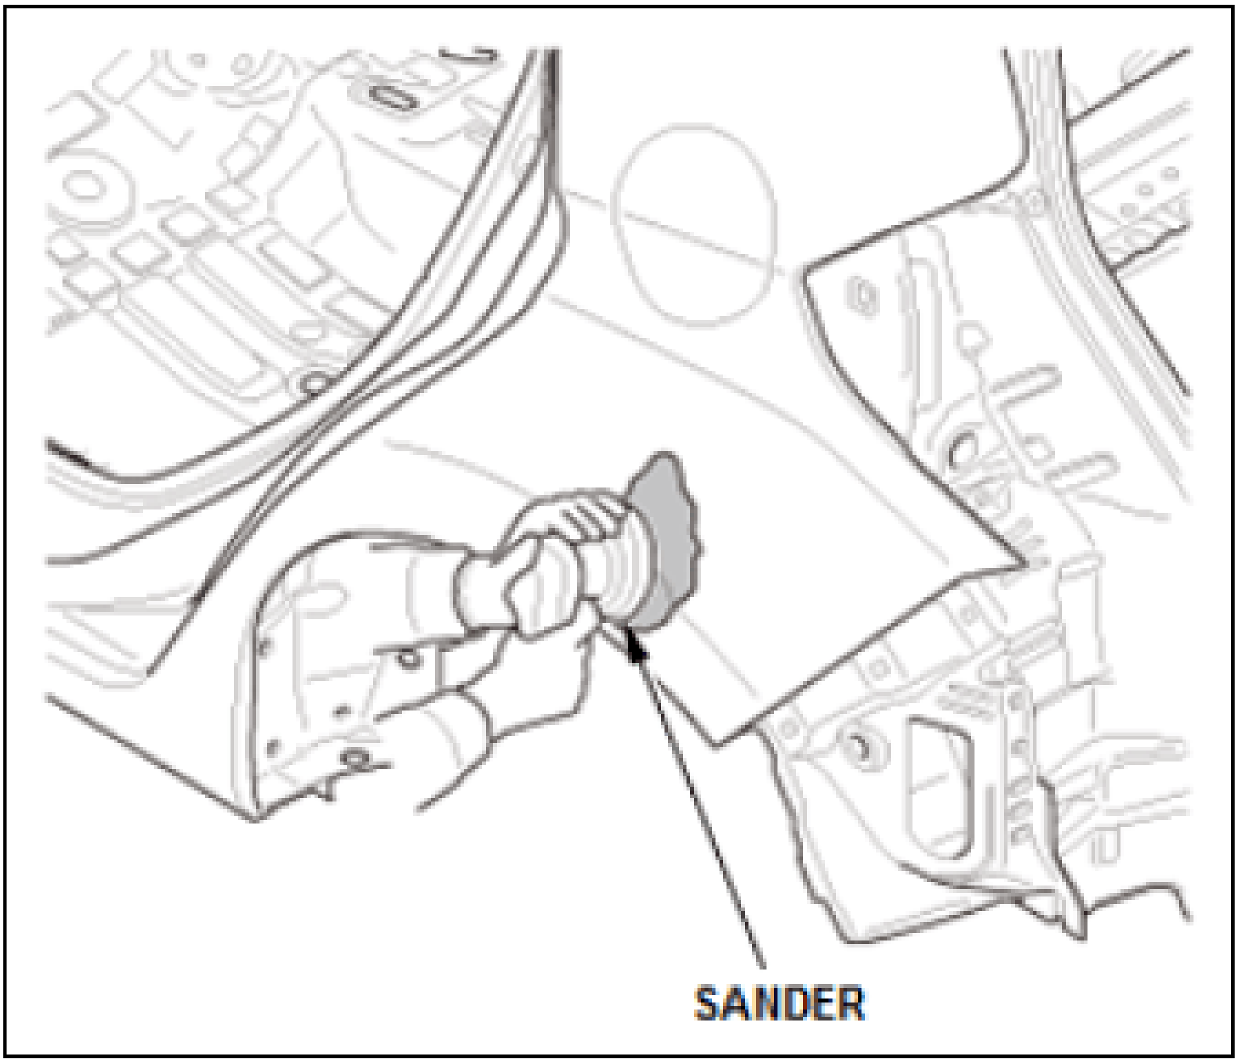
1. Confirm damaged area:
    - Before starting the repair work, make sure to confirm the deformation of the damaged area.
    - Use visual and feel inspection methods for minor body damage.
    - Some obvious damage only requires a visual inspection. Other damage is more difficult to spot and requires projected light to identify damage by reflection. For these types of damage, it is important to check the damaged areas from multiple angles.
    - Gently touch the damaged areas with your hands to judge the damage by feel. Wear cloth gloves or put a thin cloth between the surface and hand when touching to improve the sensitivity. Move your hands in many directions for an accurate inspection.



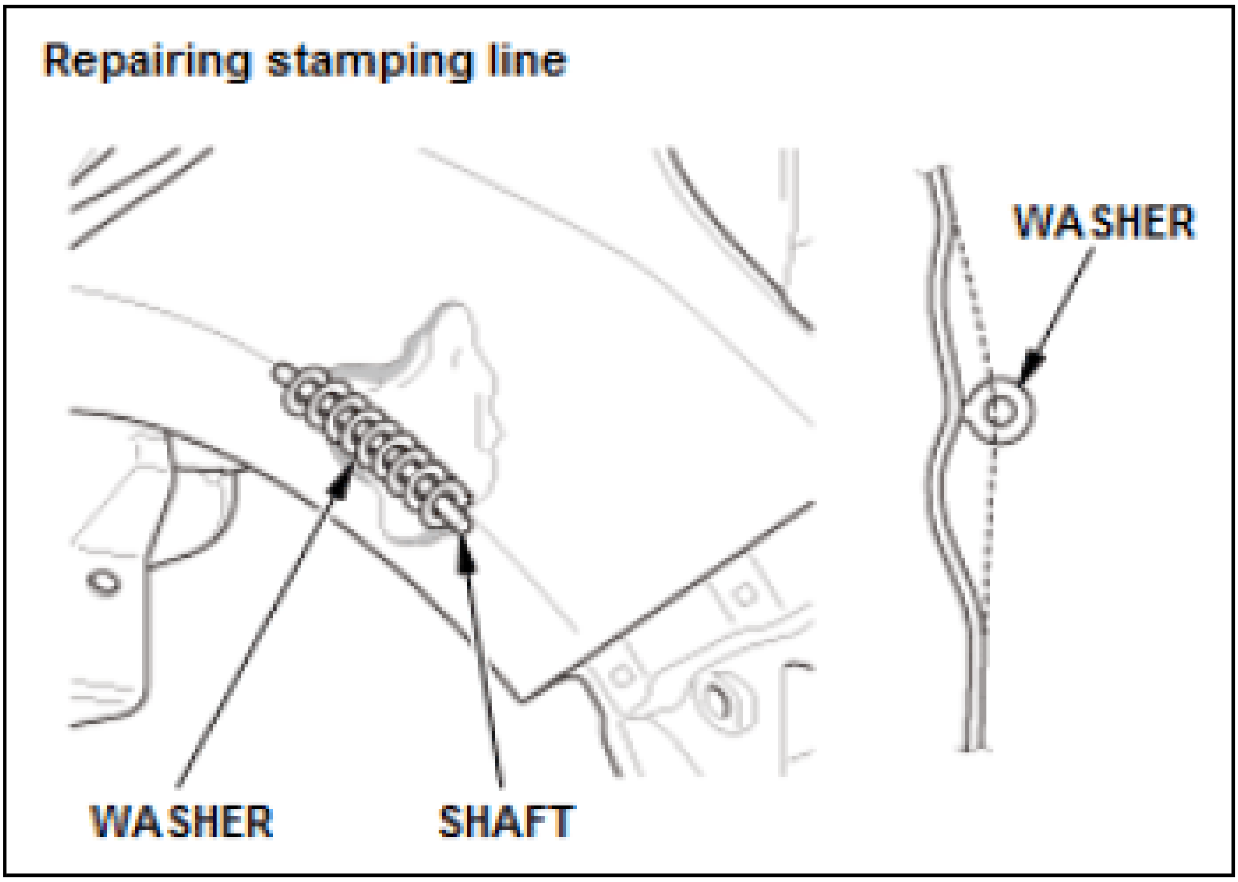
PLASTIC DEFORMATION
ELASTIC DEFORMATION

2. Remove paint from panel surface.

   Grind off the paint layers from the damaged area using a disc sander.



3. Repair work:
   - Because the stamping line maintains body panel rigidity, major stress occurs when stamping lines are deformed. Correct repair of this stamping line can relieve this strain.
   - Repair the stamping line first and then reform the flat surface damage.
   - If the stress cannot be relieved with stamping line repair alone because the damage is too serious, panel rigidity loss is partially due to elongation caused by plastic deformation on the plain surface.
   - If elongation of the flat surface is identified, shrink (draw) the panel to relieve the stress.



1. When repairing a stamping line, weld washers along the stamping line then pull out the damage by inserting a shaft through the washers. This will make stamping line repair easier. If the shaft cannot go through the washers, re-weld the washers so that a shaft can be inserted.
2. Hook a chain around the center of the shaft and pull out the damage using a slide hammer and hold tension.

NOTE: **Do not apply excessive pulling force.**

3. Correct the depressed area on the stamping by tapping on wide chisel along the body creases.

NOTE: **Do not apply excessive hammer force.**

4. Correct around the welded washers to smooth out the surface by hitting lightly with a hammer. Be careful not to apply excessive hammer force.

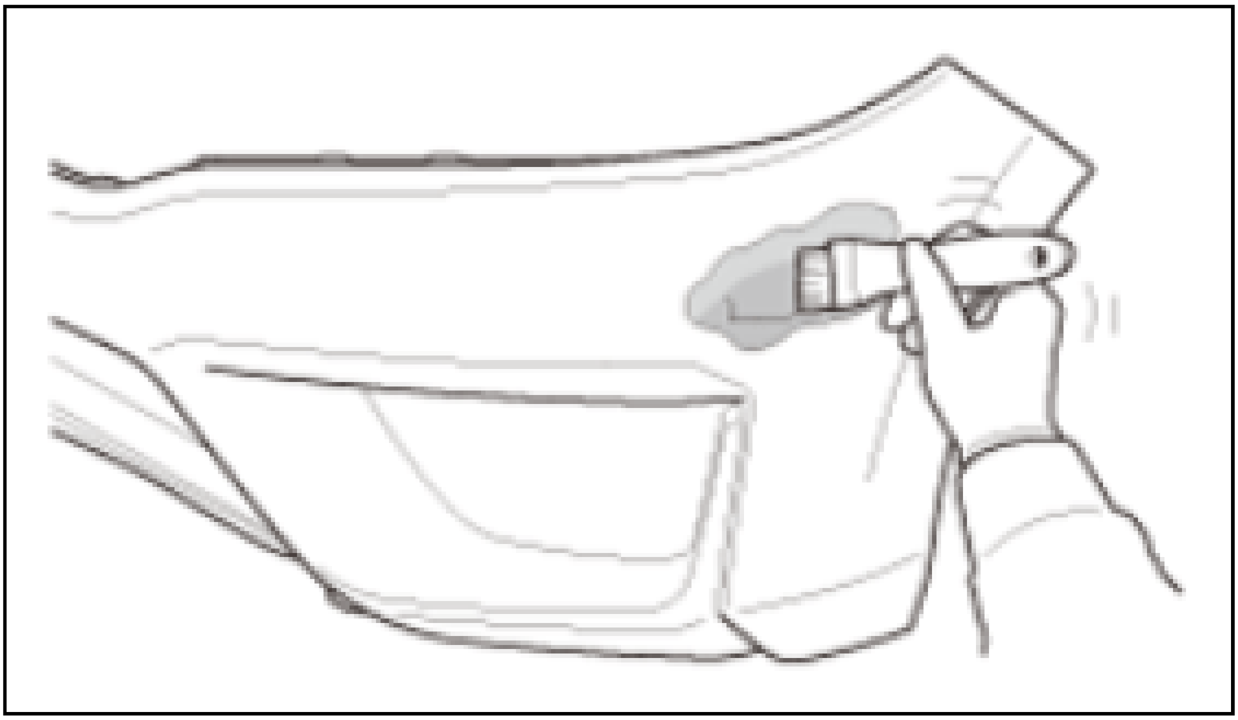
REPAIRING PLASTIC PARTS

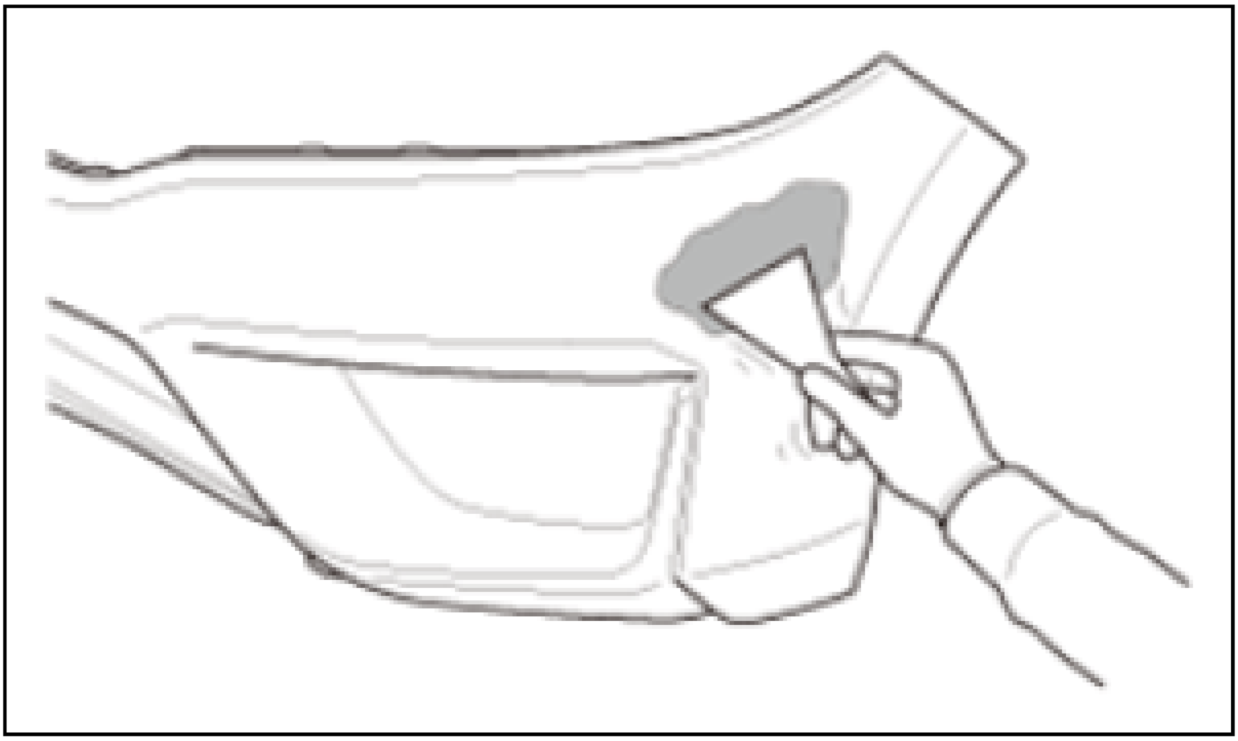
PP Polypropylene Bumper Repair Procedures

1. Filler

   Fill in the damaged area using epoxy-type body filler.

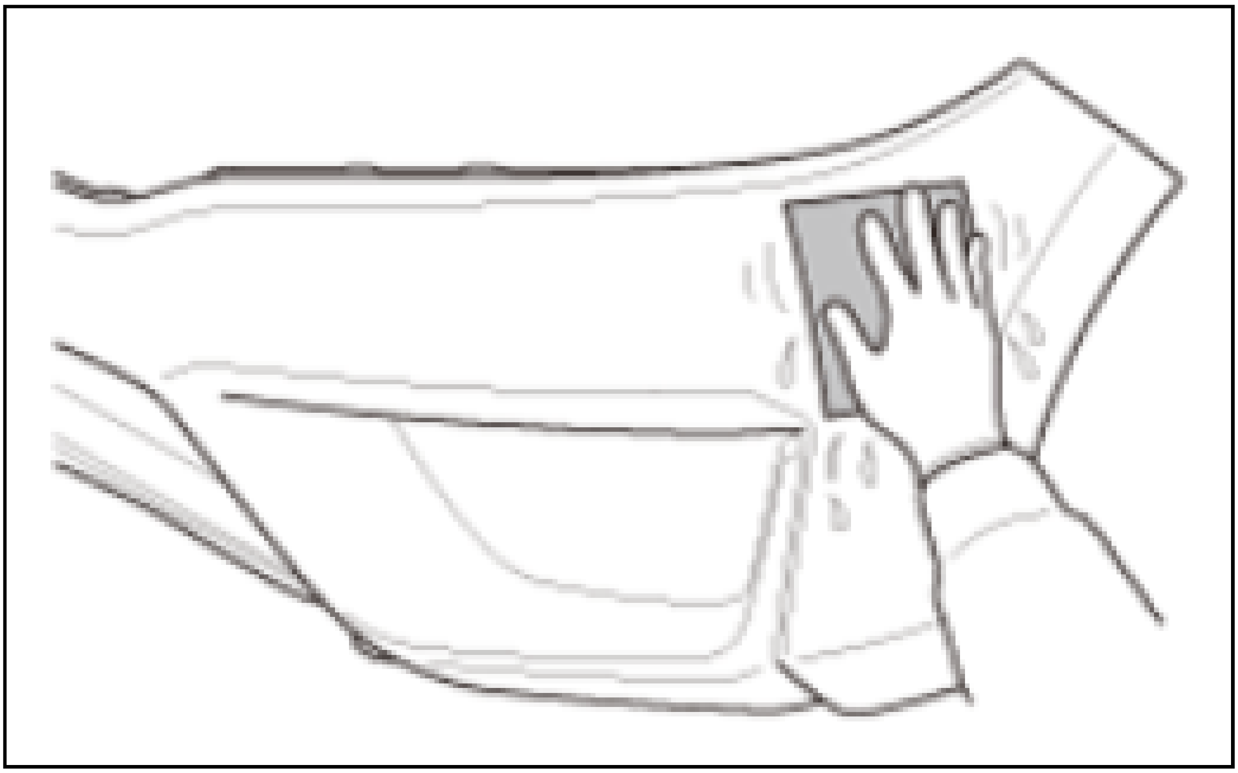
   1. Apply primer for PP bumper in the damaged area where filler will be applied.
   2. Mix the filler and hardener.
   3. Restore the part's original shape by applying sufficient filler to the damaged area using 2-3 separate thin coats.





2. Sanding and surfacing:
    - Rough sand with P120 sandpaper first and finish sand the surface with P180 to P240 sandpaper.
    - Use the wet sanding method when possible.
3. Refinish the part (base coat/clear coat)

    Refer to the appropriate paint information.



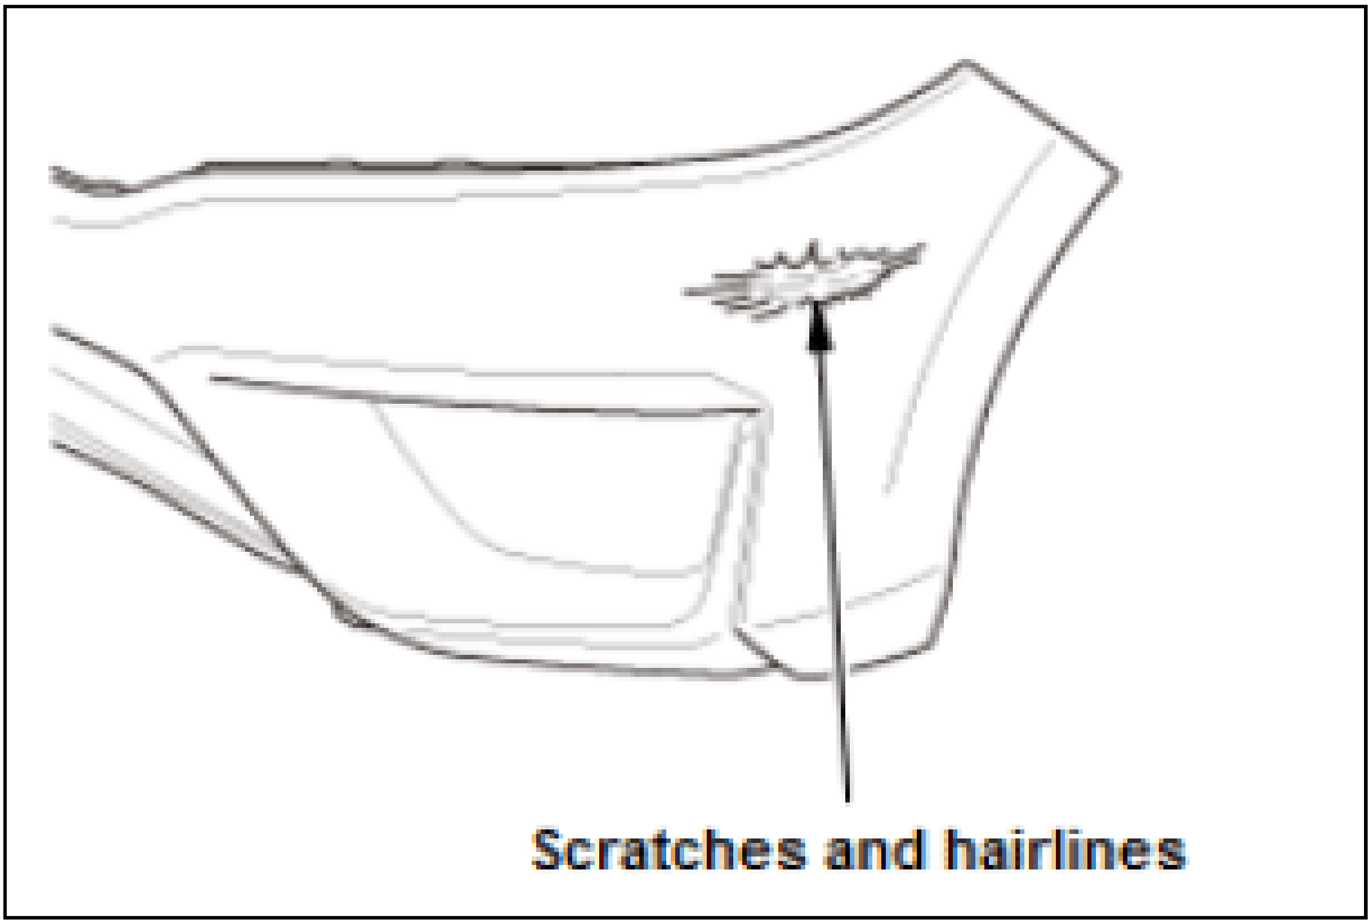
Plastic Part Repair Methods

Many plastic parts are used for exterior parts of a vehicle. In addition to sheet metal repairs, it is sometimes necessary to repair plastic parts. The major large plastic parts include: bumpers, side sill garnishes, and spoilers. They may be constructed of PP, ABS, PC, or nylon-polyester-based materials. In many damage situations, plastic part replacement is preferred over repair.

NOTE:

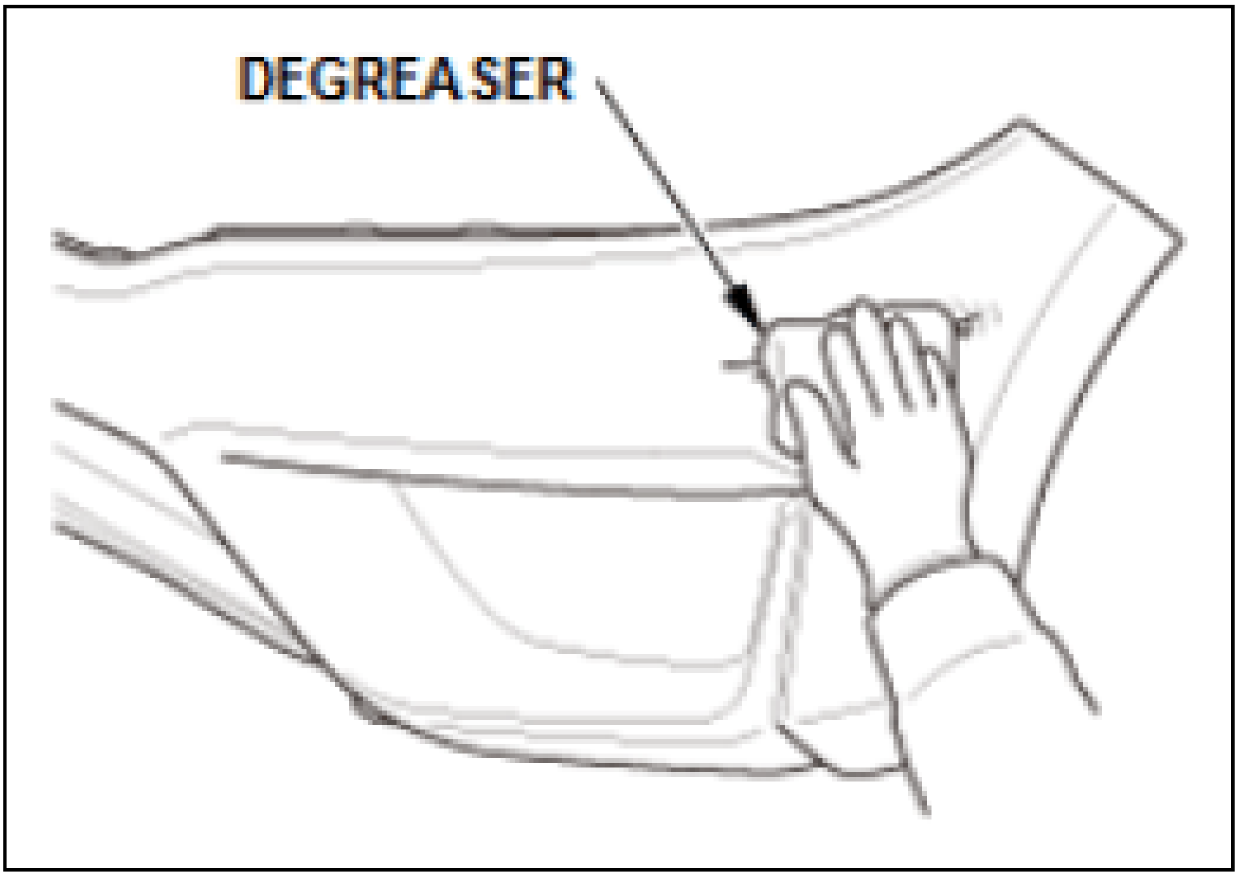
- **Before attempting repairs, identify the plastic part's construction and select the most appropriate repair materials.**
- **Follow the manufacturer's instructions for the repair materials.**
- **Be careful to avoid part deformation and damage during forced-dry with heat during the repair process, be careful with the.**

Example of damage: Scratches and hairlines on PP bumper.



Scratches and hairlines

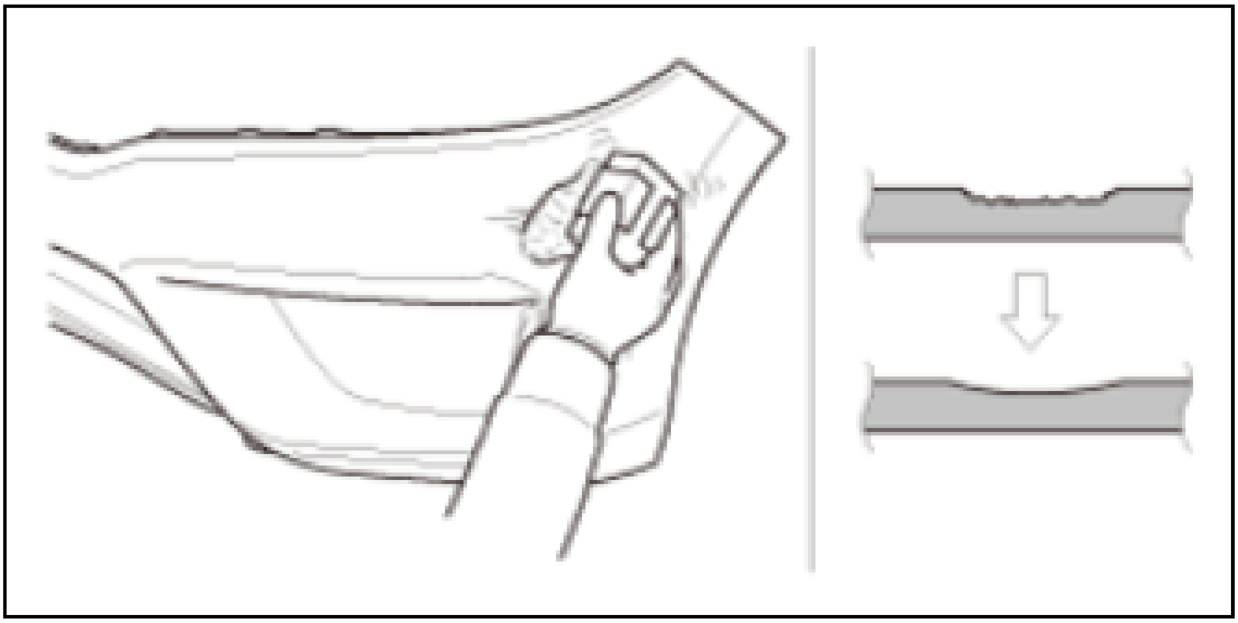
1. Preparation and cleaning:
    - Wash the damaged area with water.
    - Thoroughly clean both the front and rear sides of the damaged area using a degreaser to remove wax and oils.



2. Stand and study raw surface

   Featheredge the damaged area using P80 to P120 sandpaper.

Then degrease the surface.

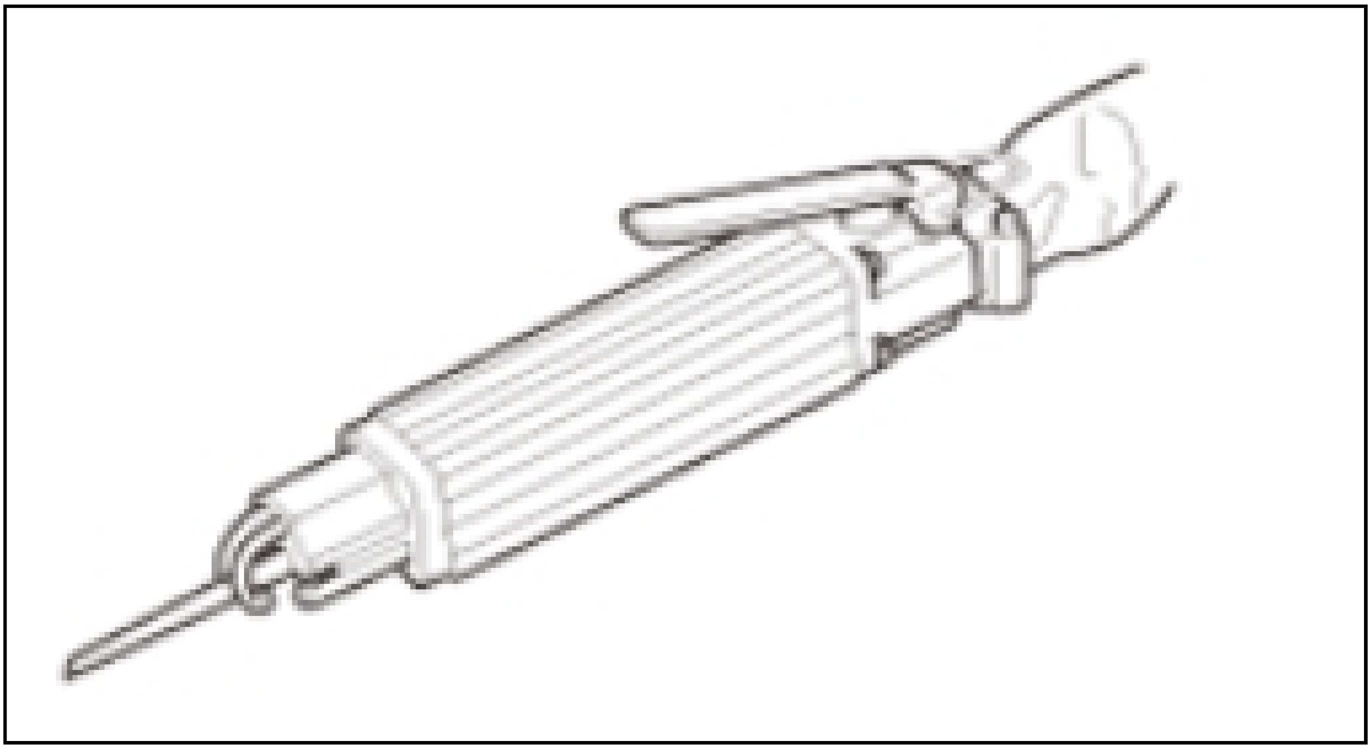


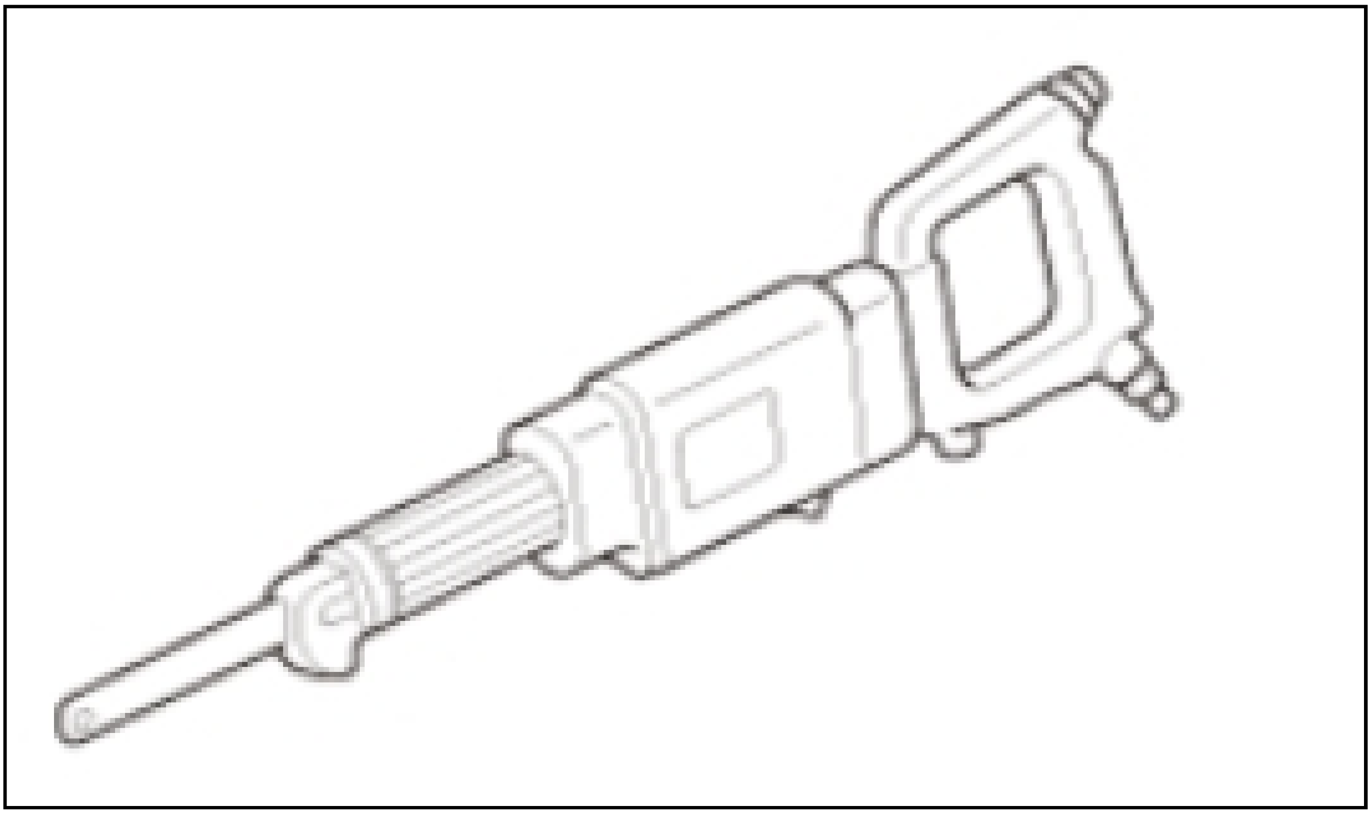
TOOLS AND EQUIPMENT

CUTTING TOOLS

Air Saw

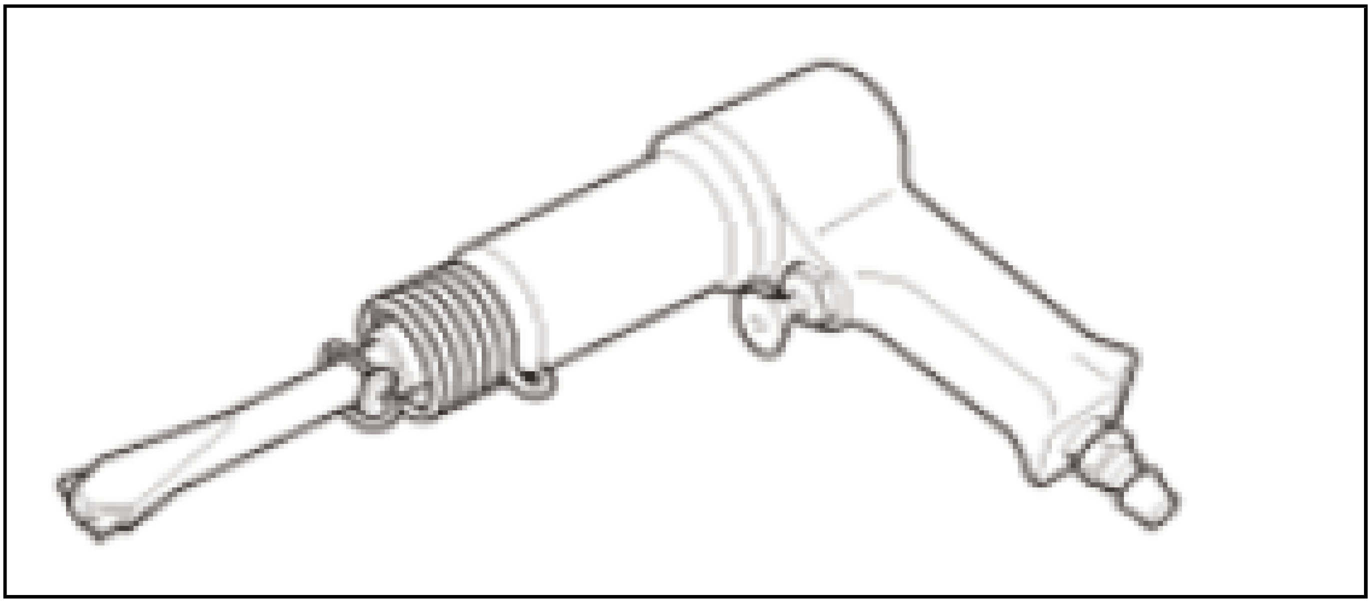
- Used to cut outer panels.
- Makes quick, clean cuts, but noise and vibration can be significant.

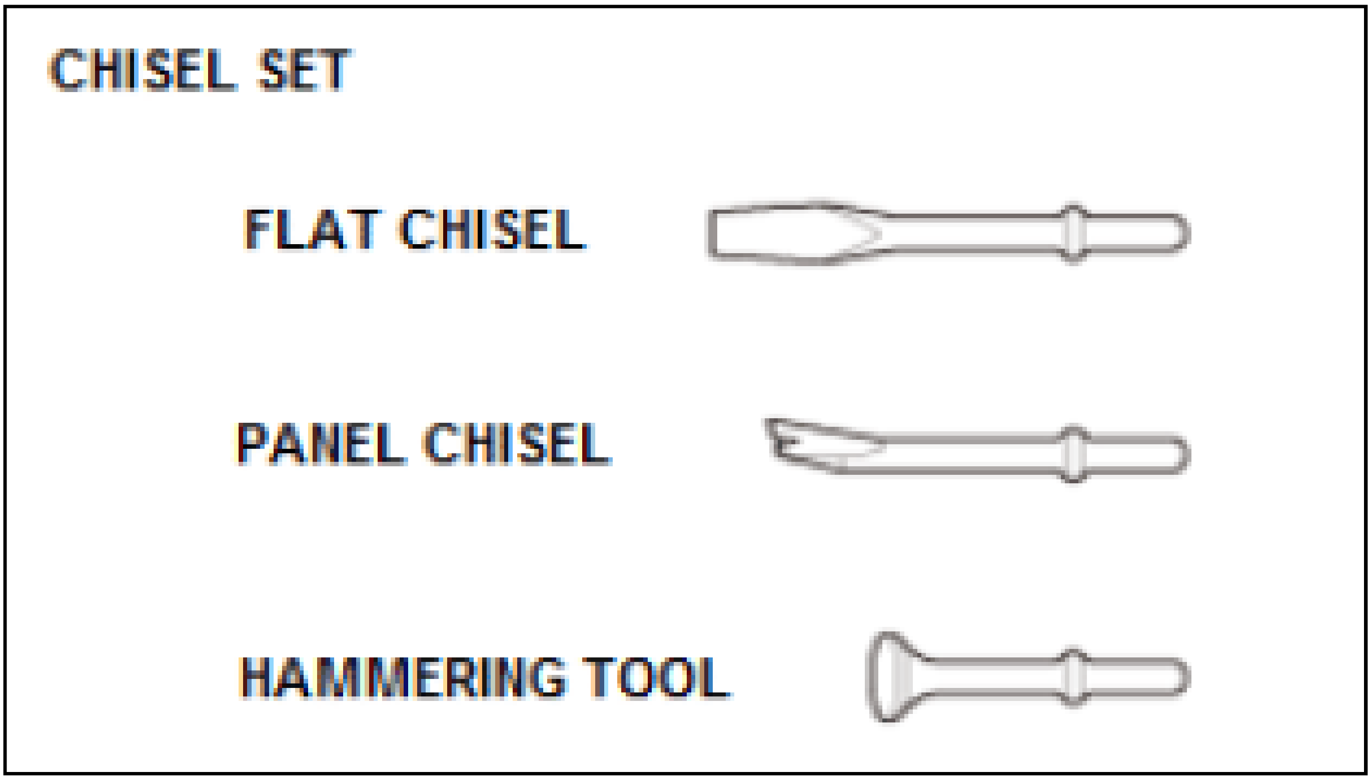




Air Chisel

- Used for rough cutting when removing damaged parts.
- Compact and light in weight. Excellent for hammering out damage to access other parts.
- Can cut straight, curved, or along stamping lines when cutting panels.
- No cutting chips produced.
- Noise and vibration are significant.



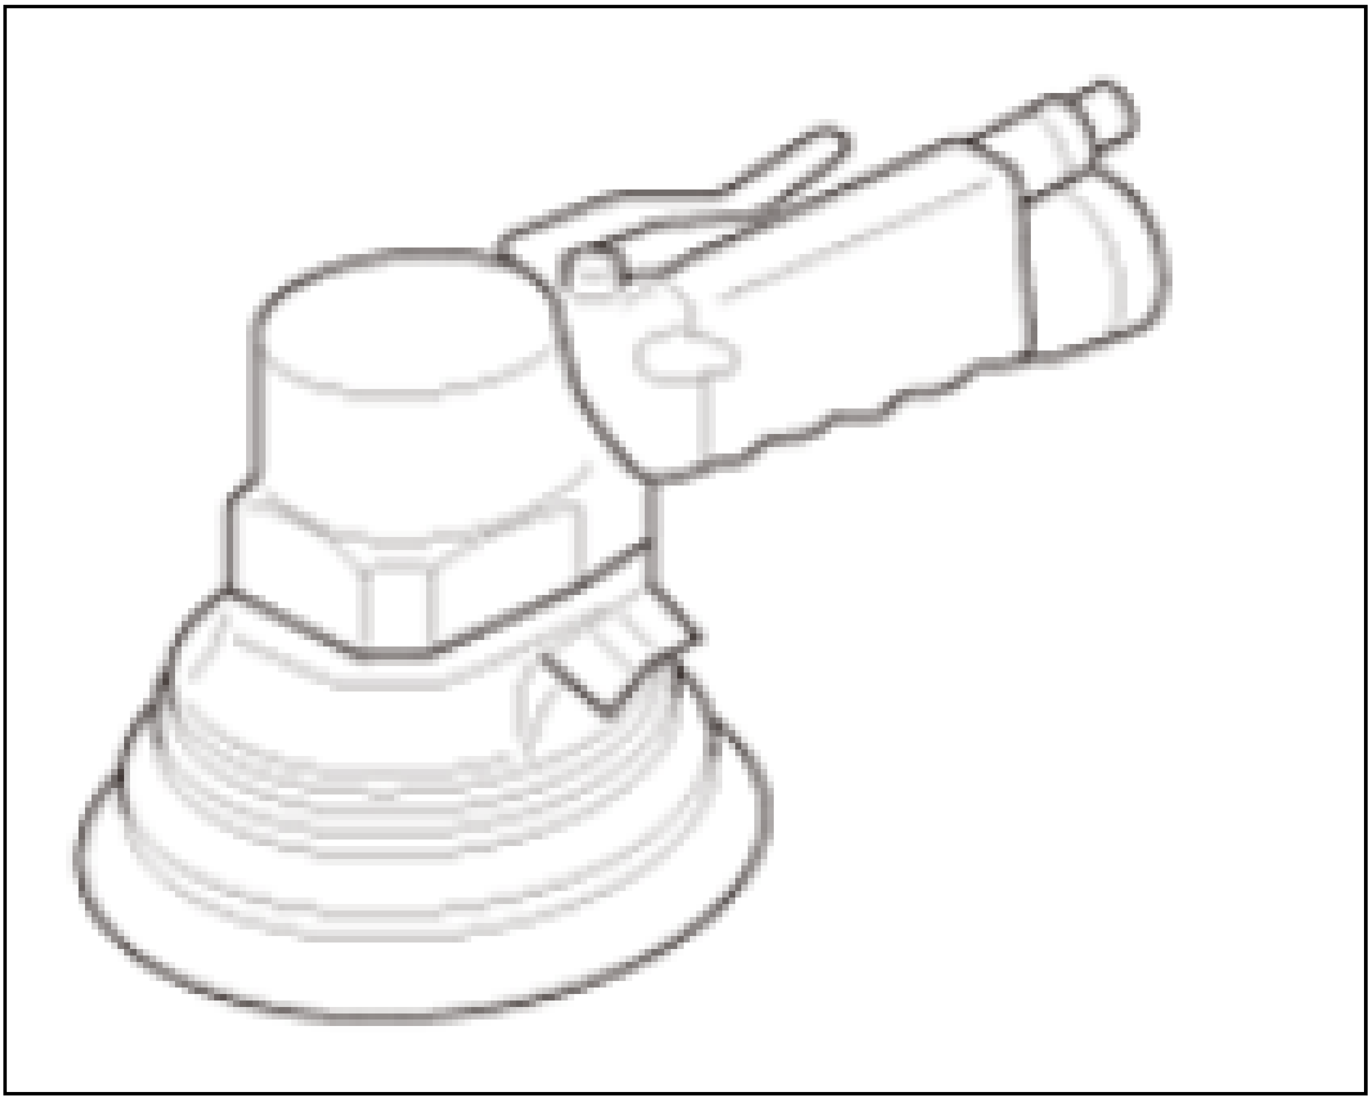


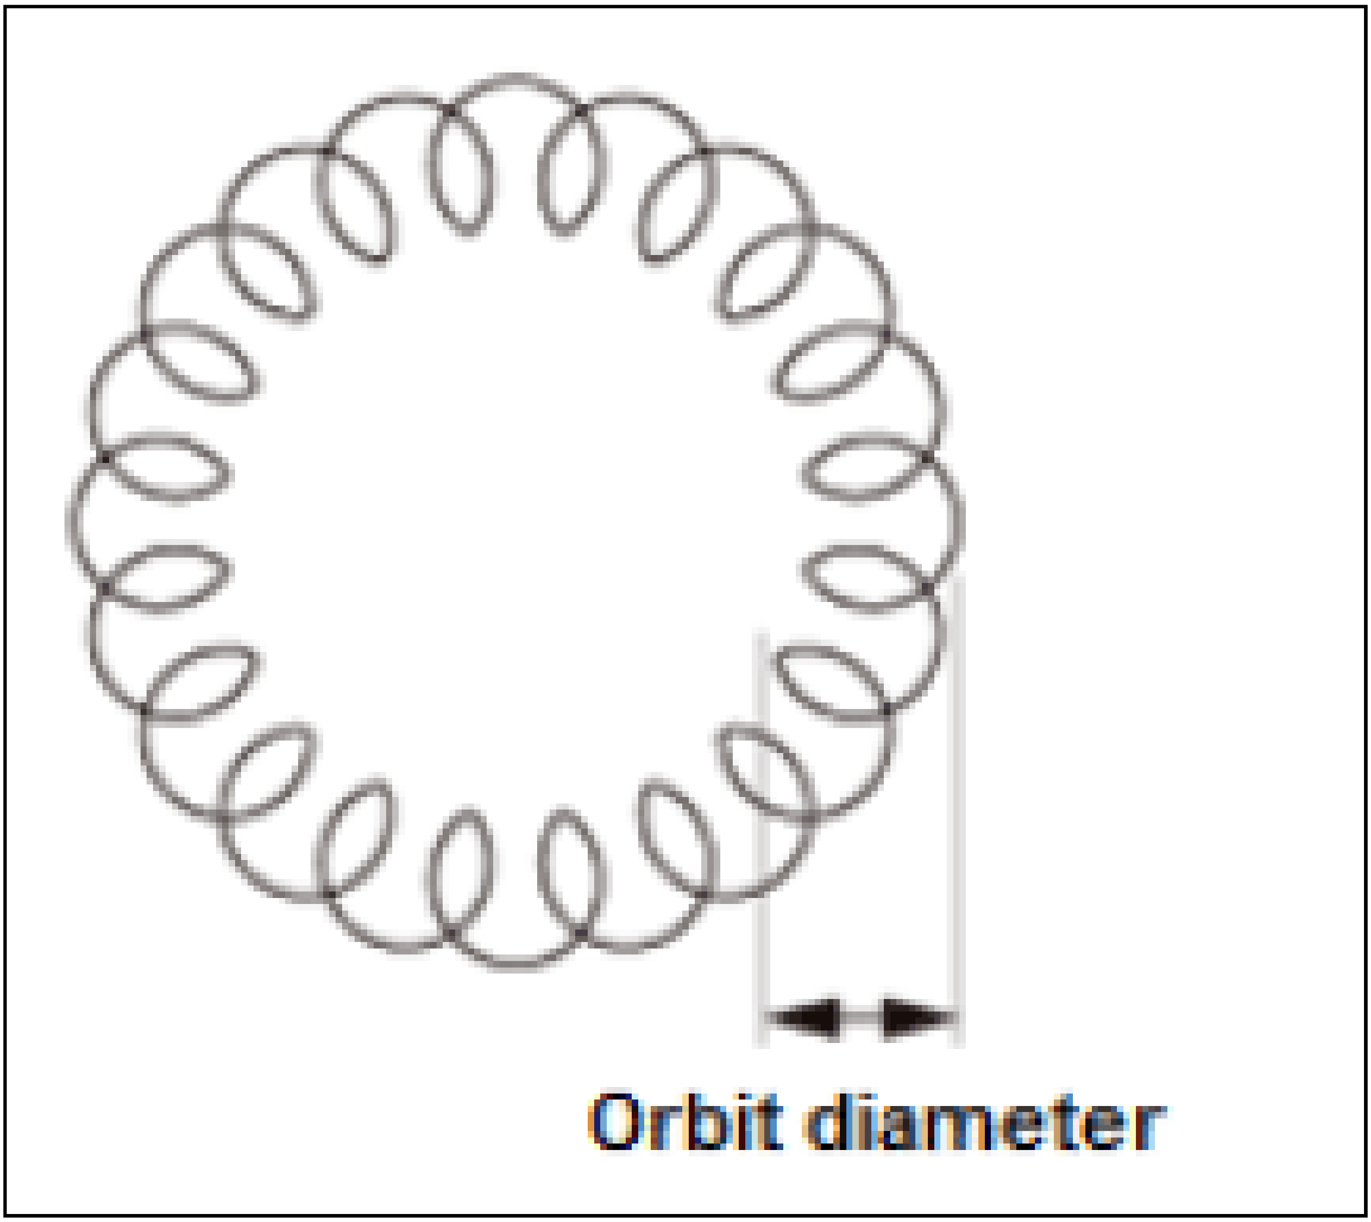
GRINDING AND SANDING TOOLS

Putty Grinder/Sander

Dual-Action (DA) Sander

- Used for many types of sanding such as feathering, scuffing, rough and intermediate body filler or putty sanding etc.
- Eccentric and rotatory motion achieves highly efficient sanding, with a minimum of sanding scratches.
- This sander spins a circular pad and the pad moves in a circular direction simultaneously and sands a wide area.
- Changing the orbit diameter size allows use in a wide variety of sanding applications such as rough body filler sanding and primer surfacer polishing.

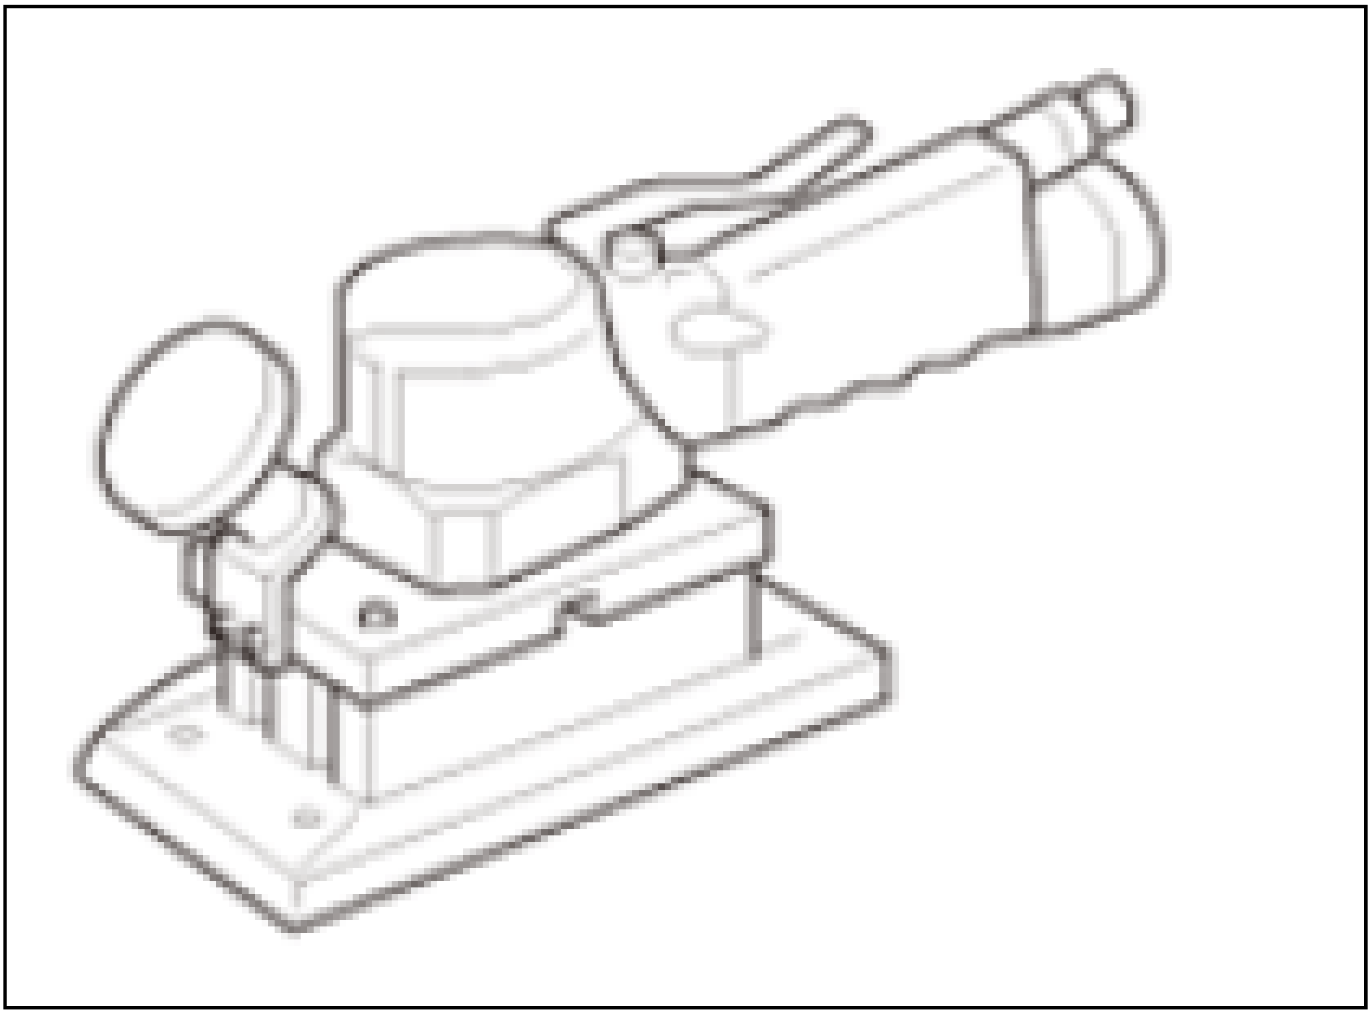


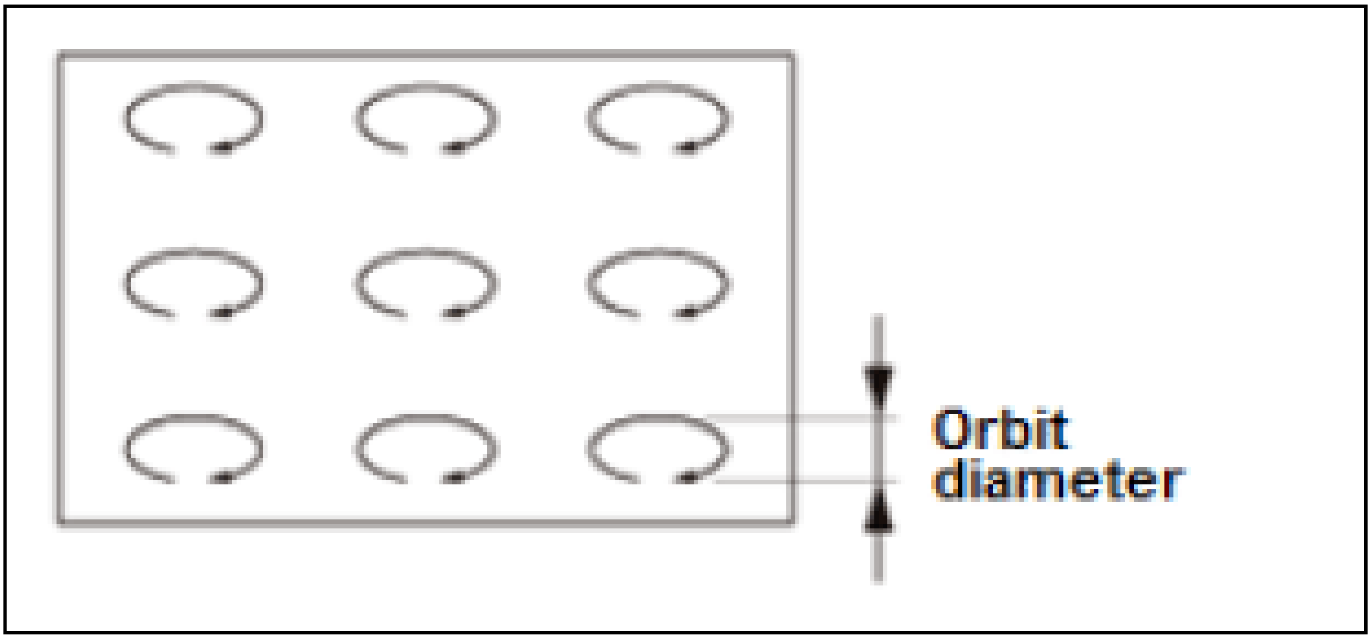


Orbital Action Sander

- Used for rough and intermediate sanding of surfaces with body filler or putty.
- Because it has a wide contact surface, distortion can easily be removed.

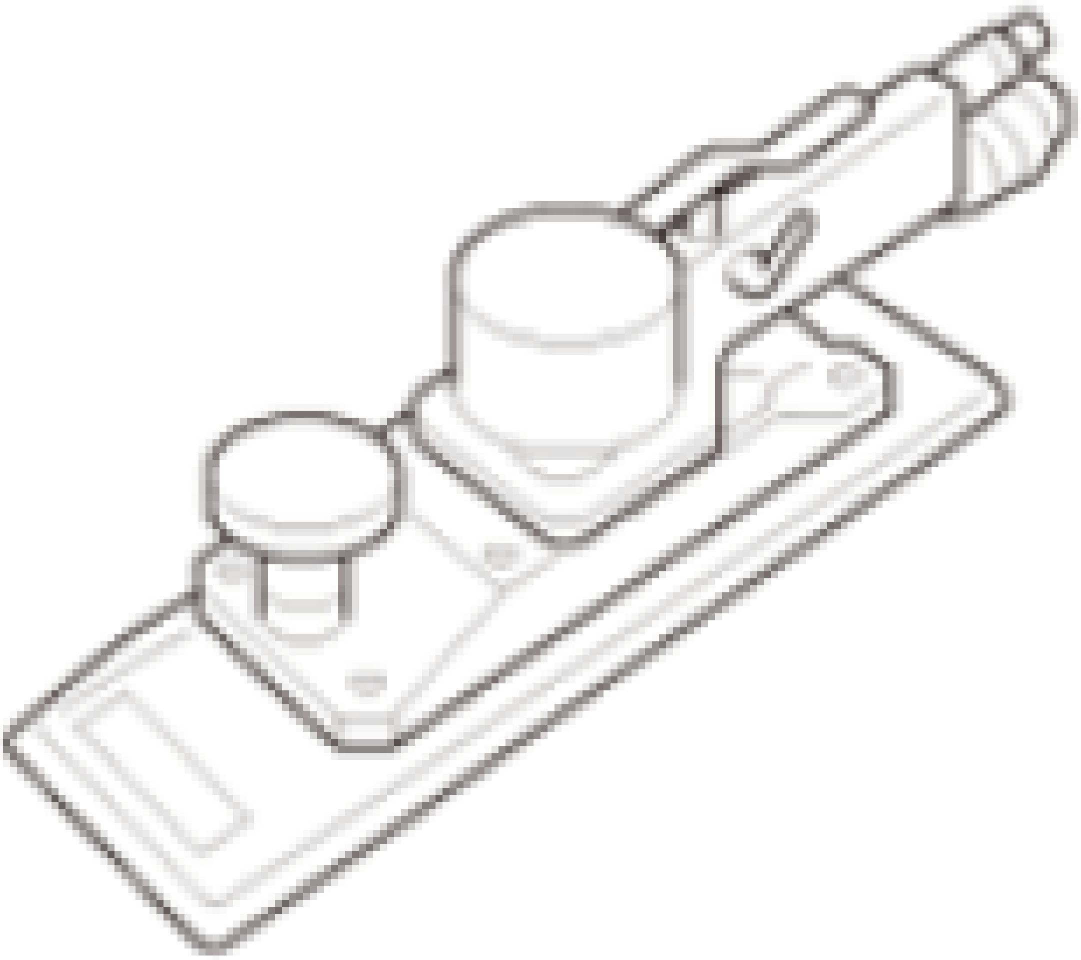
- This sander vibrates a rectangular pad along an oval path when sanding a surface.
- It can be used for a wide variety of applications from removing putty distortion to primer surfacer polishing depending on the size of orbit diameter.

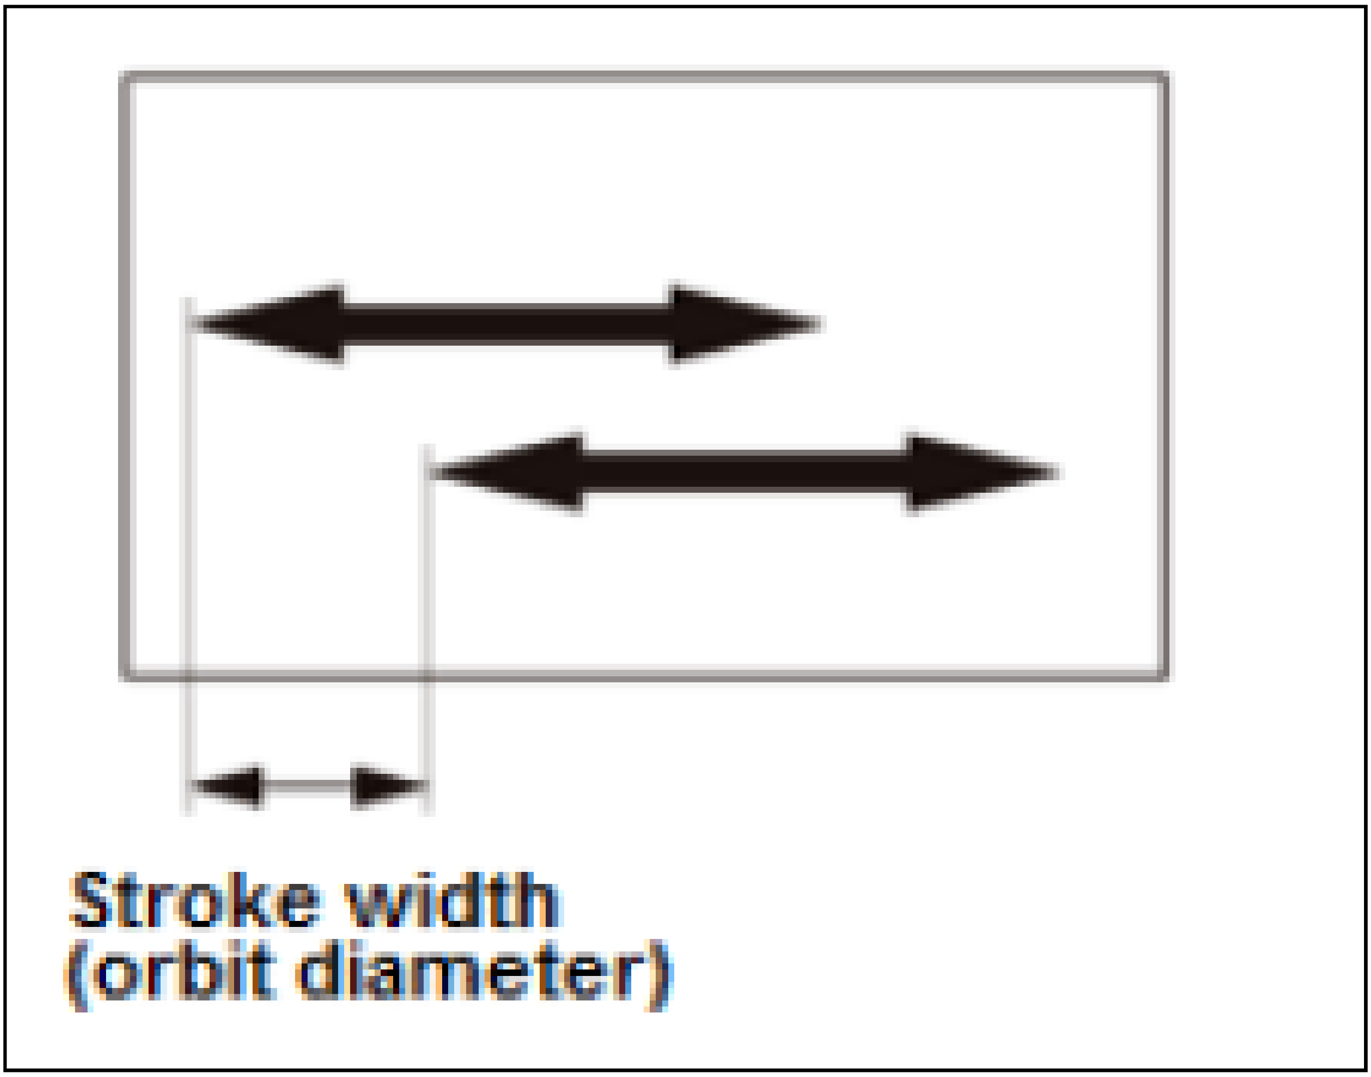




Straight Line Sander

- Used for rough polishing of filled or puttied surfaces.
- Good for polishing work on wide surfaces.
- This sander moves a rectangular pad in a straight line front to back when sanding a surface.
- Rather than sanding a large surface area, it is often used to remove distortion on a body surface as a part of final processes.



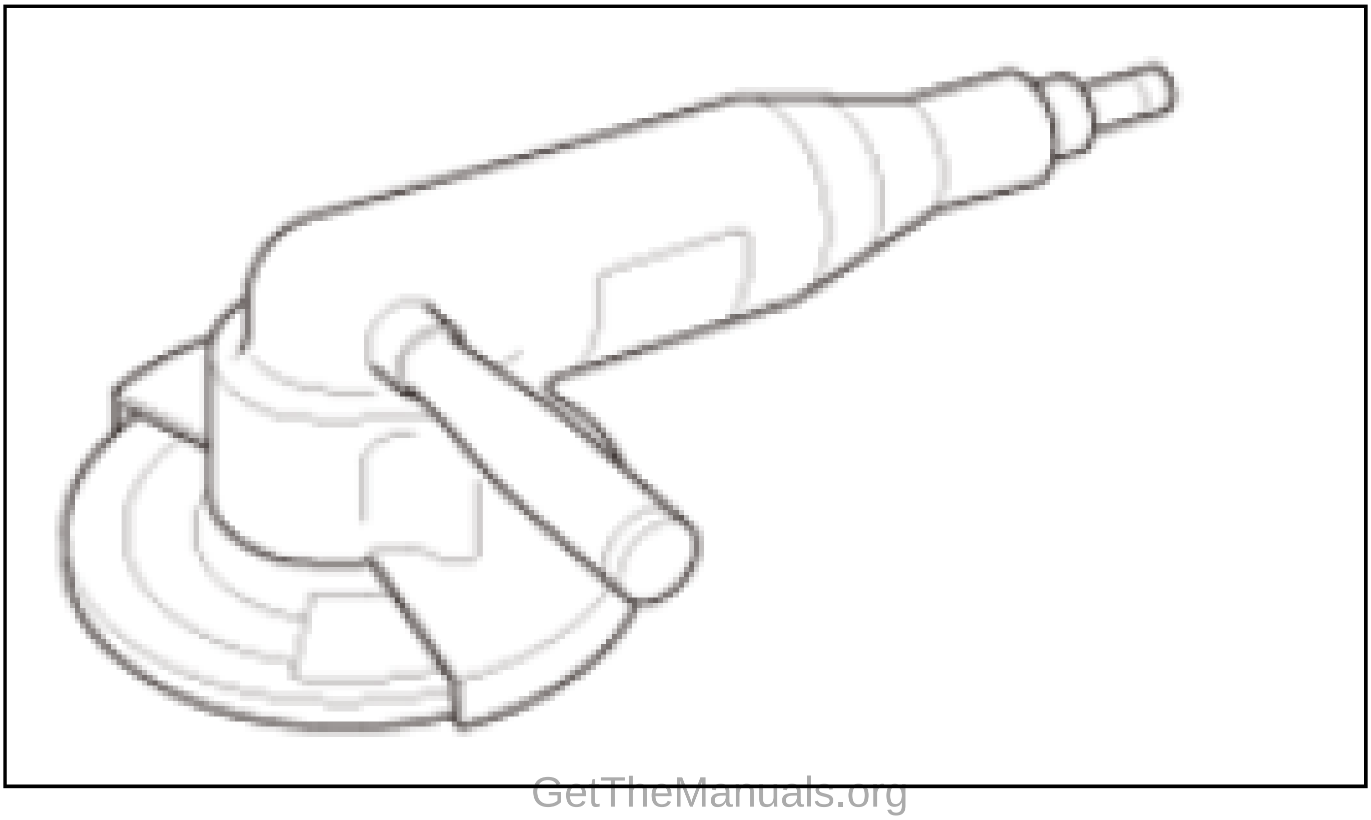


Stroke width
(orbit diameter)

Steel Sheet Grinder/Sander

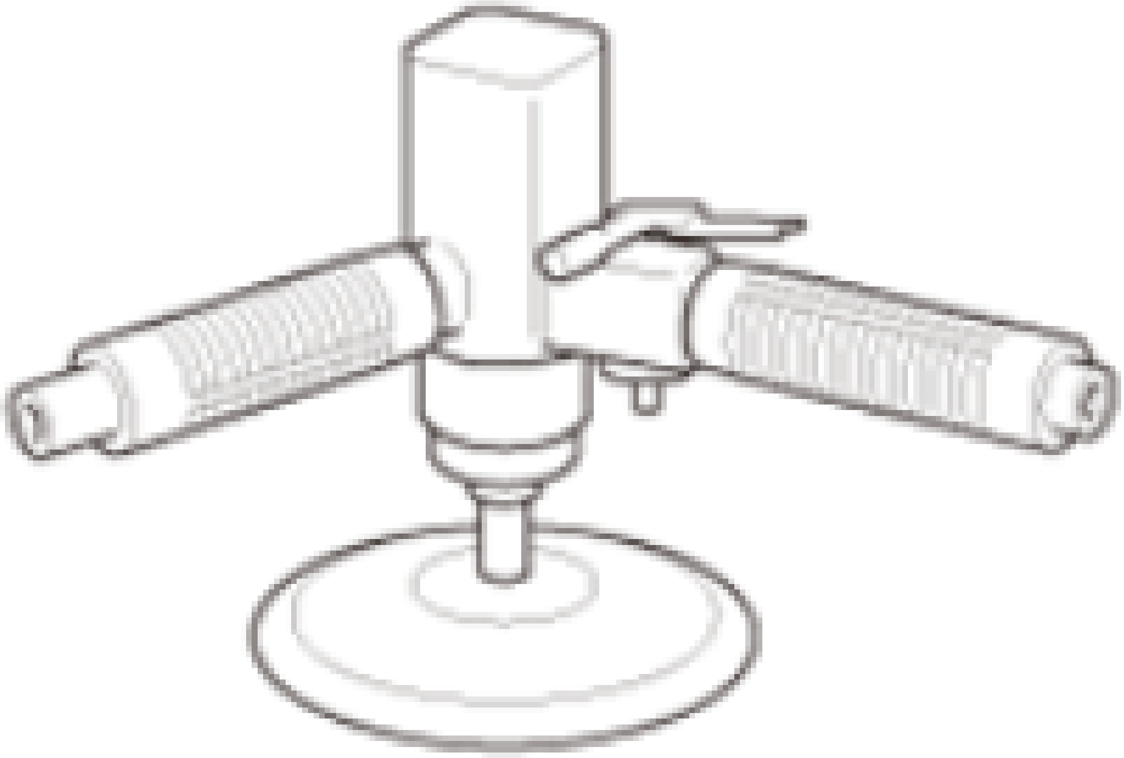
Angle (Disc-Type) Grinder

- Used for polishing after welding.
- There are two types; air and electric powered.



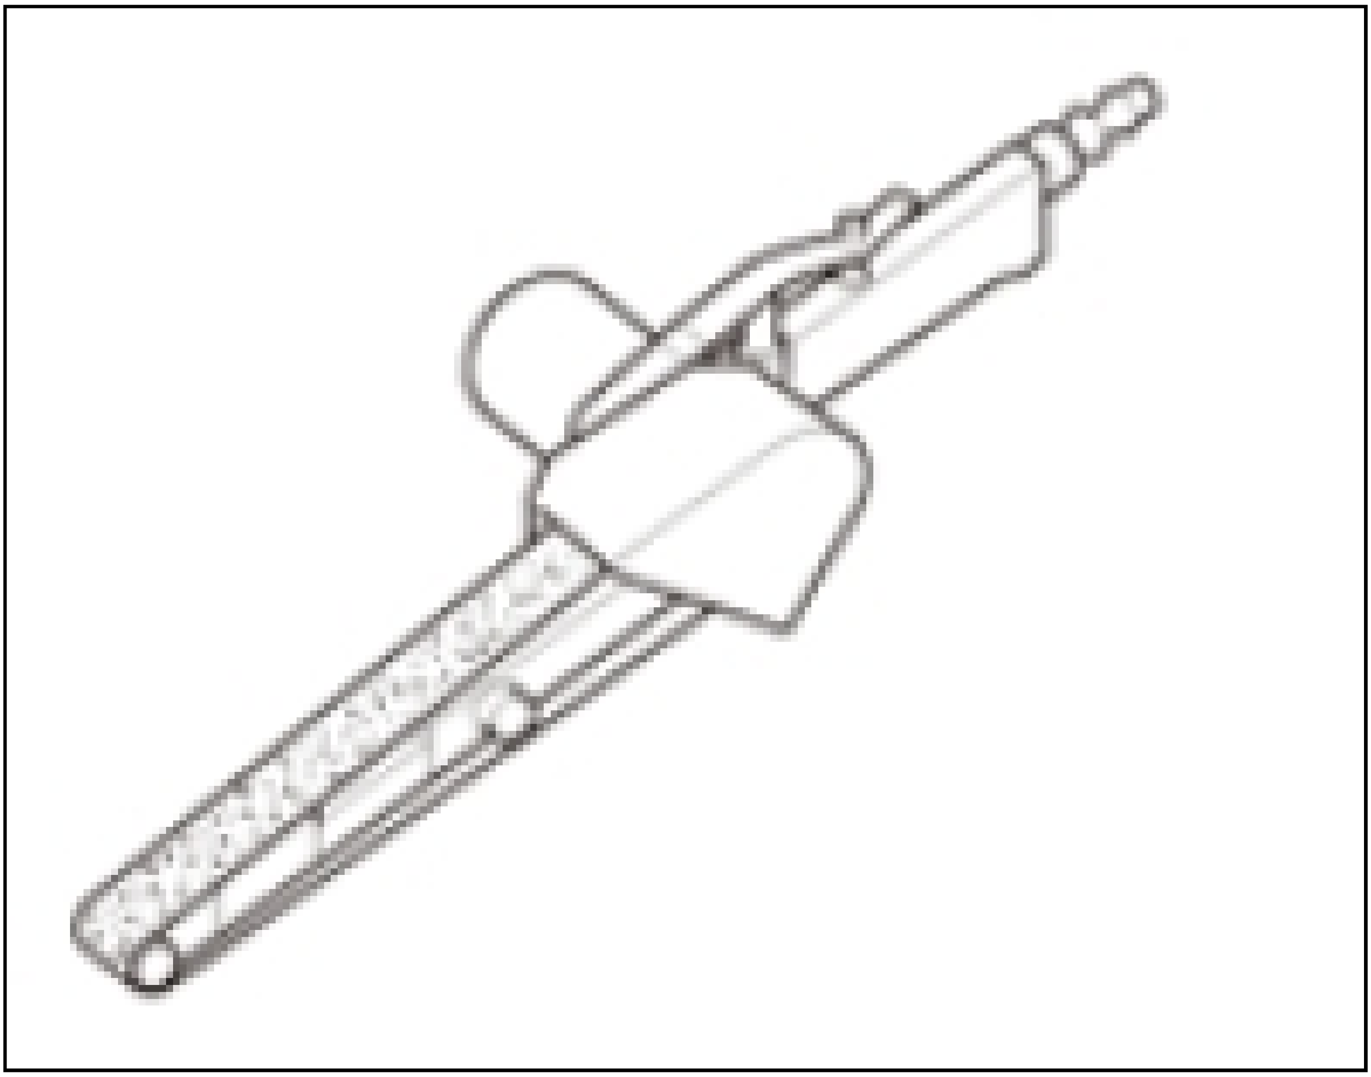
Single Action Sander

Used to remove paint layers.



Belt Sander

- Used to peel off paint layers on welding areas.
- Also may be used to remove spot welds, especially in areas that cannot be accessed with a drill.
- Can be used in tight spaces where a disc sander cannot access.
- Lightweight and compact, allows one-handed work.
- Multiple belt widths available.

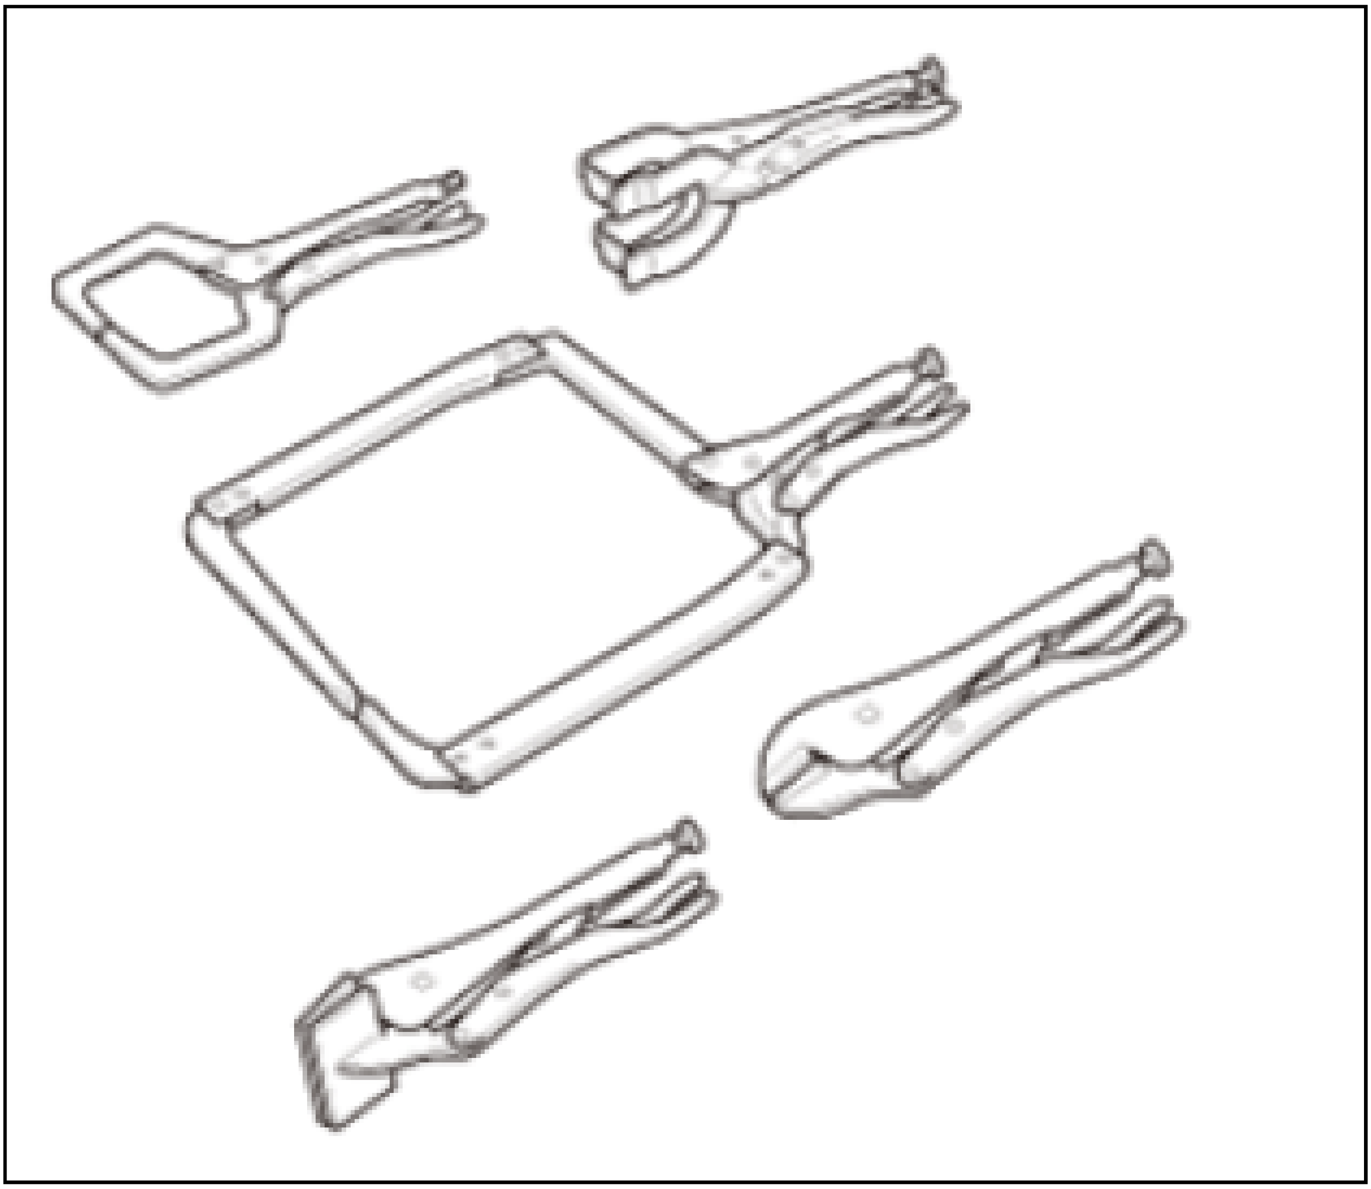


INSTALLATION TOOLS

Parts Positioning And Holding Tools

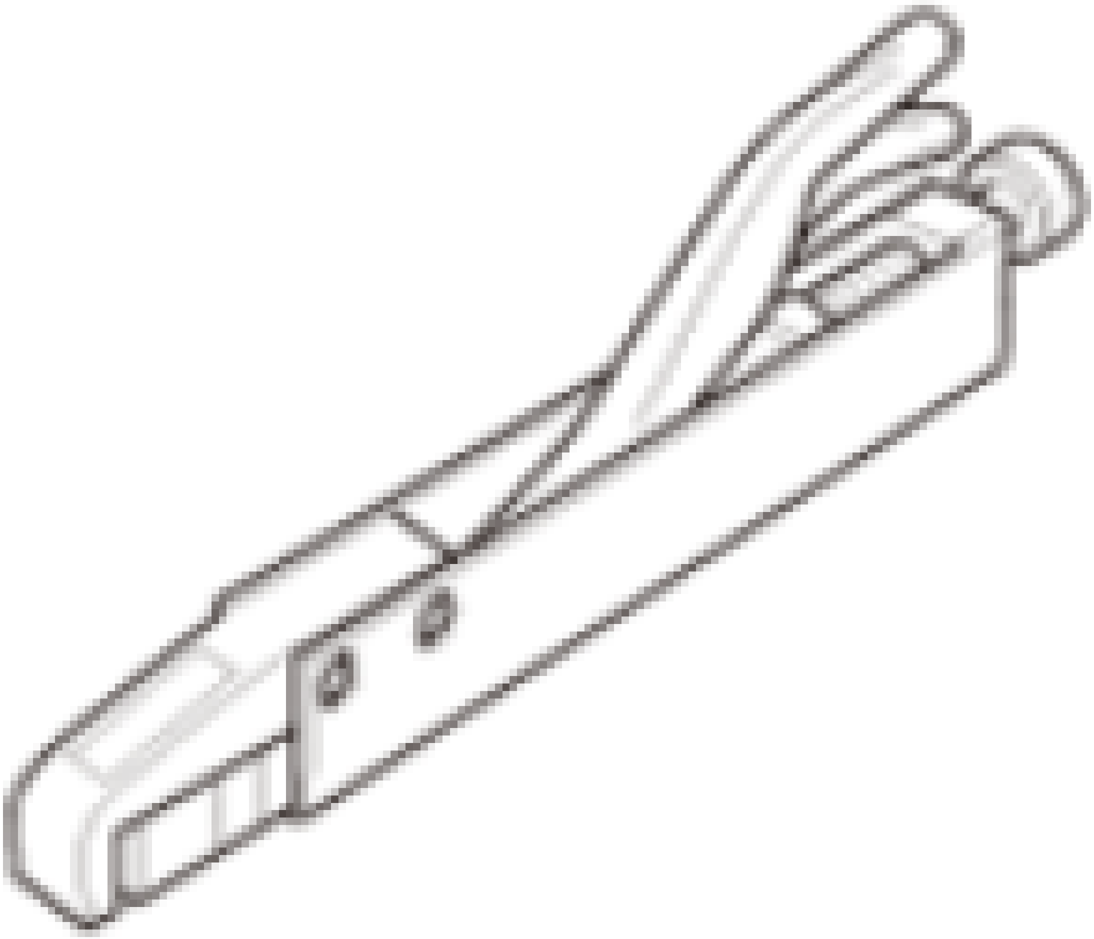
Vise-Grip Pliers

- Used to temporary hold parts during welding.
- Jaw opening and clamping force adjustments can be easily made.



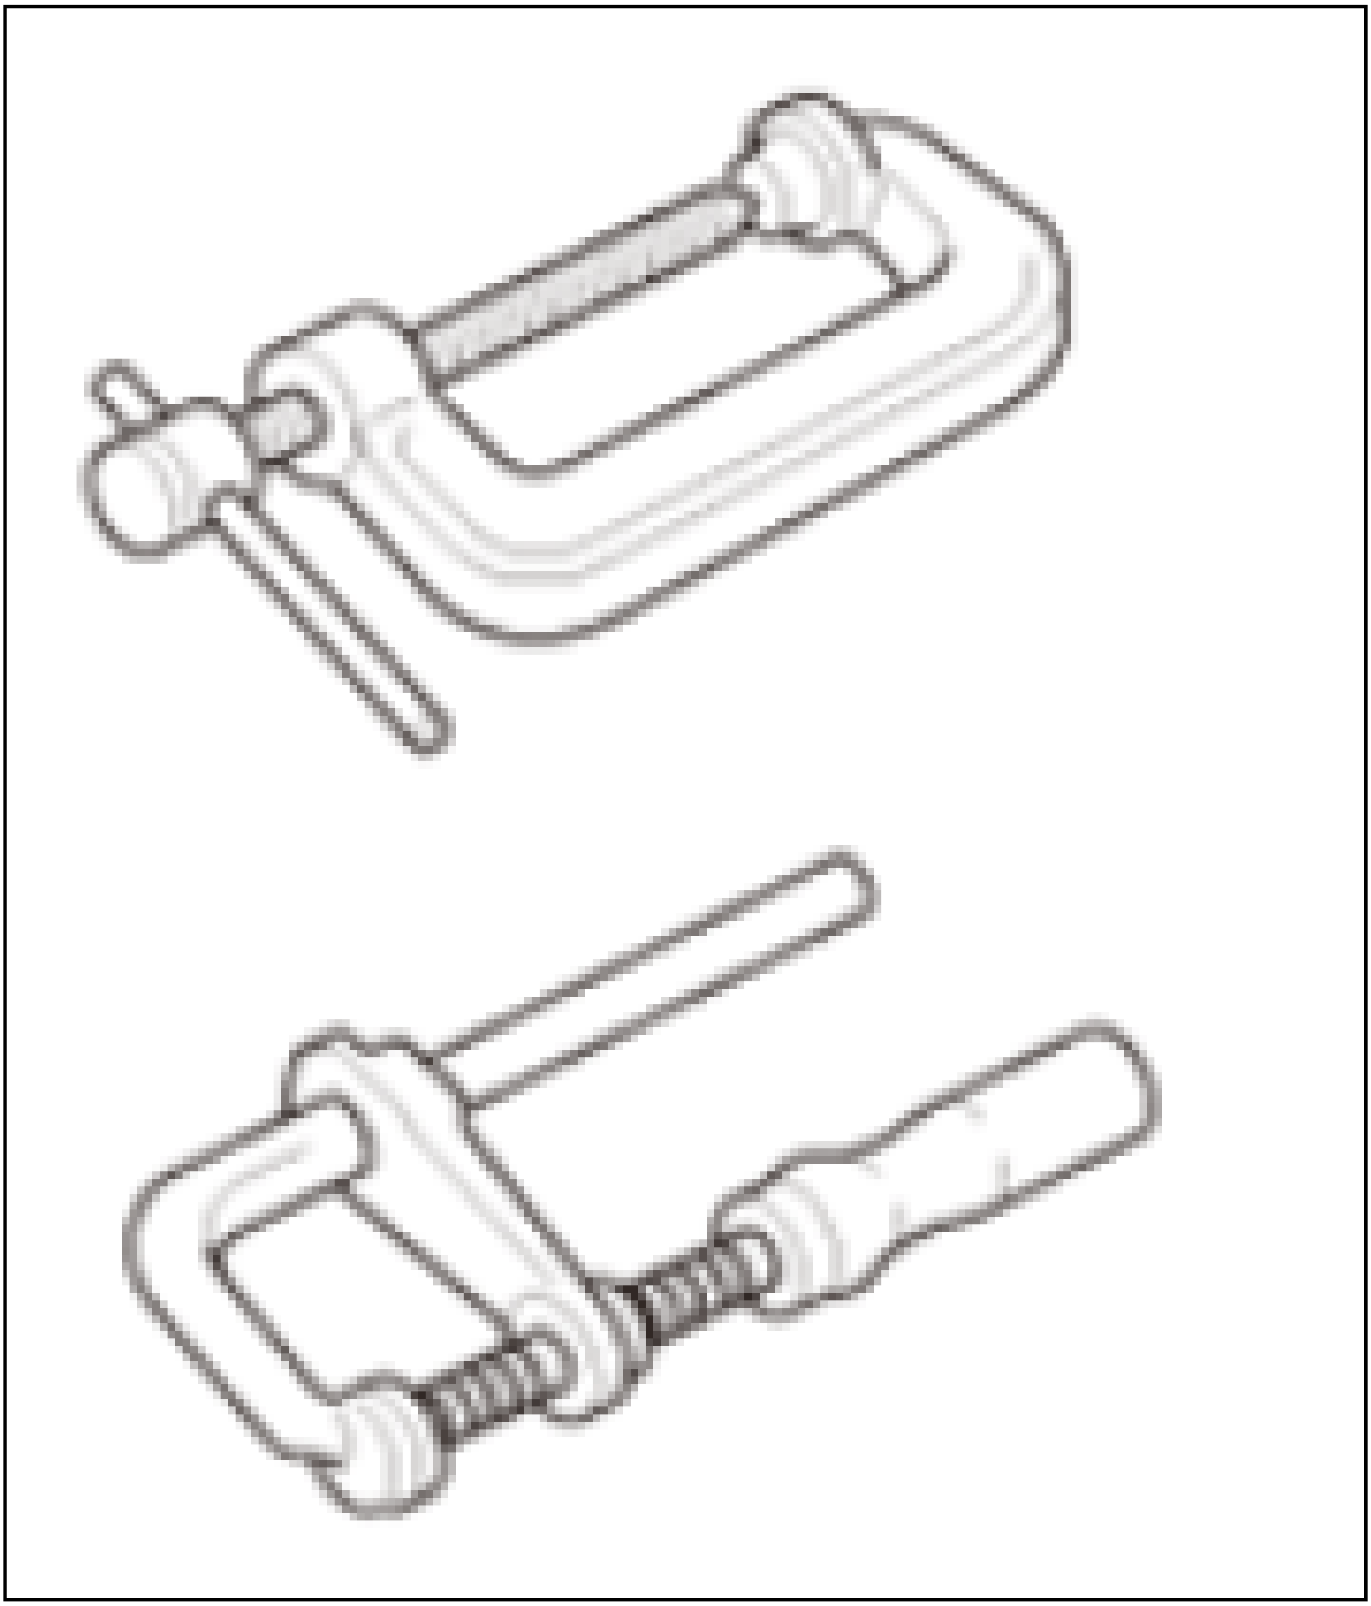
90 Degrees Vise Grip Pliers

- Used to temporary hold parts during welding.
- Jaw opening and clamping force adjustments can be easily made.
- 90 degree jaw angle allows fit of doors and trunk lid to be confirmed.



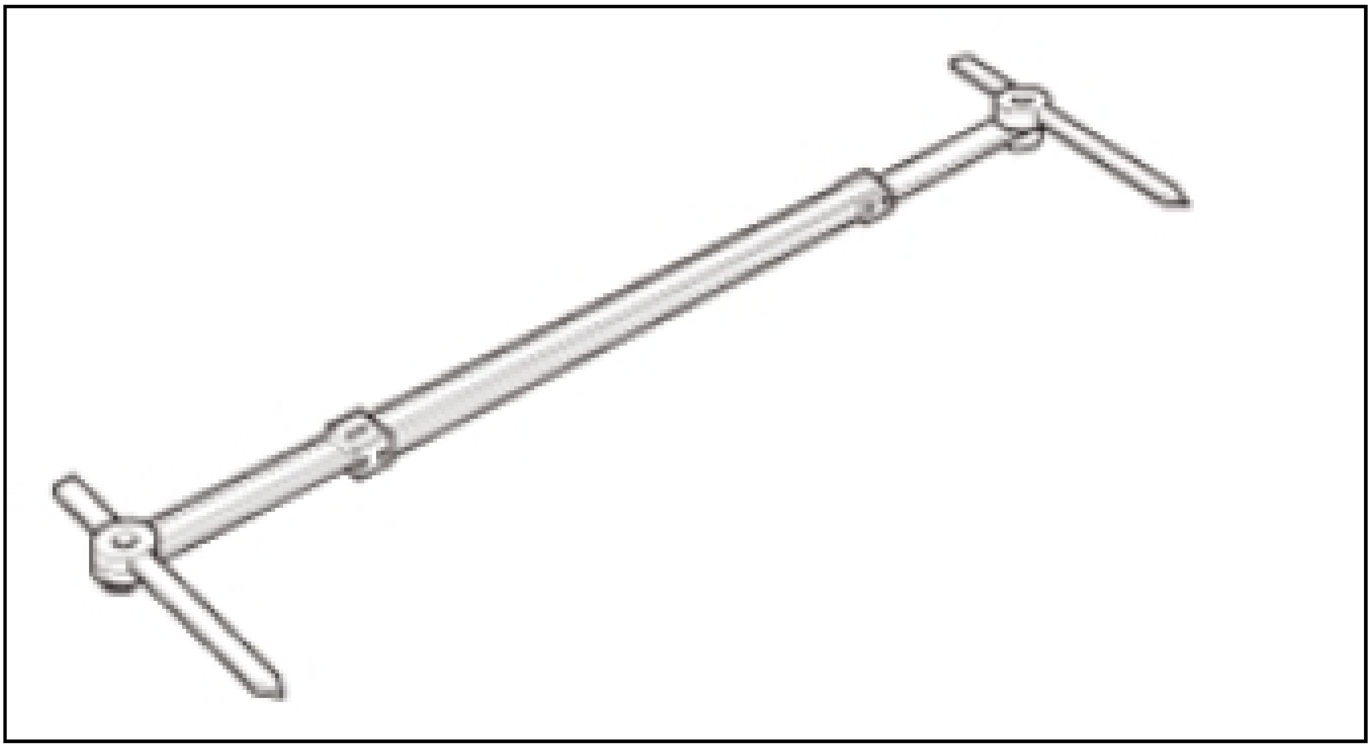
Screw Clamp

- Used to assemble panels and hold parts during welding.
- Screw opening dimensions and clamping force adjustments can be easily made.
- Less likely to scratch or mark panels than vise-grip pliers.



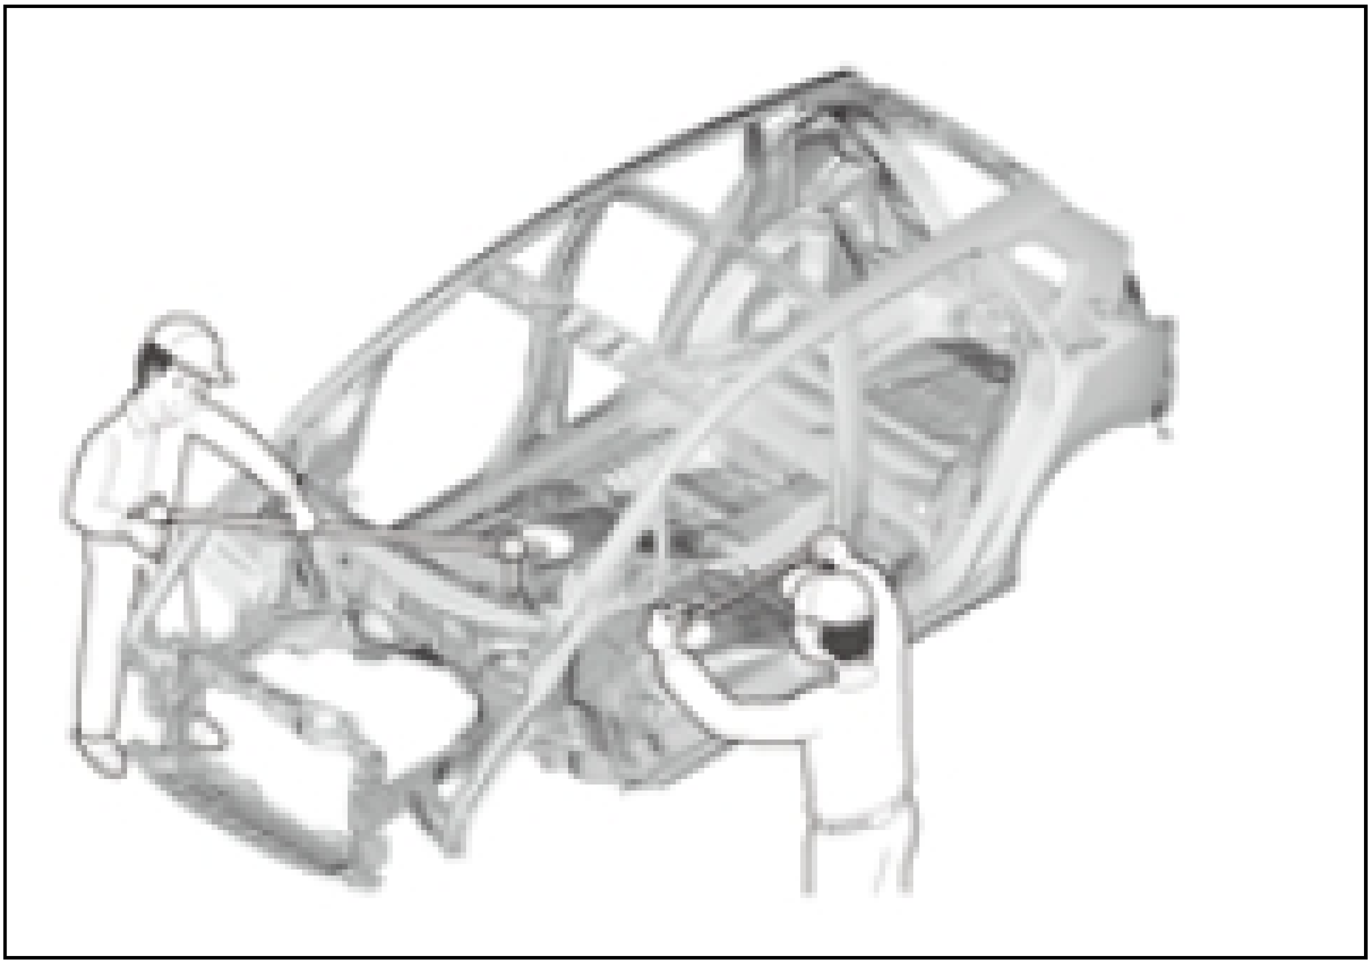
MEASURING TOOLS

Body Dimension Measuring Tool



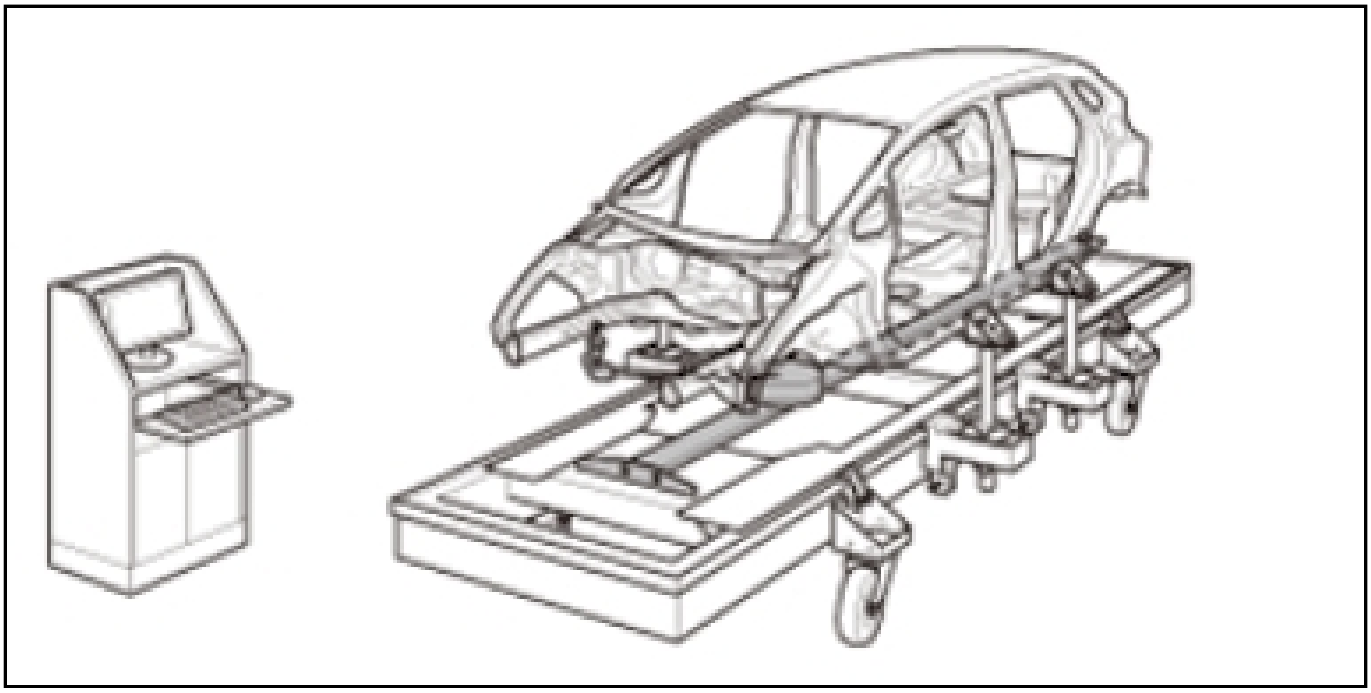
Tram Gauge

- Used to measure the various body dimensions to check for upper body and underbody structural damage.
- Because of its expandable measuring probes, it can be widely used for a variety of measurements.

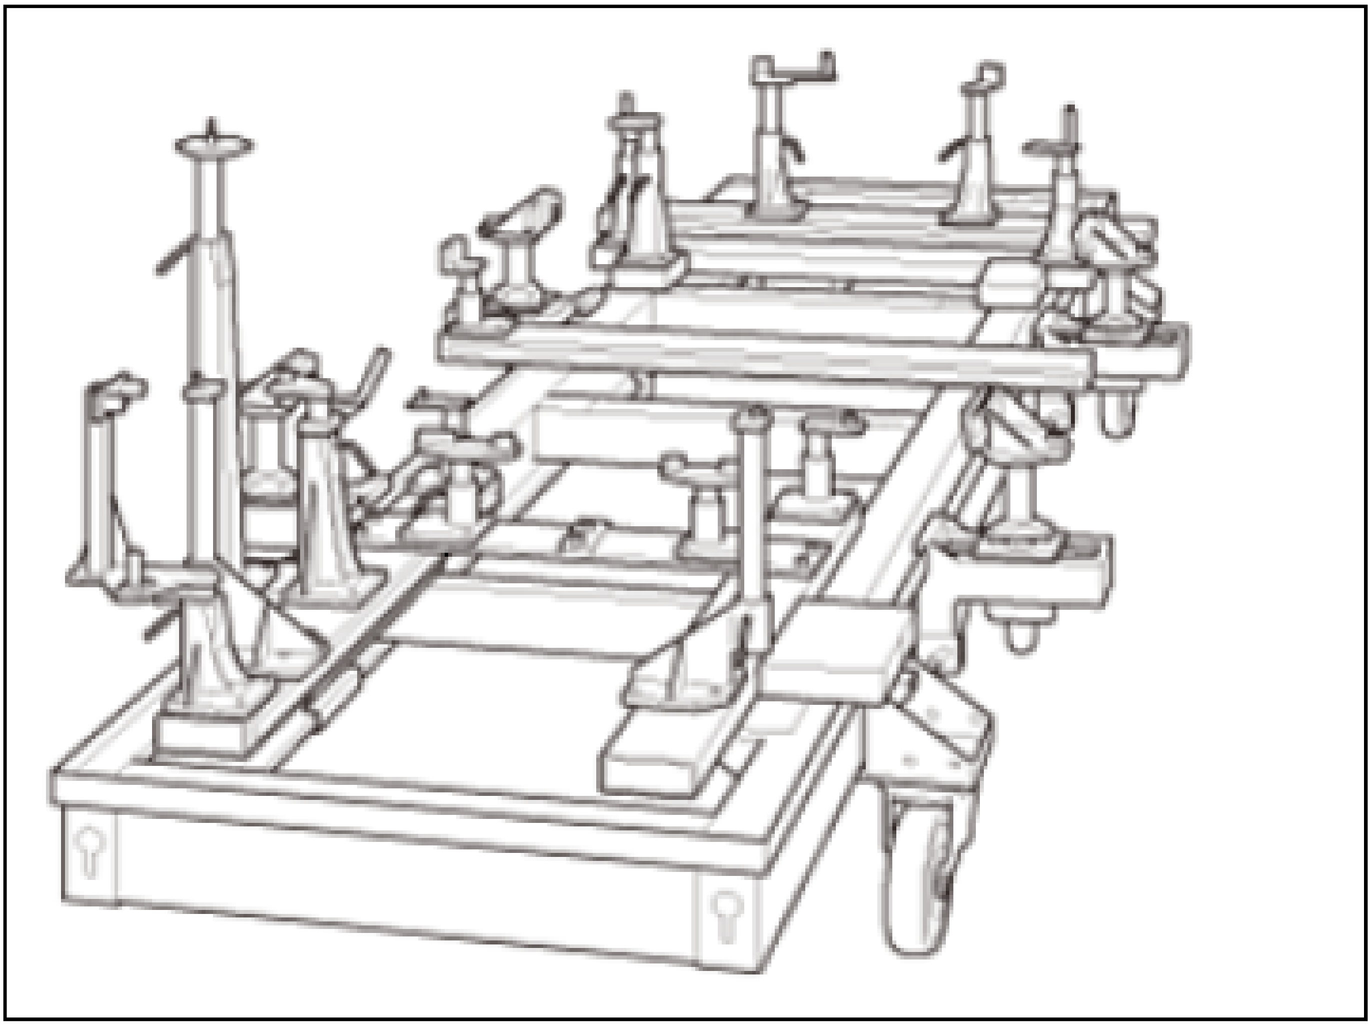


- Used to measure body dimensions when correcting the body structure on a bench.
- There are two types; mechanical type and jig type.

Mechanical type



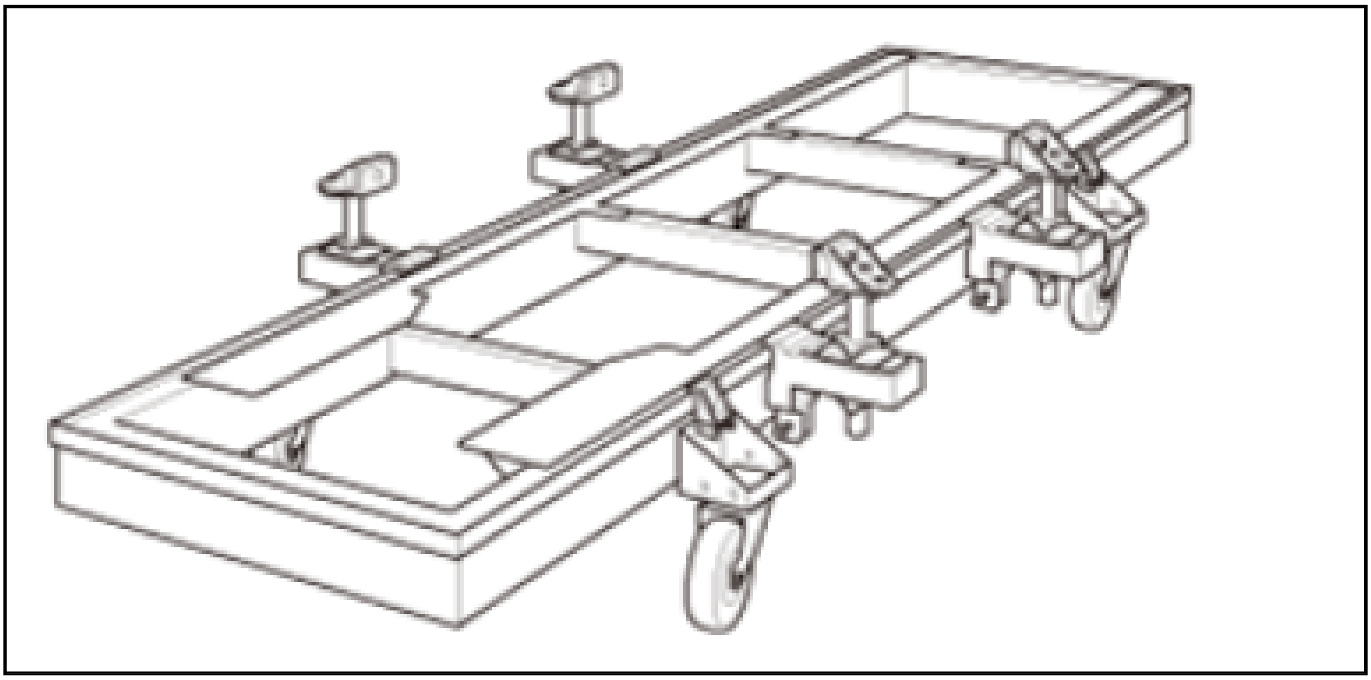
Jig type



Frame Correction Machine

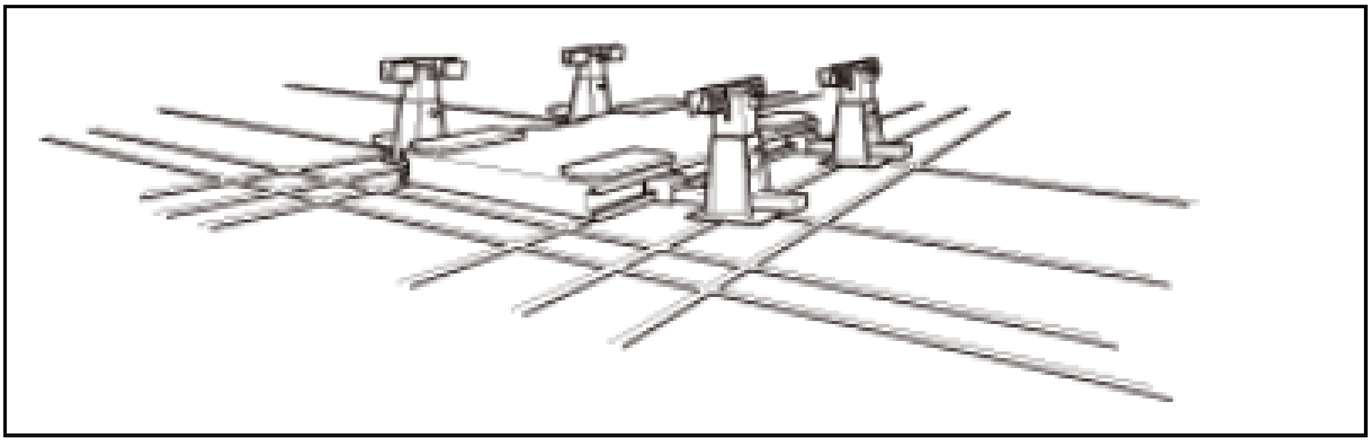
Bench Type

- Used for heavier damage levels.
- Bench can be used as a standard to obtain accurate body dimensional measurements before and during pulling.
- Tight clearances between the bench and vehicle body can make some underbody work difficult.



Floor Type

- Used for relatively light damage.
- Set up is easier than bench type equipment.
- Allows pulls to be made in multiple directions with multiple points.



OTHER TOOLS

Air Chuck Grinder

- Heads can be changed according to the type of work, making this a very versatile tool.

Main usage types:

- Grinding wheels

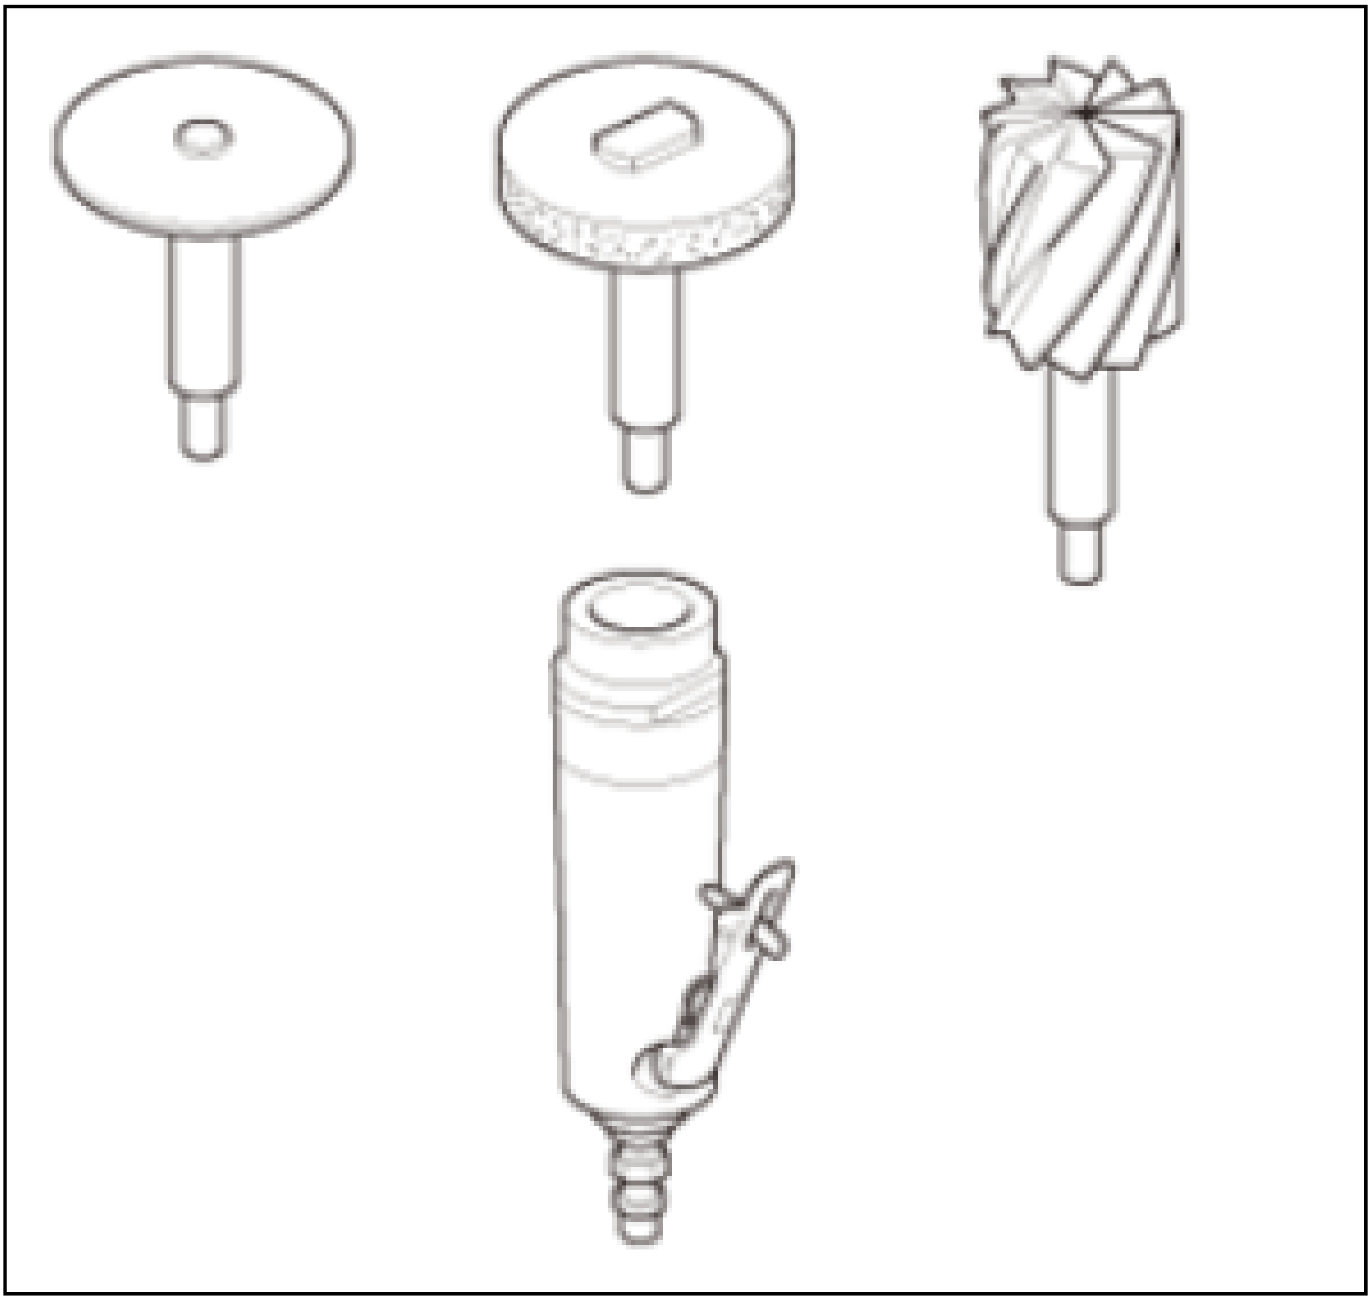
  Used to remove spot welds where a spot weld cutter cannot be used due to space limitations.

- Rotating wire brush

  Can be used to remove body sealer, paint layers and rust.

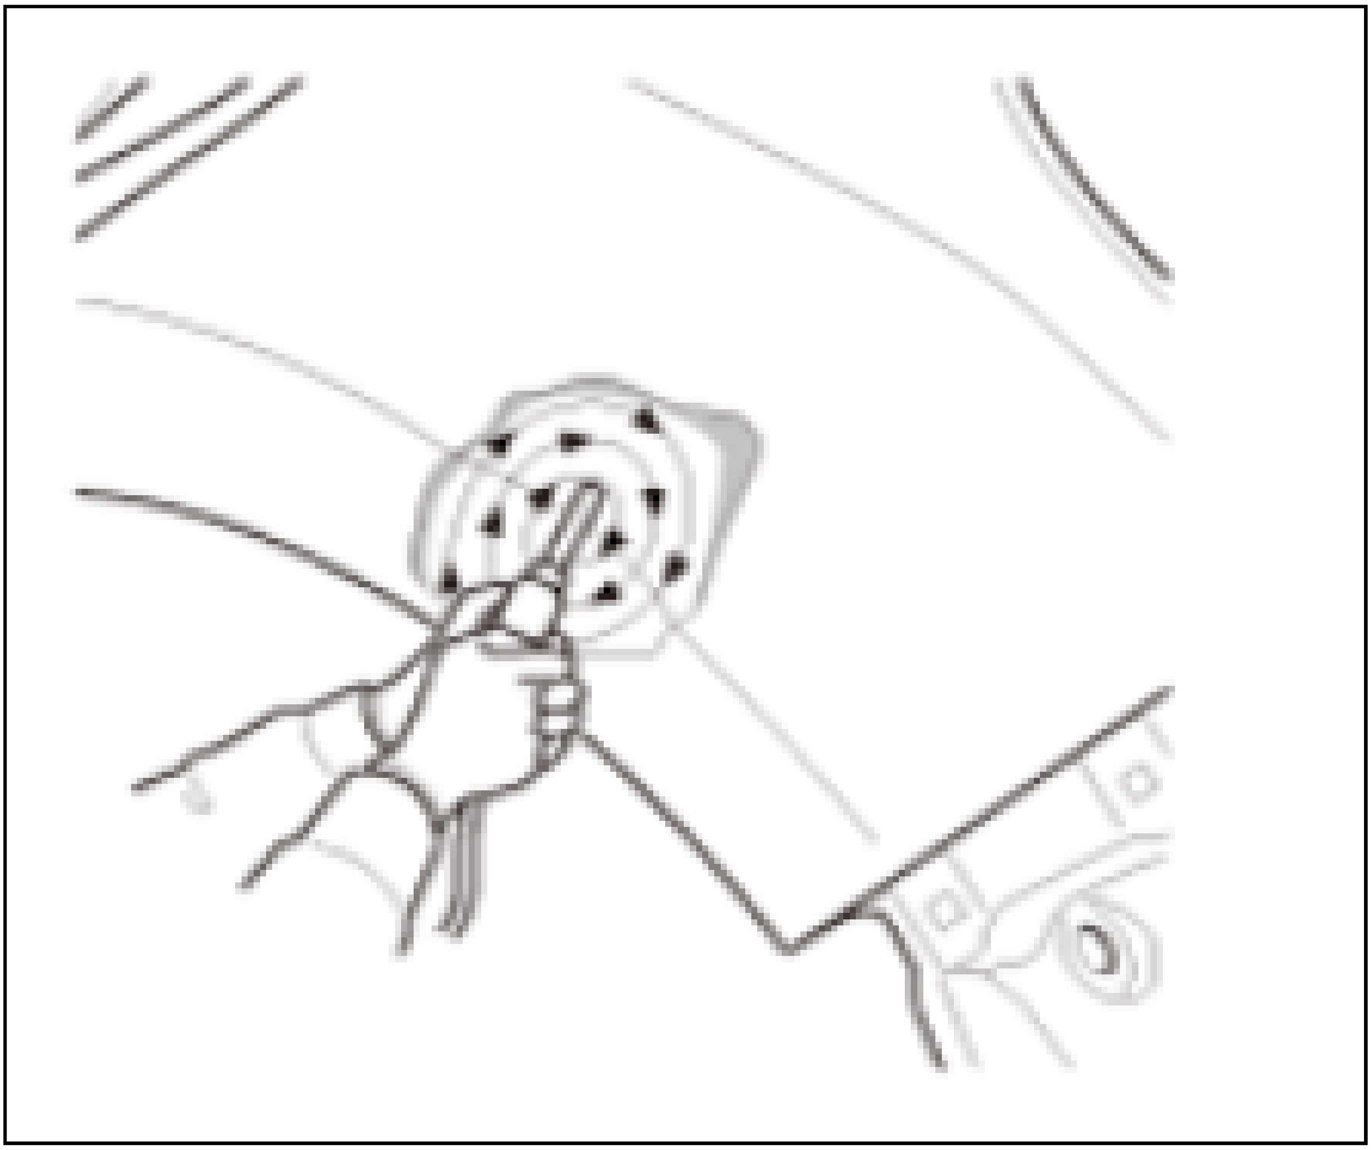
- Rotary cutter

  Used to peel off fillet welding on aluminum alloy body.

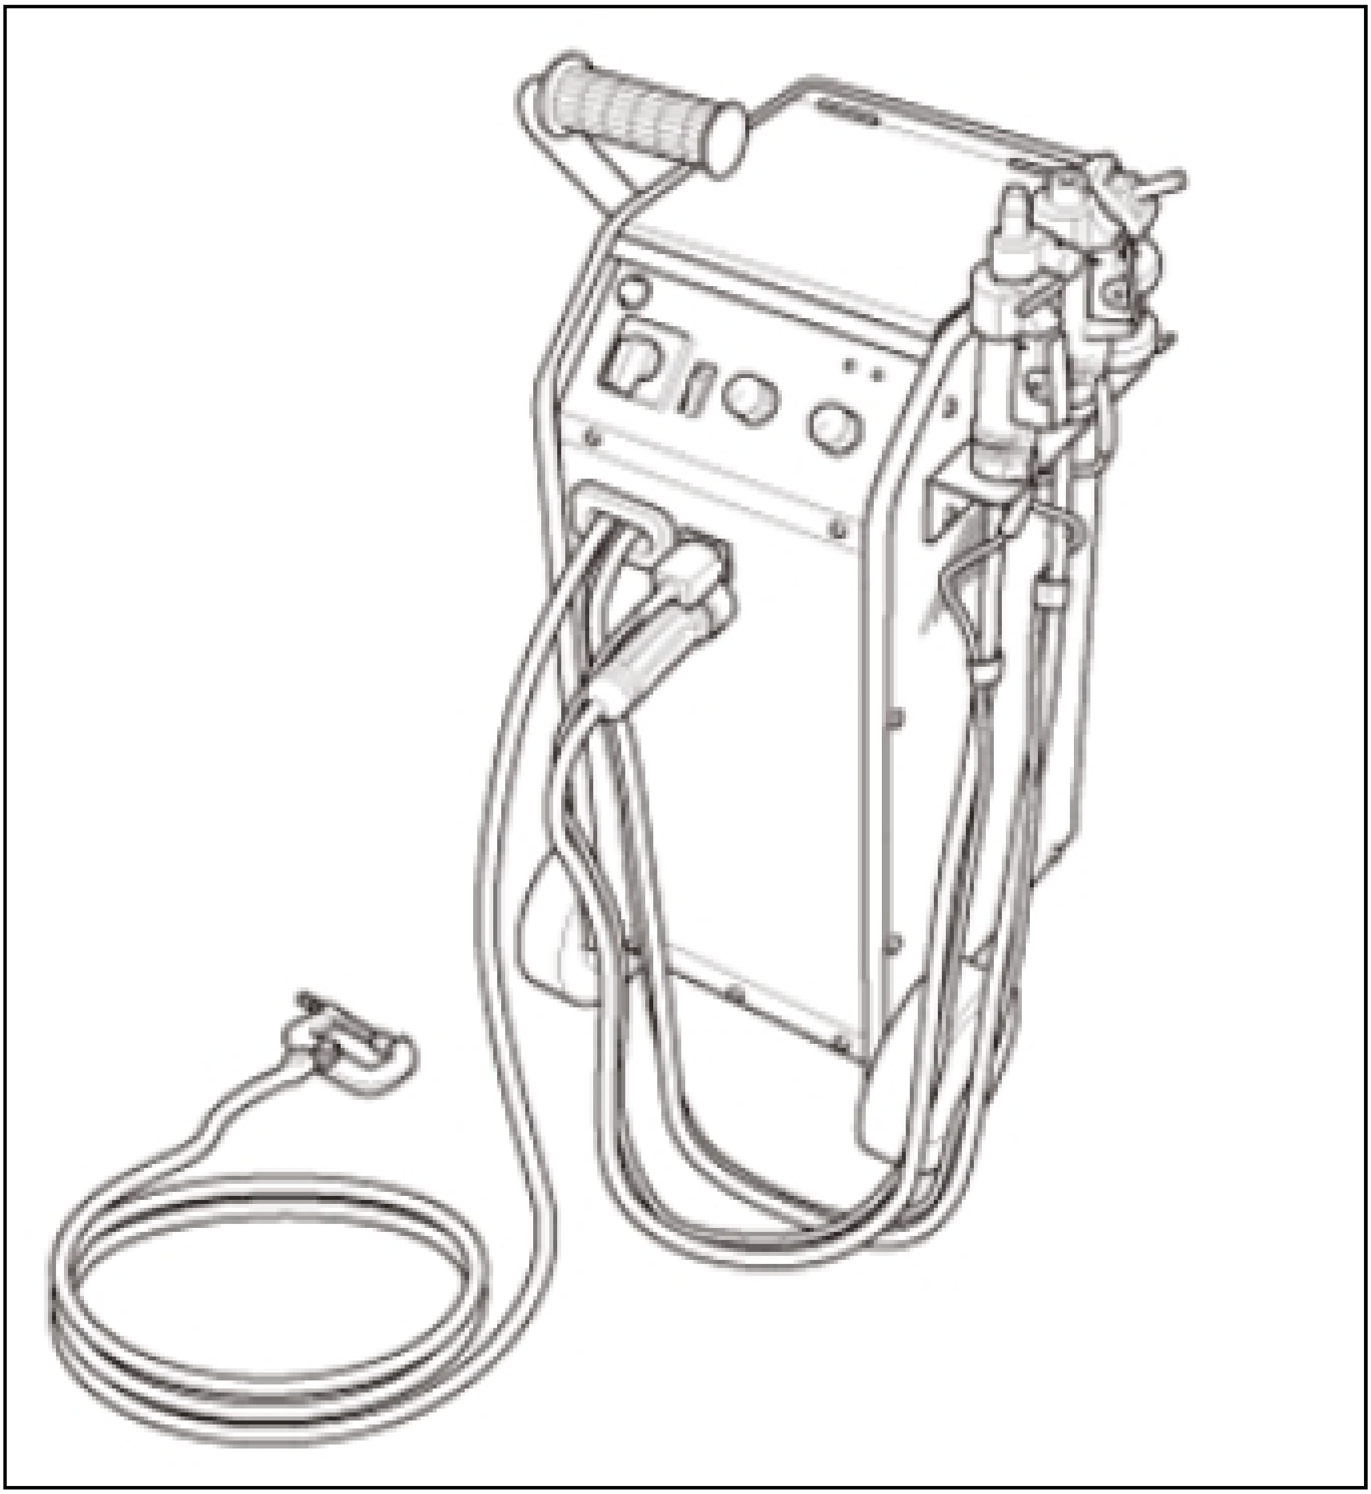


PANEL REFORMING TOOLS

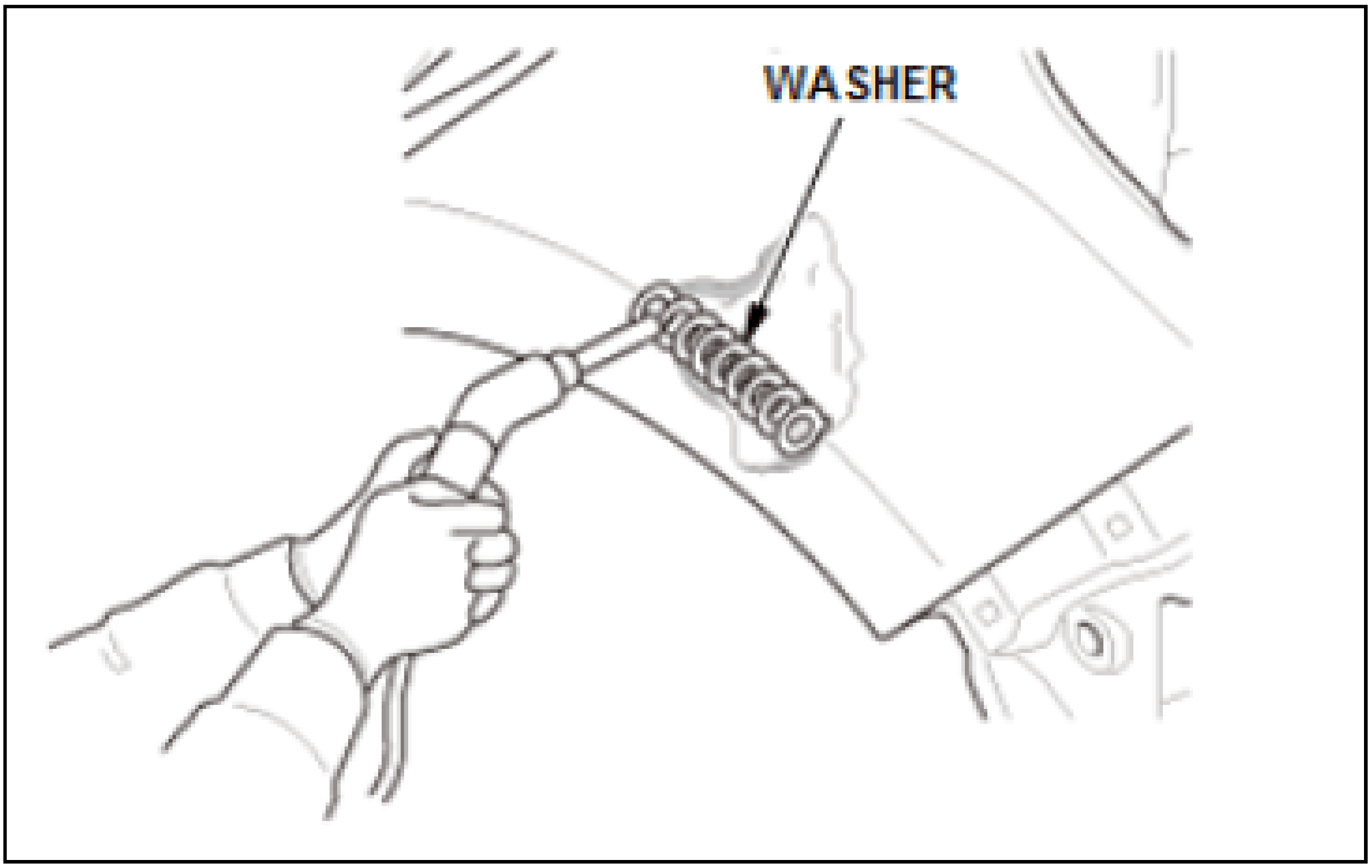
Drawing By Carbon Electrode



Washer Or Stud Welding Machine



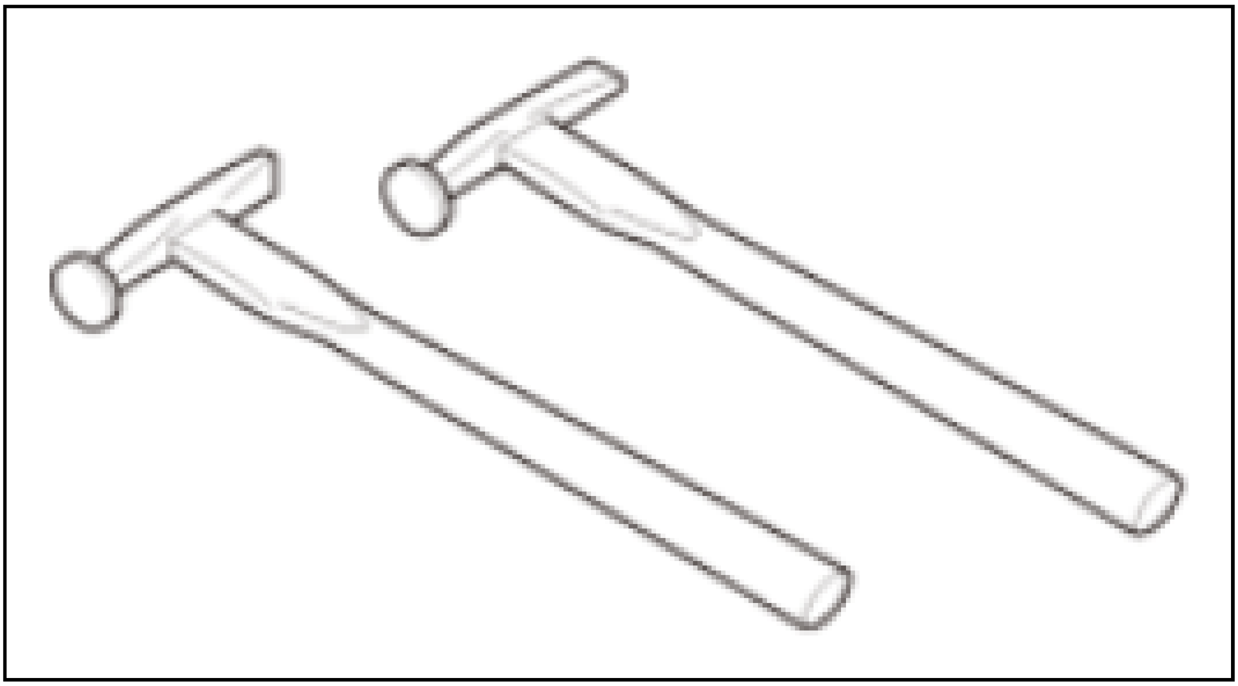
- Used to pull out damaged panels by attaching metal washers or studs.
- Allows working the panel from the outside when the back side of the damage is not accessible.
- Drawing work is possible with the use of carbon electrode.



Hammers

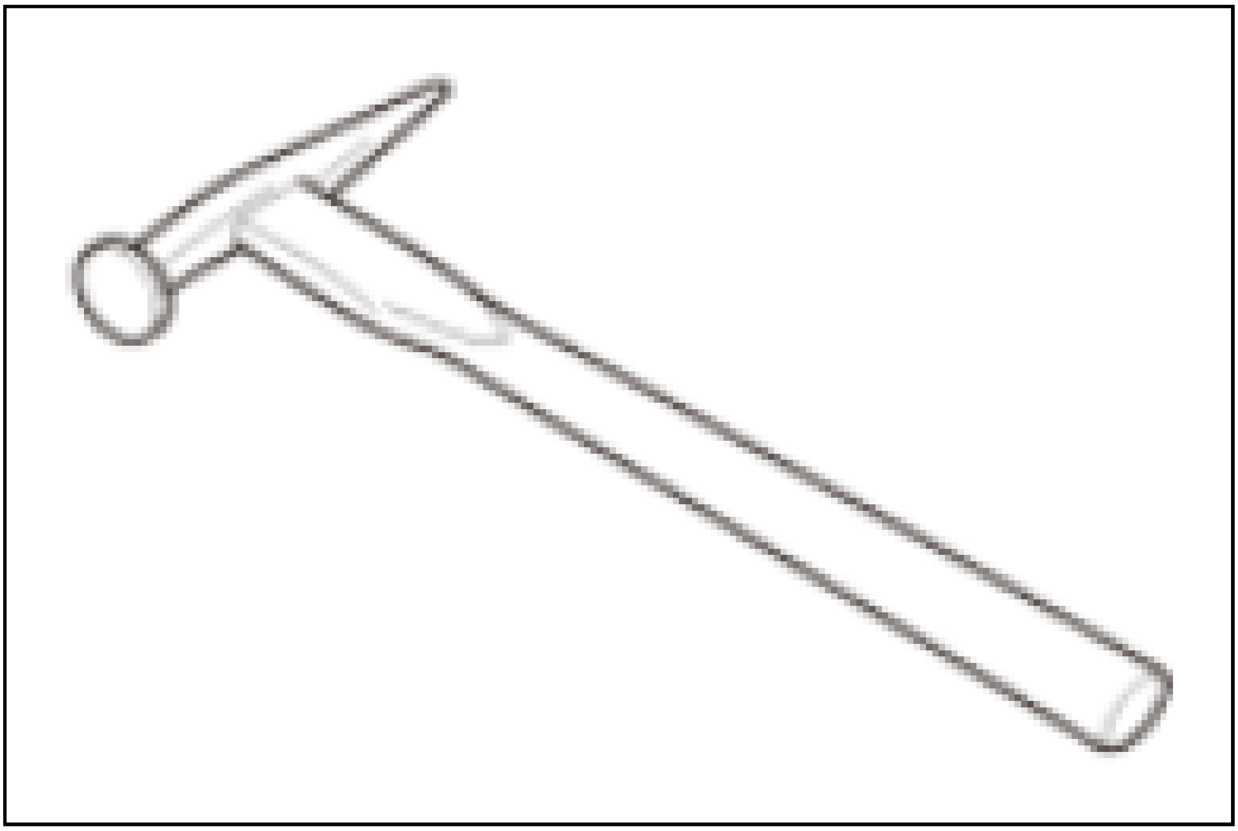
- **Leveling Hammer**

  Used with a dolly and spoon for panel reforming.

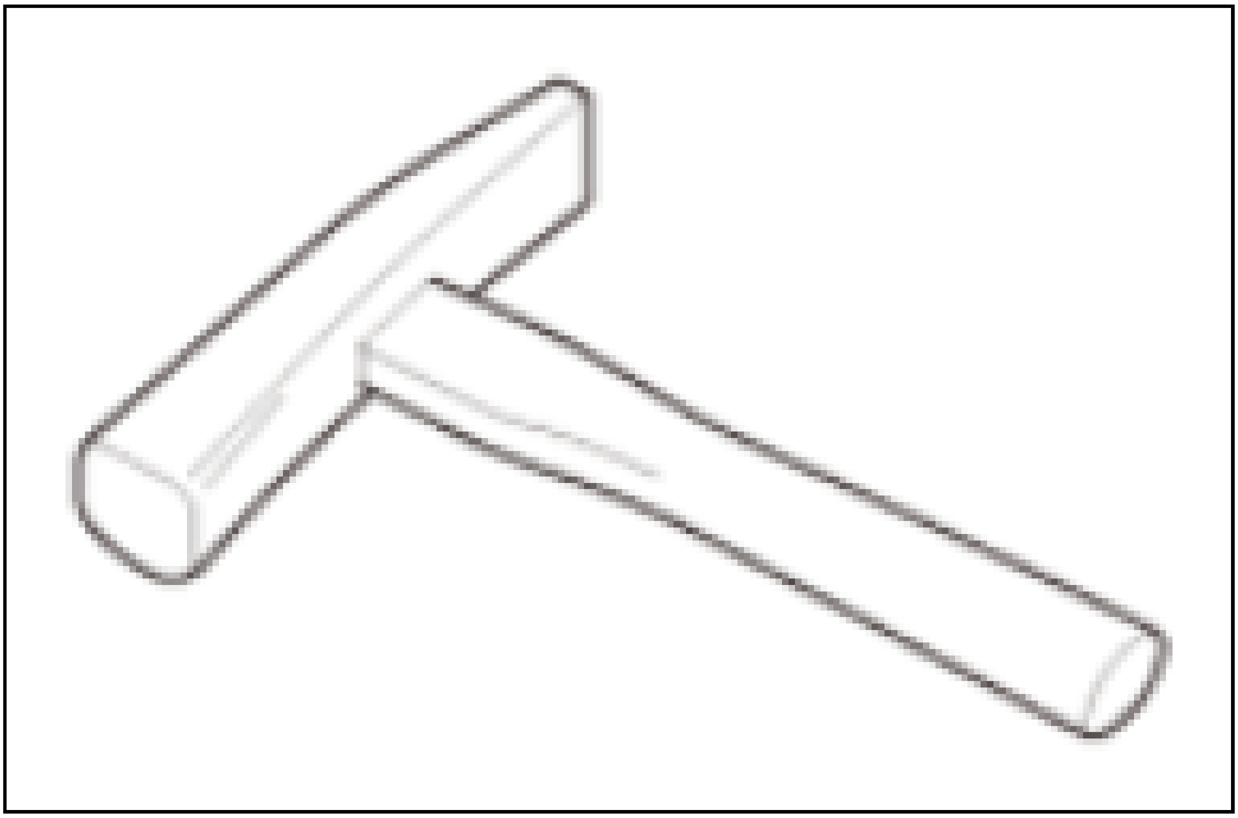
- **Pick Hammer**

  Used with a dolly and spoon for panel reforming.



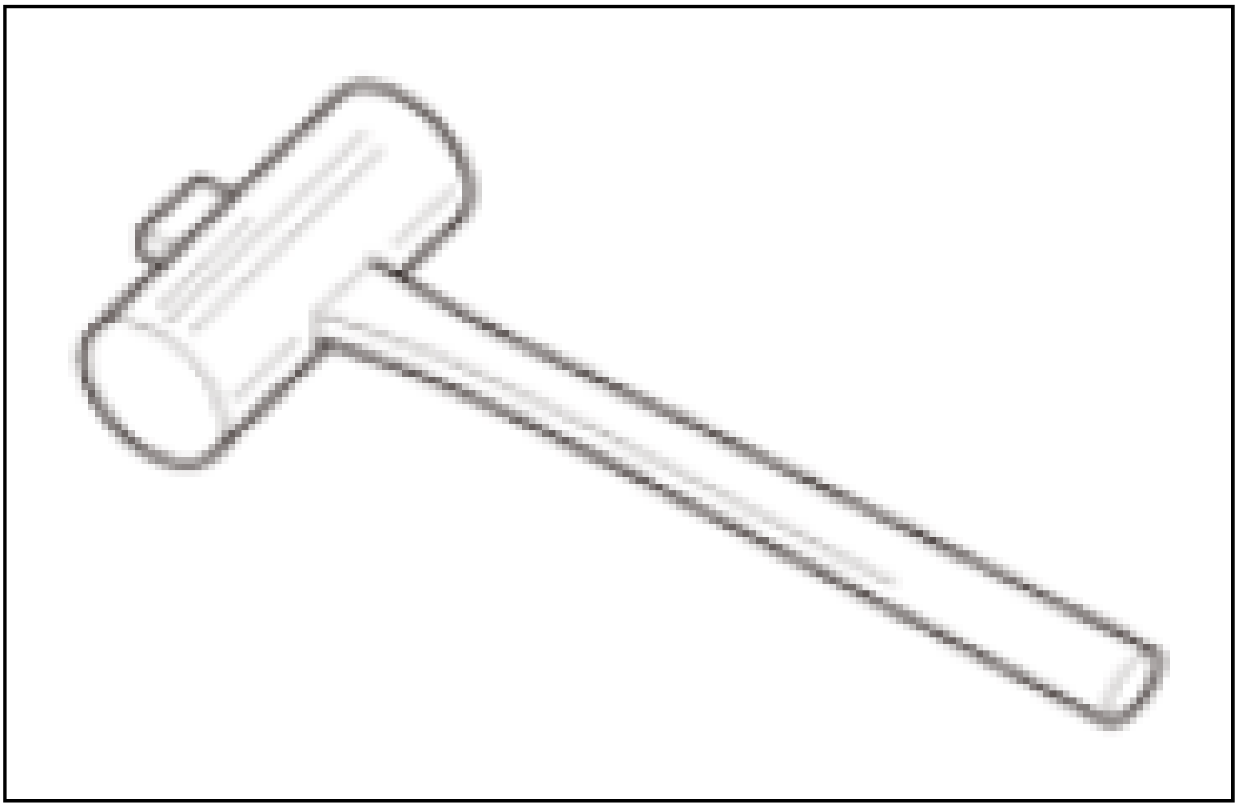
- **Rough Pulling out Hammer**

  Used with a body/frame correction machine and/or a porto-power for rough repairs. Also can be used to remove outer panels.



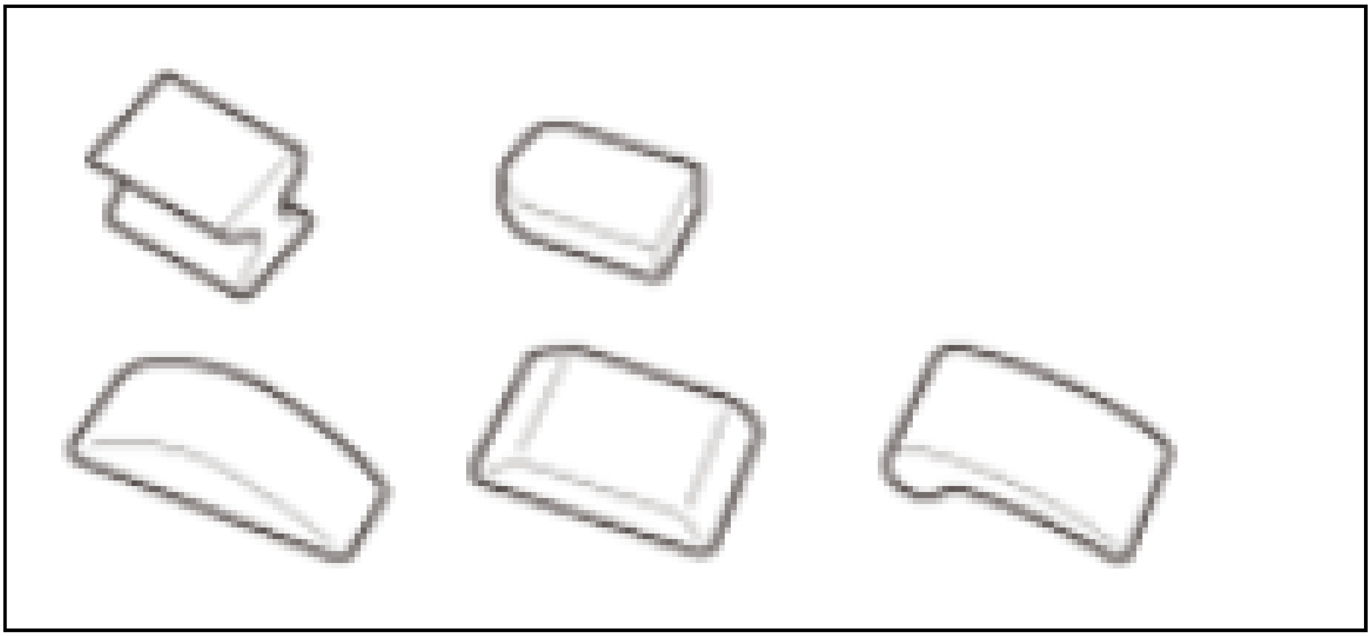
- **Wooden Hammer**

  Used for reforming steel using a drawing process or for reforming a steel panel without elongating it.



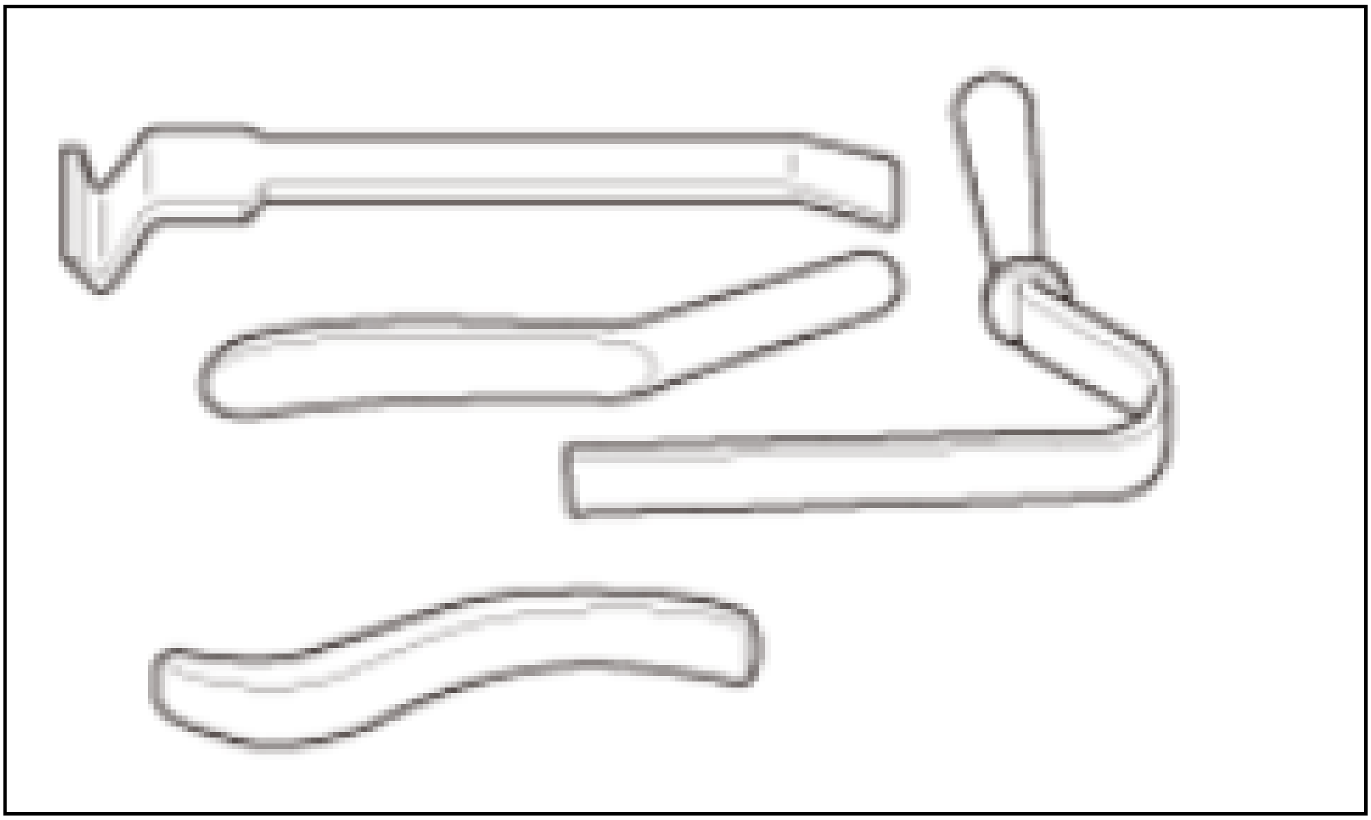
Dolly

- Used with a hammer to reform panels.
- Choose the most appropriate one according to the shape of the panel.



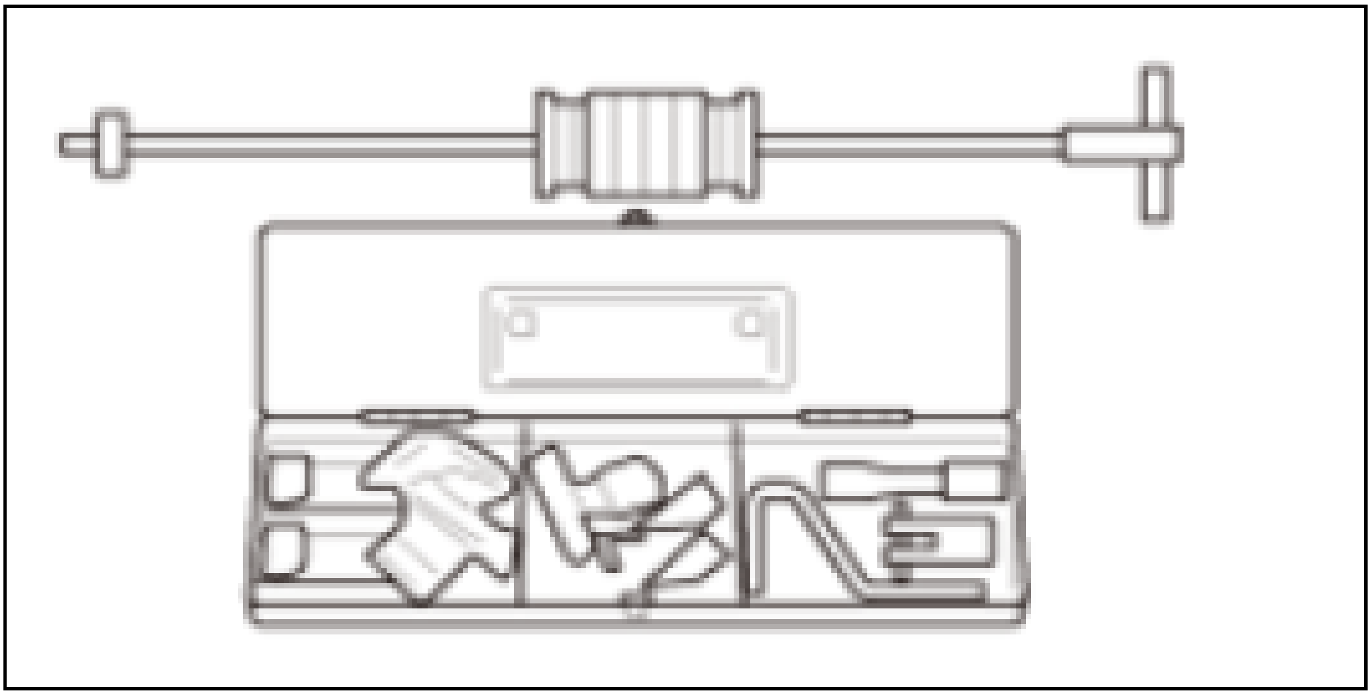
Spoon

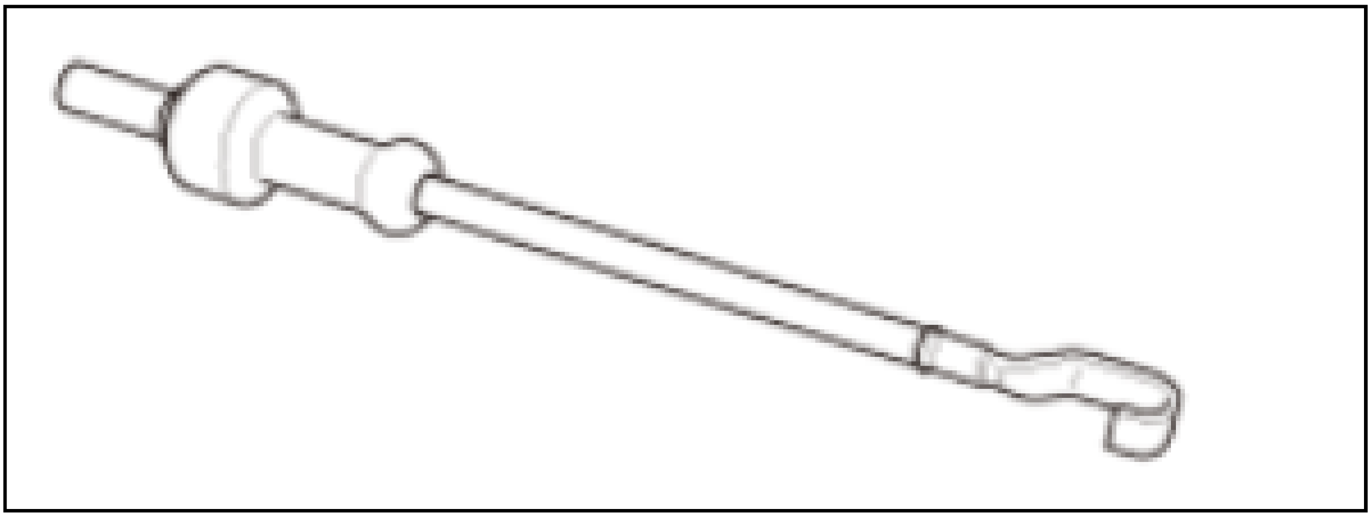
- Used where a dolly cannot be used because of a space limitations.
- Very durable because of it's special material construction.
- Select the most appropriate one according to the shape of the panel.



Body/Dent Puller (Slide Hammer)

- Used to pull-out panels with minor damage.
- Used for a wide range of applications by the combination of attachments and slide hammers.

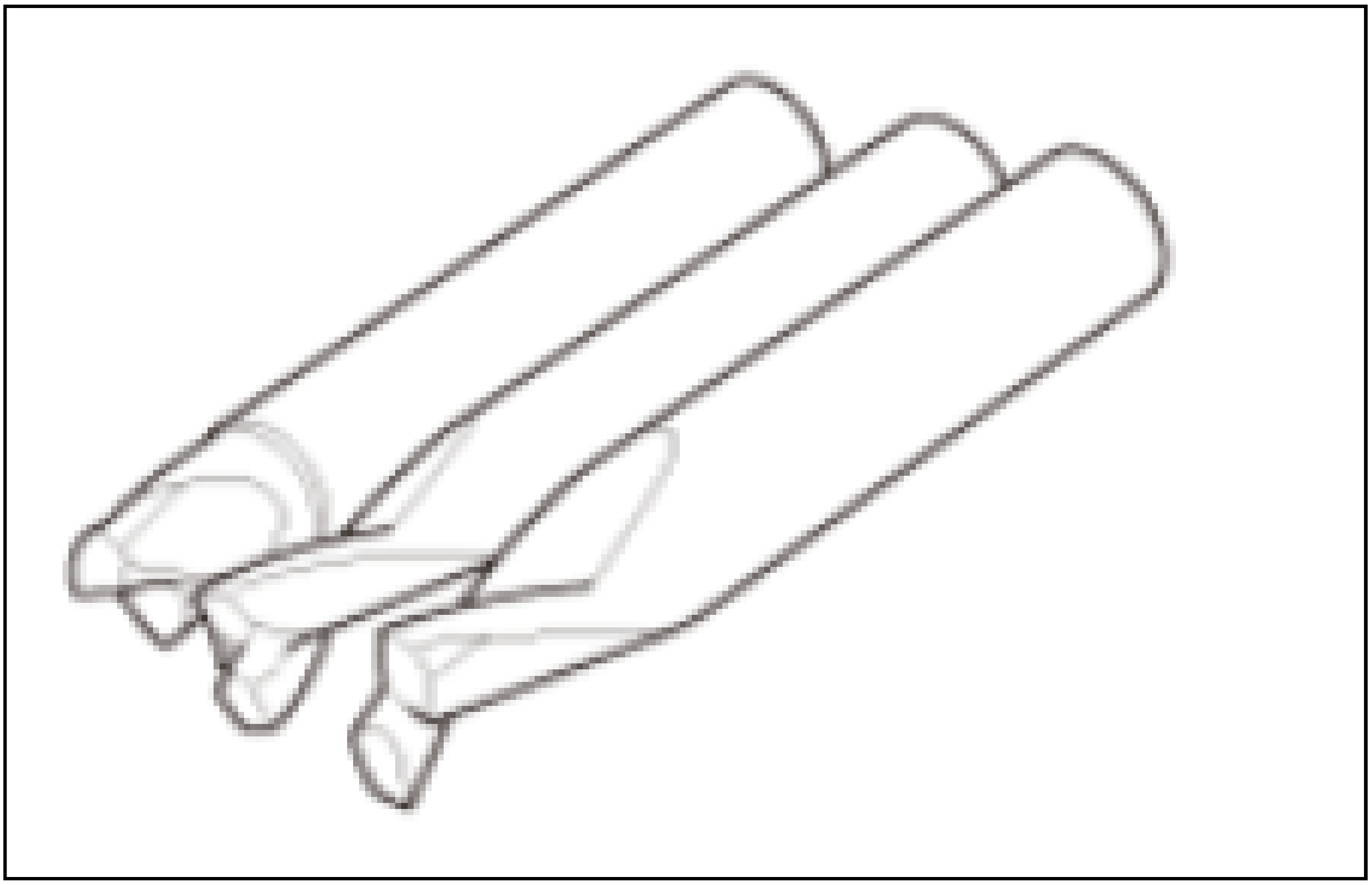




SPOT WELD REMOVAL TOOLS

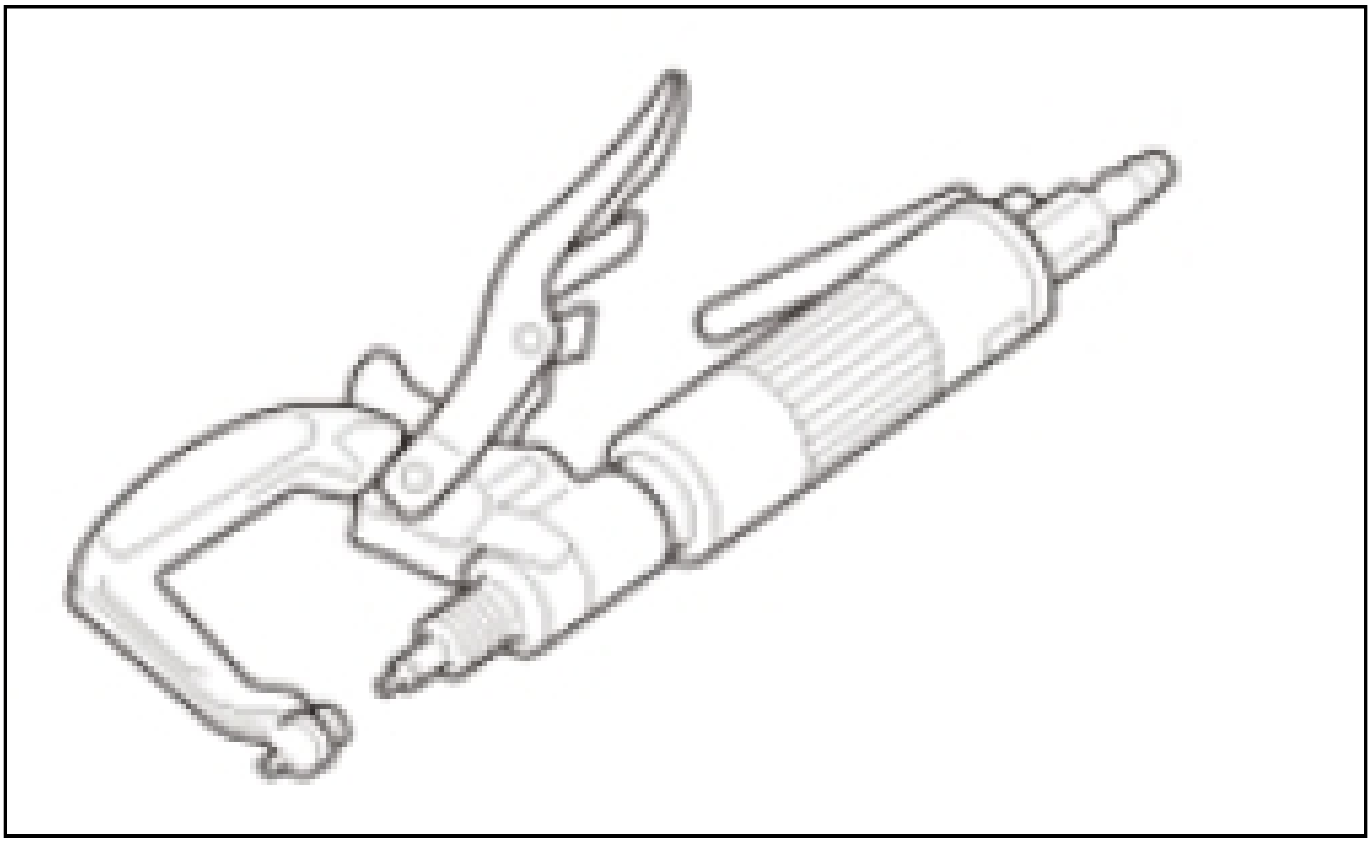
Spot Weld Cutter (Drill Type)

- Used with an air drill to remove spot welds.
- Makes finishing work easy because it does not leave any nuggets on the base material.



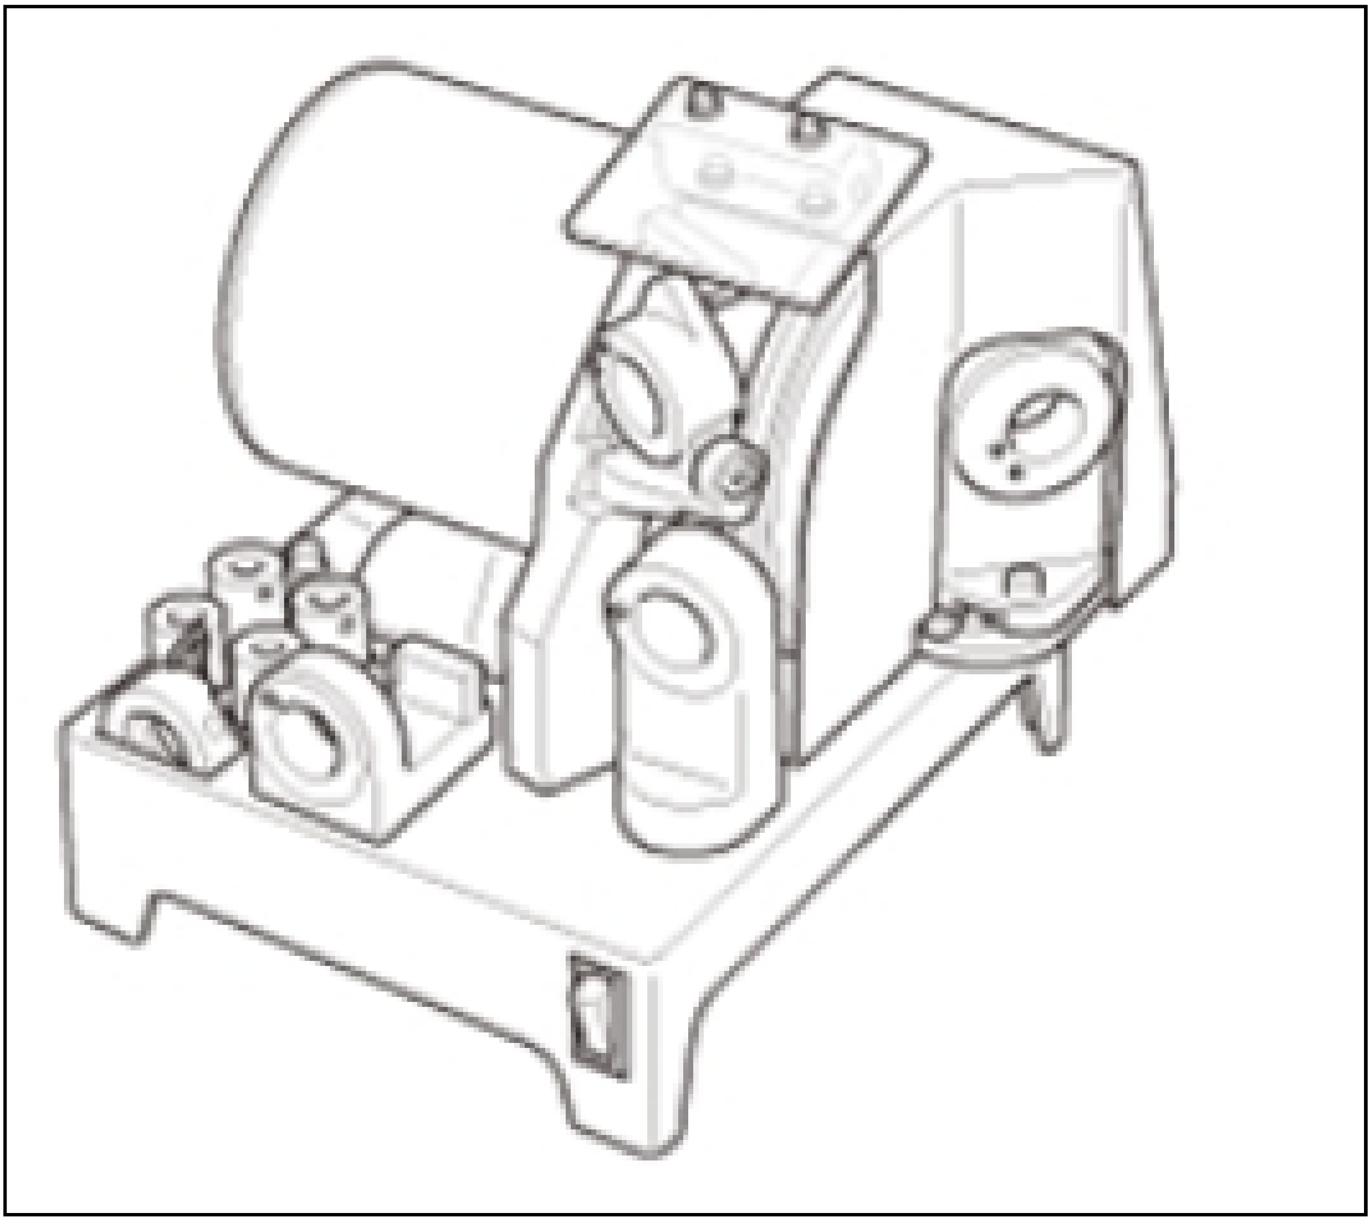
Spot Weld Drill

- Dedicated tool used to remove spot welds.
- Some models are specifically designed for cutting spot welds on high and ultra high strength steel parts.
- Maintains pressure and centering on the weld nugget while cutting.



Spot Weld Cutter Sharpening (Grinding) Machine

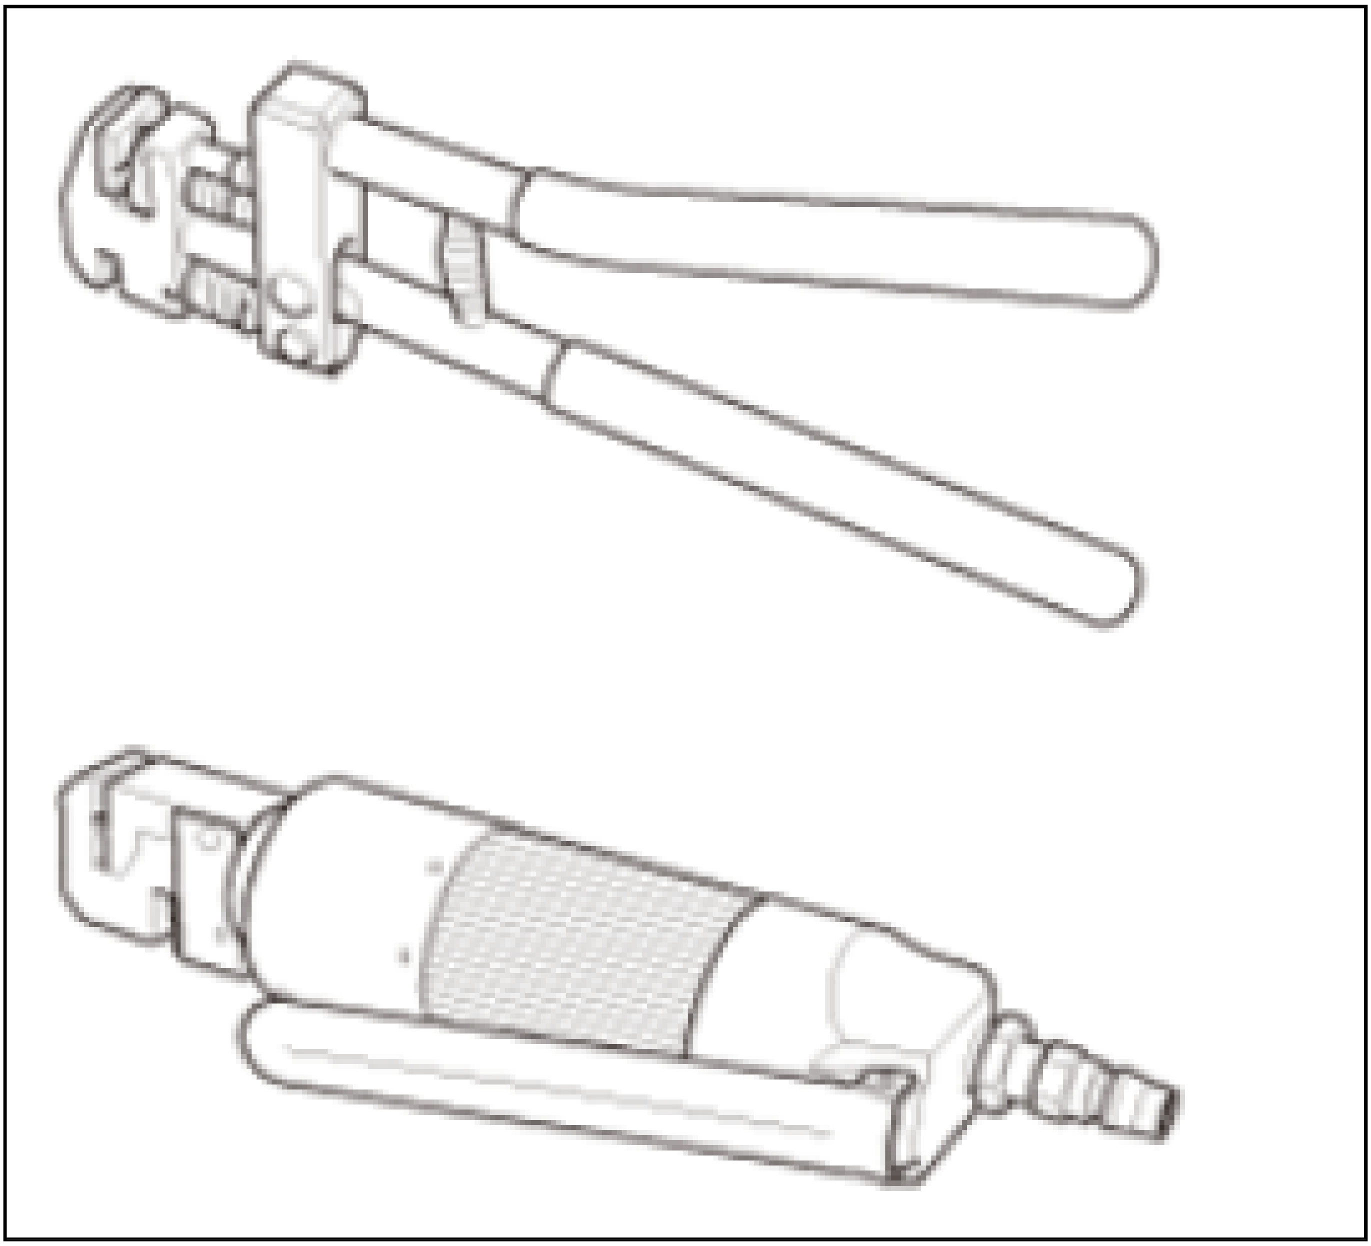
- Used for grinding and sharpening spot weld cutters.
- Easily and quickly grinds and sharpens spot weld cutters.



PANEL REPLACEMENT AND CRIMPING TOOLS

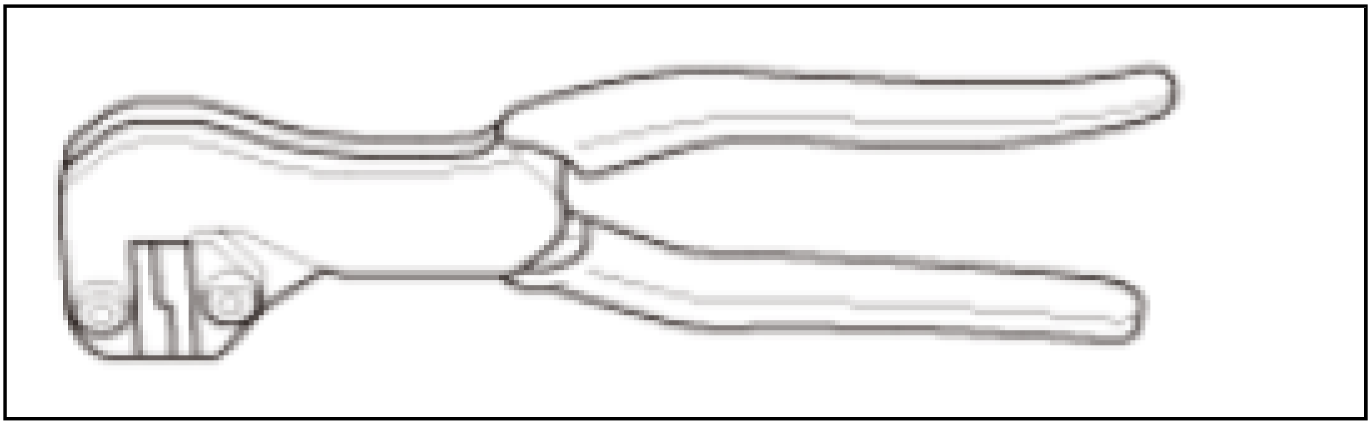
Steel Hole Punch

- Used to make holes for MAG plug welding.
- Reduces time required for making holes - No drilling.
- Makes burr-free holes.
- There are two types; manual type and air type.
- May be difficult to use on some higher strength steels.



Hemming Tool

- Used for hemming work for outer door panels.
- Expertise or high skills not required.
- Clean finish.



Hemming Pliers

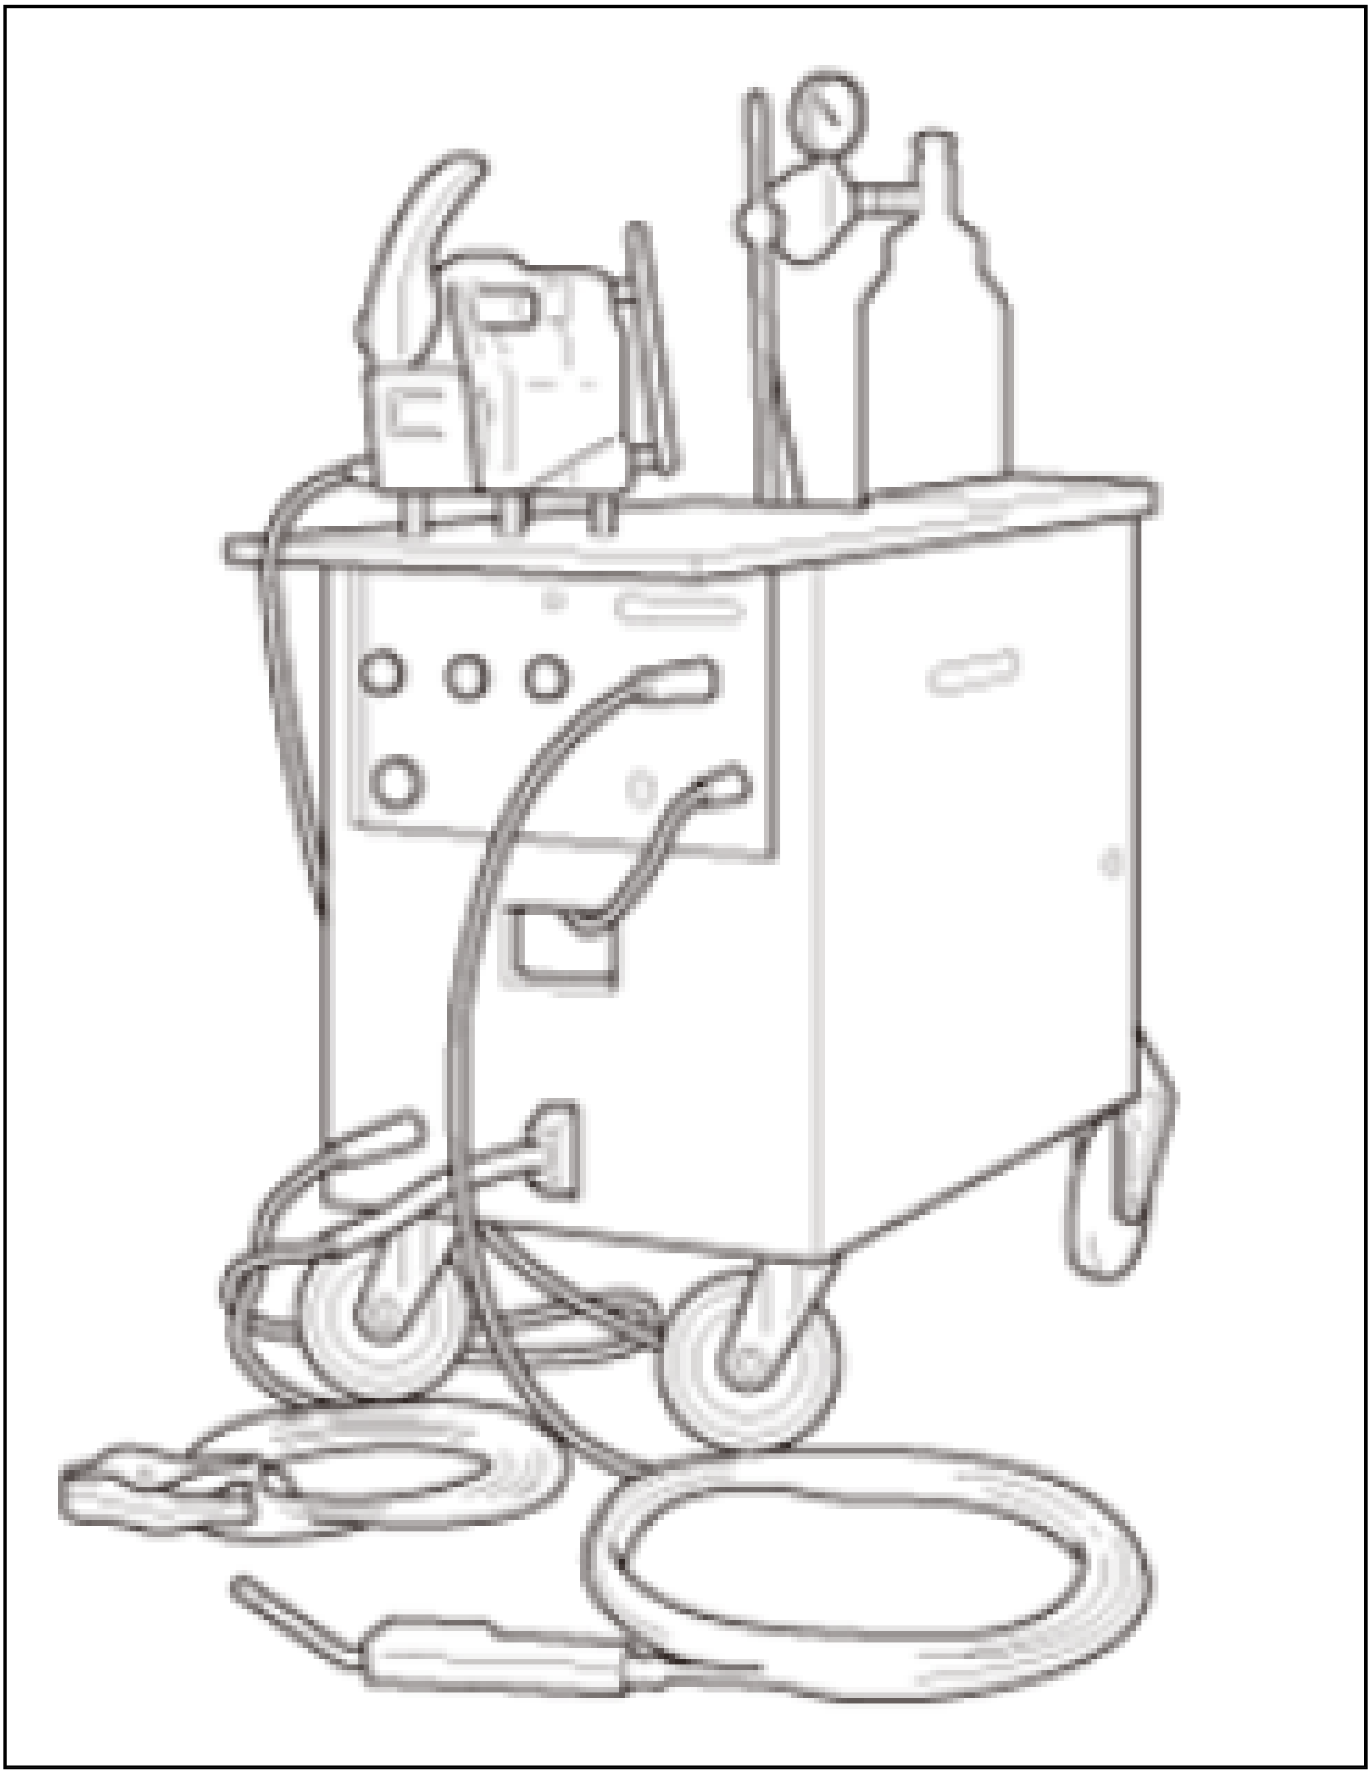
- Used for wheel arch area when replacing rear outer panels.
- Flanging work easily done.
- Air powered versions available.

WELDER

MAG/MIG Welder

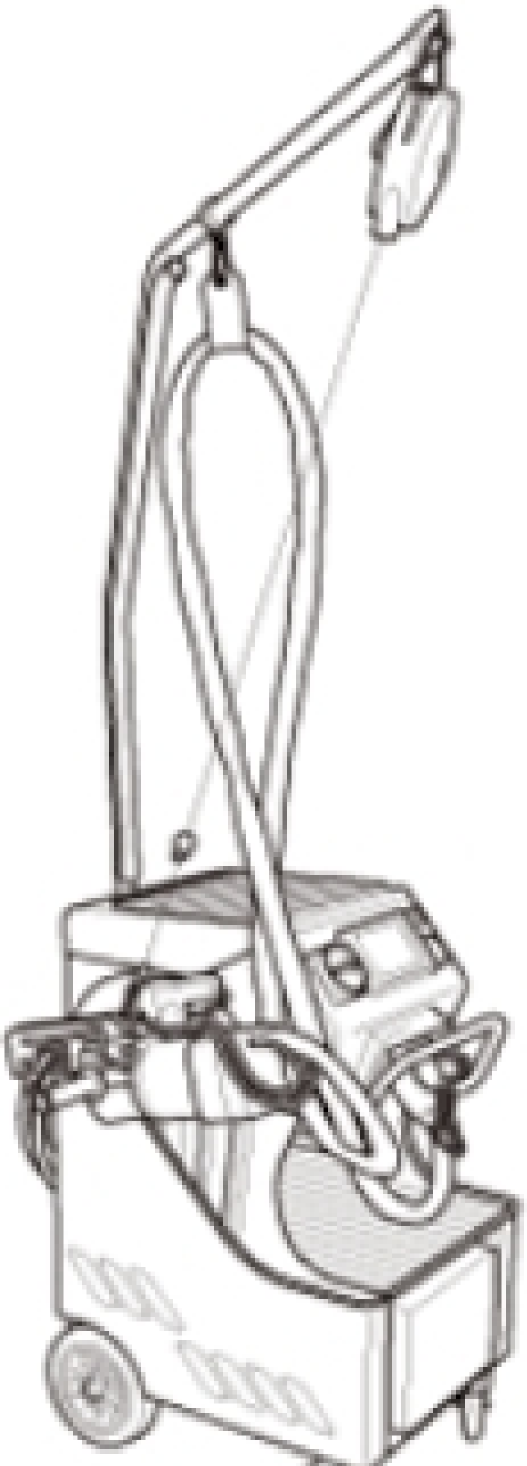
- Used for MAG welding or MIG brazing of steel panels or aluminum.
- A high quality weld can be achieved because shielding gas prevents oxidation and nitriding, reducing distortion.
- Because welding can be done only from one side, the range of application is wide.

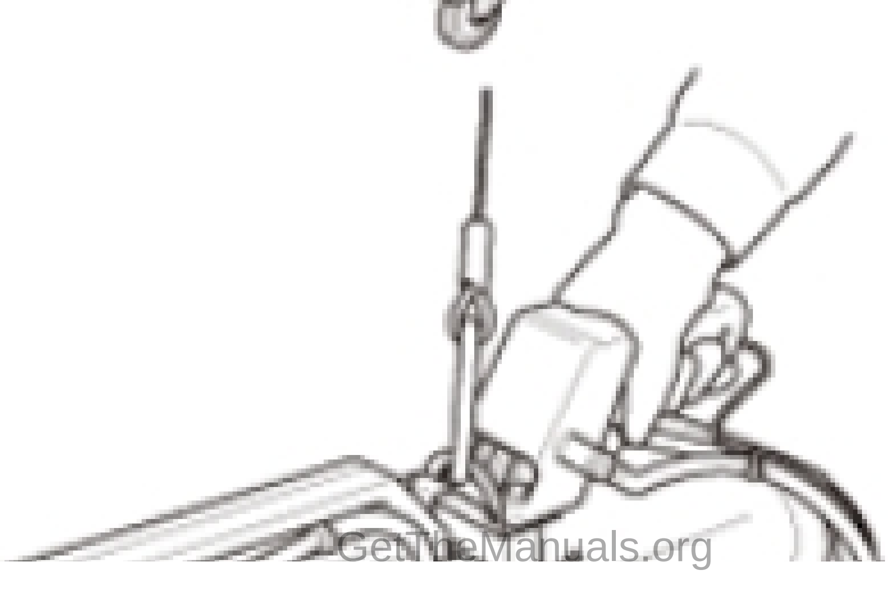
NOTE: **The shielding gas used varies depending on the welding or brazing type.**

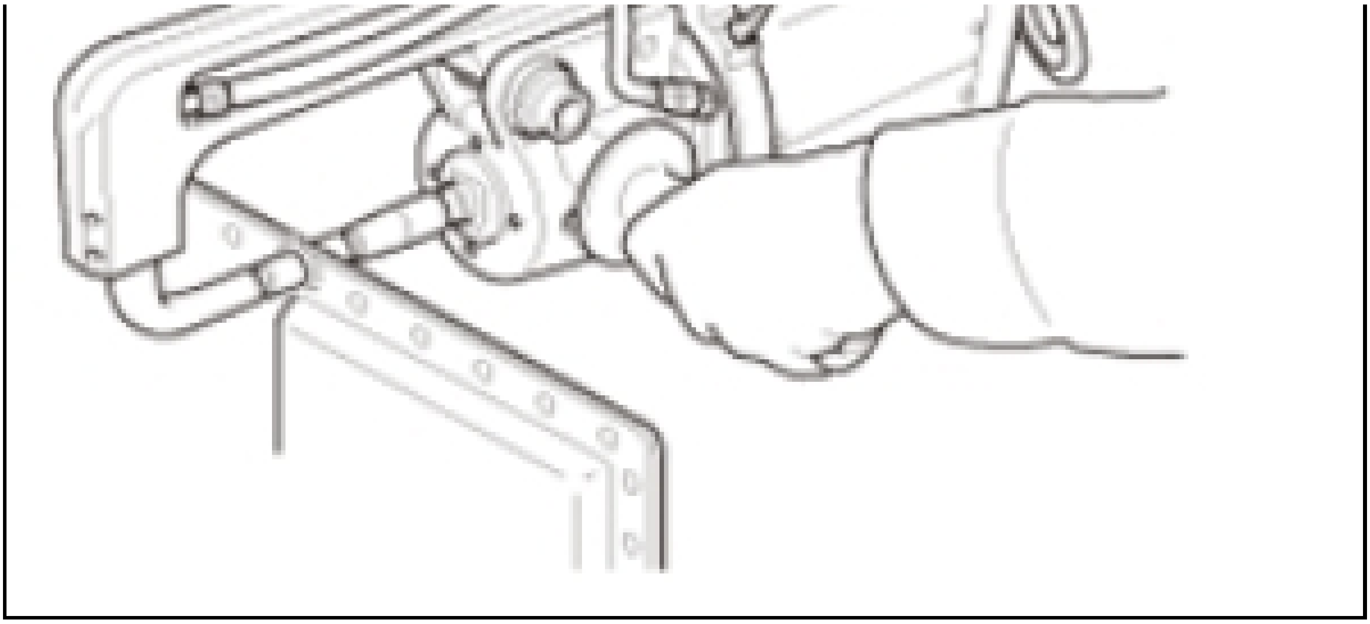


Squeeze-Type Resistance Spot Welder (STRSW)

- Used to clamp and weld steel panels.
- Because the time required for welding is short and heat application is localized, heat affect zone (HAZ) and distortion are minimal.
- Required when welding with ultra high strength steels (>980 MPa)
- Also good for welding thin panels.
- Faster and more efficient than MAG plug welding.







SAFETY AND CLEANLINESS

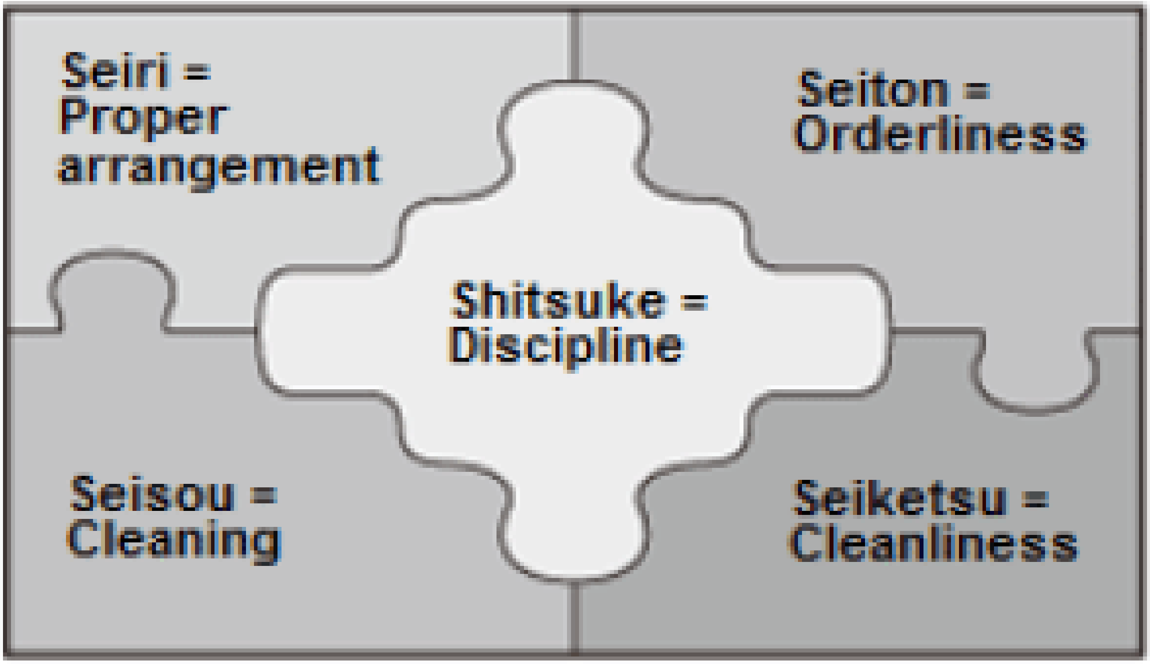
5S (ORGANIZATION OF WORK ENVIRONMENT)

5S means:

- Sort (Seiri)
- Straighten (Seiton)
- Shine (Seisou)
- Standardize (Seiketsu)
- Sustain (Sitsuke)

Use of the 5S process is required to build a safe and comfortable working environment. It also promotes efficient and smooth workflow:

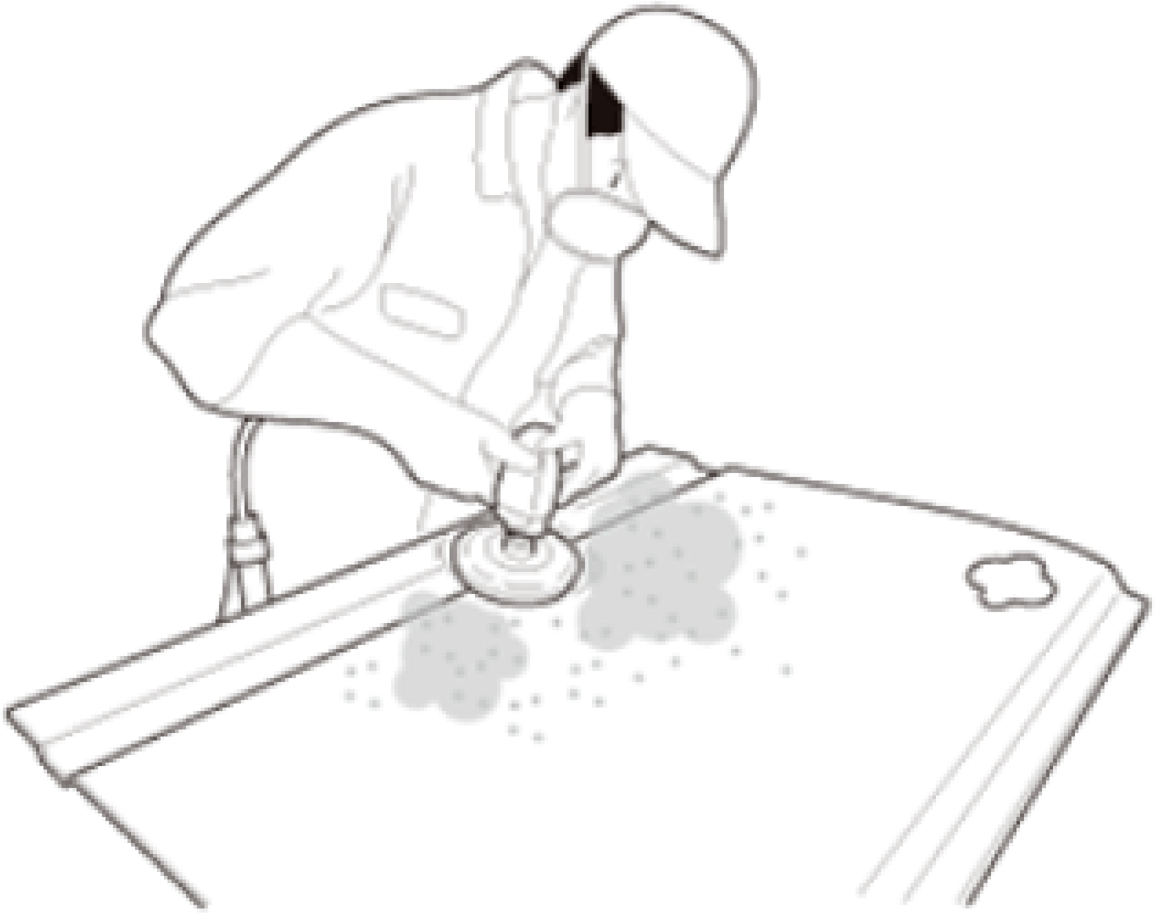
- Sort (Seiri): Sort out what is necessary and unnecessary. Remove or clean up unnecessary items.
- Straighten (Seiton): Organize the items so they can be accessed and used immediately when needed.
- Shine (Seisou): Keep your work environment clean at all times.
- Standardize (Seiketsu): Maintain organized and clean working conditions at all times.
- Sustain (Sitsuke): Enforce the above rules for all work areas.
  - Building a standardized and clean work environment contributes directly to a highly efficient workflow. In addition, it provides a positive impression to customers and helps generate repeat business.
  - It is very important to comply with the rules and common sense in order to cultivate healthy and respectful business and work relationships.

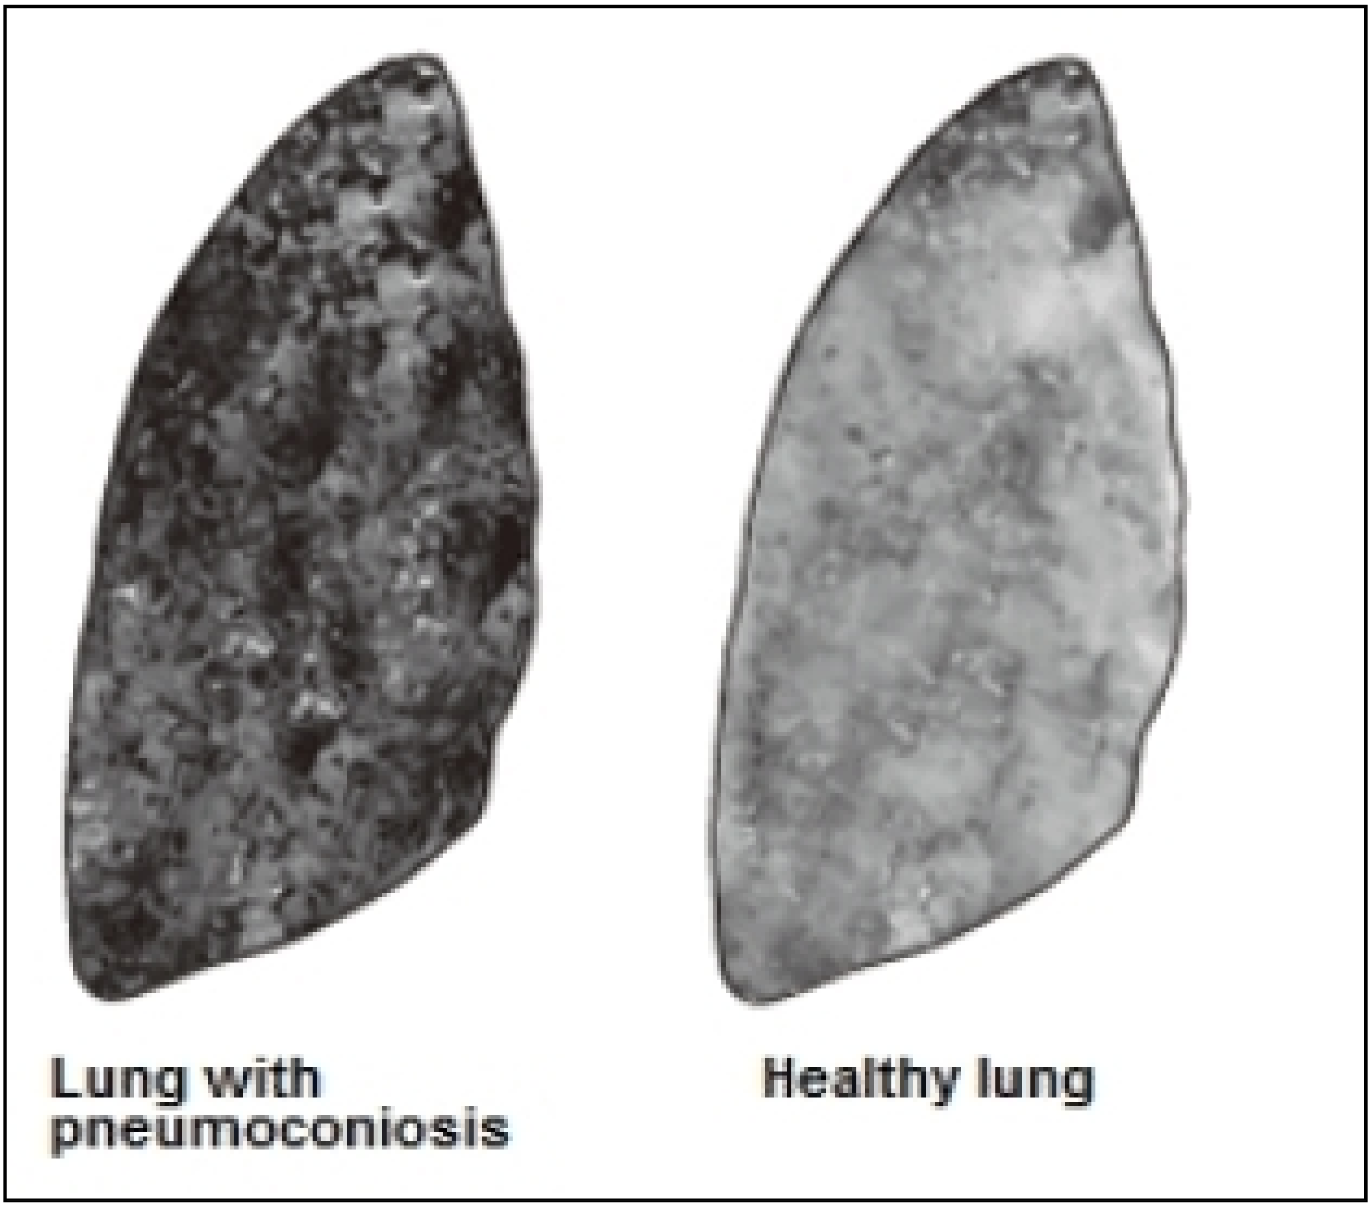


Seiri = Proper arrangement
Seiton = Orderliness
Shitsuke = Discipline
Seisou = Cleaning
Seiketsu = Cleanliness

DUST AND FUMES

Size Of Dust





Dust

- Tiny particles generated during grinding and welding processes are commonly called dust.
- Dust can enter into the lungs and may cause respiratory disorders such as Pneumoconiosis.

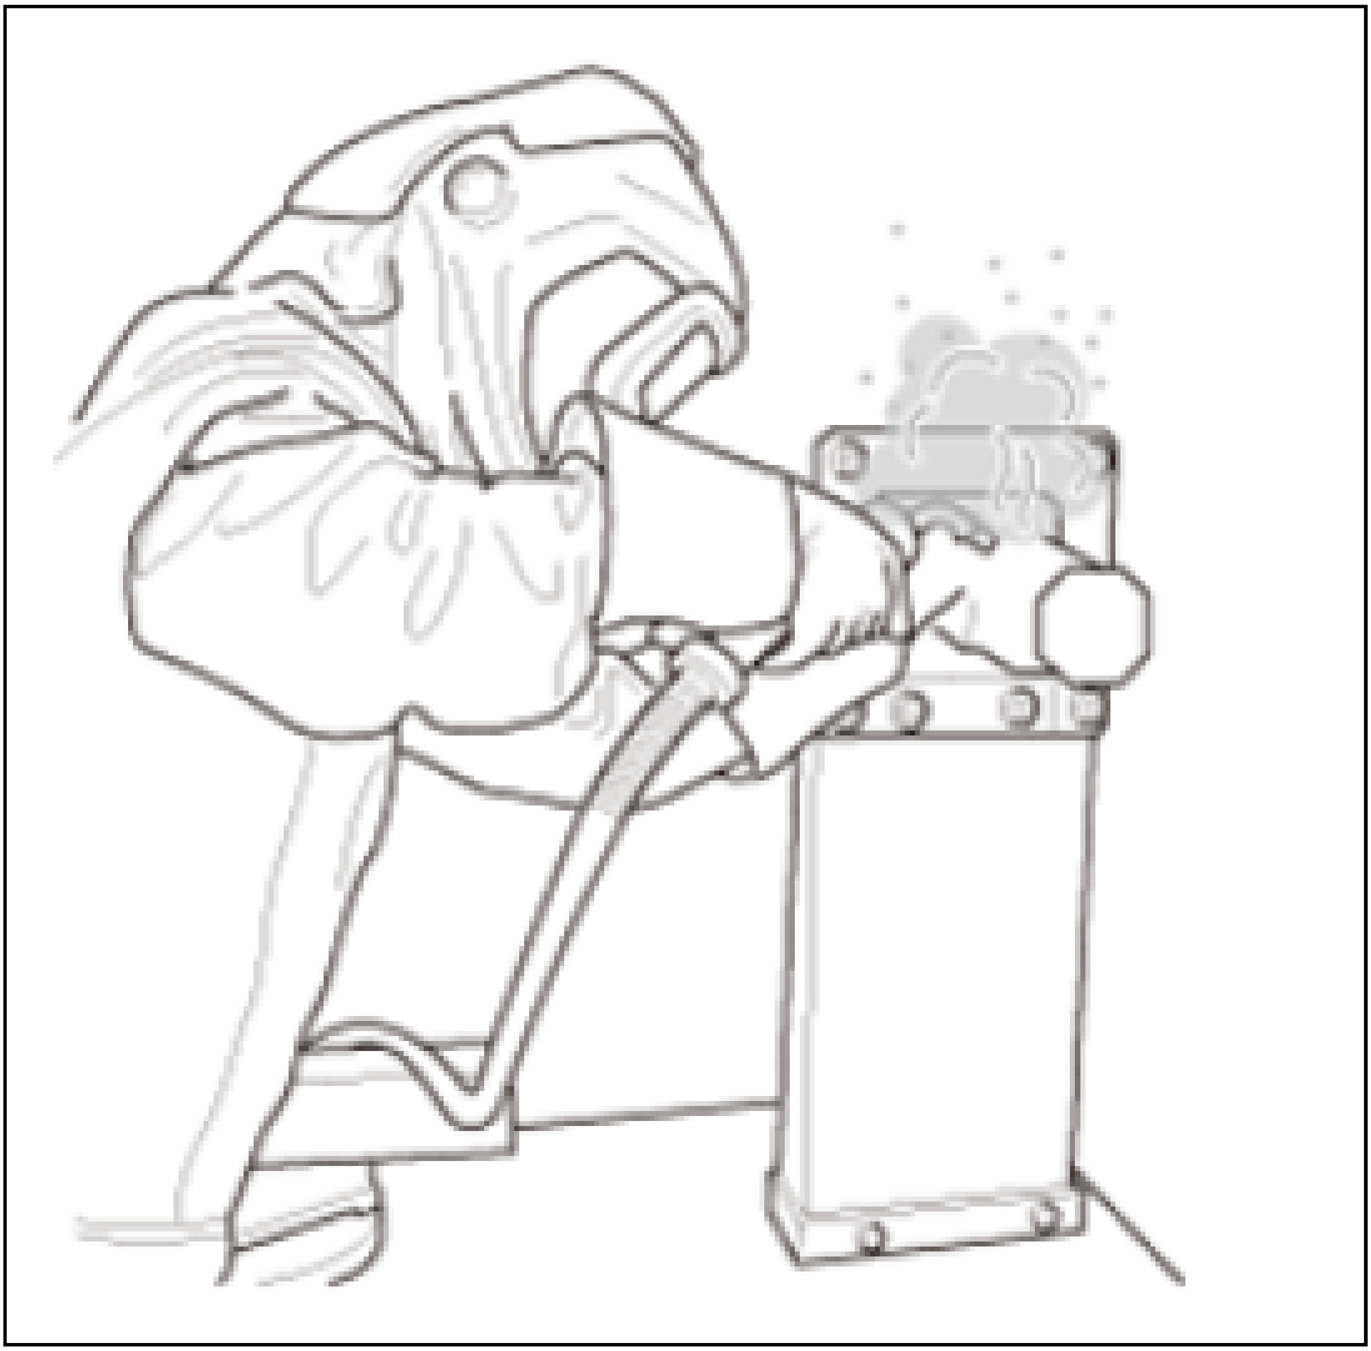
Pneumoconiosis is classified as an occupational lung disease. It is a restrictive lung disease caused by long term inhalation of dust particles.

Protection Equipment: Always wear a respirator or dust mask approved for the materials you are working with:

- Although the size of dust particles may differ depending on the material, those sized 0.1 to 5µm generally end up in the lungs most frequently.
- Most dust is inhaled during breathing.

Welding Fumes

Welding fumes are tiny airborne particles generated during arc welding, such as MAG or MIG, when the base material and welding wire are heated to the point of vaporization. Prolonged breathing of welding fumes can cause these particles to accumulate in the lungs and may result in "welder's lung", which is a kind of pneumoconiosis.



Zinc Fumes

Many steel parts are zinc plated for corrosion resistance. When the zinc coating is vaporized during cutting, welding, or brazing of galvanized steel, exposure to these fumes can cause an acute allergic condition known as "Metal Fume Fever". The symptoms of metal fume fever are very similar to those of common influenza. This condition can be avoided by adequately ventilating the work area and wearing a respirator approved for use with zinc fumes.

FIRE AND EXPLOSION RISKS

Organic Solvents:

Vapors created by organic solvents are generally heavier than air. They generally sink to floor level and stagnate in recessed areas. Organic solvents are generally considered as a hazardous materials, so extra caution is required during storage and handling.

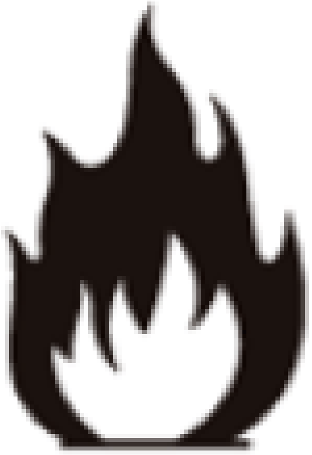
The symbols at left on packaging indicate that the chemical contained inside is Flammable (will ignite and burn readily) or an Oxidizer (may, generally by yielding oxygen, cause or enhance the combustion of other materials):

- Most of the paint used for automobile refinishing is flammable.
- Hardening agents (catalysts) used with body fillers and fiberglass may be flammable, an oxidizer, and also generate heat during curing.

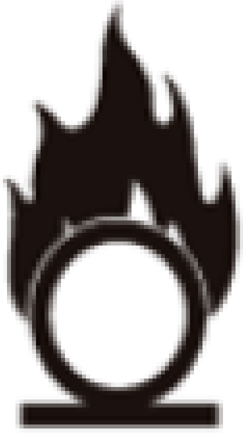
WARNING:

- **Ventilation systems should be installed at the lowest point on the shop floor for thorough vapor removal.**

- **Keep lids on containers of organic solvents such as paint and reducers.**
- **Follow established precautions for flammable material storage and dispensing, such grounding containers to prevent static discharge.**

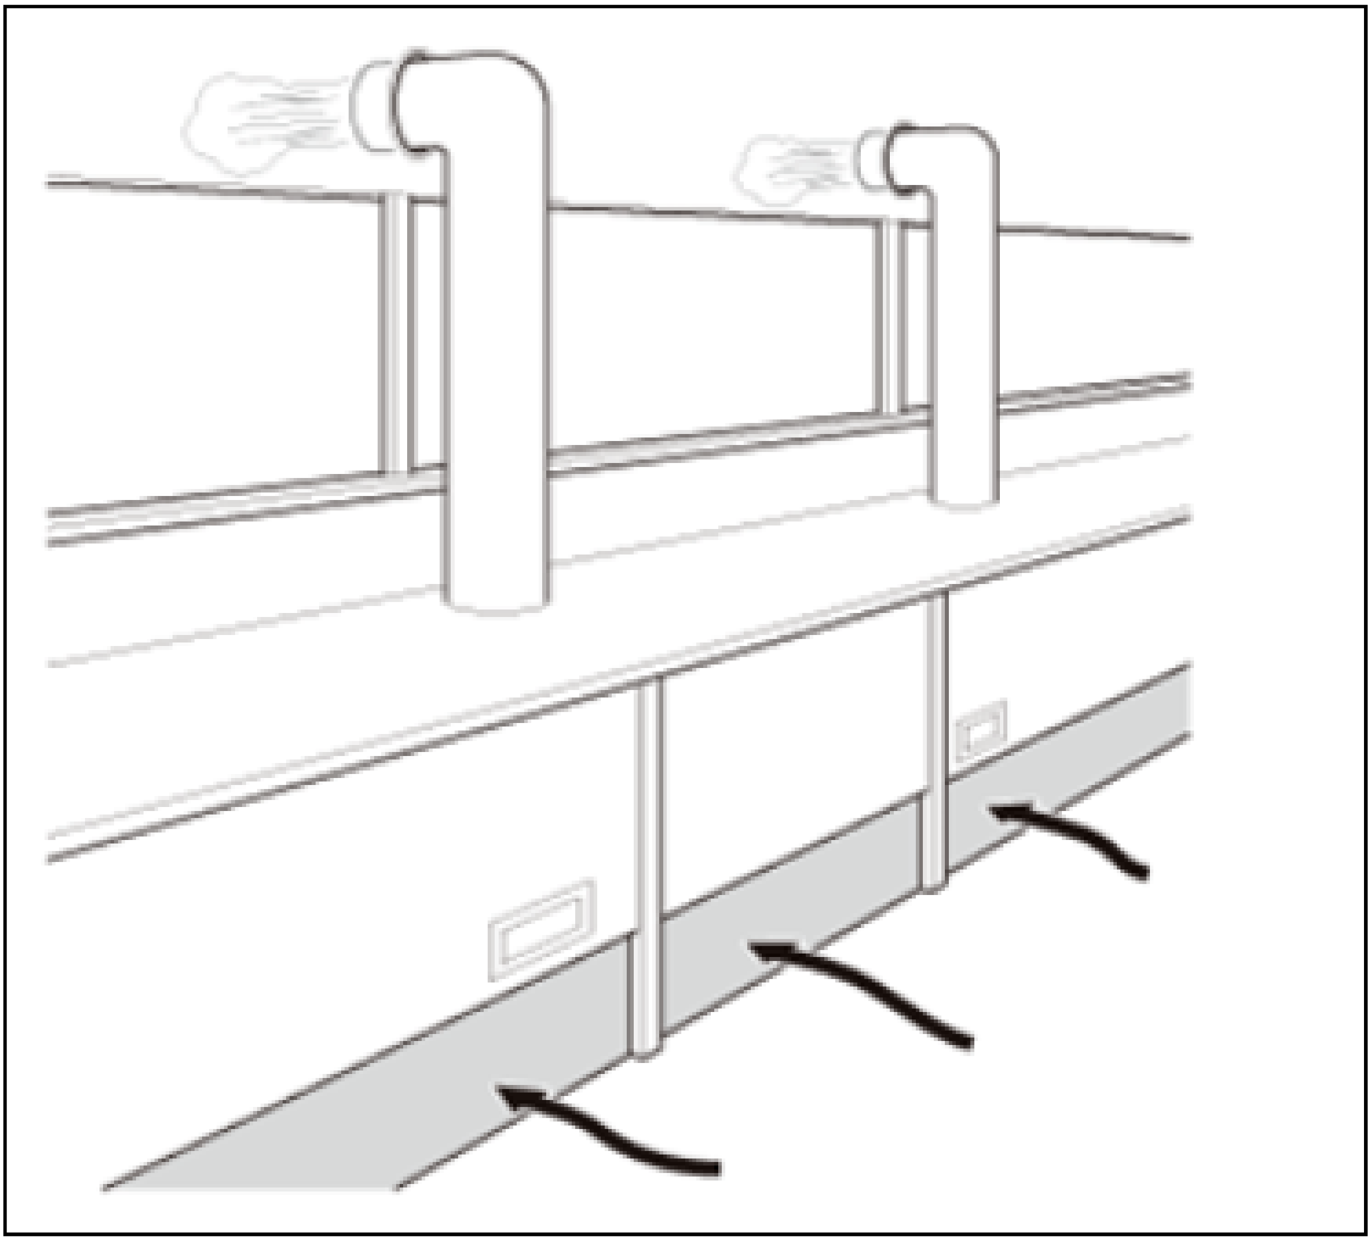


Flammable Symbol

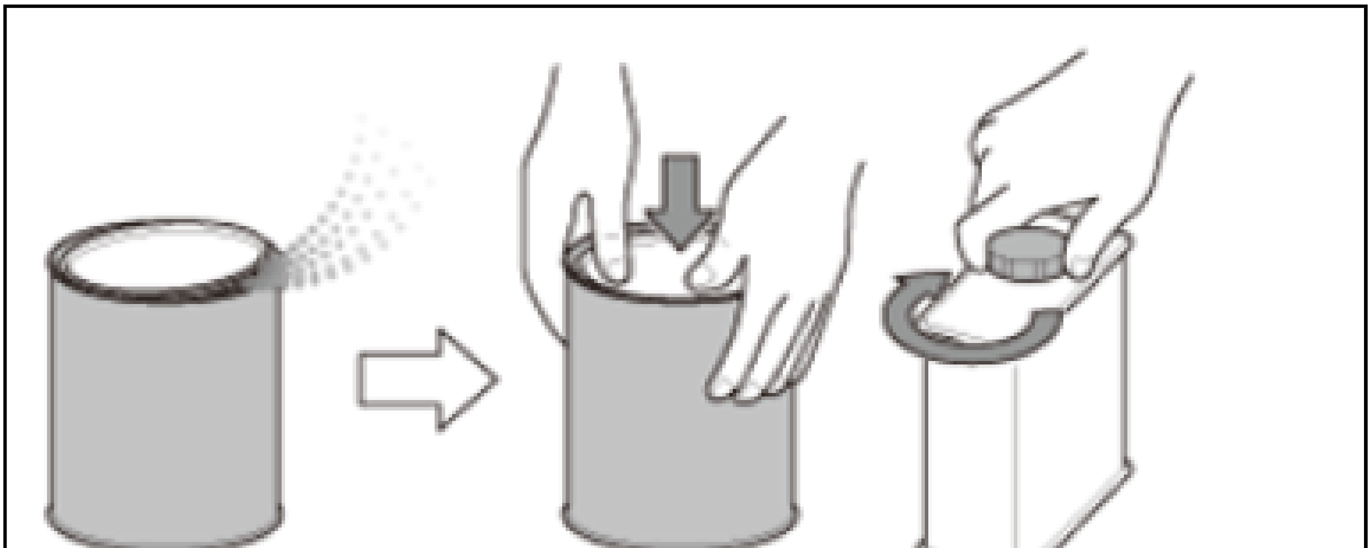


Oxidizer Symbol

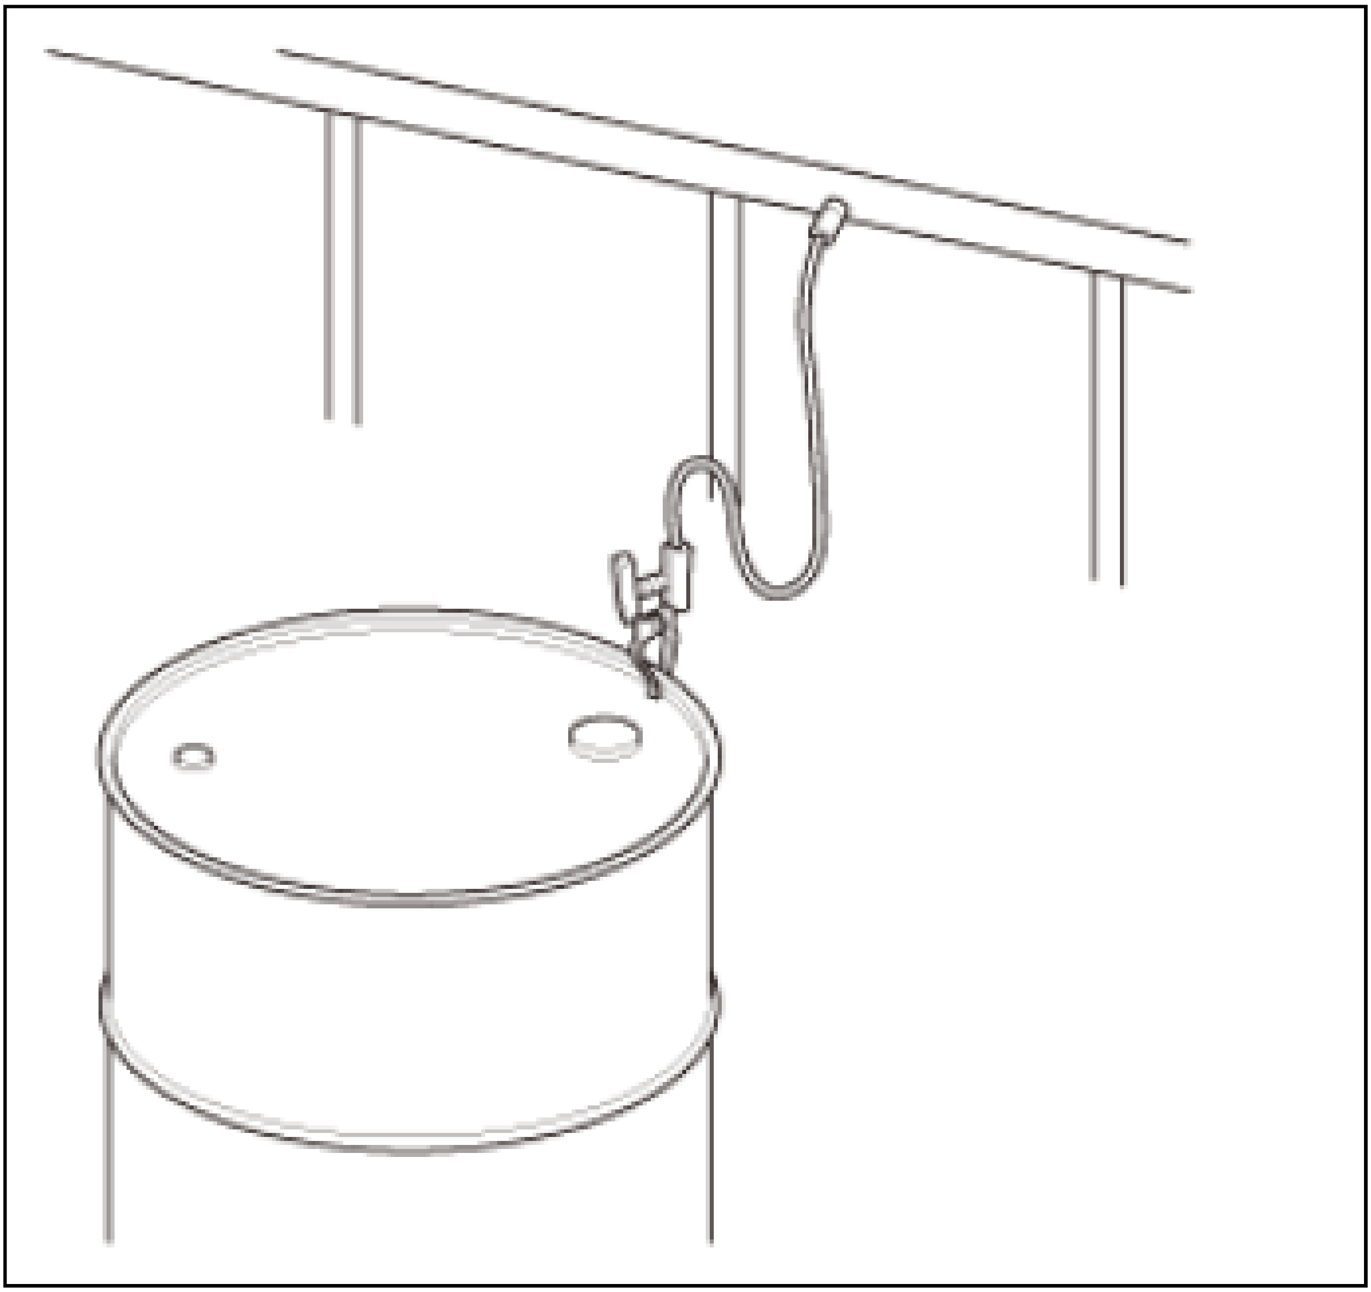
Example of ventilation system:



Keep lids on containers of chemicals such as paint and reducers or thinners.



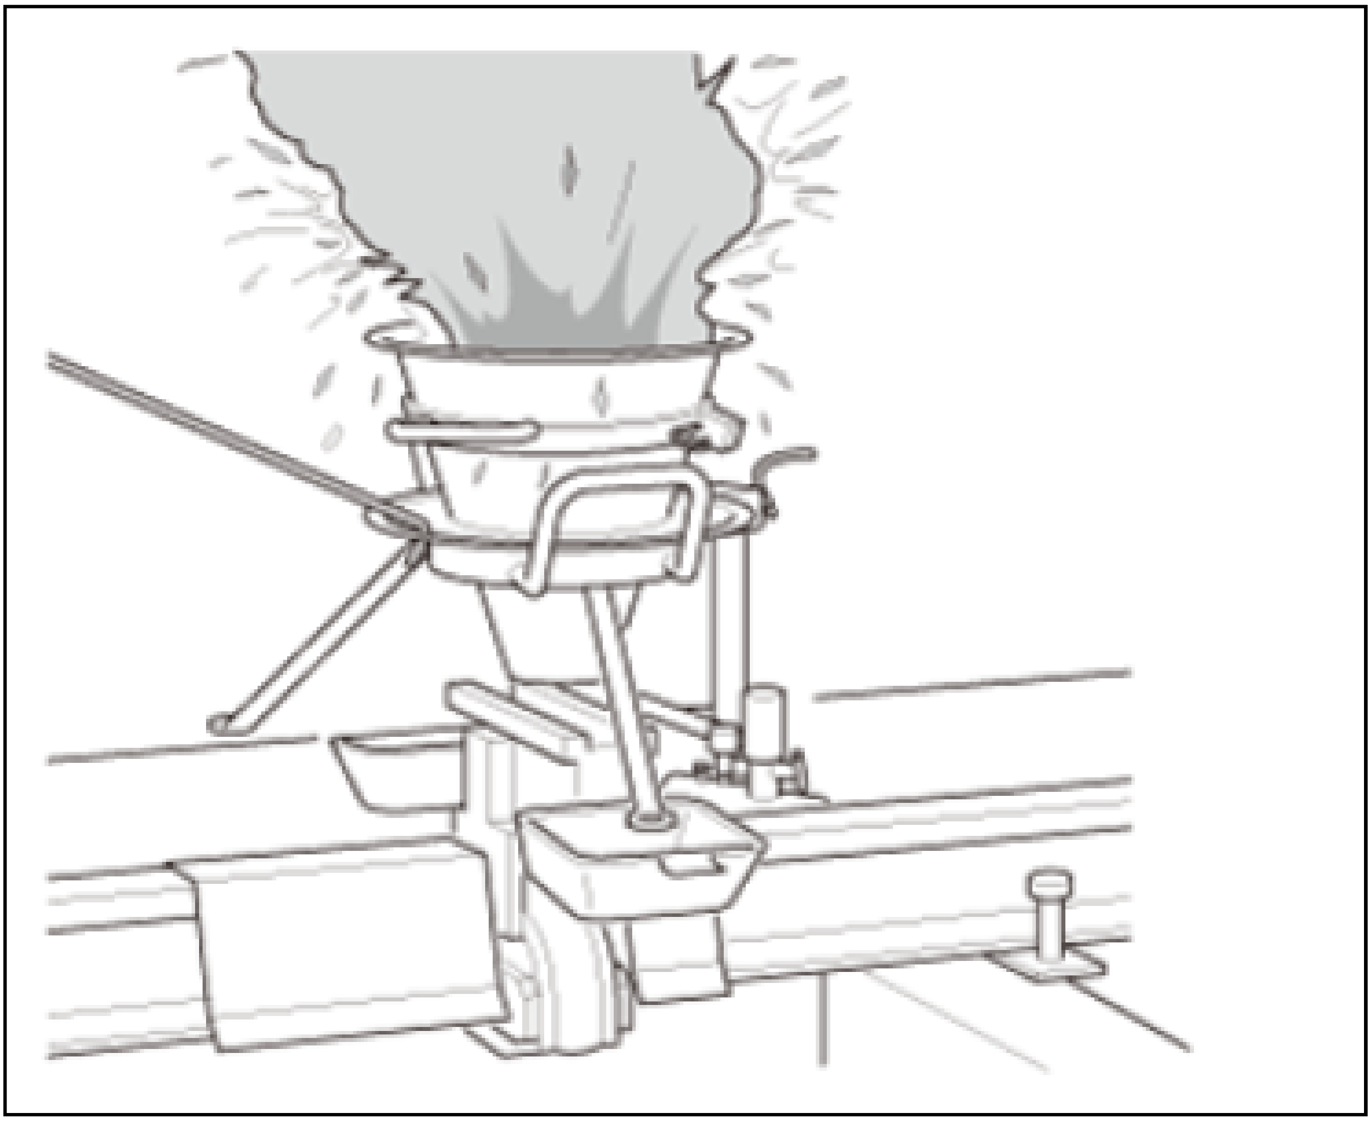
Grounded flammable material container:



Thermite reaction

WARNING: **Aluminum repair areas should be completely separated by wall or curtains to prevent aluminum dust from mixing with iron oxide or any other material**

Thermite reaction is an active oxidation-reduction reaction when powdered aluminum and iron oxide (rust) powders are allowed to mix. Once ignited, it will combust at temperatures in excess of 4500Â°F (2500Â°C).

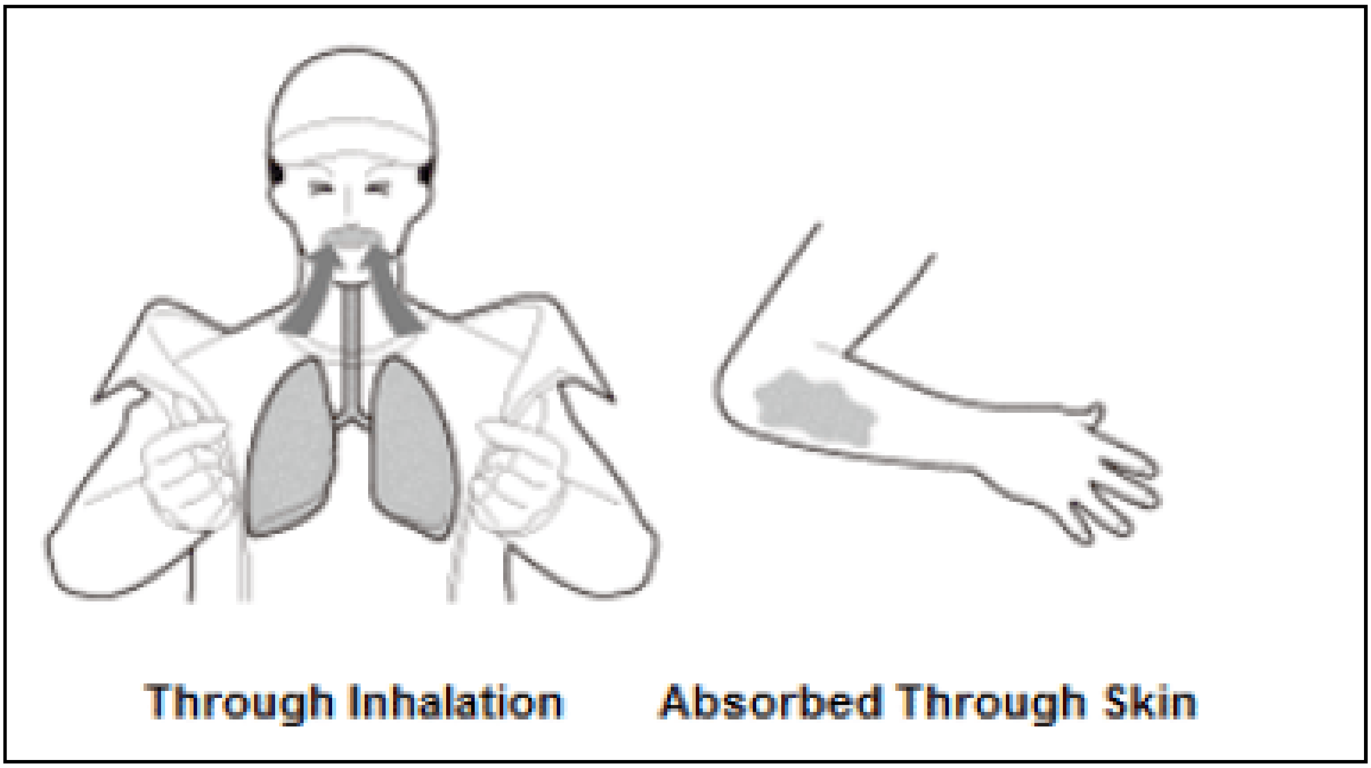


ORGANIC SOLVENT TOXICITY

Toxic Effects Of Organic Solvents

Organic solvents may enter the human body by inhalation of the vapors, or direct skin contact. They tend to concentrate in organs with high amounts of fat, such as the liver. Depending on the amount and length of exposure, symptoms can become acute or chronic. The main symptoms are shown below:

- Skin rash
- Respiratory (breathing) difficulty
- Mental confusion
- Dizziness, anemia etc. (blood generation stops)
- Symptoms of poisoning (acute, chronic)



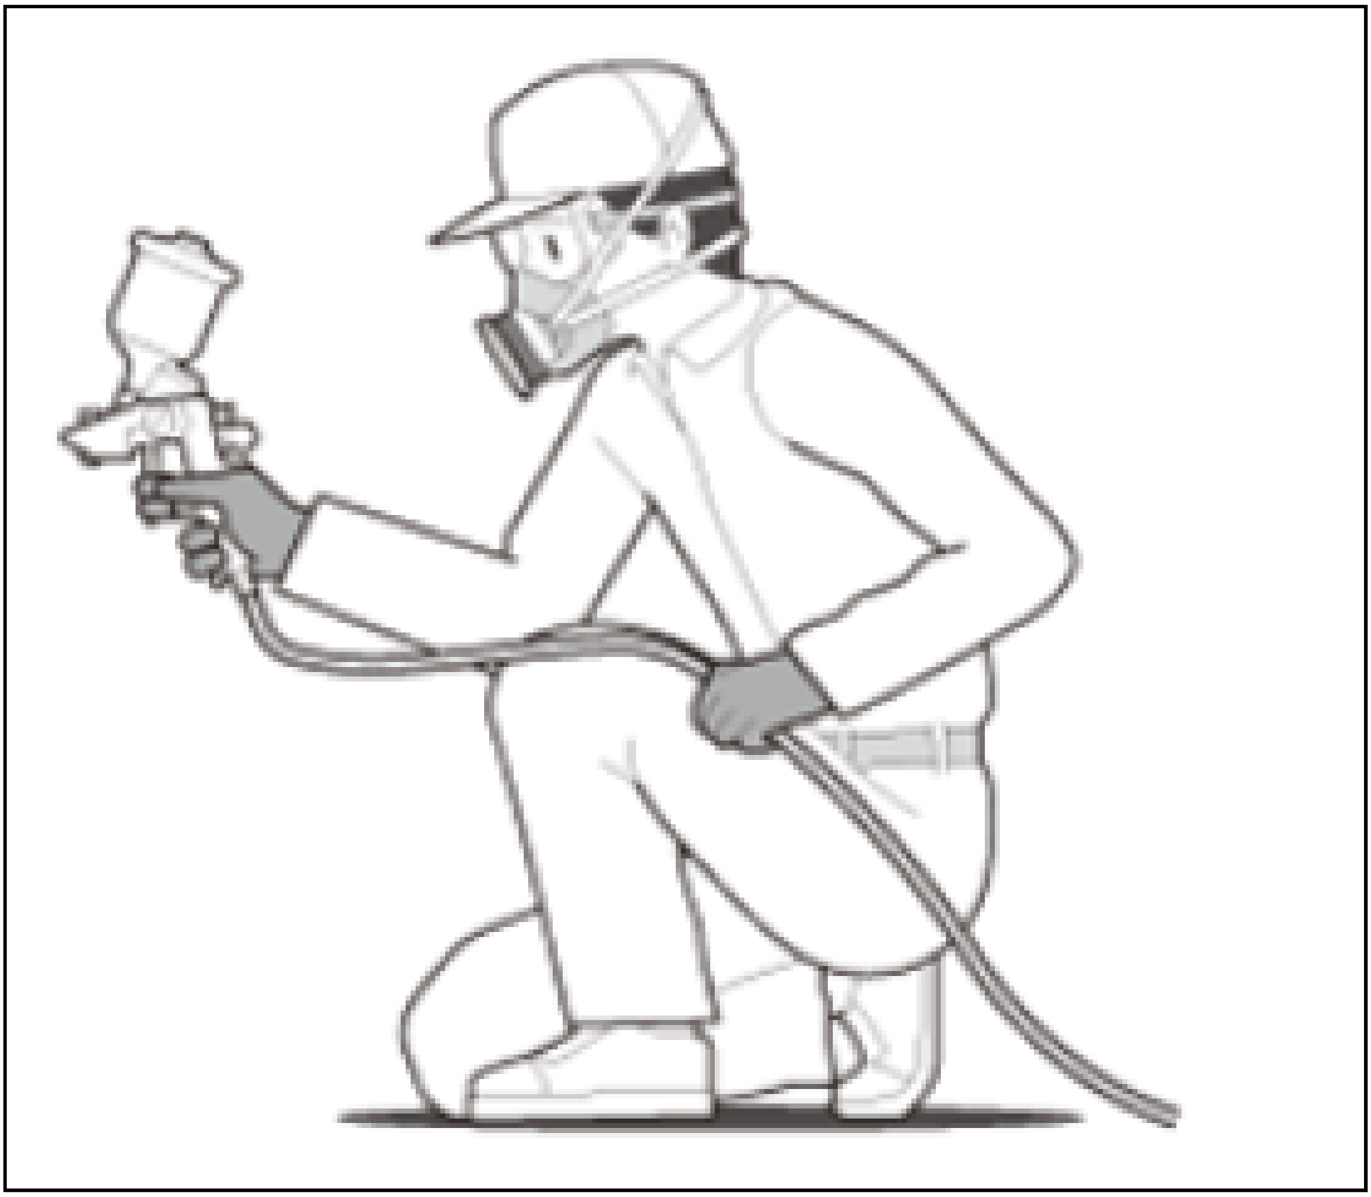
Health Hazards Associated With Solvent Exposure

- Toxicity to the nervous system
- Reproductive system damage

  Liver and kidney damage, respiratory impairment, cancer, and dermatitis

Precautions For Isocyanate Group (-NCO) Compounds

- Hardeners used with two-component urethane paints contain isocyanate compounds.
- Health effects of isocyanate exposure include: irritation of skin and mucous membranes, chest tightness, and difficulty breathing.
- Isocyanates include compounds also classified as potential human carcinogens and known to cause cancer in animals.
- Always wear a respirator, protective clothing, and gloves designed and approved for use with isocyanates. when working with chemicals containing these compounds.
- If you experience any of the above symptoms, stop using isocyanate compounds immediately and seek medical attention.



WHAT IS AN MSDS

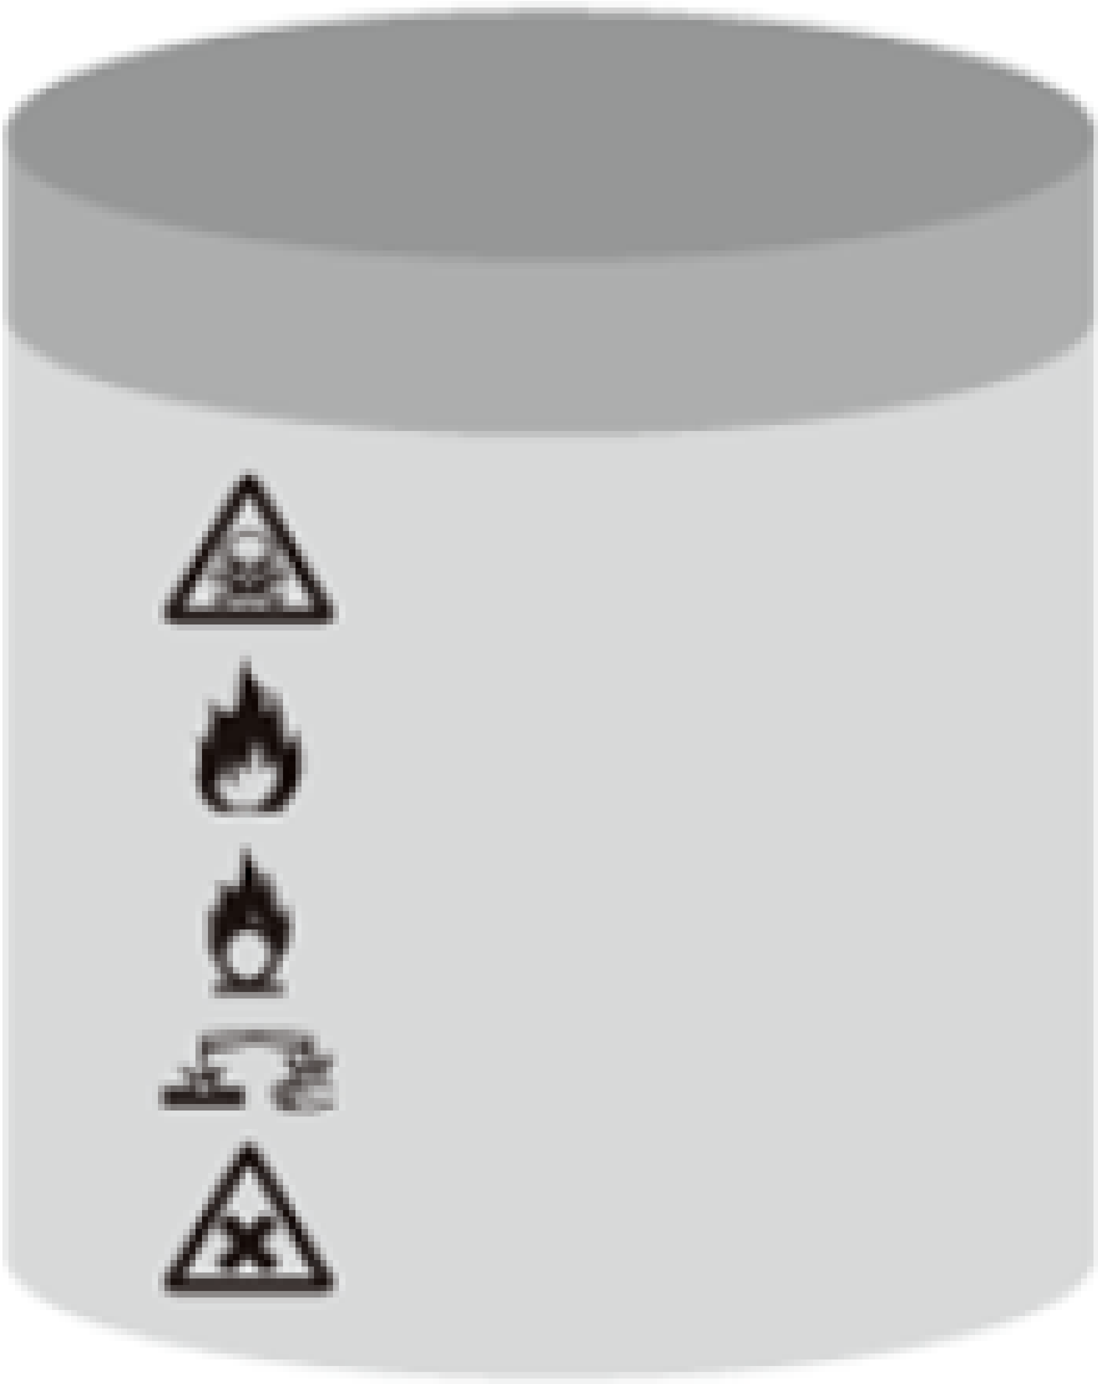
MSDS stands for "Material Safety Data Sheet". It is intended to provide workers and emergency personnel with procedures for handling or working with that substance in a safe manner.

Always review the MSDS before using any chemical so you know how to safely use it and what to do in case of a problem such as a spill occurs.

Information Included In a Typical MSDS

- Material name and contents volume
- Physical data (melting point, boiling point, flash point, etc.)
- Toxicity
- Health effects
- First aid
- Reactivity
- Storage requirements
- Disposal
- Protective equipment
- Spill-handling procedures

Note that MSDS formats can vary from source to source within a country depending on national requirements.



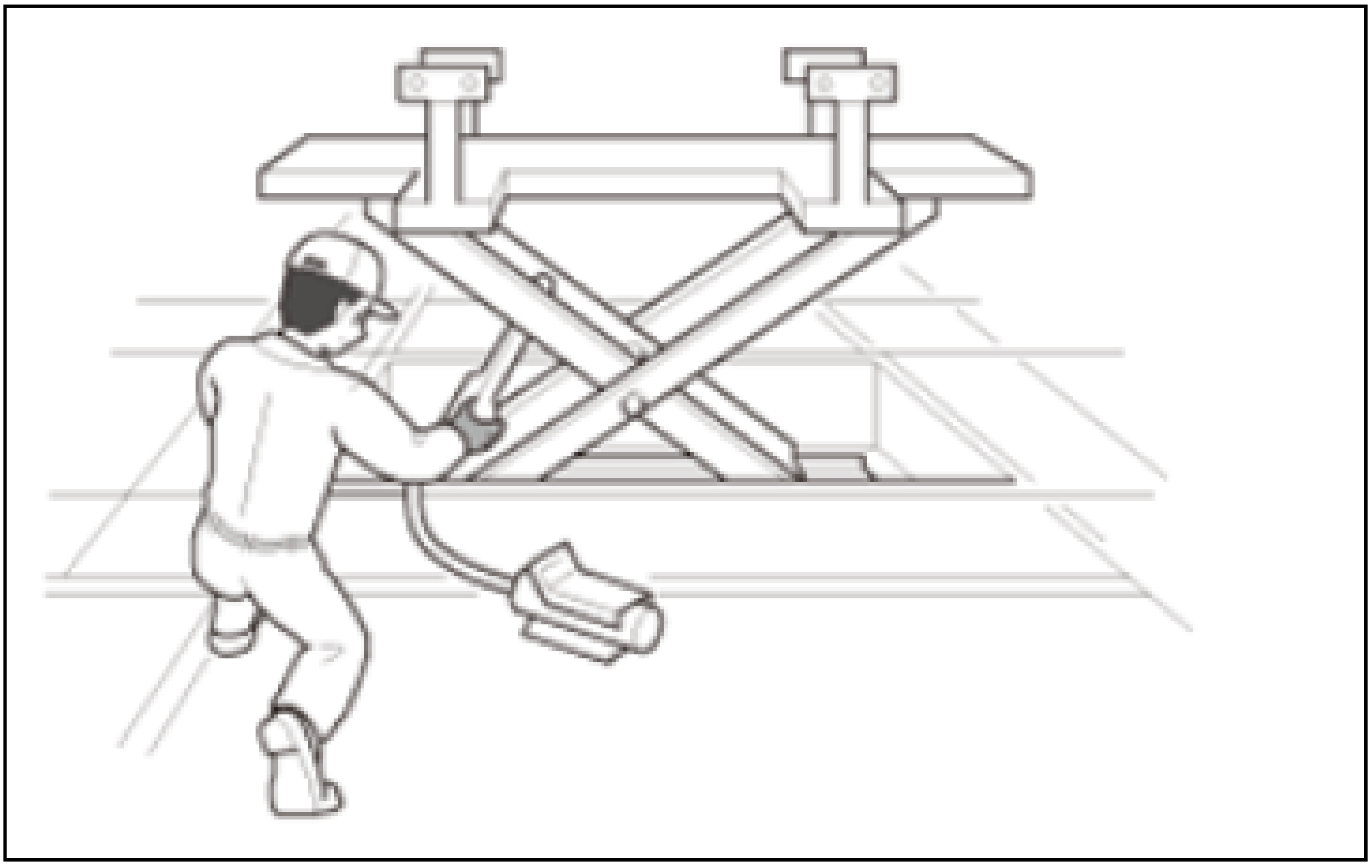
This mark indicates a toxic substance. Do not inhale or take internally and avoid direct skin contact.

This mark indicates a substance is oxidizer and may easily react with other products, generally by yielding oxygen, and cause or enhance the combustion of other materials.

This mark indicates a flammable product that will ignite at relatively low temperatures, such as room temperature.

EQUIPMENT MAINTENANCE CHECKS

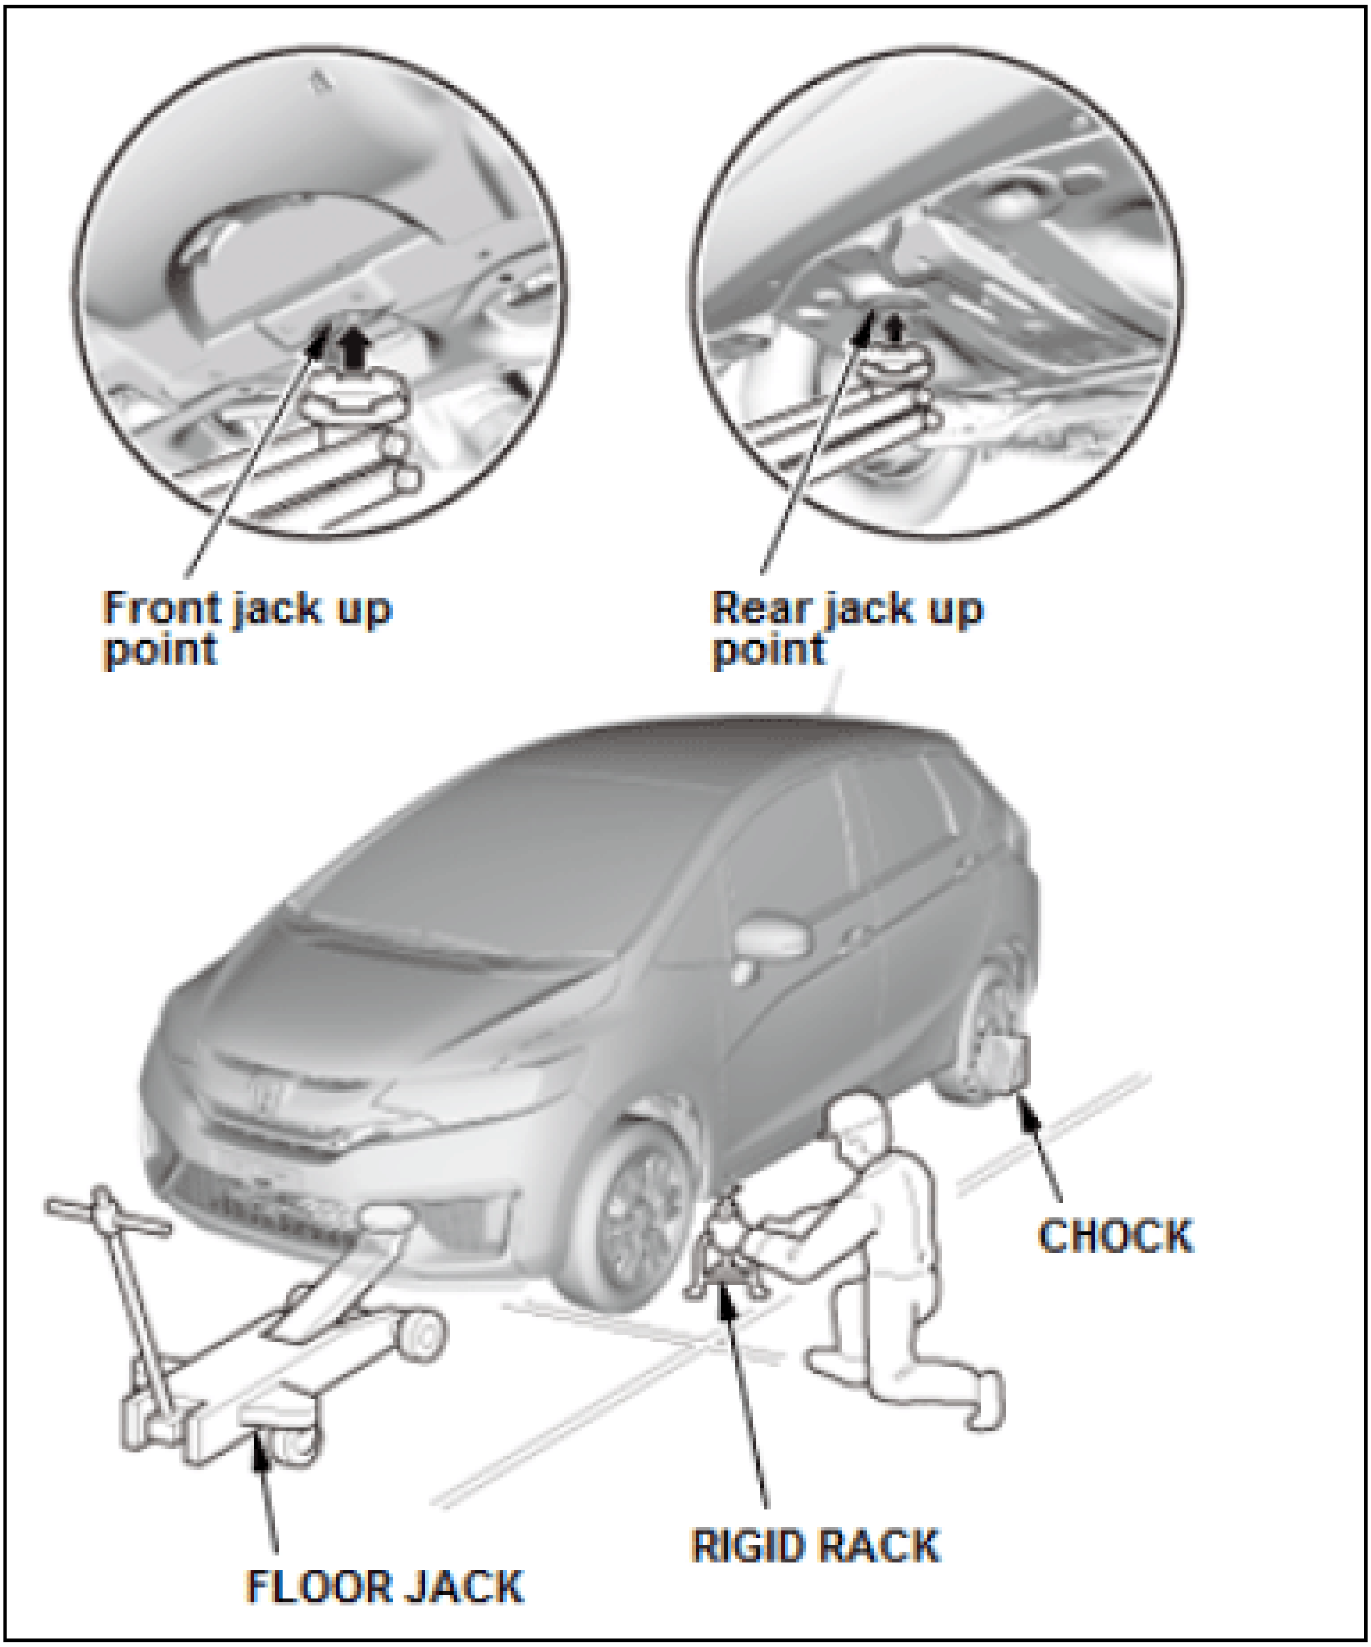
- In order to maintain a safe working environment, all equipment and machines in the workshop must function properly for their intended purposes. It is very important to conduct regular inspection and maintenance before using any shop tools or equipment.
- Always make sure your work area has properly functioning ventilation and that any hazardous materials are properly stored, etc.



PRECAUTIONS FOR OPERATION

Vehicle Jacking

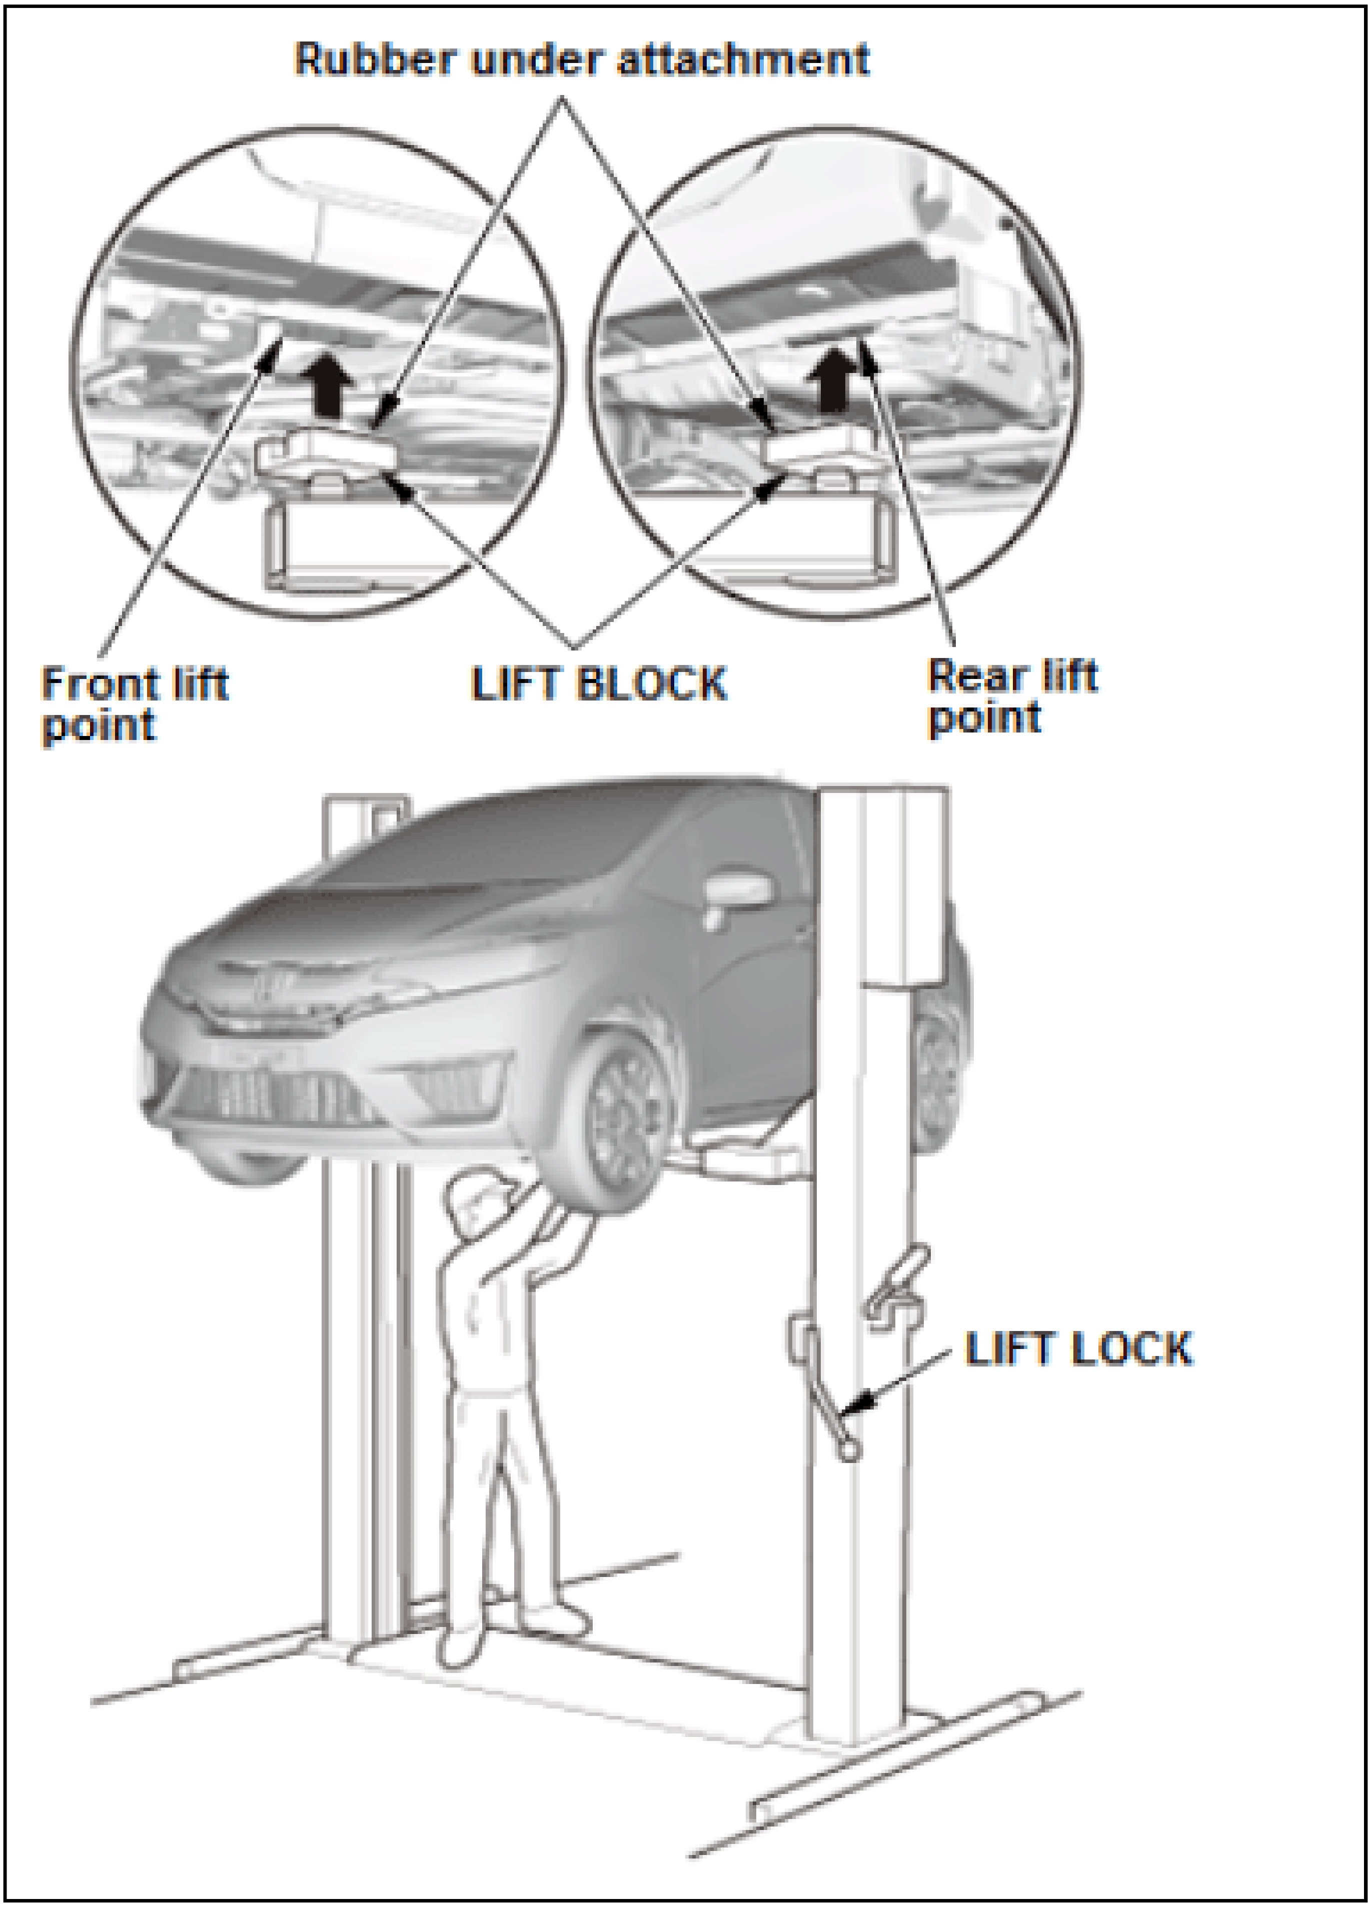
- Do not use a floor jack on sloped or weak ground as this may result in the vehicle falling.
- If a vehicle has an excessive weight imbalance due to cargo on board, do not use a floor jack.
- Always set wheel chocks on both sides of the wheels not being raised.
- After the vehicle is jacked up, always use jack stands to hold the vehicle in place.
- Never crawl under the vehicle while the vehicle is raised using a jack alone, even for a short time. If the vehicle falls, it may result in serious injury or death.



Vehicle Lifts

- Set the lift arms and pads securely at the specified lift points. If the lift blocks are positioned at places other than those specified, the vehicle may be damaged or fall off of the lift.
- If major assemblies are being removed, always put an equivalent weight at the opposite end of the vehicle to maintain the weight balance.
- Never lift only one side of a vehicle using a lift.
- When lifting a vehicle, always watch the vehicle's condition and confirm that no unsafe conditions exist.
- Stop lifting the vehicle only when all four wheels are suspended off the ground and confirm that the vehicle is securely positioned before continuing.
- Never go under the vehicle while the lift is operating.

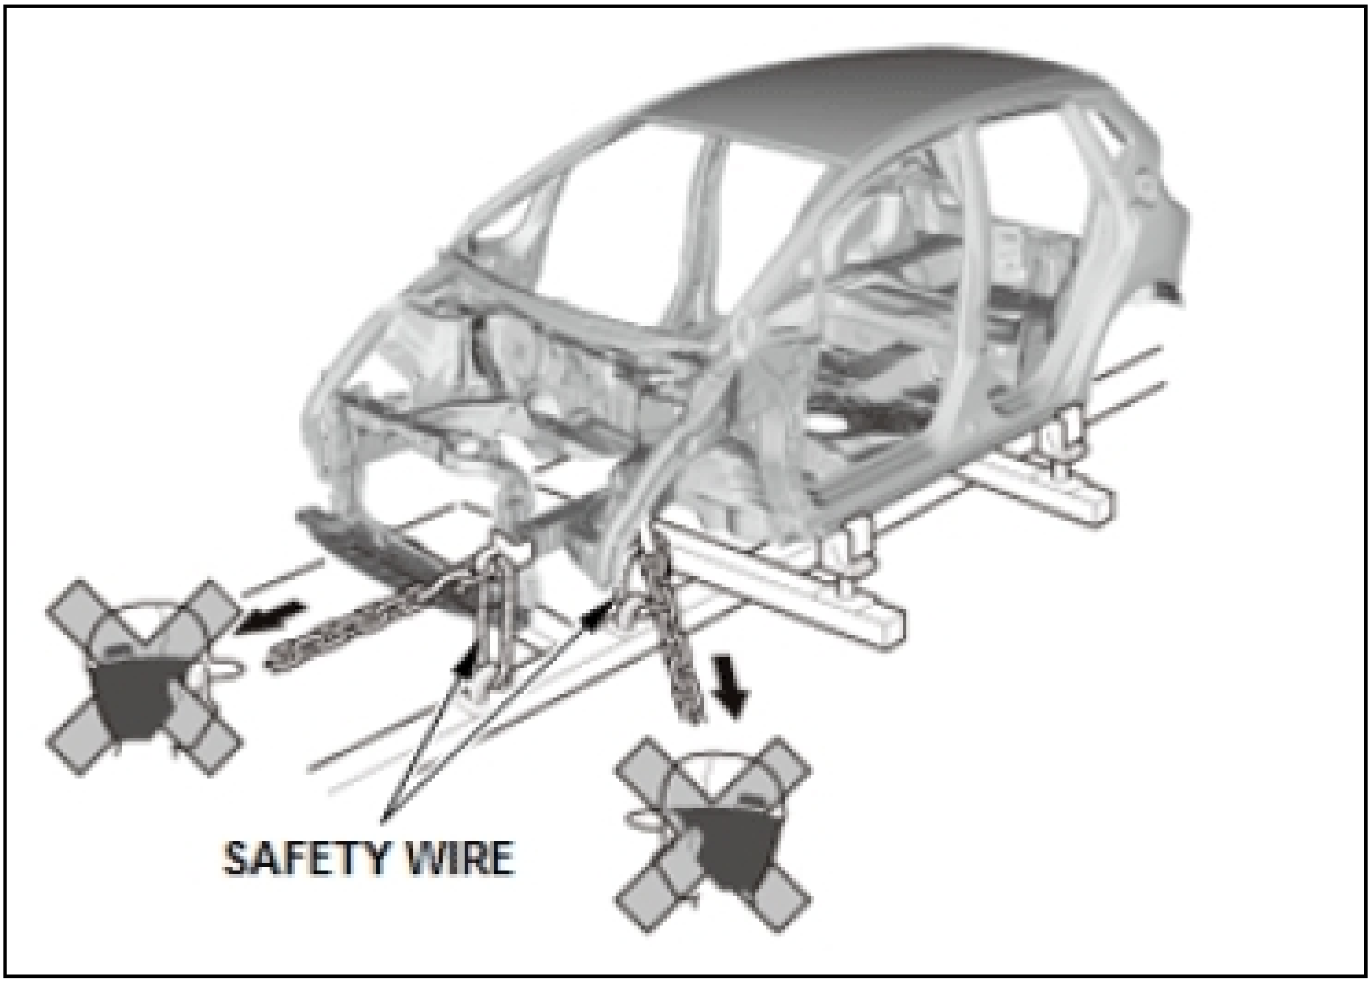
- After the vehicle is raised to your working level, make sure the all of lift's safety catches engage and hold the vehicle securely.



Rubber under attachment
Front lift point
LIFT BLOCK
Rear lift point
LIFT LOCK

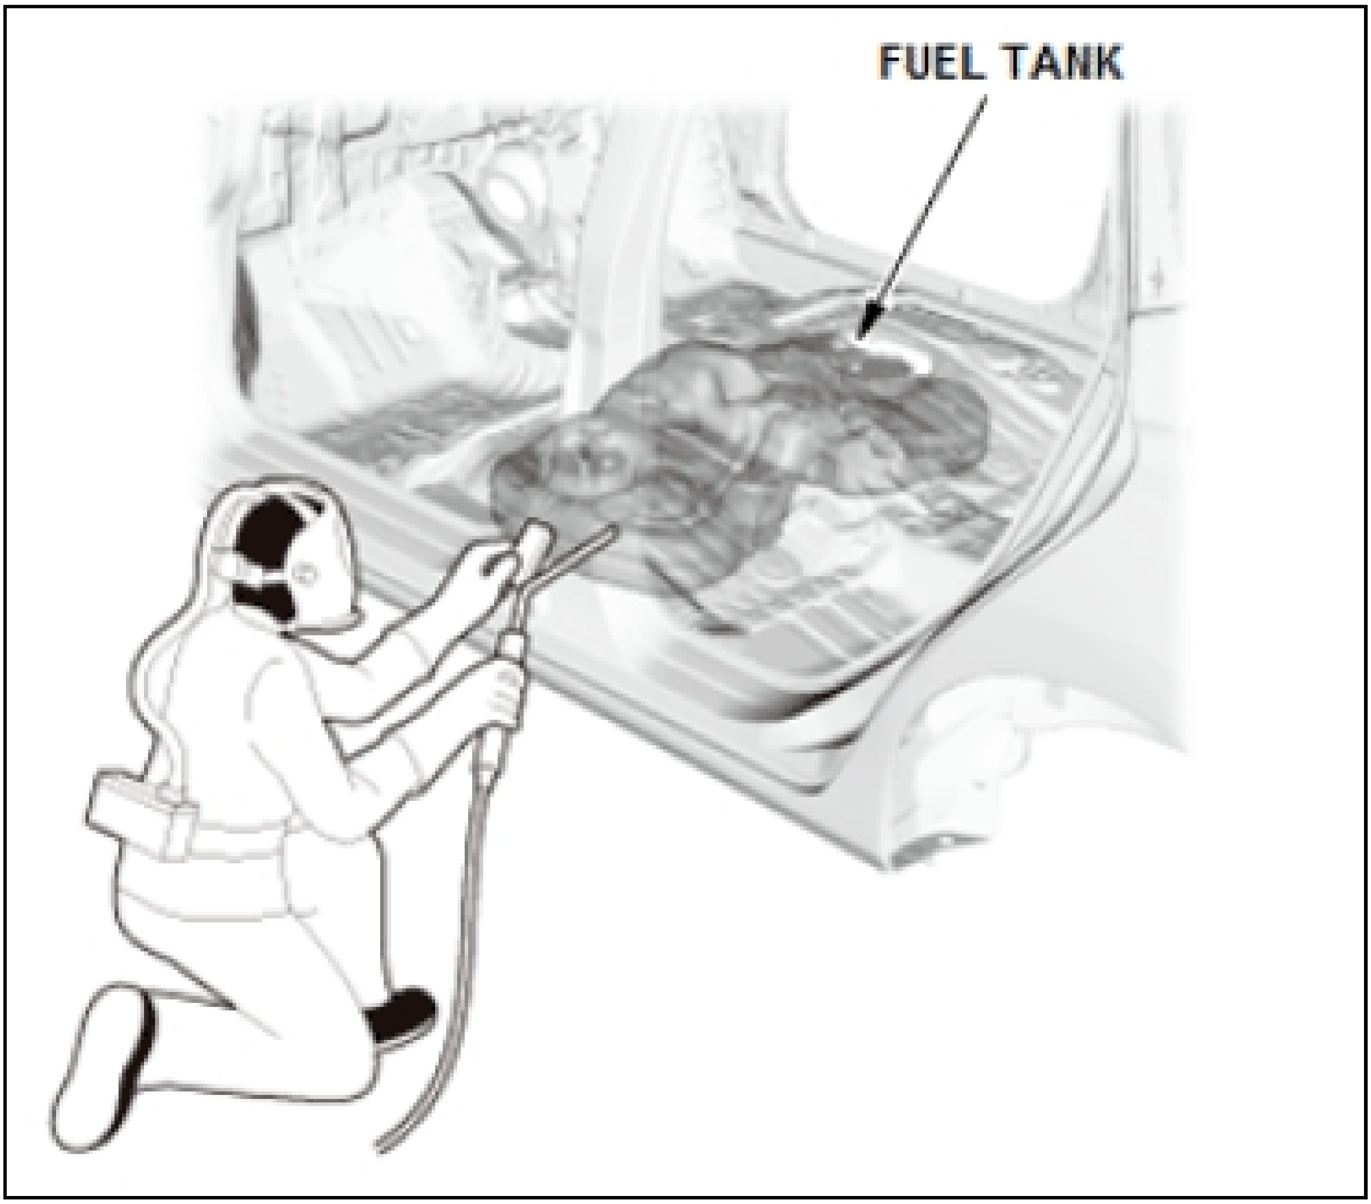
Frame And Body Straightening

- Check the condition of the clamps and chains before using the equipment. Do not use deformed or cracked clamps or chains.
- Use appropriate capacity clamps and chains. Using inadequate clamps or chains may result in violent failures.
- If straightening equipment is being used for rough frame correction, do not enter the chain's pulling direction. Always stand in a safe place.
- Always use safety wires on chains and clamps to reduce the chance of injury or vehicle damage if a chain fails.



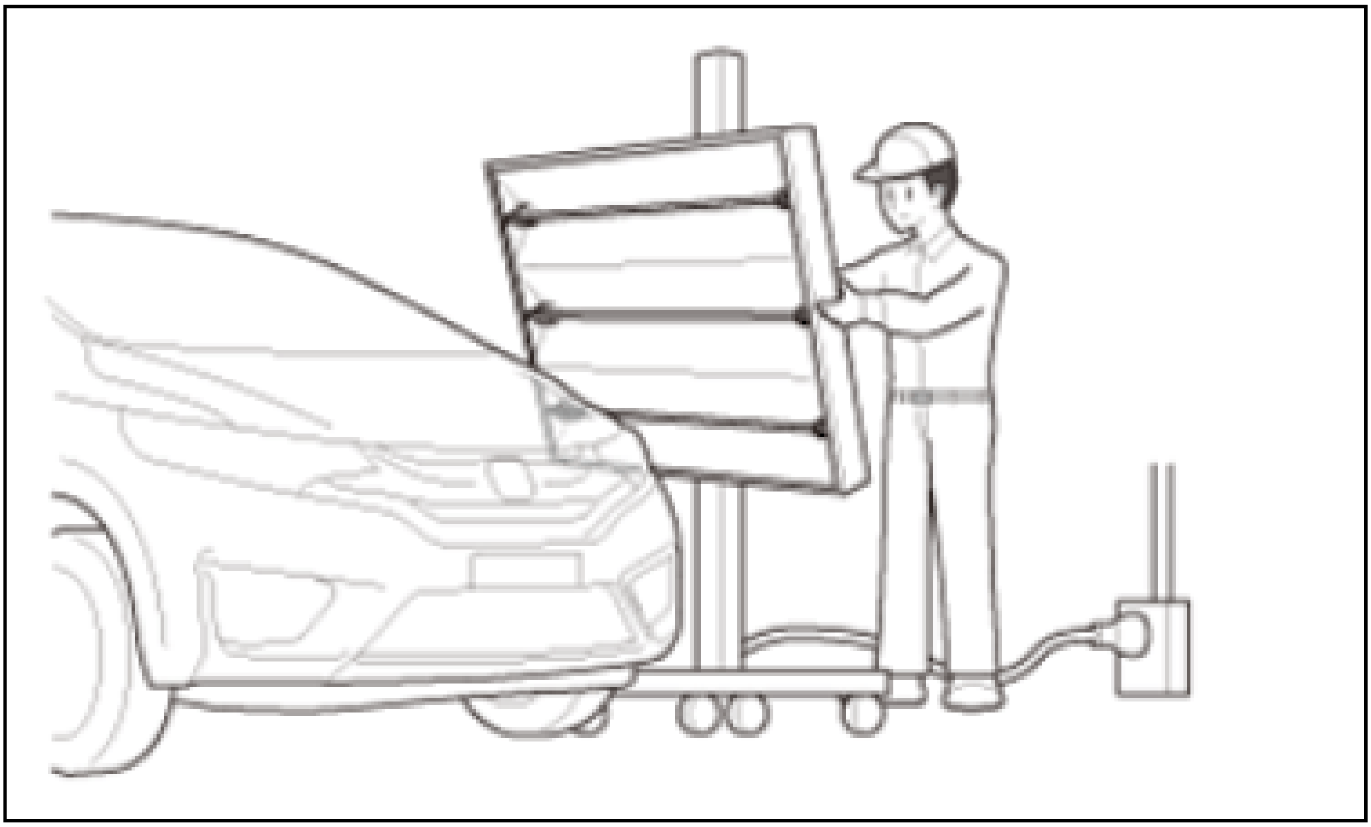
Welding Operations

- Remove the fuel tank if welding near the tank or combustible materials located in close proximity to the fuel tank.
- Protect the vehicle with a welding blanket.



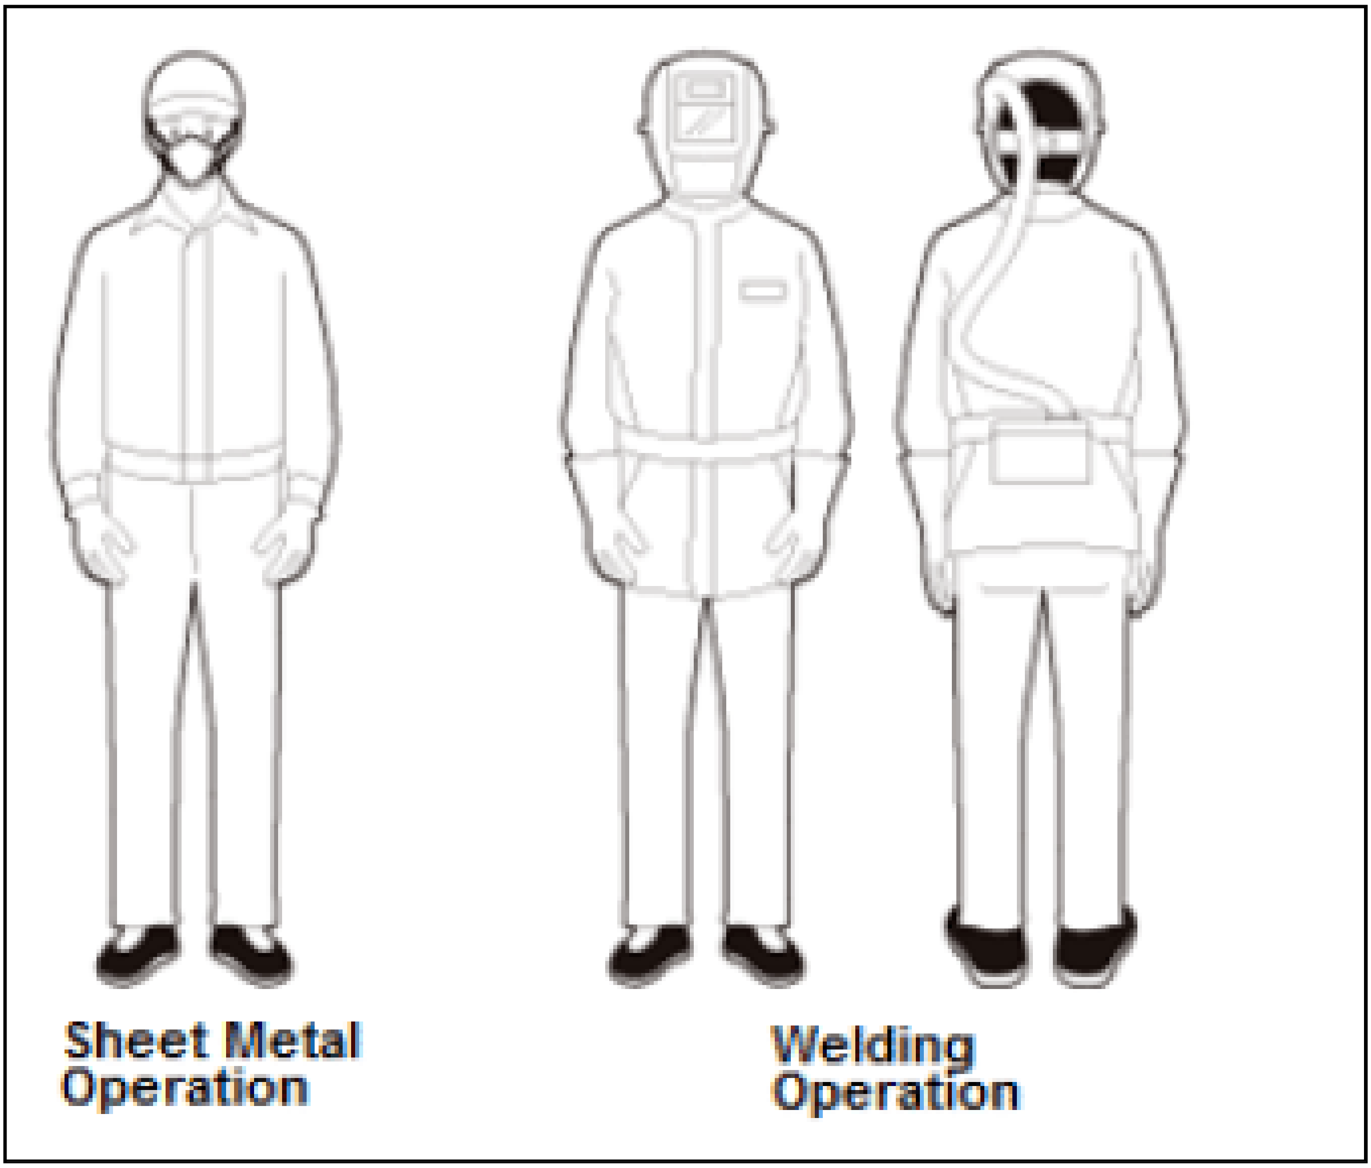
Drying Work

Do not put inflammable things near the painting booth or dryer.



SAFETY EQUIPMENT

Collision repair technicians must wear a long sleeve clothing, a cap and safety shoes. When necessary put on safety glasses, gloves, ear plugs, a respirator or dust mask, etc. to ensure personal safety.



- Work uniform, Dustproof work wear

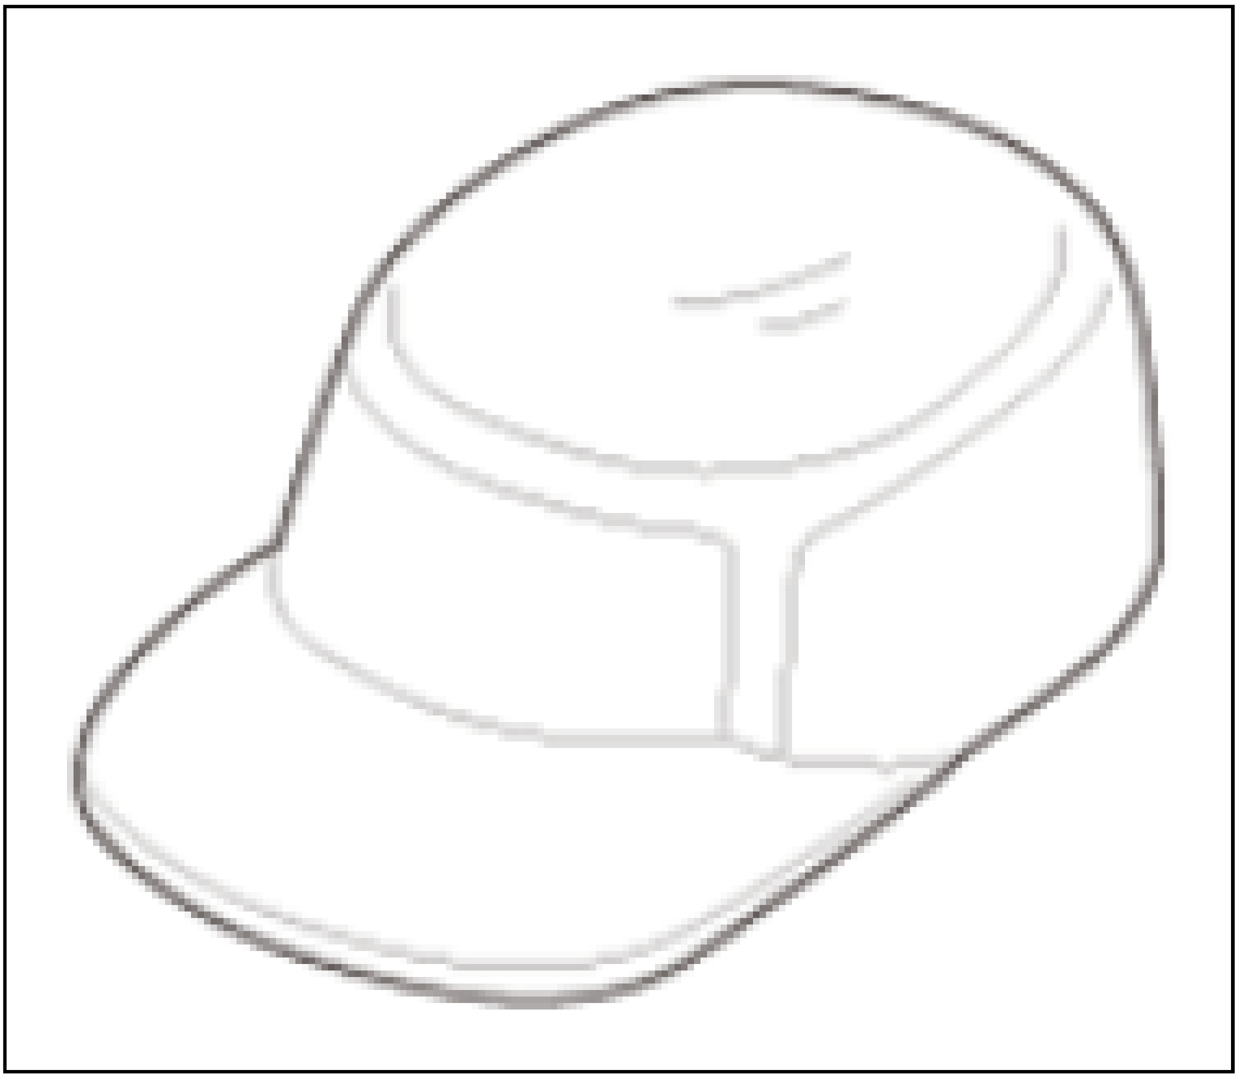
  It is important to wear protection equipment for your safety and health. It also is important to wear appropriate equipment according to the operation and tasks.

  Purpose of work uniform: Prevention of injuries and protection of customers' vehicles from external damages.

  Purpose of dust proof work wear: Prevents absorption of organic solvents through the skin.

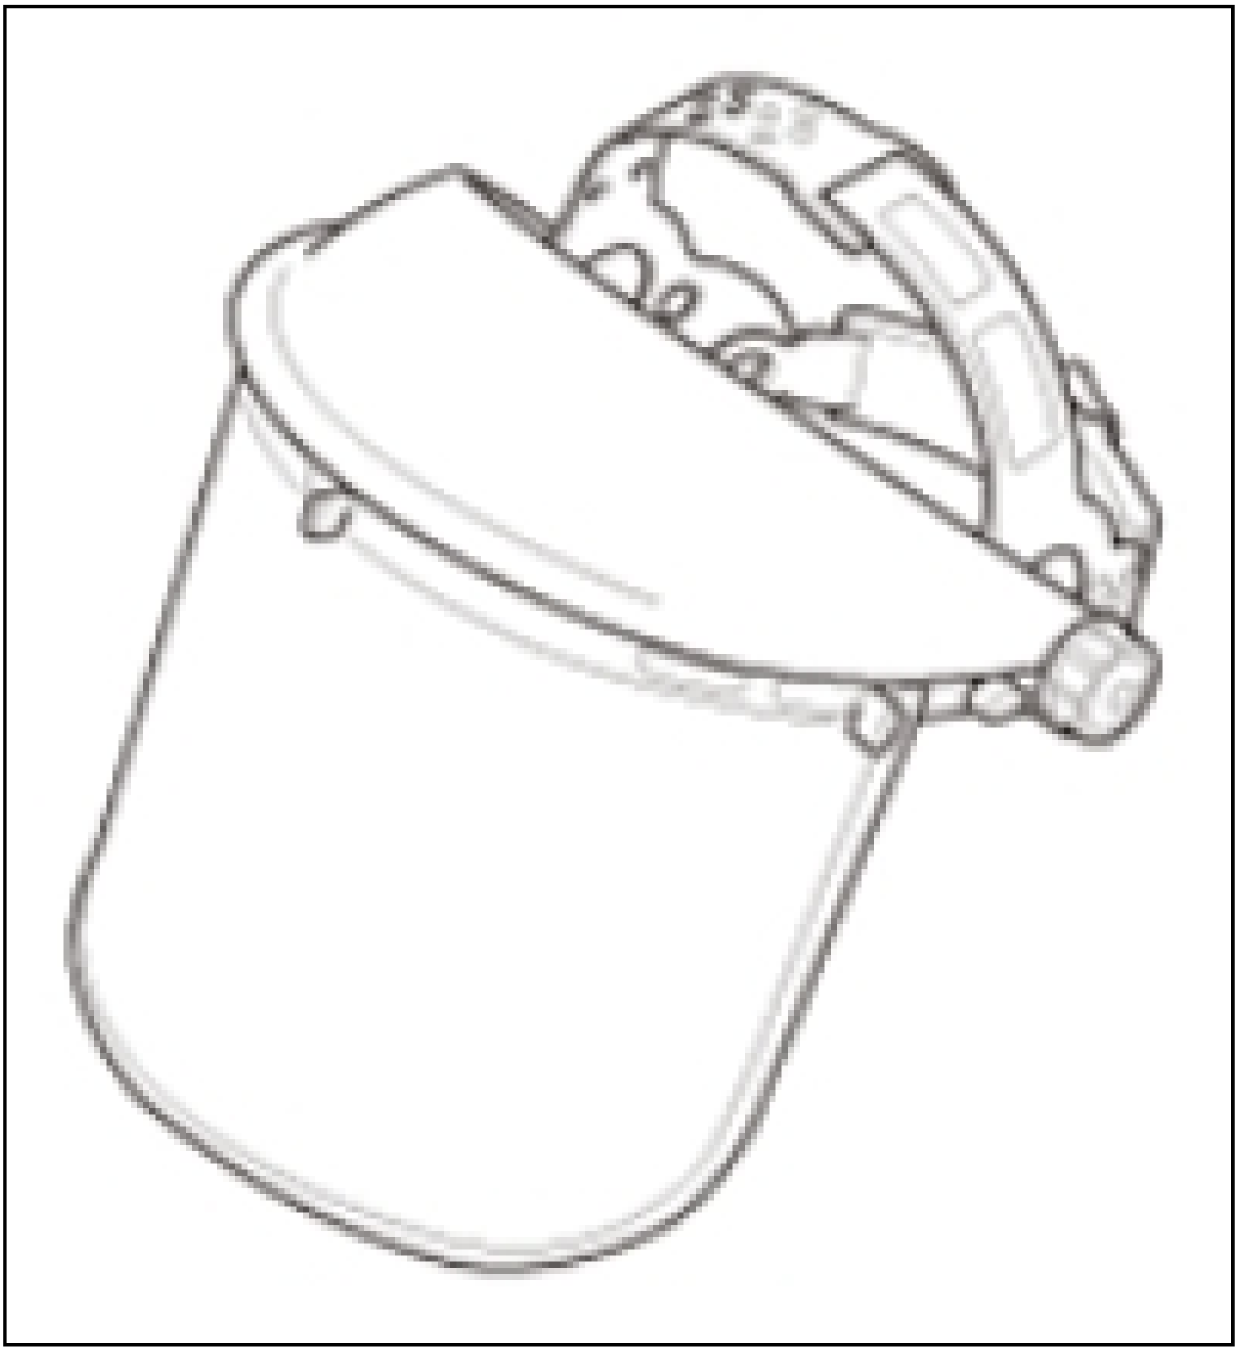
- Cap

  Prevention of head injuries.



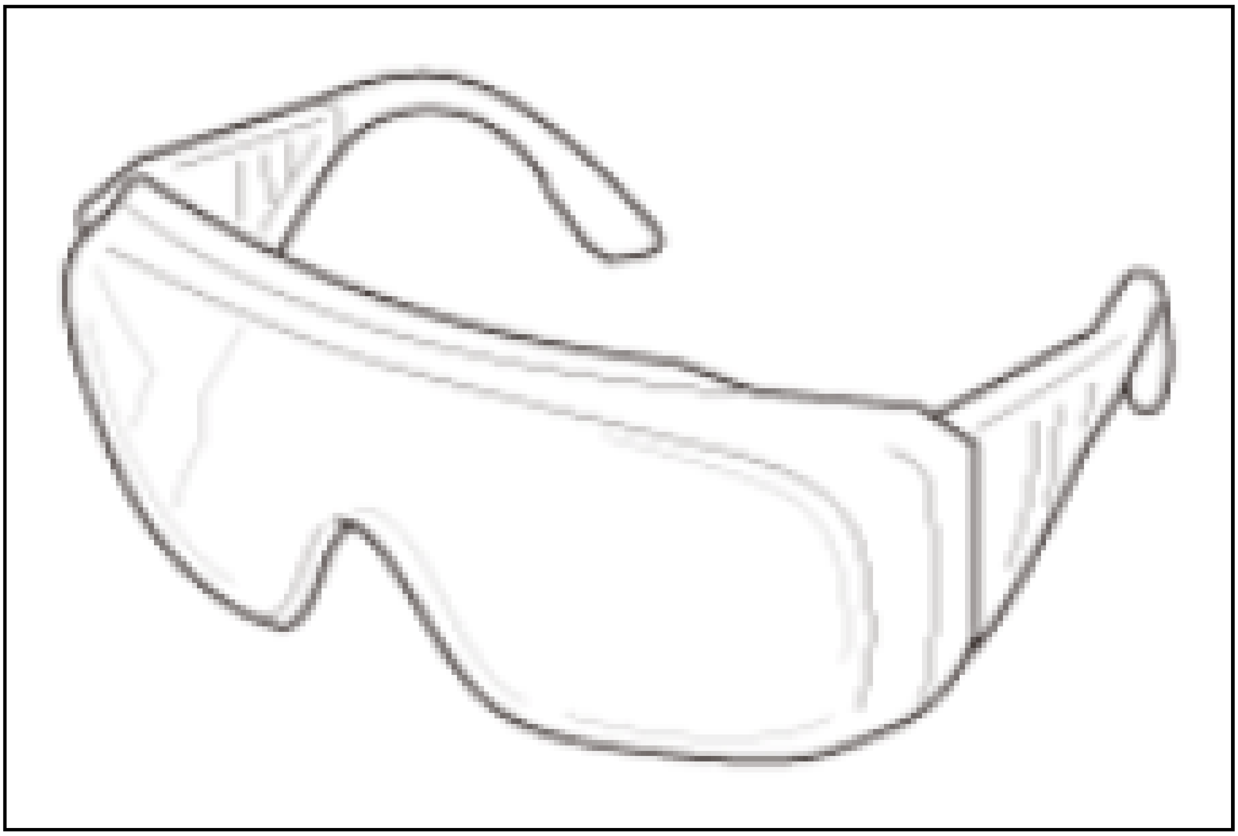
- Face shield

  Protects eyes and face from dust and sparks during grinding.



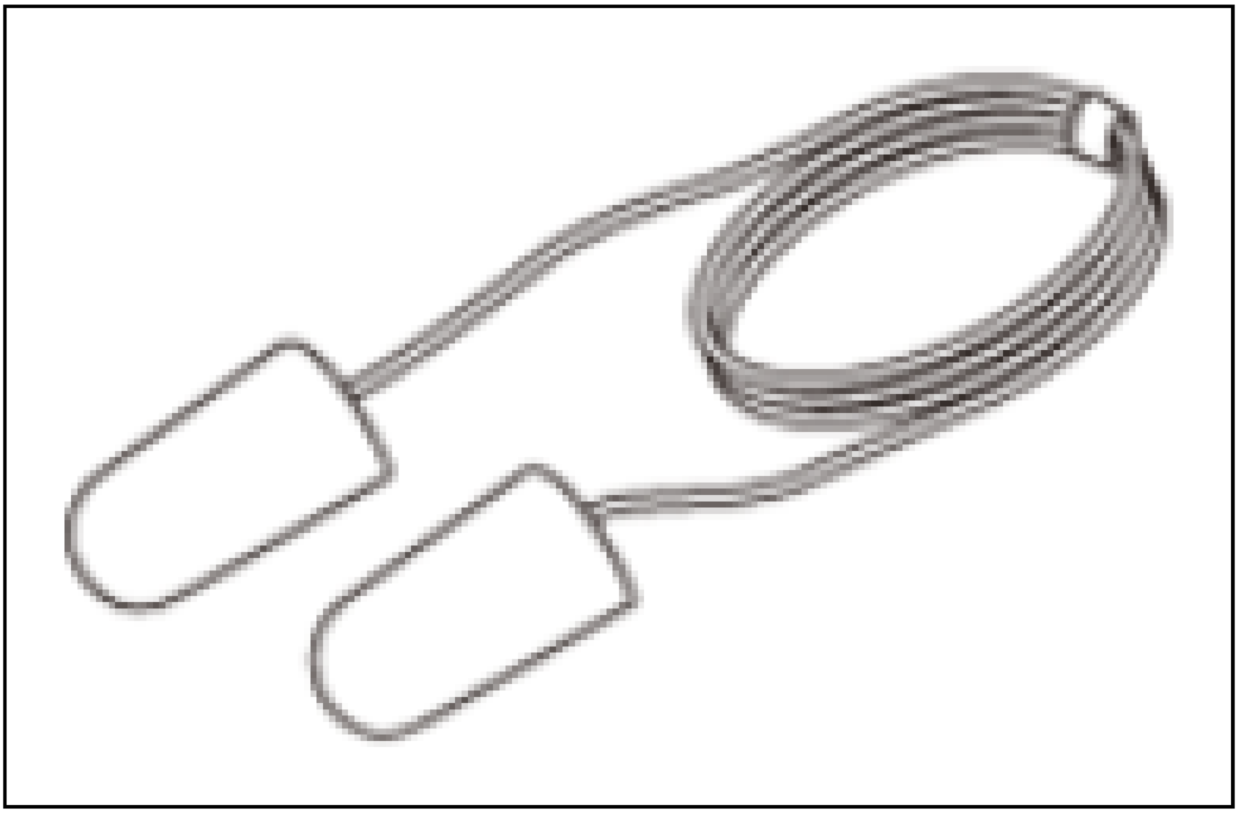
- Safety glasses

  Protect eyes from air-borne dust, dispersed liquid, organic solvent gas and paint mist.



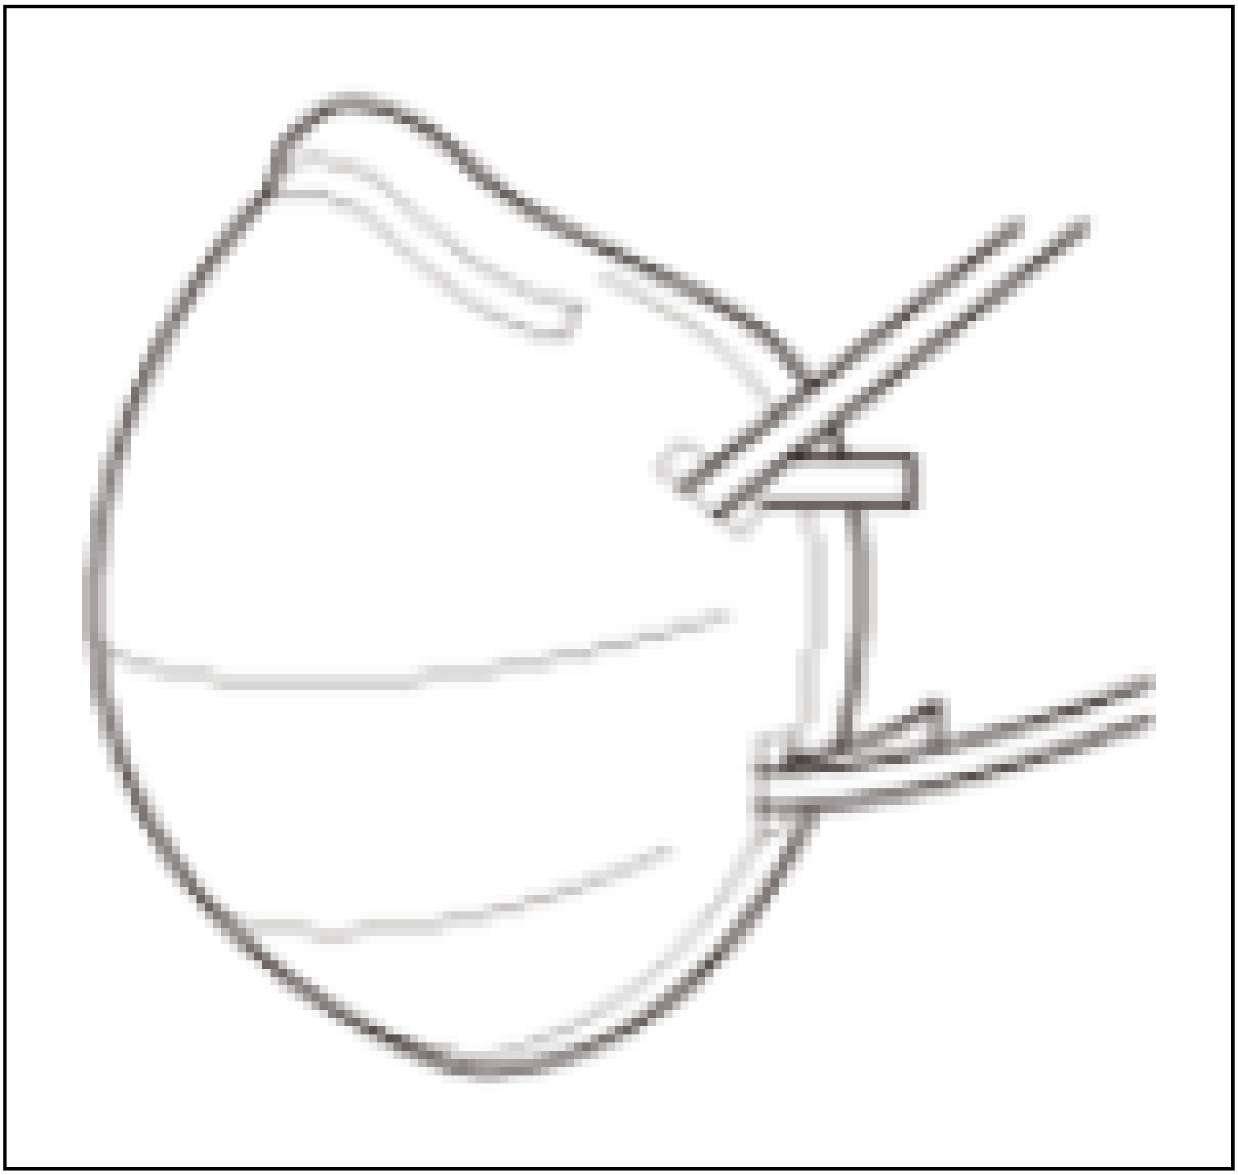
- Ear plugs

  Protect ears from excessive noise levels during equipment operation.



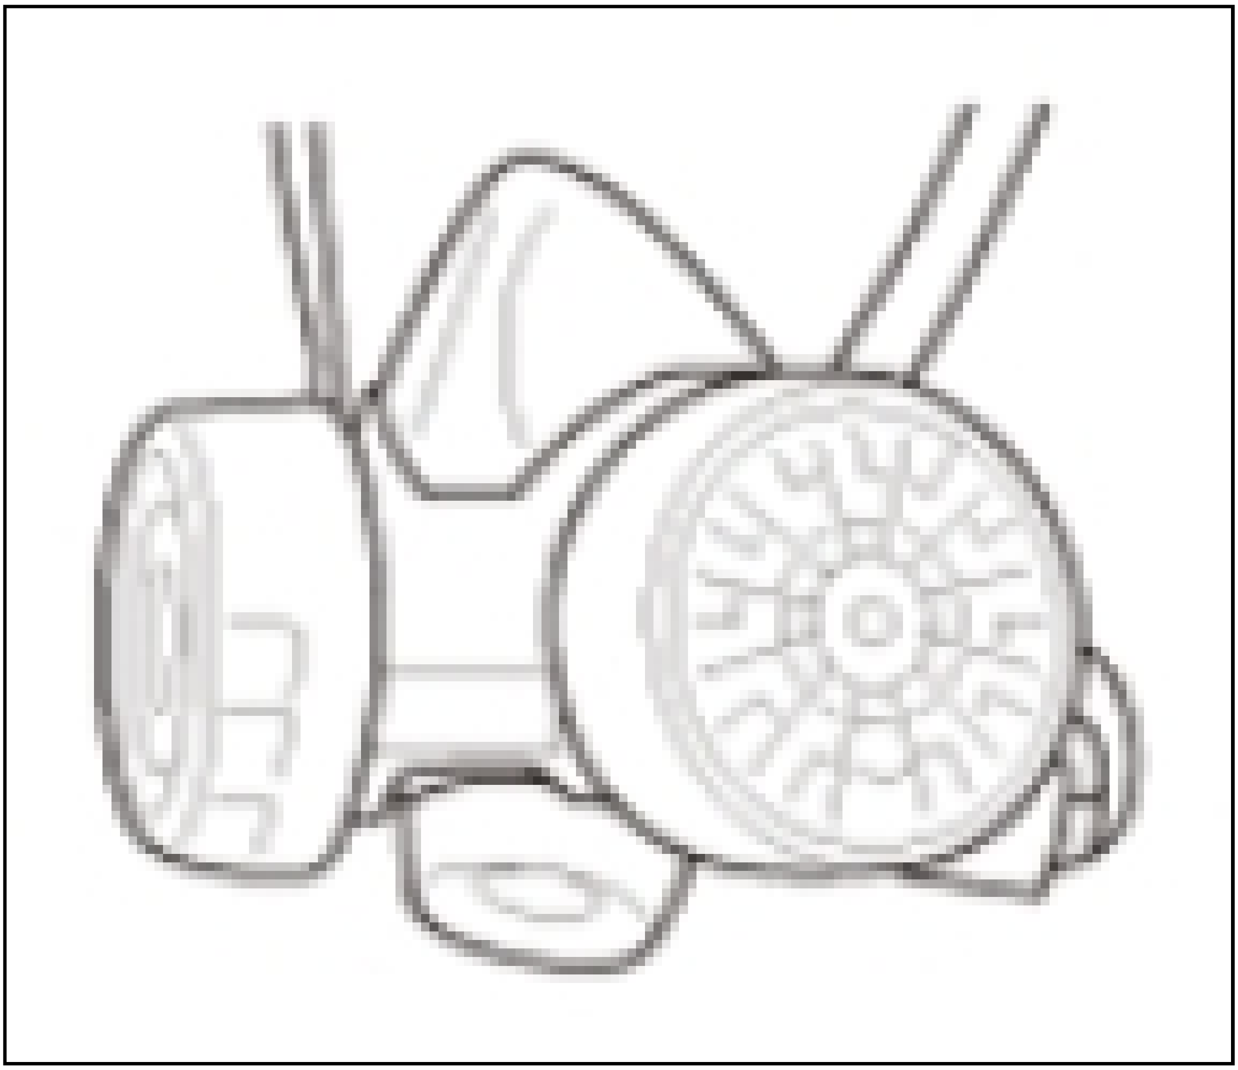
- Dust mask

  Protects lungs from dust inhalation during sanding or grinding.



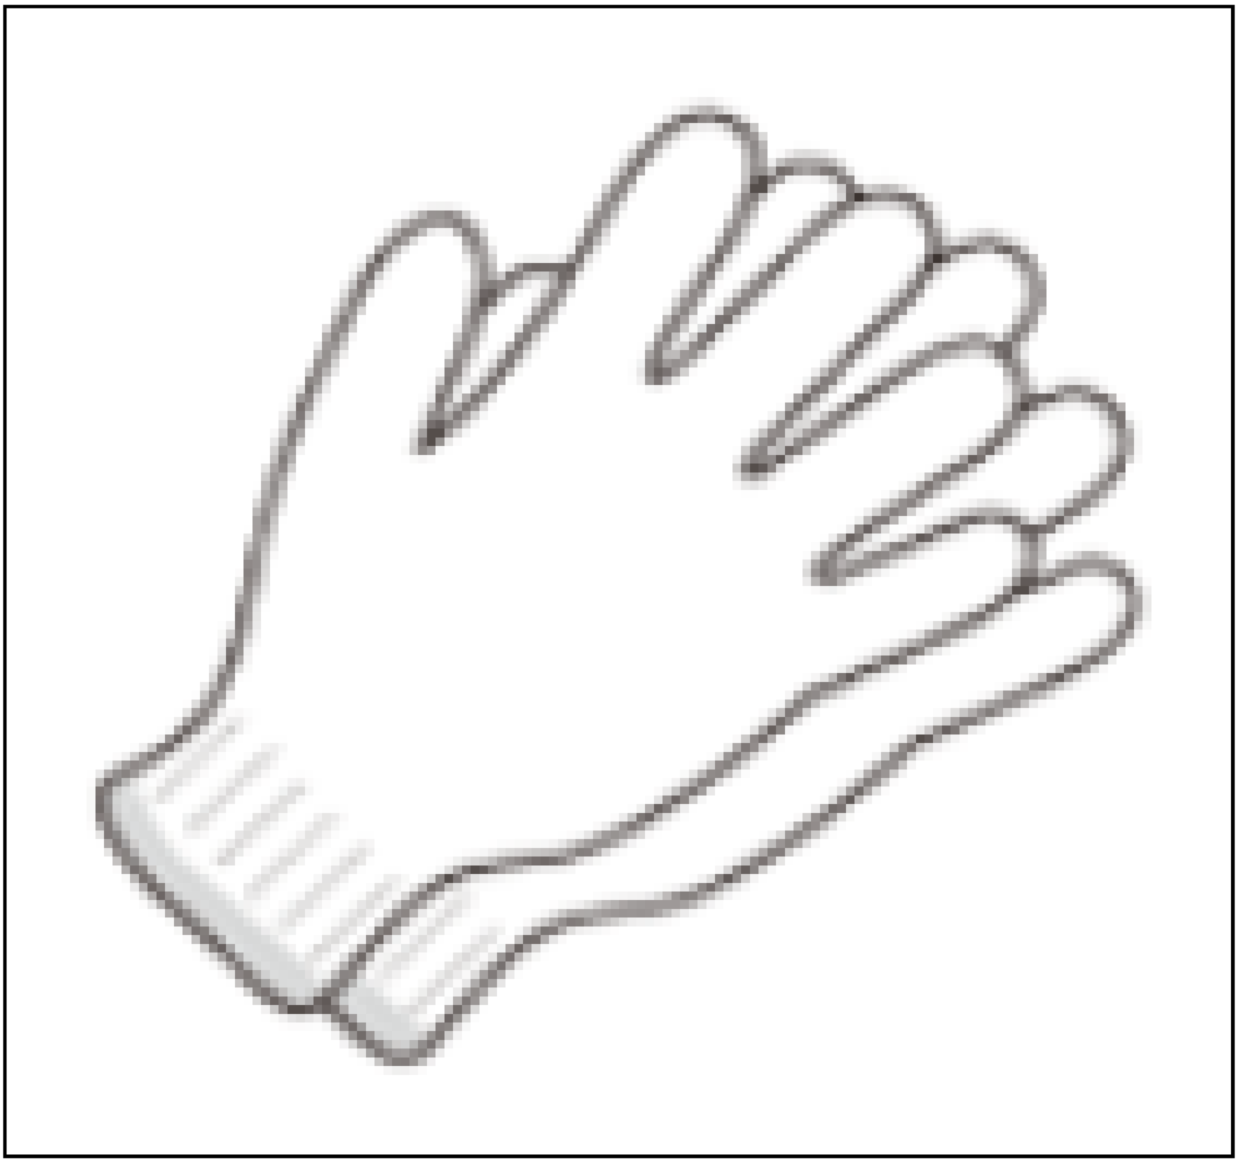
- Respirator

  Prevents inhalation of toxic solvents and dust during painting or welding.



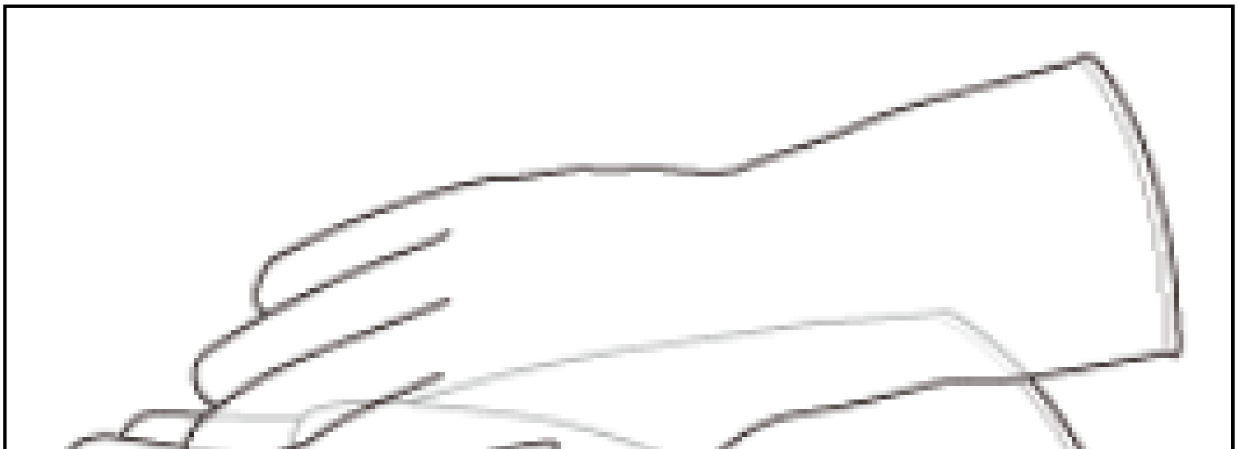
- Gloves

  Protect hands during general body repair operations.



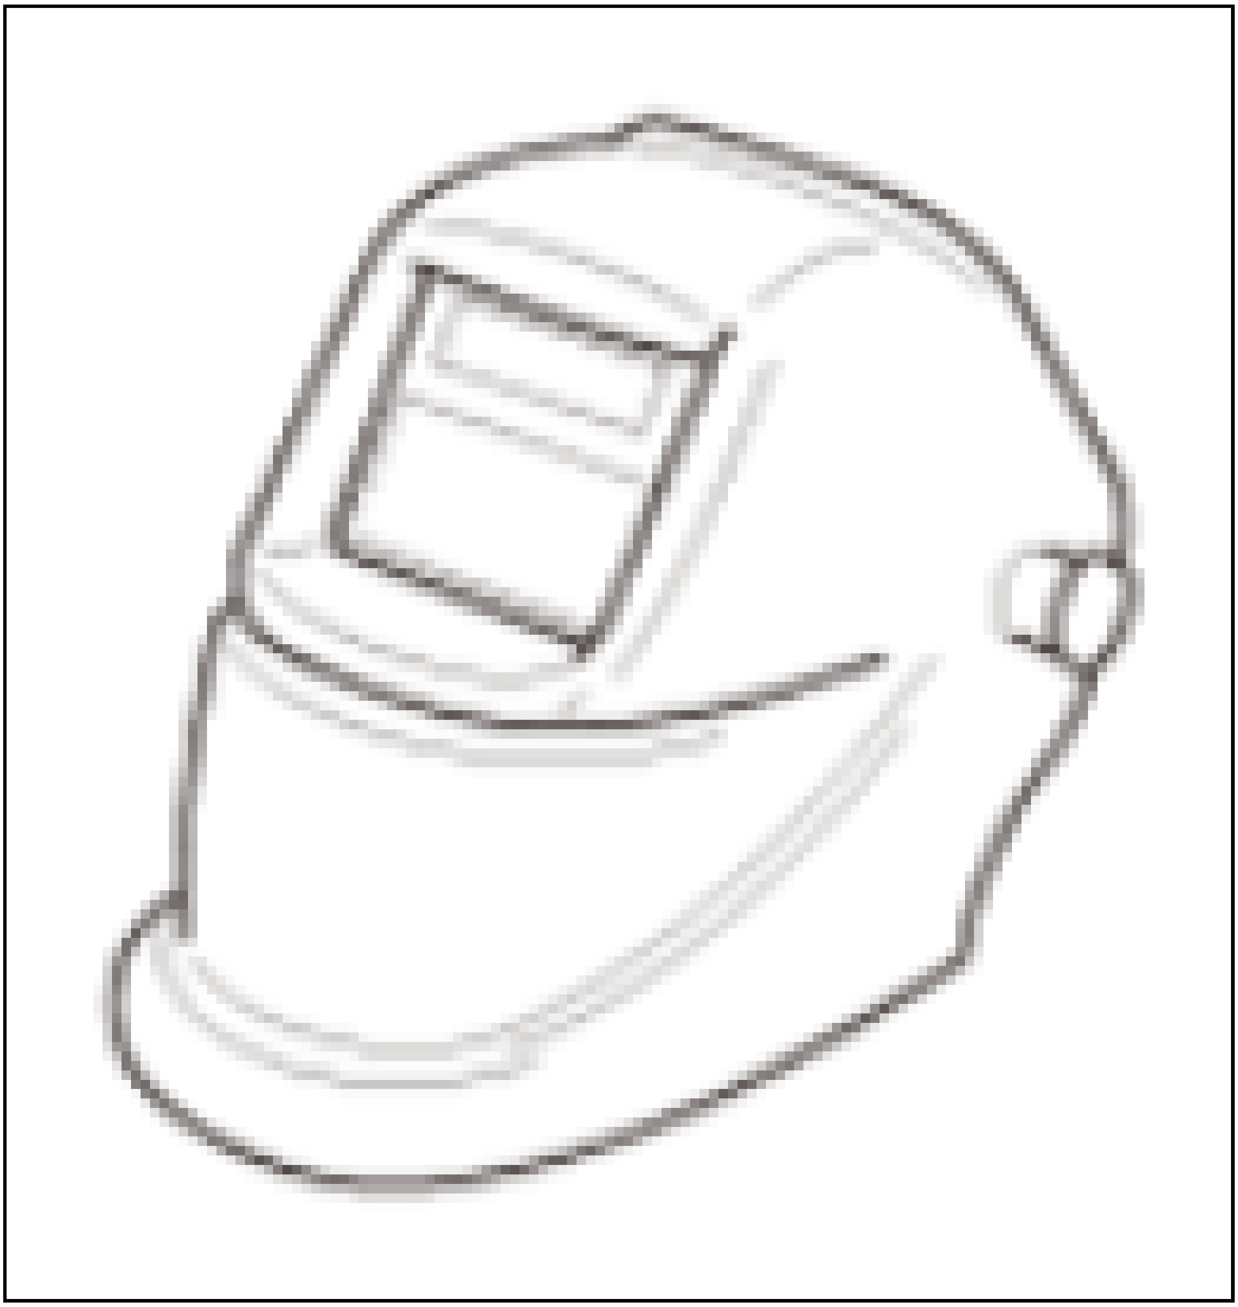
- Solvent gloves

  Prevent absorption of organic solvents through the skin.



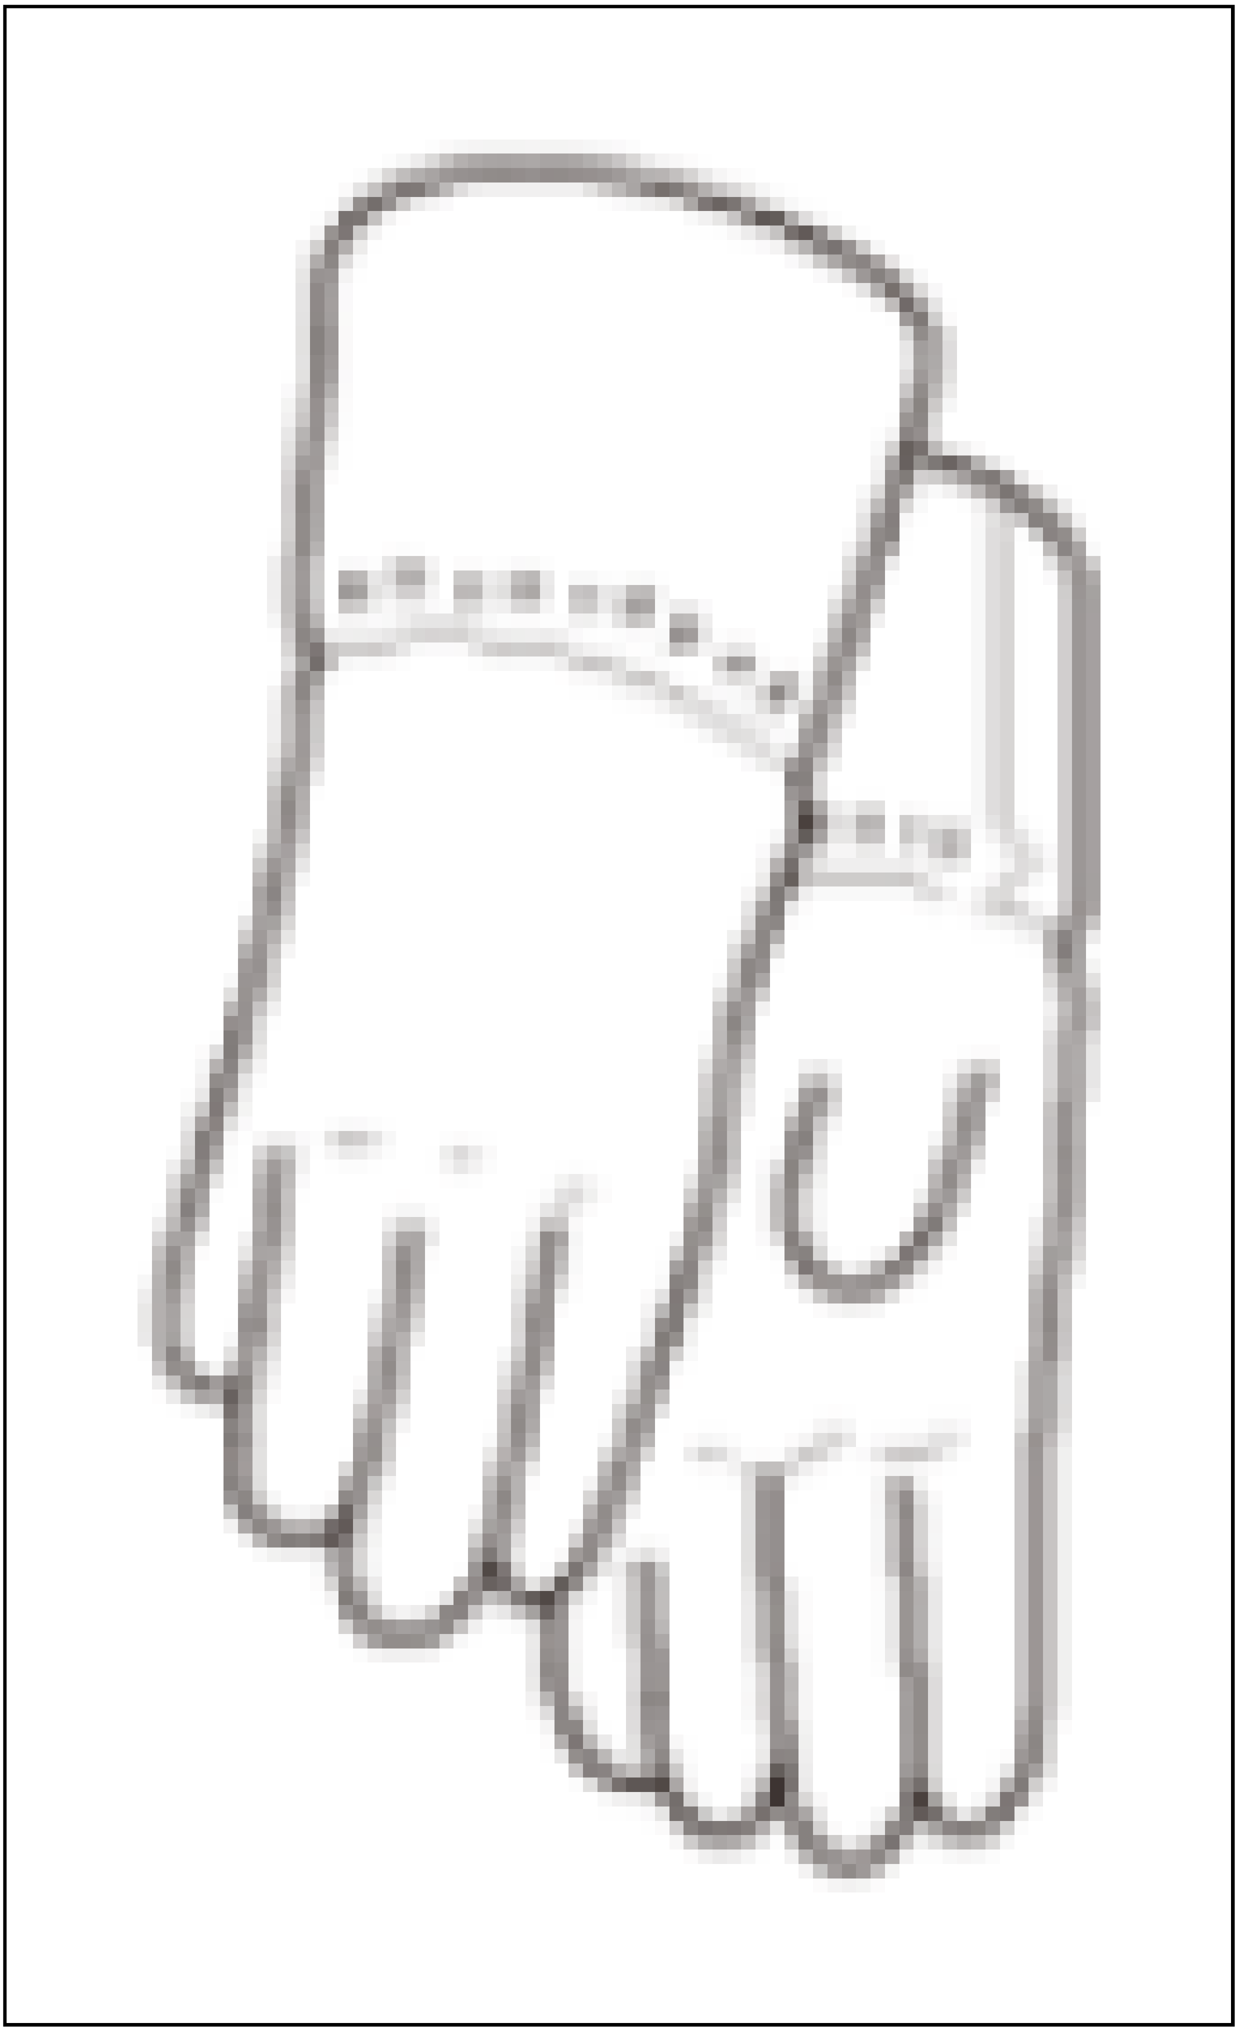
- Welding helmet

Protects eyes, face and neck from flash burn, ultraviolet light, sparks, infrared light, and heat during welding. Auto darkening helmets make welding much easier and safer.



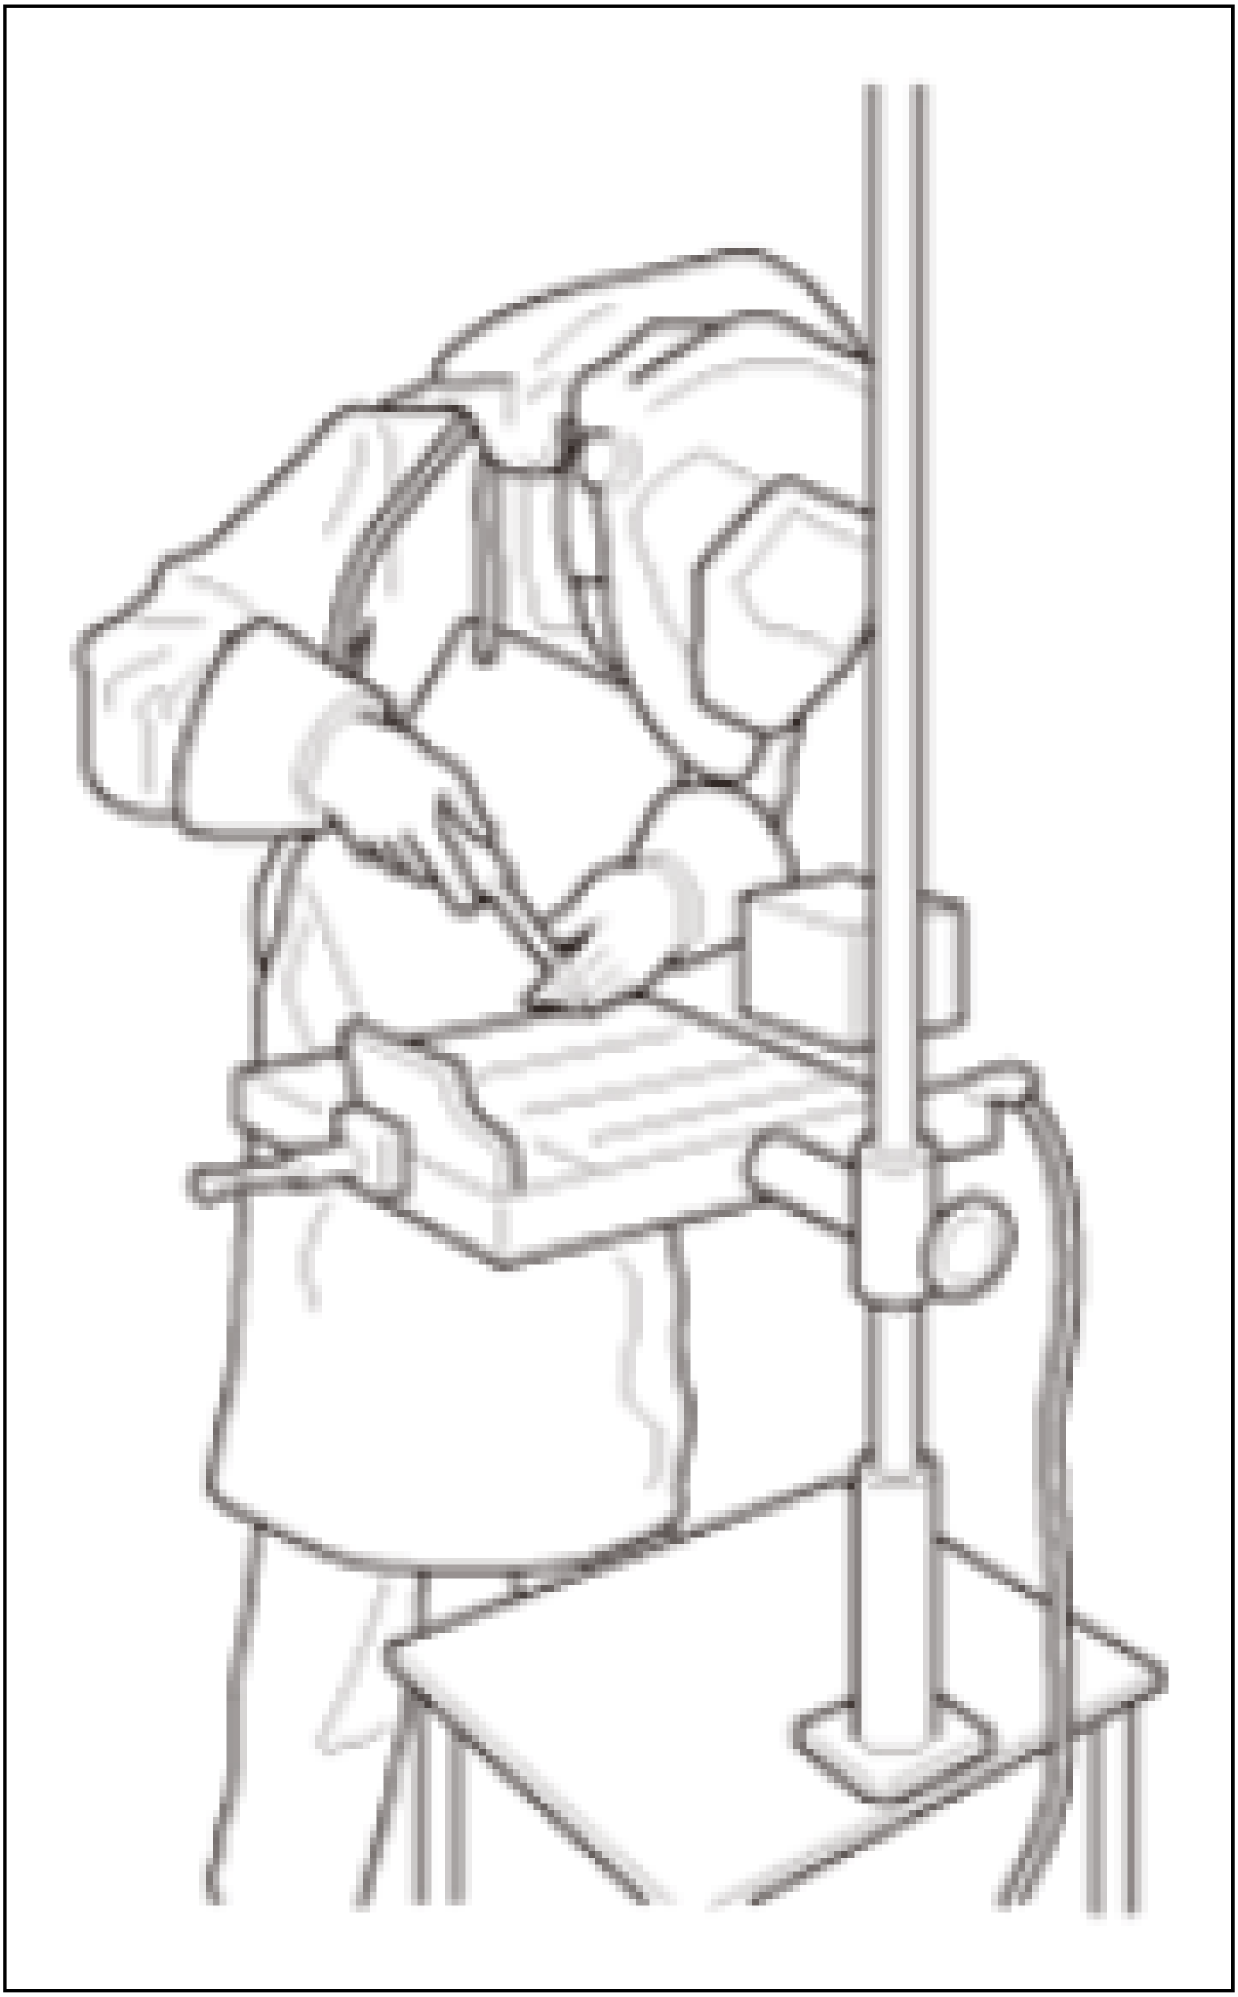
- Welding gloves

Protect hands from heat, sparks, and hot metal slag during welding.



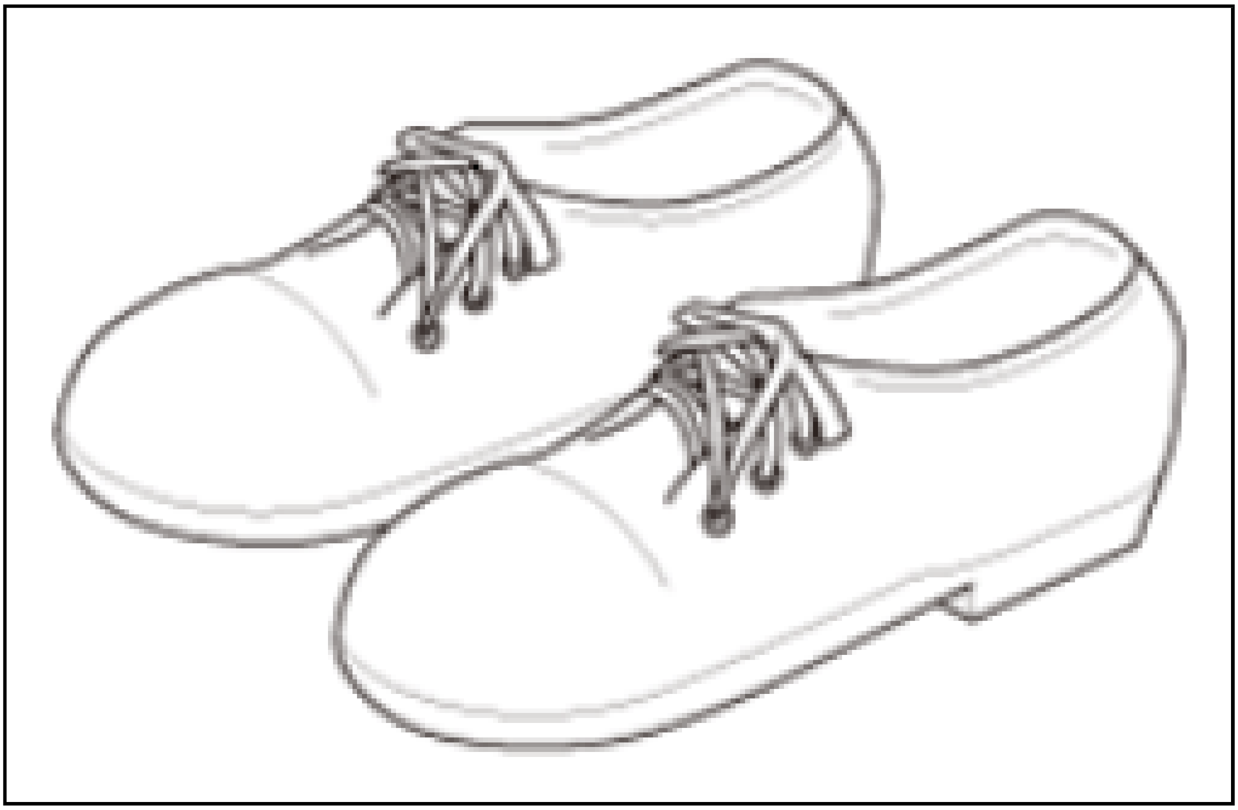
- Welding apron, arm/leg cover, hood

Protect arms, legs and other body parts from flash burn, ultraviolet light, sparks, infrared light, and heat during welding.

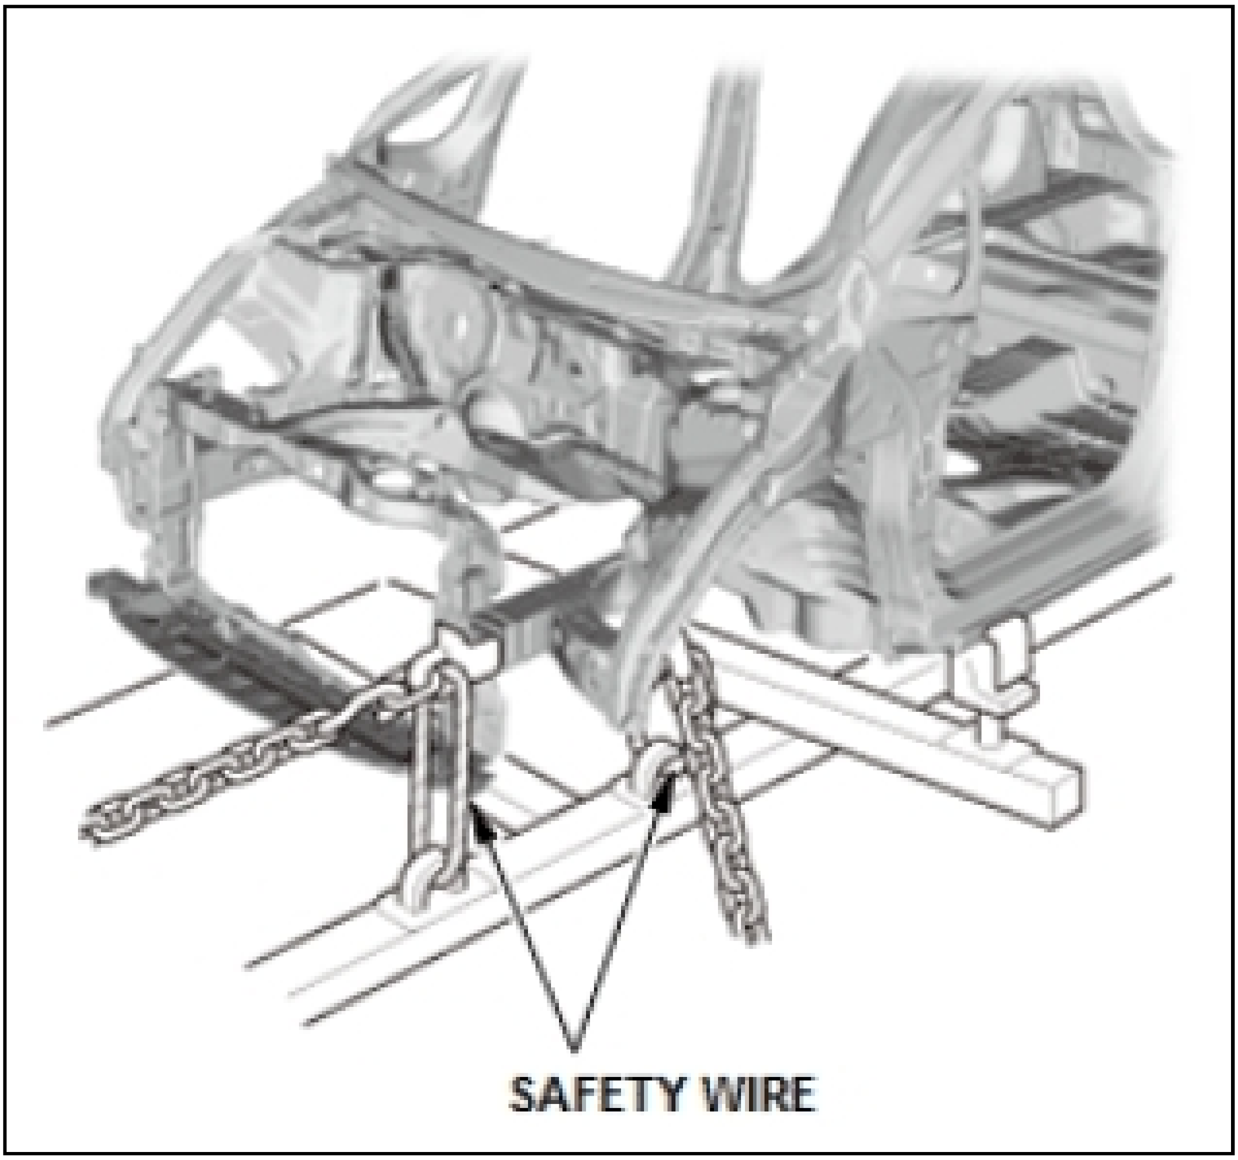


- Safety shoes (static electricity free shoes)

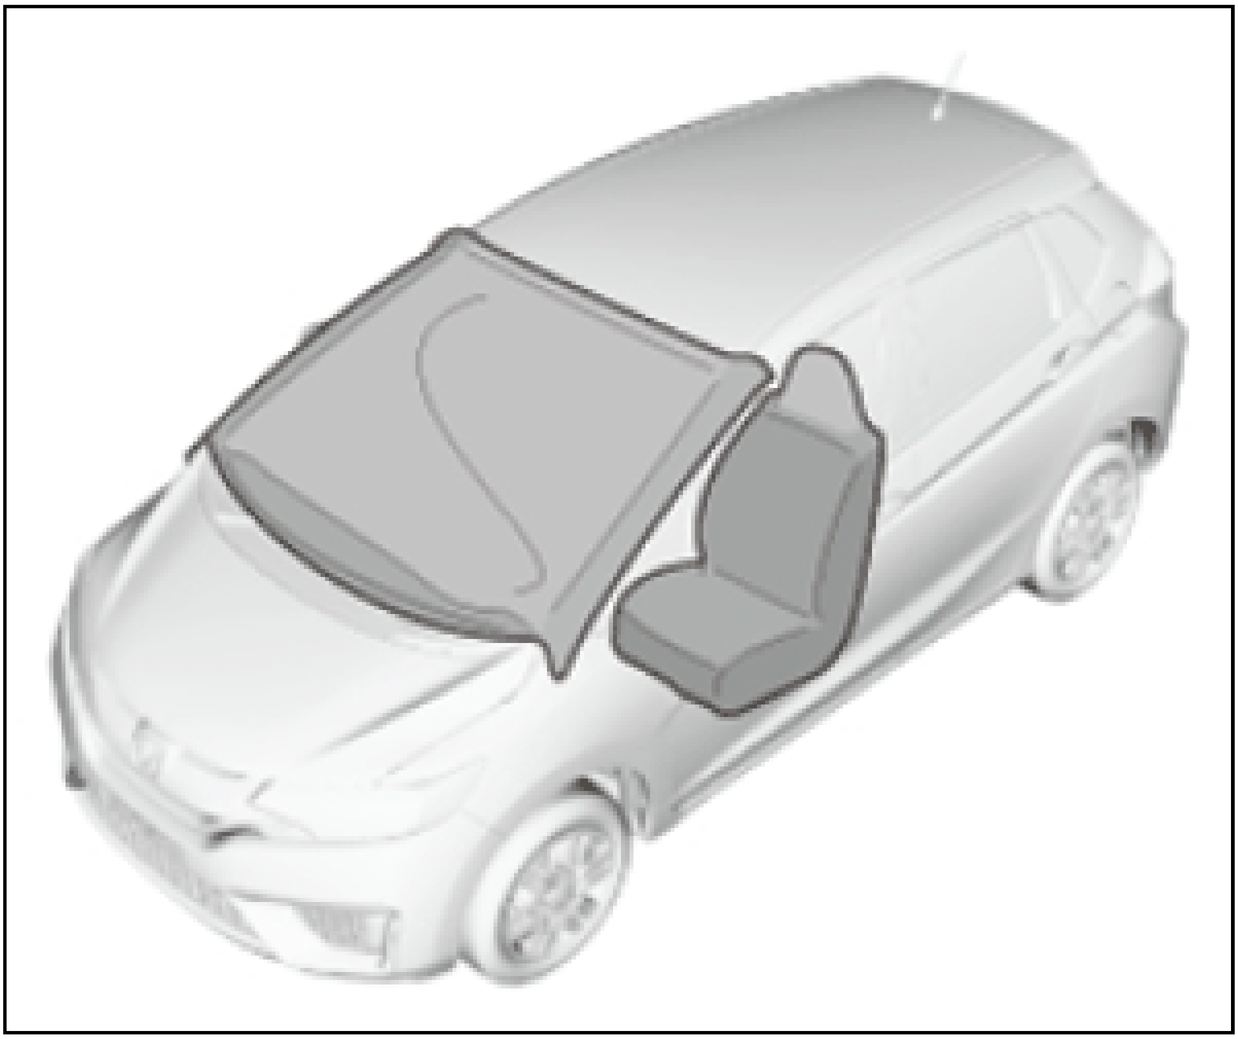
Protect toes from heavy falling objects.



- Safety Wires
  - Used for body and frame repair and straightening operations.
  - Help prevent injuries if a pulling chain fails or detaches while under tension.

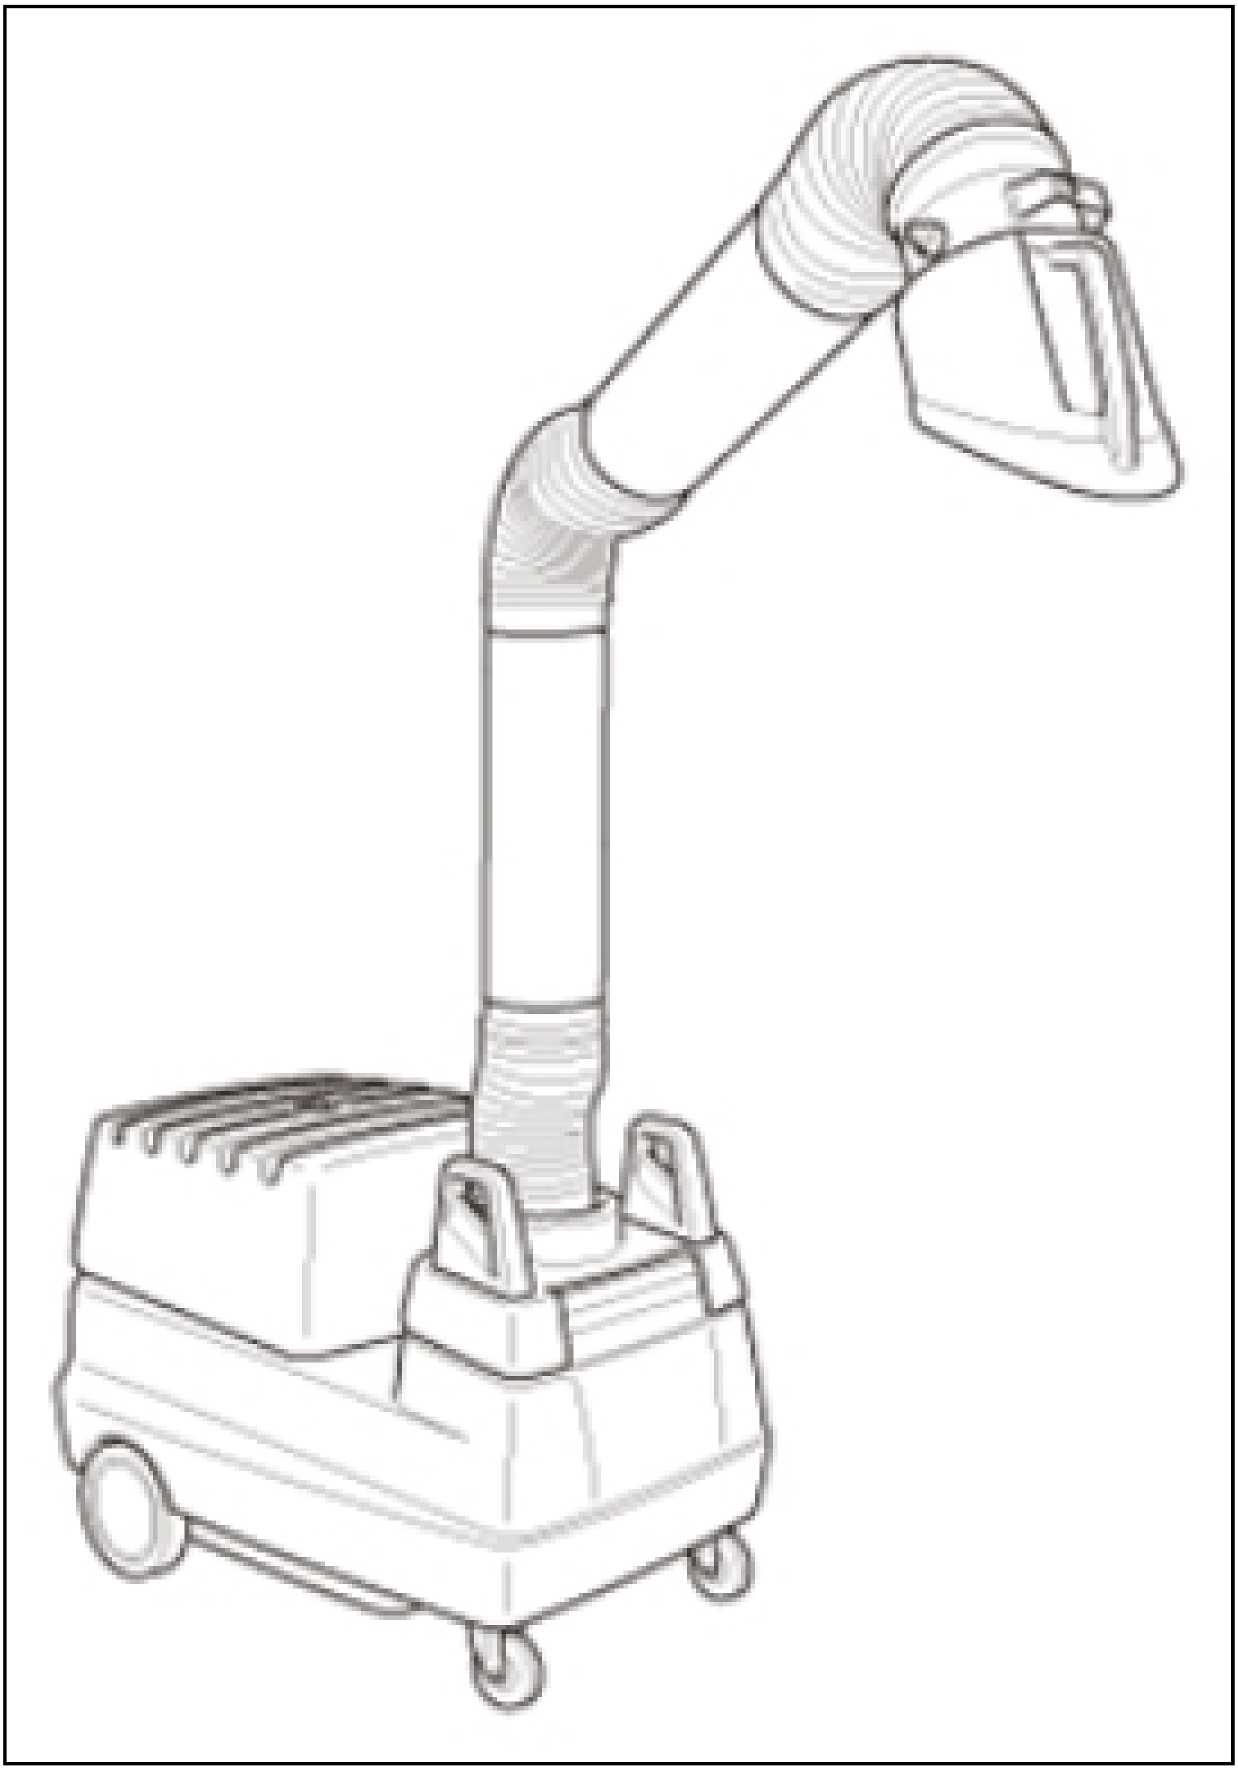


- Welding Blankets
  - Fireproof and/or heat resistant covers used to protect body parts such as glass and seats during welding operations.
  - Some use fireproof material such as carbon fiber.

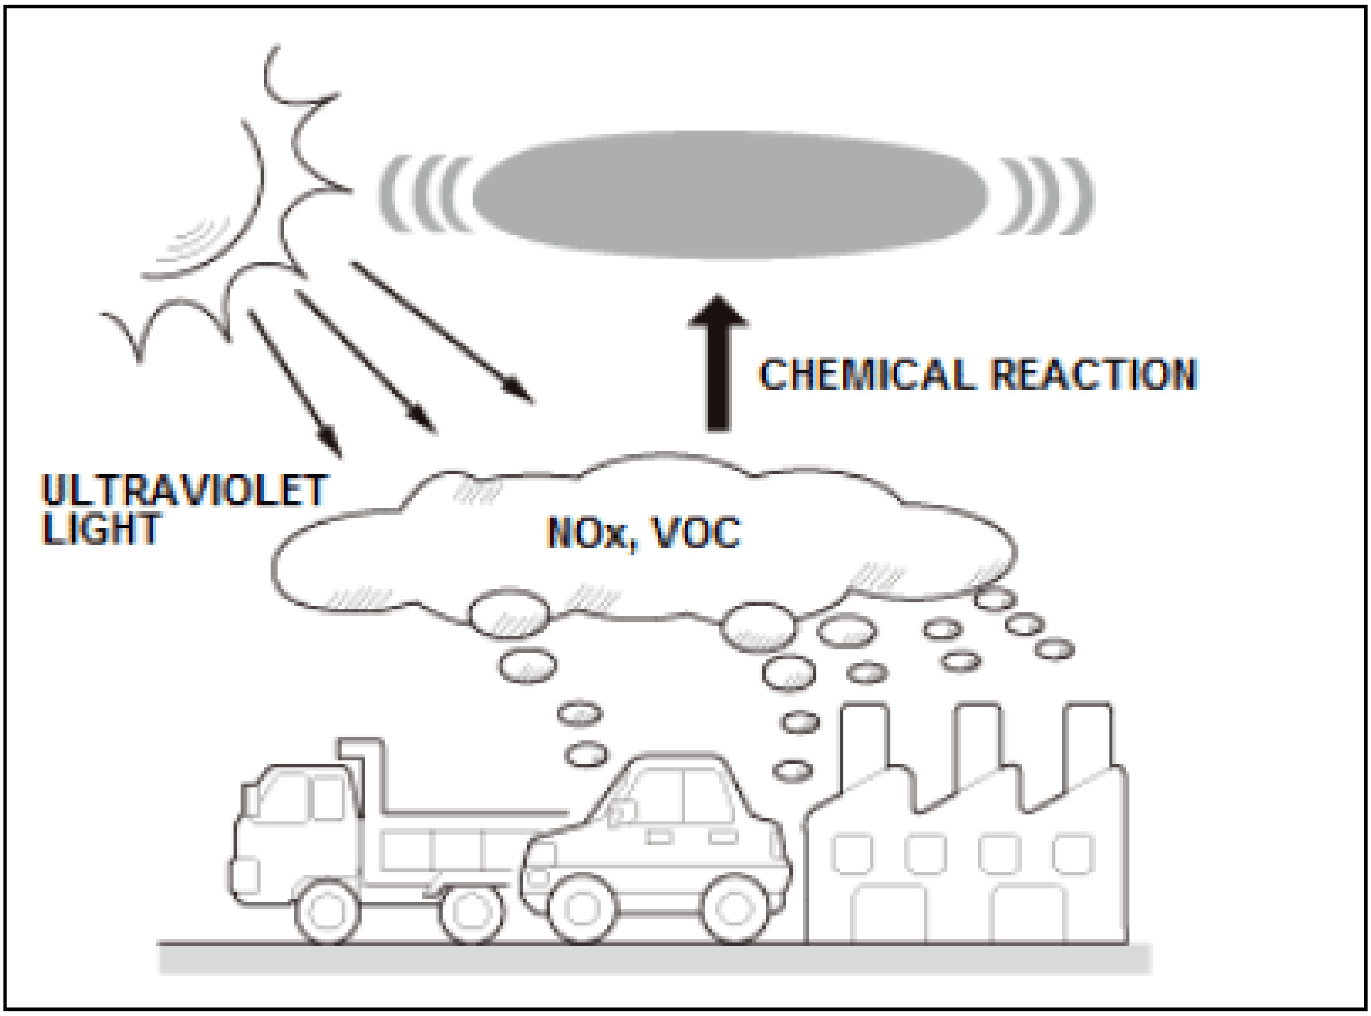


- Fume Collector

  Collects welding fumes which can cause pneumoconiosis, emphysema, or other respiratory disorders during metal welding.



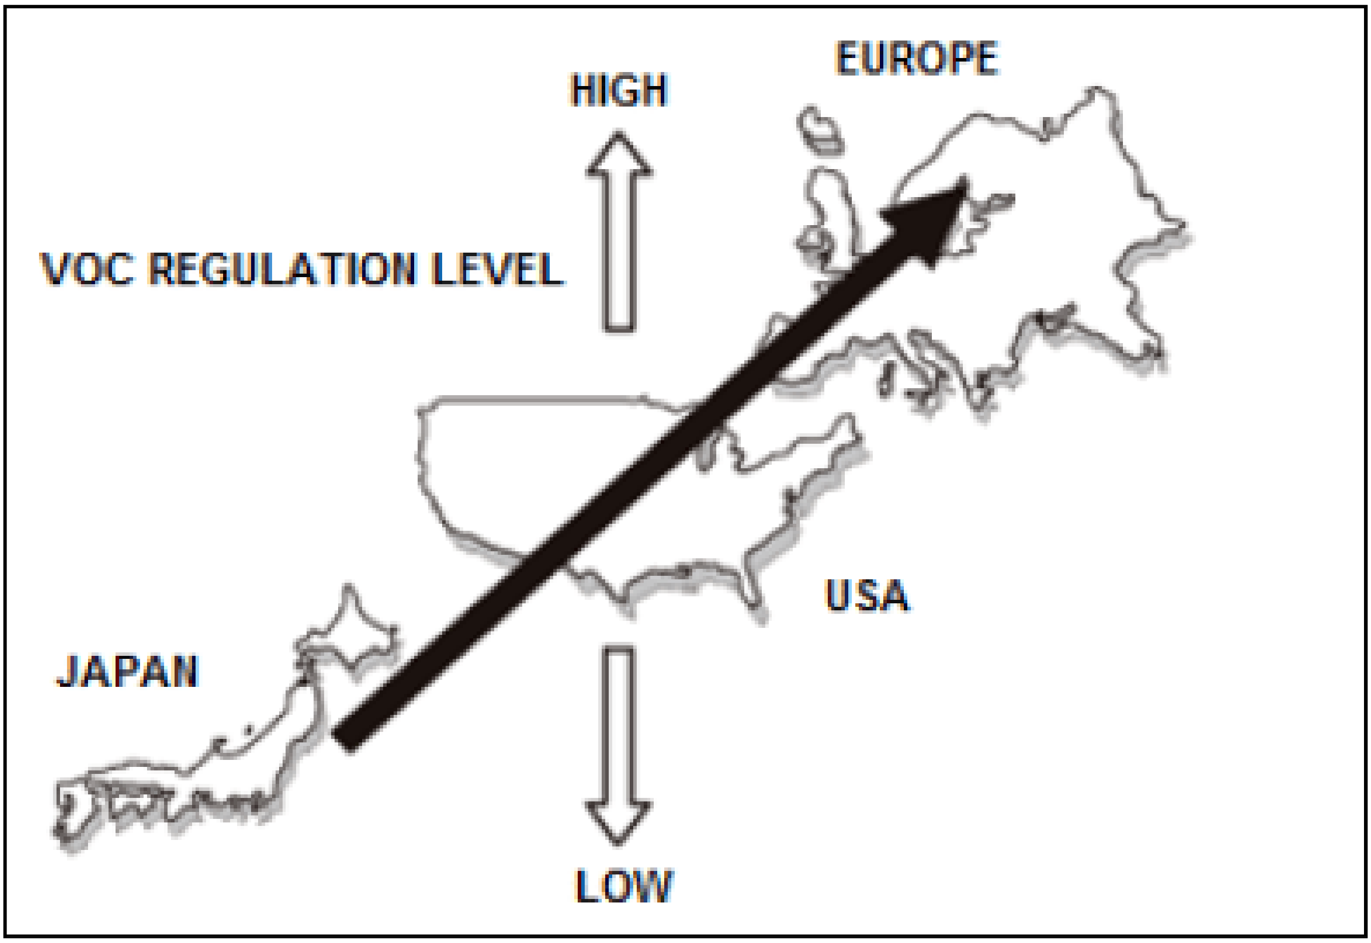
AIR POLLUTION



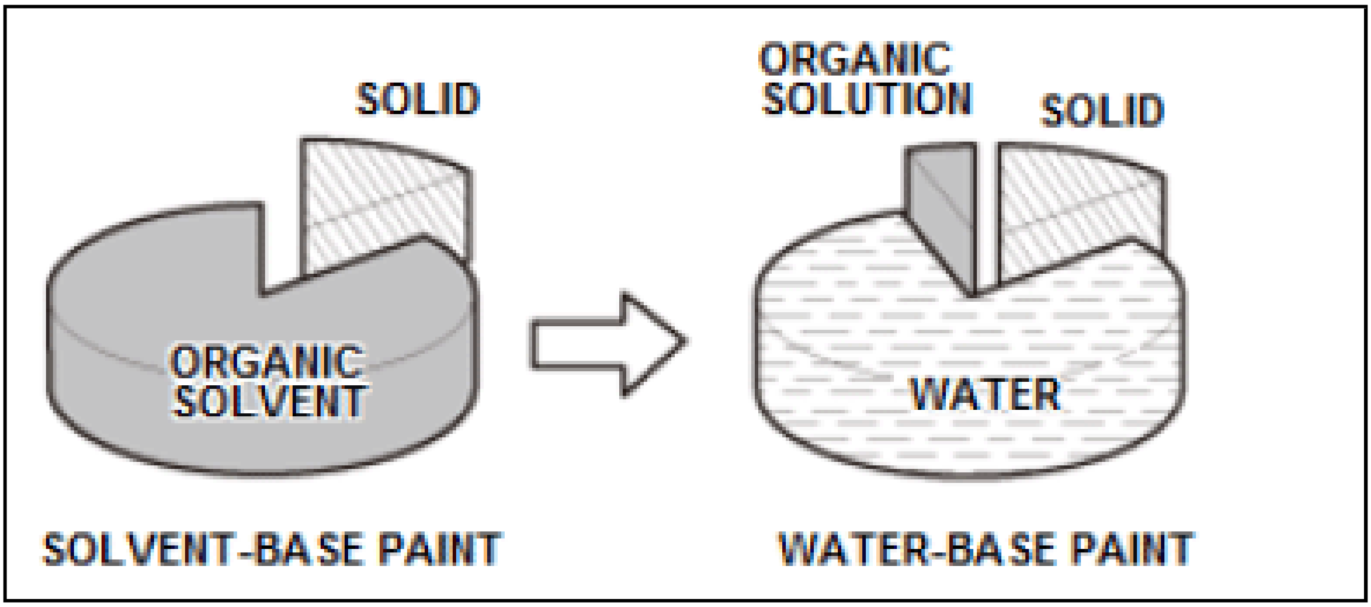
Photochemical oxidant (ozone) is a secondary contaminant generated by the photochemical reaction through solar exposure. The primary contaminant, which contains NOx and VOC as a main component, is emitted from factories and vehicles into air. It has been proven that photochemical oxidants are harmful to human health.

*VOC (volatile organic compounds) is a collective term for organic compounds such as toluene, xylene, ethyl acetate and many other substances. These VOC vapors travel through the air.

REDUCTION OF VOC



EUROPE
HIGH
VOC REGULATION LEVEL
USA
JAPAN
LOW



SOLID
ORGANIC SOLUTION
SOLID
ORGANIC SOLVENT
WATER
SOLVENT-BASE PAINT
WATER-BASE PAINT

Variety of activities to reduce VOC which is a cause of photochemical oxidant emission is carried out by the wide range of business fields globally Paint suppliers are not an exception. They have introduced products such as high-solids type paint and solvent-free borne paint. Honda, along with the rest of the automotive industry, has adopted use of borne base coats in production.

NOTE: **VOC Level Regulations Vary by Country**

Europe has the strictest standards because of shared borders and critical air pollution issues.

The collision repair industry has also moved toward widespread adoption of borne paint in order to further reduce VOC emissions.

BASIC FINISH AND PAINT INFORMATION

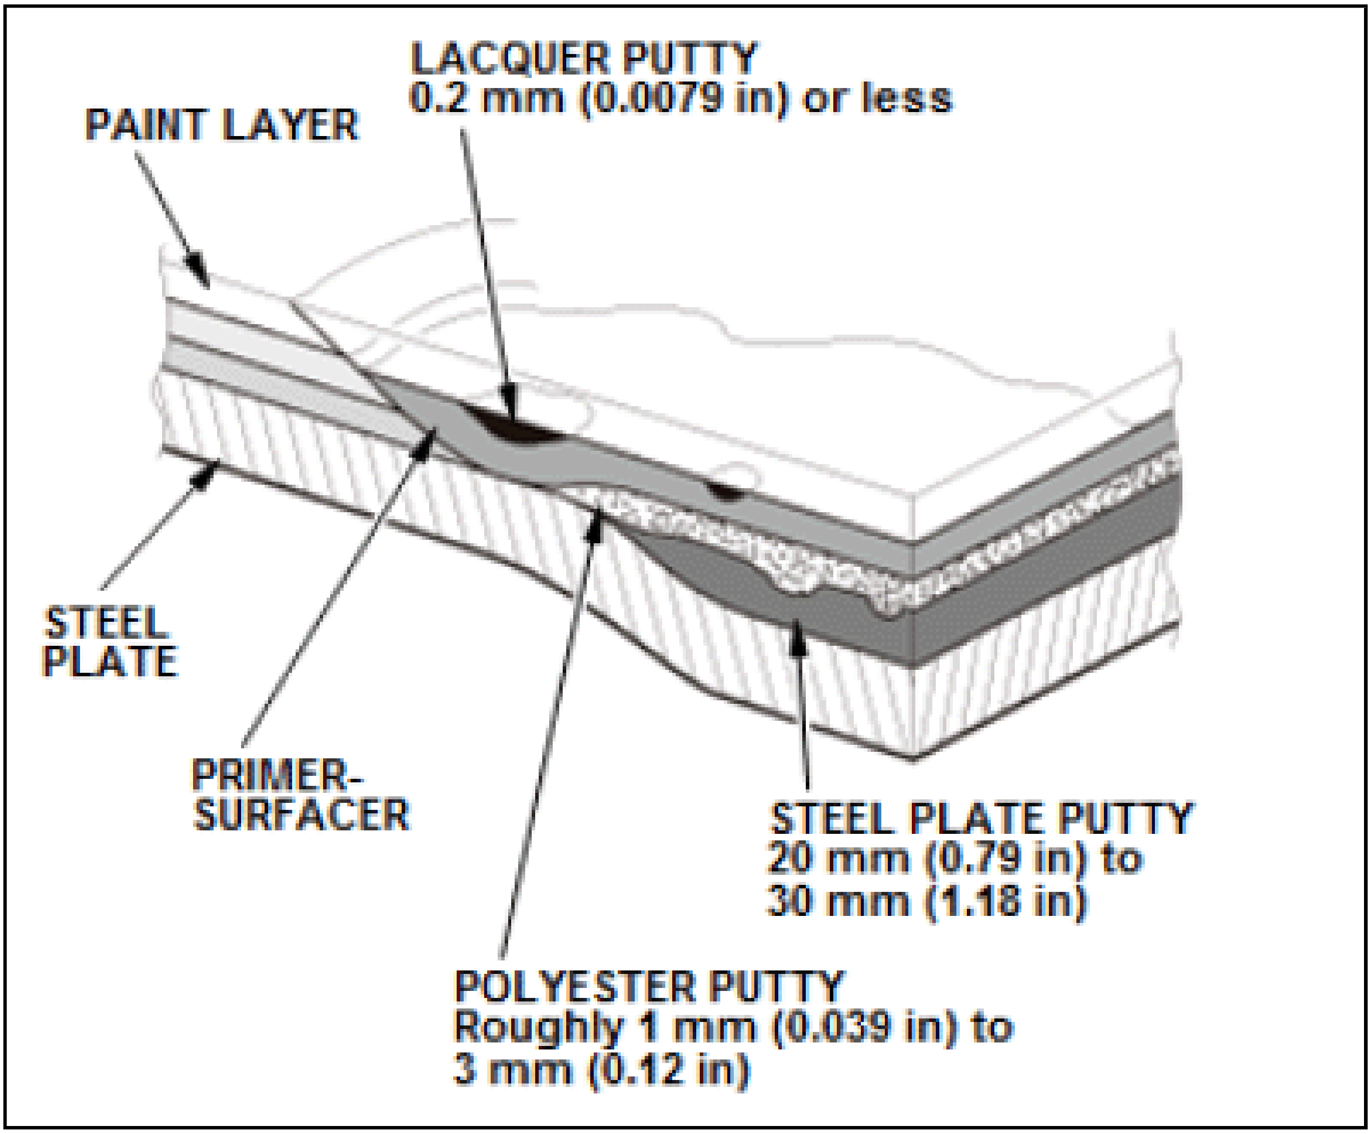
AUTOMOTIVE REFINISHING PRODUCTS

Body Filler And Spot Putty

Putty is a paste-like paint used to fill deep dents that cannot be filled by other types of undercoat or secondary coats. There are three types of commonly used fillers/putties:

- Metal putty
- Polyester putty
- Lacquer putty

Apply fillers/putties selectively, depending on the depth of the dent to be filled. Putty is normally applied thickly by a body filler scoop, or spatula, to fill the dent, then sanded smooth later.



Metal Putty

A dual-component paint mainly consisting of an unsaturated polyester resin. It hardens when mixed with organic peroxides (hardener). This putty is used mainly to correct surface irregularities on the base metal during sheet metal repair. It is very flexible and can be applied in very thick coats up to around 30 mm (1.2 in). Metal putty is very porous and is difficult to sand.

Polyester Putty

A dual-component paint mainly consisting of an oil-modified unsaturated polyester resin. It hardens when mixed with organic peroxides (hardener). This putty is used mainly to correct pores and shallow dents remaining after application of metal putty It has a very fine and flexible texture and primer-surfacer can be applied directly over it. It cannot be applied to in a thick coat approx over 3 mm (0.12 in). This putty should not be applied directly over the bare metal due to low adhesion under those conditions.

Spot (Lacquer) Putty

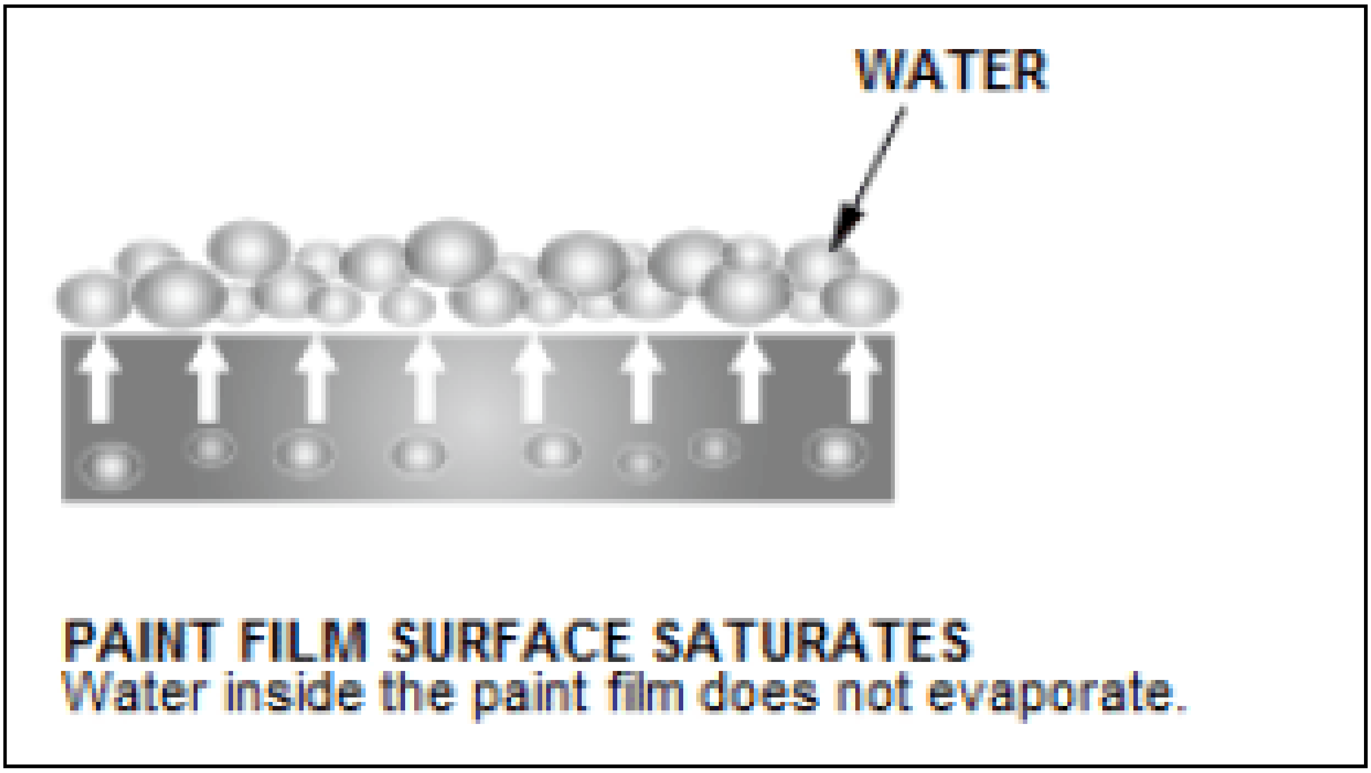
This is a single-component putty mainly consisting of nitrocellulose and alkyd or acrylic resin. It is used mainly to fill shallow sanding scratches, pores, or dents remaining after the primer-surfacer application.

NOTE: **Presently there is a combination putty available which combine the best characteristics of several different putty types into one.**

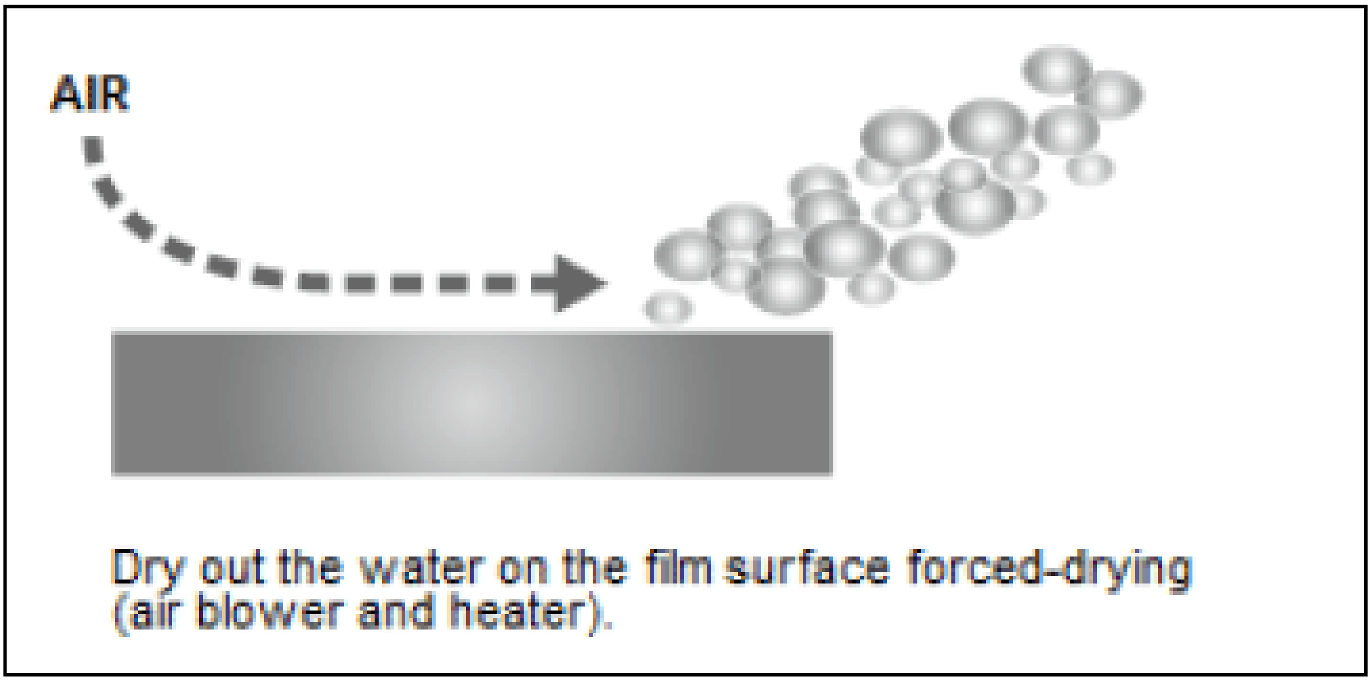
Thickness Limitation of Putty:

There are limitations to the application thickness, which vary by filler or putty type can be applied at once per putty type.

Drying Water-Based Paint



WATER
PAINT FILM SURFACE SATURATES
Water inside the paint film does not evaporate.



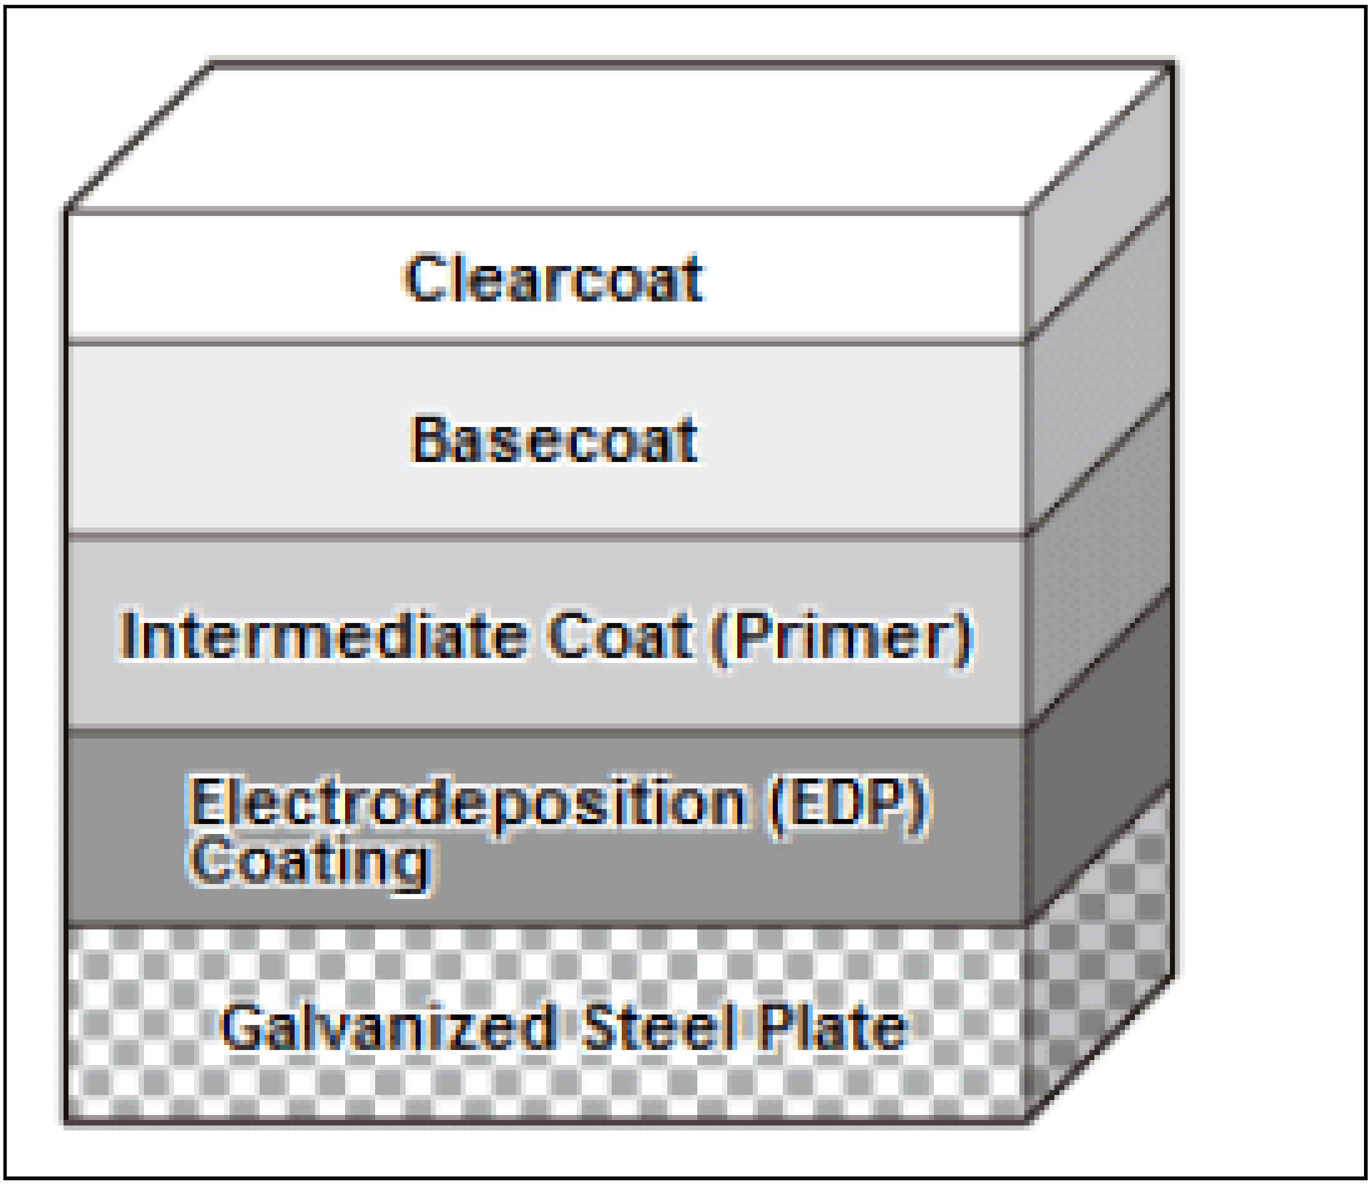
AIR
Dry out the water on the film surface forced-drying (air blower and heater).

When using water-based paint, the paint film is formed as the water evaporates and dries. This is a similar method to de drying laundry, so humidity and air flow rate have a significant impact. In order to shorten the drying time of water-based paint, water evaporation is accelerated by forcing a higher air flow (by using a blower) and higher temperature (using a heater to reduce humidity).

Paint Performance Criteria

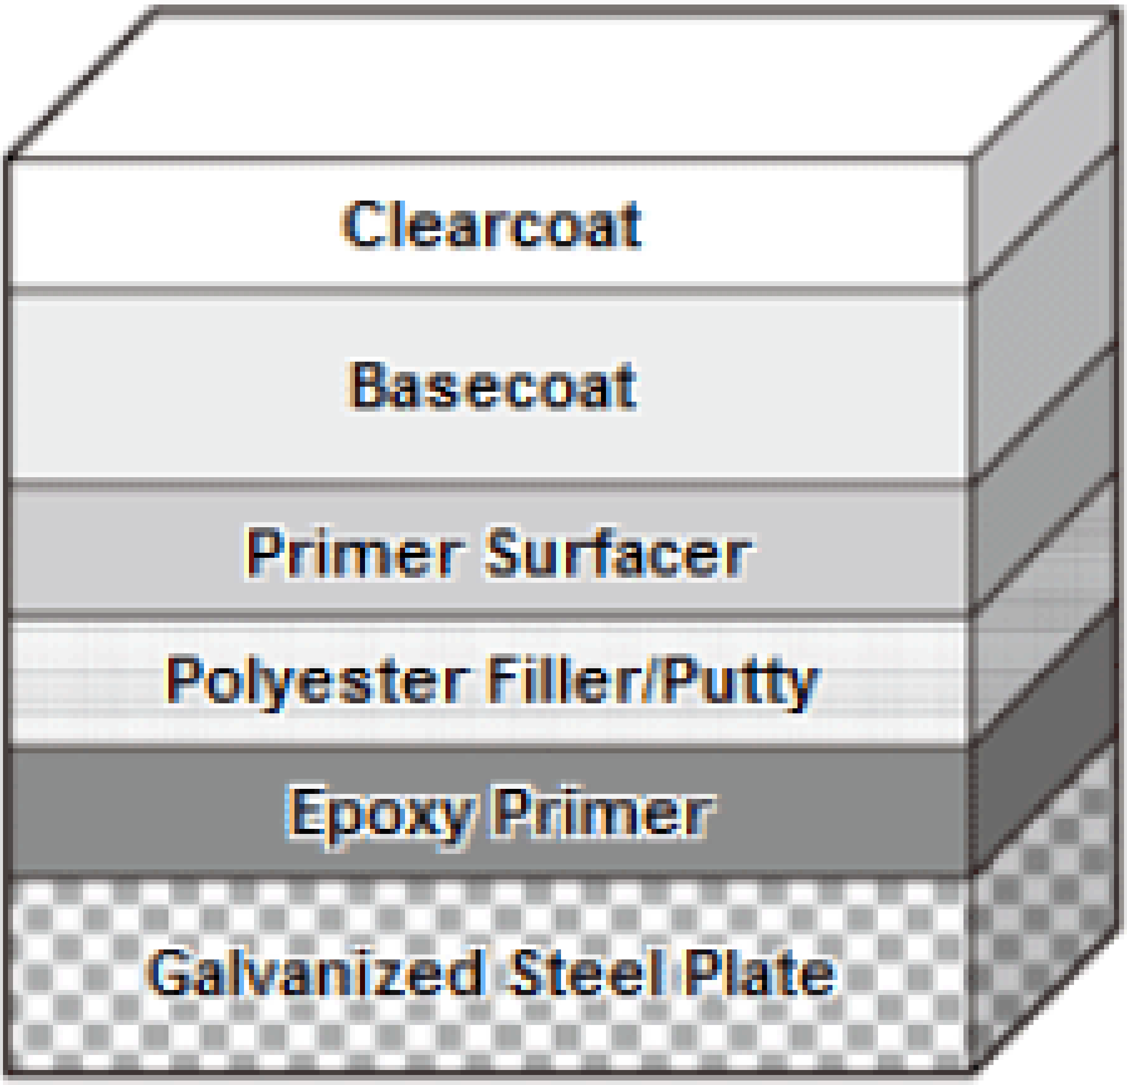
Automotive paint finishes require multiples layers of coatings, each with different performance criteria, to achieve the required performance and durability levels.

Paint Film Layers for Production Vehicles (Ex.)



Clearcoat
Basecoat
Intermediate Coat (Primer)
Electrodeposition (EDP) Coating
Galvanized Steel Plate

Paint Film Layers for Repair (Ex.)



- Rust Prevention:

  Rust prevention performance is crucial to the undercoat (putty primer-surfacer, etc.) that is applied directly to the steel surface.

- Filling:

  Used to fill dents in the damaged bodywork, sanding scratches and pin holes in the undercoat.

- Absorption Prevention (Sealing):

  Undercoating materials often have many tiny holes. When the top coat is applied directly over those porous materials, those holes will absorb the wet paint and the top coat will lose its luster. To protect the top coat from absorption, a sealer must be applied before the topcoats.

- Luster:

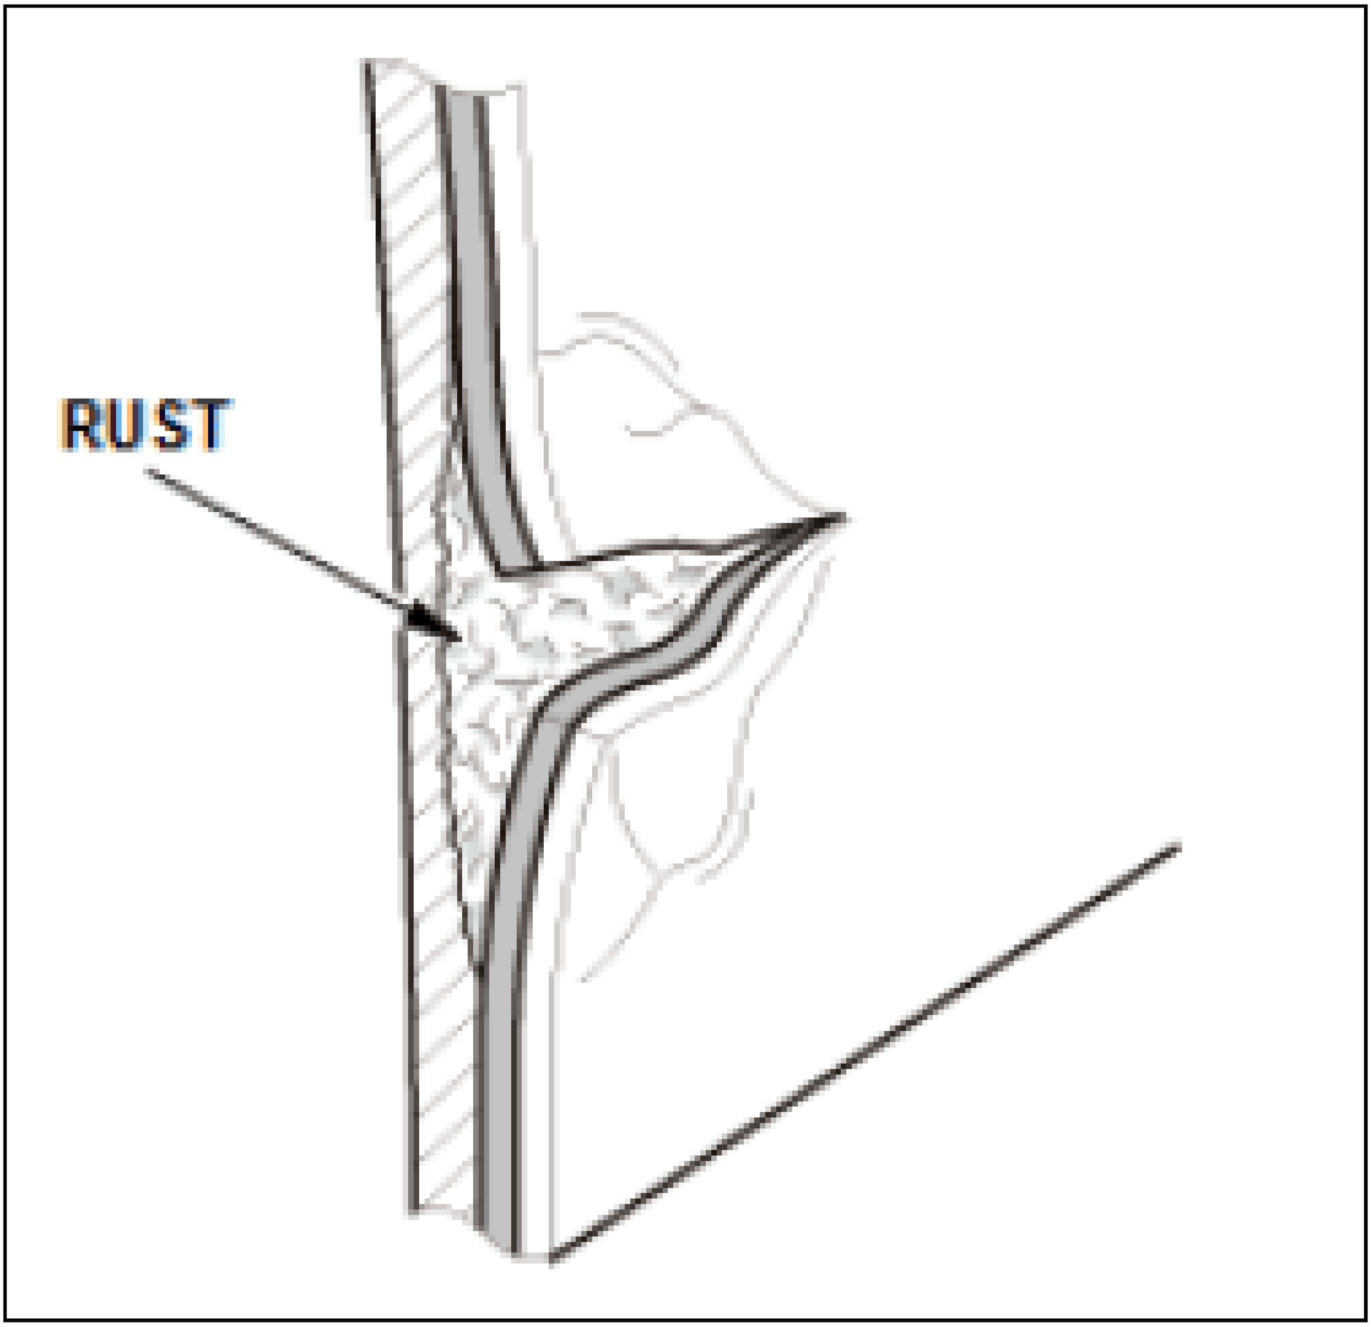
  When applied properly paint gives the color, luster and smoothness to the surface. In addition, all these elements will be very durable.

- Adhesiveness:

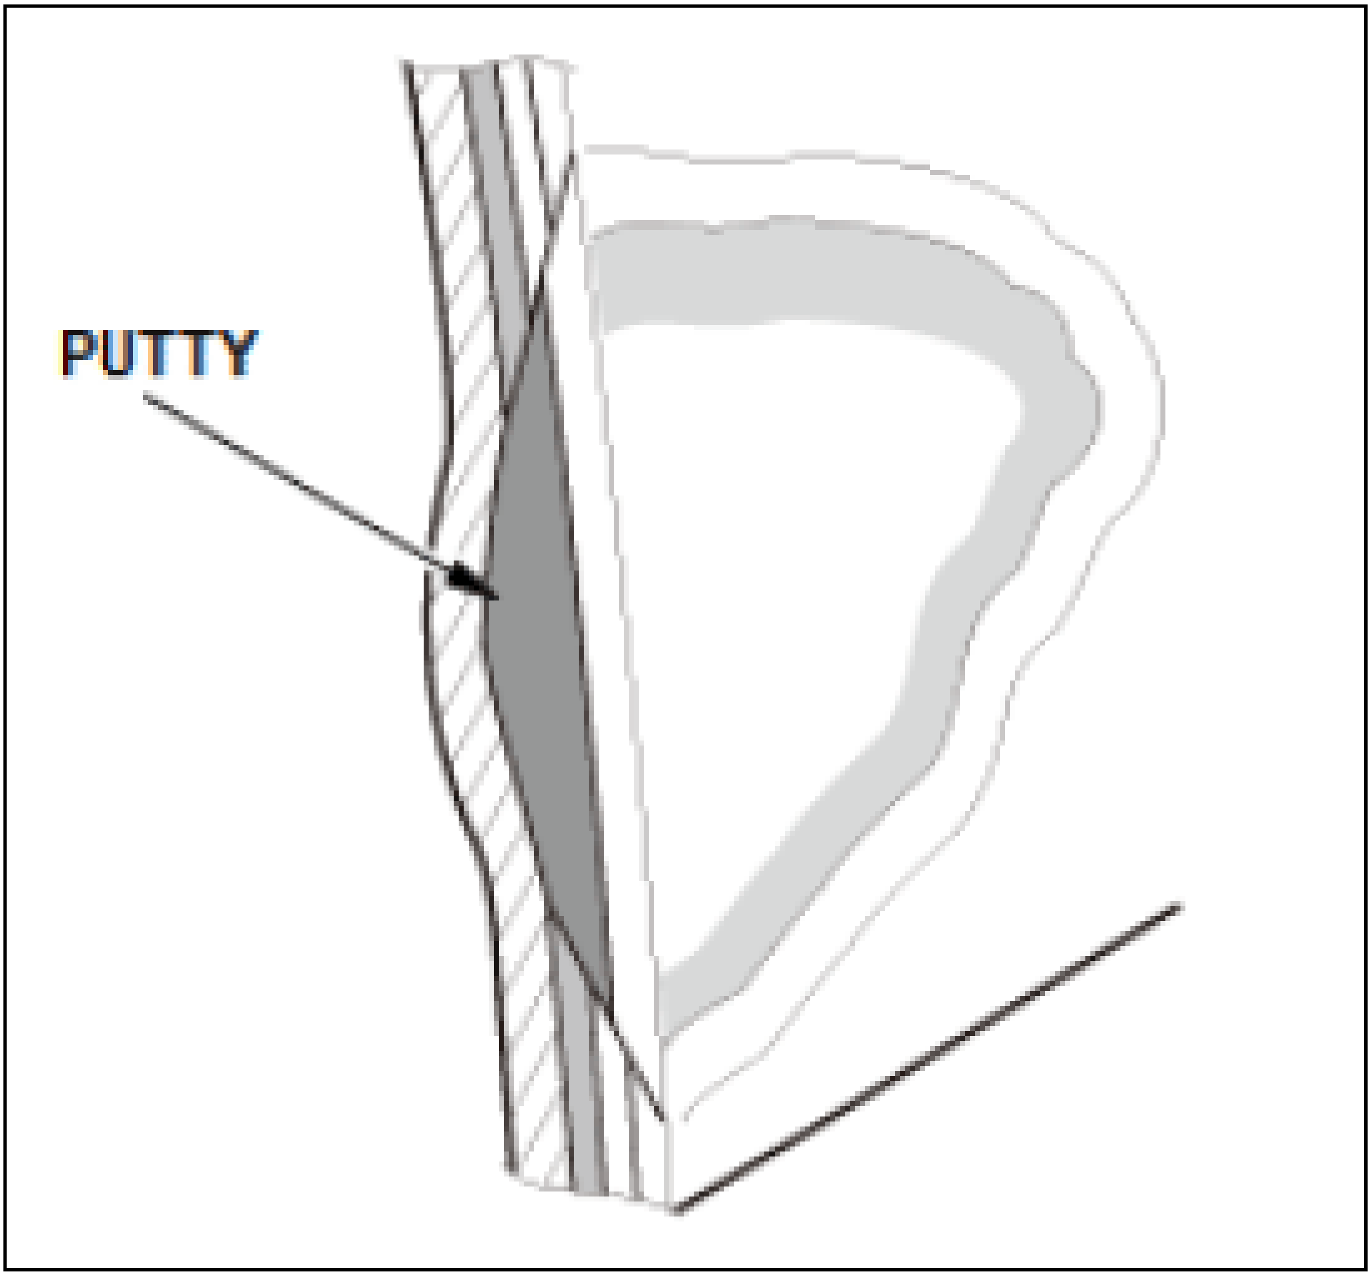
  The base metal or the undercoat must firmly hold the new coat of paint to prevent peeling away from each other.

- Workability:

  The ease of handling and work speed of the paint finish processes.



RUST



Primer

Primer is applied directly onto the bare metal to prevent corrosion and promote adhesion of the next paint coat. It is generally applied as a very thin coat and does not require sanding. There are several kinds of primer. However, a pure primer is less often used today in repairs and repainting, because a new product, primer-surfacer, has been developed to replace it.

Etching Primer

Also sometimes called wash primer. Etching primer mainly consists of vinyl butyral resins and zinc chromate (rust preventive pigments) and an additive with phosphoric acid as a main base resin. Etching primer is available in two types, a single-component type and a dual-component type. The dual-component type wash primer provides better rust preventive. Etching primer must be applied very carefully because its adhesion power reduced if applied too thick or left to dry more than necessary.

Urethane Primer

A dual-component type primer mainly consisting of alkyd resins. It hardens when mixed with isocyanate (hardener). Urethane primer provides outstanding corrosion protection and adhesion power, but requires hot air around 140Â°F (60Â°C) for drying. Drying under normal temperature 68Â°F (20Â°C) or below is a very slow process.

Epoxy Primer

This is a dual-component type primer mainly consisting of epoxy resins. It hardens when mixed with an amine family hardener. Similar to urethane primer, it also provides outstanding corrosion protection and adhesion power and requires hot air around 140Â°F (60Â°C) for drying. Drying under normal or low temperatures is a very slow process.

Primer Surfacer

Primer-surfacer has characteristics of both traditional primers and surfacers. The most recent primer-surfacer has a stronger characteristic as a surfacer:

- Corrosion resistance (required for primer)
- Smoothness (required for surfacer)
- Sealing or absorption prevention (required for surfacer)
- Adhesion (required for both primer and surfacer)

Urethane Primer-Surfacer

The two-liquid paint and base resin and hardener to be mixed before use. It will not dissolve in paint reducer/thinner after completely dry and has high sealing performance. The drying process is slow, so forced drying is recommended.

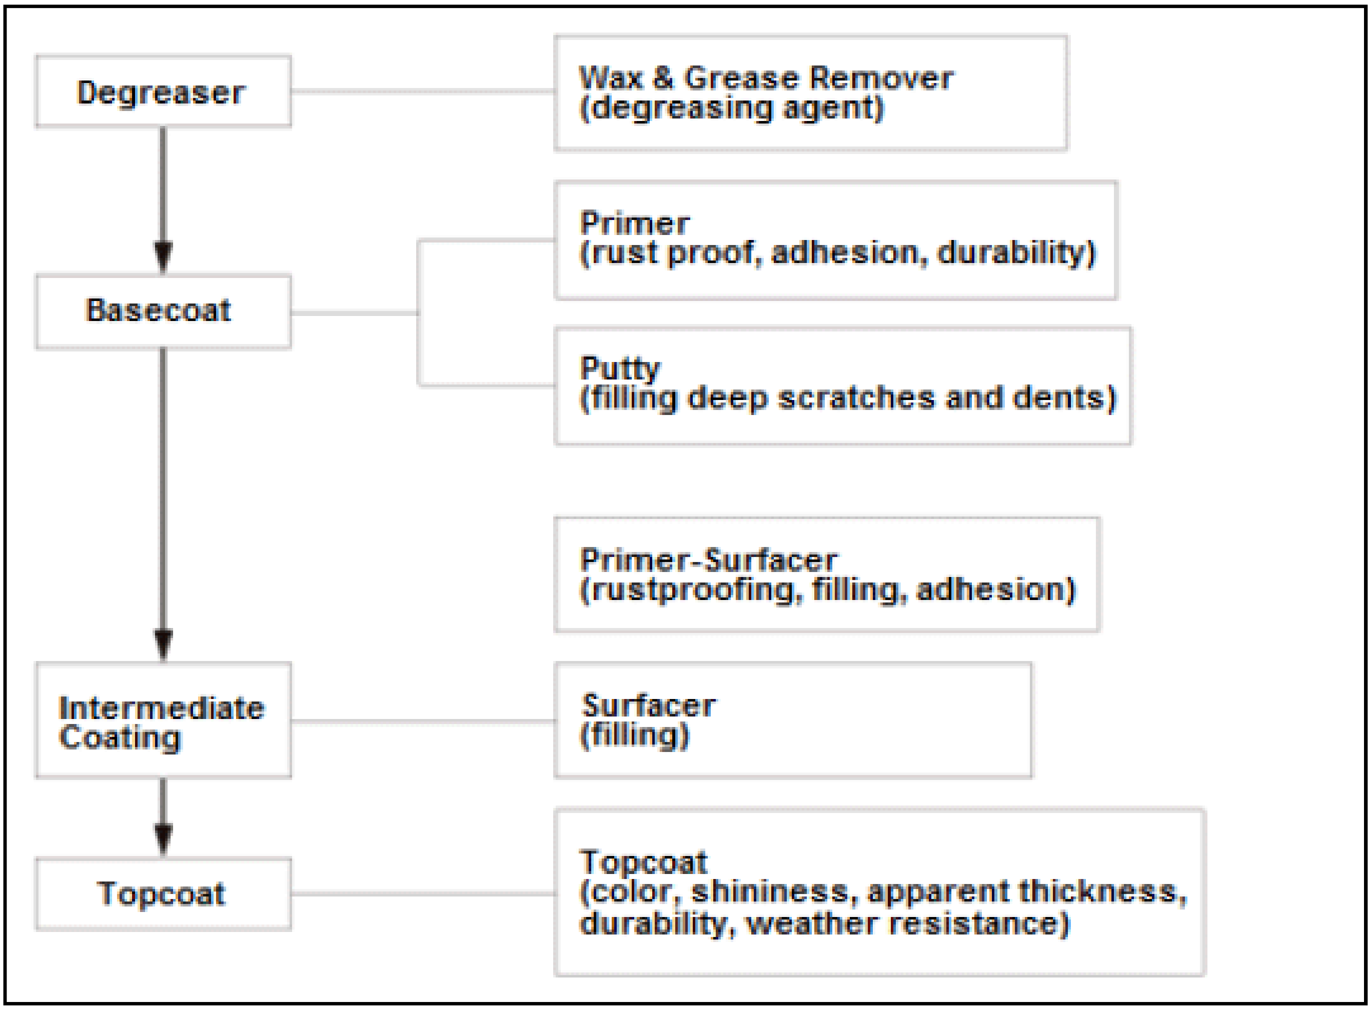
Thermoset Aluminum Alkyd Primer-Surfacer

A thermoset type of primer-surfacer often used for paint repairs. Baking is required at 230-284Â°F (110-140Â°C) for 20-40 minutes. Resulting fill qualities are same as a new vehicle.

Surfacer

Surfacer helps adhesion of primer and topcoats. It also improves paint durability and water resistance. In addition, it can remove sanding scratches filled or basecoat surfaces to improve paint finish quality. Has been mostly replaced by primer-surfacer today.

Refinish Product Categories And Purposes



Degreaser
Wax & Grease Remover (degreasing agent)
Basecoat
Primer (rust proof, adhesion, durability)
Putty (filling deep scratches and dents)
Primer-Surfacer (rustproofing, filling, adhesion)
Intermediate Coating
Surfacer (filling)
Topcoat
Topcoat (color, shininess, apparent thickness, durability, weather resistance)

Specialized Paint Products

- Paint Stripper (Coating Remover)

  Chemical paint stripper is sometimes used when removing old paint film layers.

  Chlorinated hydrocarbons are the main component, which is adjusted by a thickener to allow brush coating. A small amount of paraffin is also found in paint stripper. Always rinse surfaces thoroughly with water after removing.

- Plastic Bumper Paint

Used for urethane bumpers because of its high flexibility and improved adhesion.

- Weld Through Primer (Spot Sealer)

  A high performance, rust proof and electrically conductive primer applied to the areas where spot or MAG plug welding is being done. It is water-based and allows spot welding after coating.

- Soft Chipping Guard Primer (Paint)

  Special primer applied to the lower or bottom part of vehicles to protect parts from chipping damage cause by stones kicked up from the road surface. It has a better appearance than undercoating and general film thickness is 100-200 µm (0.004-0.008 in). Its color is gray and chipping resistance (impact resistance, adhesiveness, elasticity) is high.

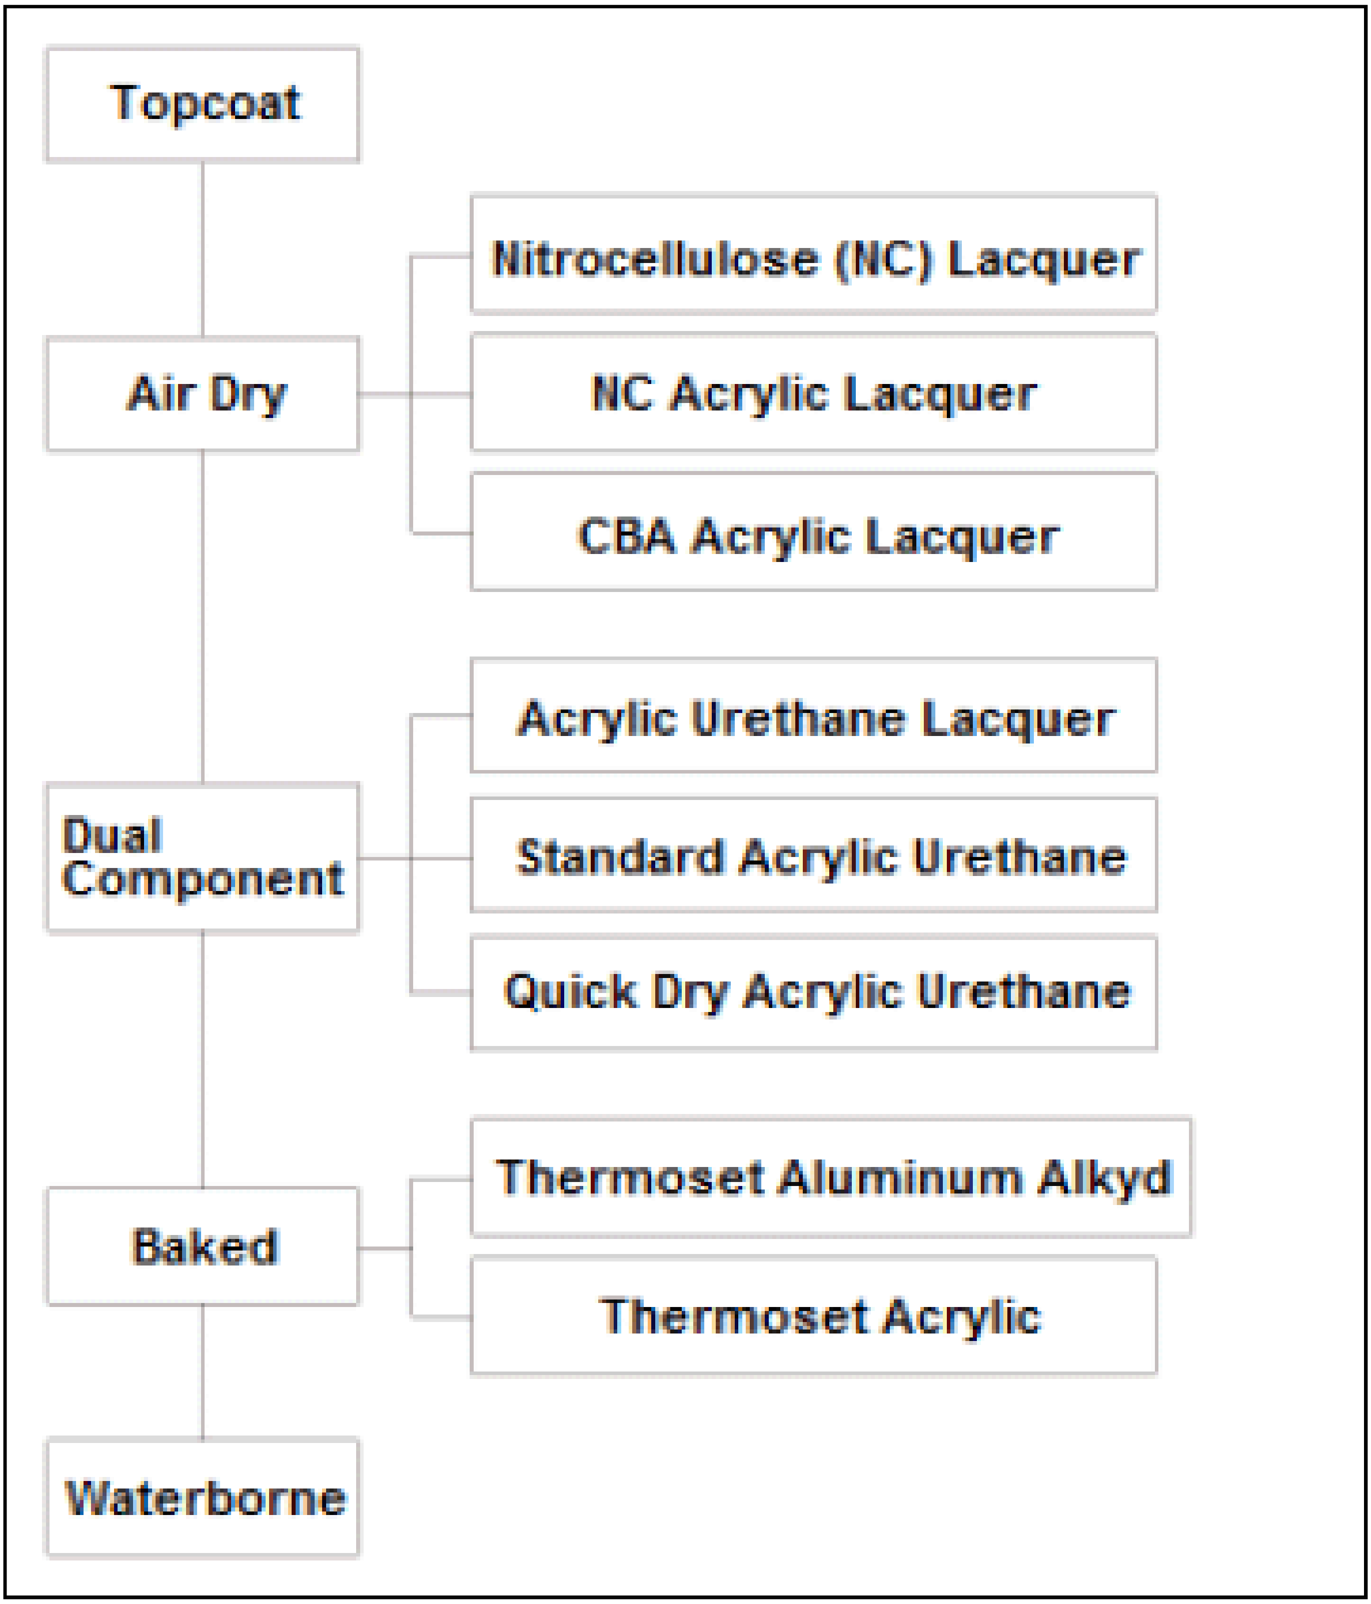
- Degreaser

  Remove contaminants such as wax and silicone from surfaces being prepared for paint.

Topcoats

Topcoats are applied last to give the color, luster, smoothness and other cosmetic qualities to the vehicle. Topcoats must also protect these qualities over a long period of time from external factors (sunlight, rain, bird droppings, etc.). Topcoats may be divided into several groups as shown below.

Topcoat Categories



Topcoat
Air Dry
Nitrocellulose (NC) Lacquer
NC Acrylic Lacquer
CBA Acrylic Lacquer
Dual Component
Acrylic Urethane Lacquer
Standard Acrylic Urethane
Quick Dry Acrylic Urethane
Baked
Thermoset Aluminum Alkyd
Thermoset Acrylic
Waterborne

Air Dry Type (Lacquer Type)

This type of top coats is commonly known as lacquers, and is divided into NC lacquers, NC acrylic lacquers and CAB acrylic lacquers by the kind of resins used. Air-dry type topcoats have the following properties:

- Quick-drying, but requires polishing when dry.
- Far less resistant against weathering or chemicals than more recent topcoat types.
- Not used much anymore due to durability and environmental issues.

Dual-Component Type (Urethane Type)

Topcoat where drying process includes a urethane reaction, which forms a net-like structure. The main agent and the hardener, are kept separate until they are mixed together just before application.

The urethane type dual-component topcoats are further divided into following three groups by resins type and drying time.

- Urethane Lacquer

  Dual component acrylic urethane is blended with nitrocellulose to quicken the drying speed. It hardens when mixed with an isocyanate hardener. Nitrocellulose does not react with urethane hardener, and does not dissolve in solvent completely so it is not suitable for quick repairs. Has been mostly replaced by quick dry acrylic urethanes.

- Standard Acrylic Urethane

  Commonly referred to as just "urethane" or "acrylic urethane," this dual-component topcoat mainly consists of acrylic resins. It hardens when mixed with an isocyanate hardener. It has an outstanding coating performance, but dries very slowly unless force dried. It is suitable for painting large areas.

- Quick Dry Acrylic Urethane

  Often referred to as a quick-drying urethane. It is designed to shorten drying time without affecting the coating performance. Made mainly of acrylic resins and hardens when mixed with an isocyanate hardener. Commonly used for paint repairs because of its quick drying property and outstanding coating performance.

Baked Type

These are single-component type paints that harden when heated to about 284Â°F (140Â°C). Baked type paints that are used in vehicle production lines are also sometimes used for repainting.

Examples of baked type topcoats are shown below.

- Thermoset Aluminum Alkyd

  Also called melamine baked paint, this is a solid type paint mainly consisting of melamine and alkyd resins. Mainly used for solid colors.

- Thermoset Acrylic

  Metallic paint mainly consisting of melamine and acrylic resins.

Waterborne Coating

A type of paint with a special water-based acrylic resin and very little organic solvent. This makes it more user and environmentally friendly Because this type of paint becomes thinner when shaken or agitated, it is relatively easy to handle and especially suited for even application of metallic colors. When used with a solvent-based clear coat, the finish quality and workability are basically equivalent to acrylic urethanes.

Water-Based Paint Characteristics

Water-based paint specifications vary slightly by product, but most share the basic characteristics below.

Paint Performance

- Environmentally friendly with low volatile organic compounds (VOC)
- Little irritating smell specific to organic solvent
- High coverage and durability
- High blending performance and even application of paint film
- Consistent color even under different painting conditions

Tools & Equipment

- Requires clean air supply
- Requires high volume low pressure (HVLP) spray gun due to high viscosity
- Requires forced air drying

Coating, Drying Process

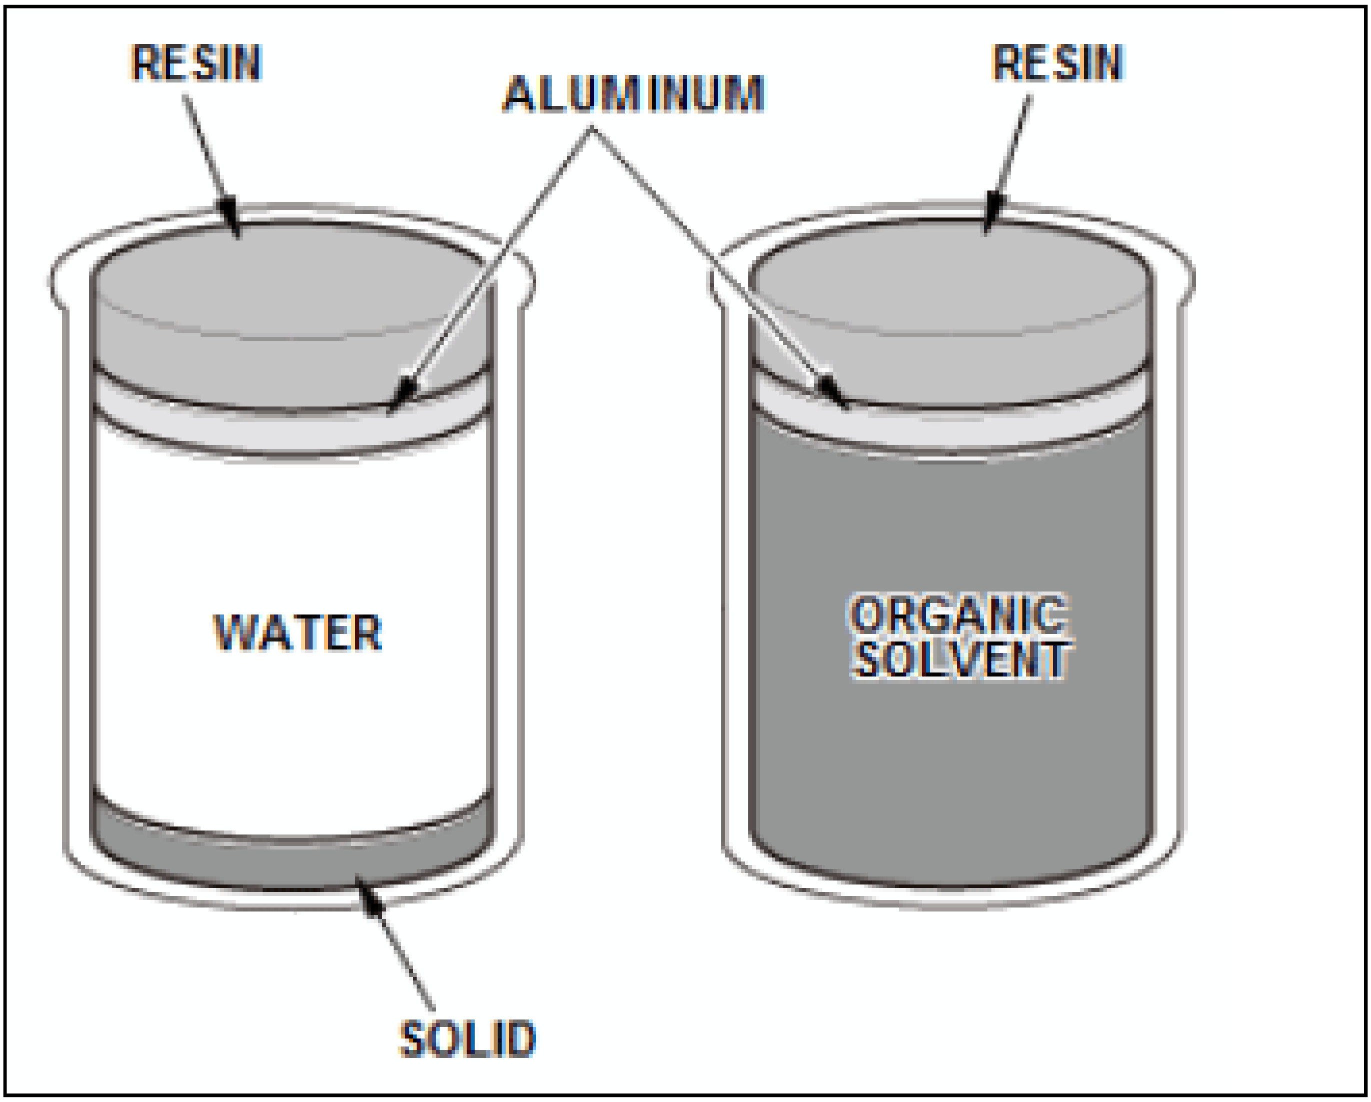
- No special skills required
- Painting method is different from solvent based paint. Initial coat is wet, subsequent coats are gradually thinner
- Must be allowed to dry completely before the next coat

Storing and Handling

- Store at a stable temperature

- Keep from freezing temperatures
- Need temperature controlled paint booth depending on the region
- Avoid long term storage
- Fire resistant and non-hazardous material

Water-Based Paint Structure



Pigment

Water-based paints, use the same basic pigments as solvent-based paint. The solvent is simply replaced with water, and additives are used to ensure stability when mixed. Some water-based paints also contain a small amount of solid matter.

Resin

Cold setting (drying) urethane resin is generally used because it will achieve performance similar to a solvent-based paint.

Solvent

Water is used as a solvent. Additives used for controlling the paint's viscosity and drying performance are also basically water-based. However, specially distilled water (not tap-water) is used.

Wax And Grease Remover

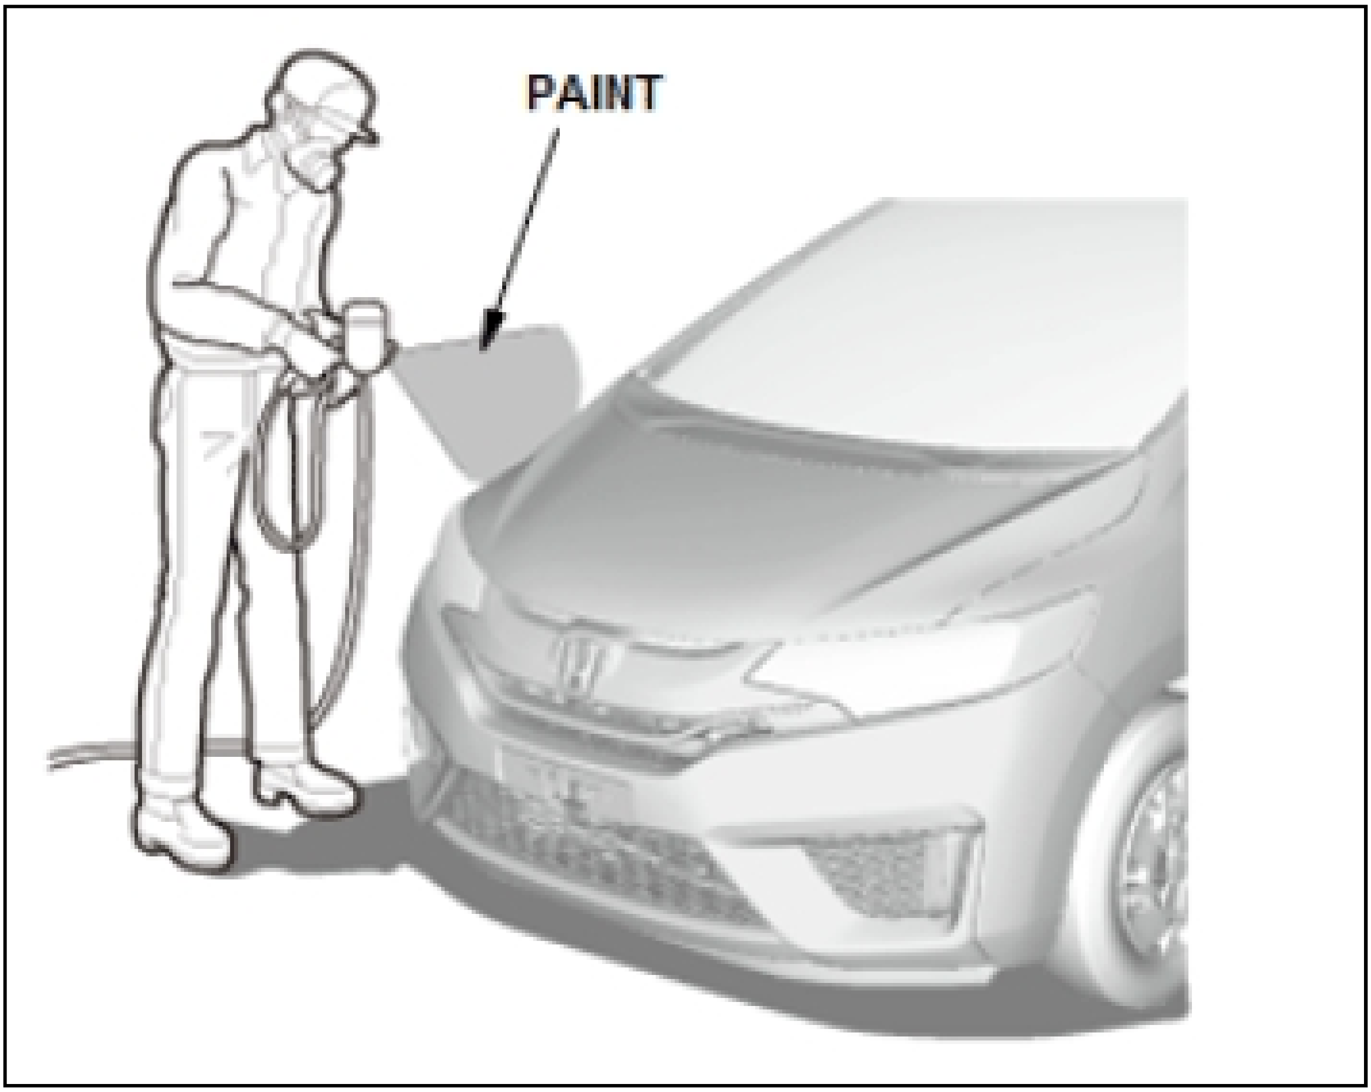
Degreasing Agents:

- Degreases metal surfaces, old paint films, and basecoats. Also removes oil (grease) and contamination after sanding/grinding.
- Fast drying with a low solvent effect. No risk of dissolving basecoats or old paint films.
- There are several types depending on parts being painted and anti-static requirements.
- There is a specific wax & grease remover for water-based paint.

DEFINITION AND PURPOSE OF FINISH (PAINTING)

Definition Of Finish

A term used to describe the entire process to form a paint film on vehicle bodies and parts using paint in liquid or powder form.



Purpose Of Finish

Steel Protection

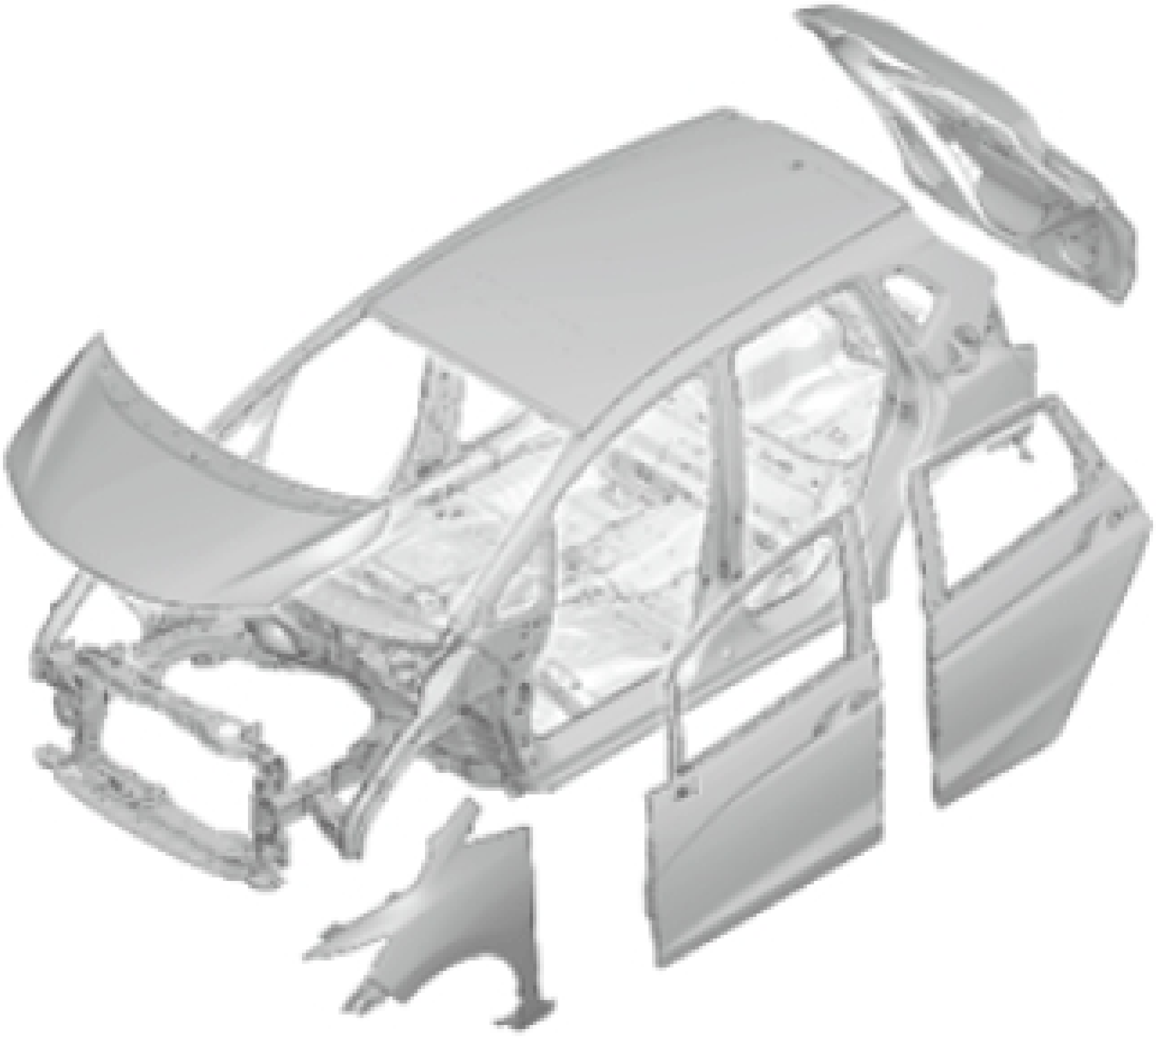
Automobiles are made of steel (steel sheet) for the most part. Left unprotected, steel oxidizes with exposure to and oxygen in the air, resulting in rust. The main purpose of the vehicle's finish is to protect steel parts from rusting.

Appearance Improvement

Automobiles use a wide variety of surfaces and styling lines. These complex forms create a pleasing, dynamic image with a sense of speed. Automotive finishes provide a three-dimensional color sense, and a beautiful appearance, which enhances the value of the product.

Safety Indicators

Finish coatings are also applied to some vehicles, road signs and even highways as lane markings to help prevent accidents and contribute to overall traffic safety.



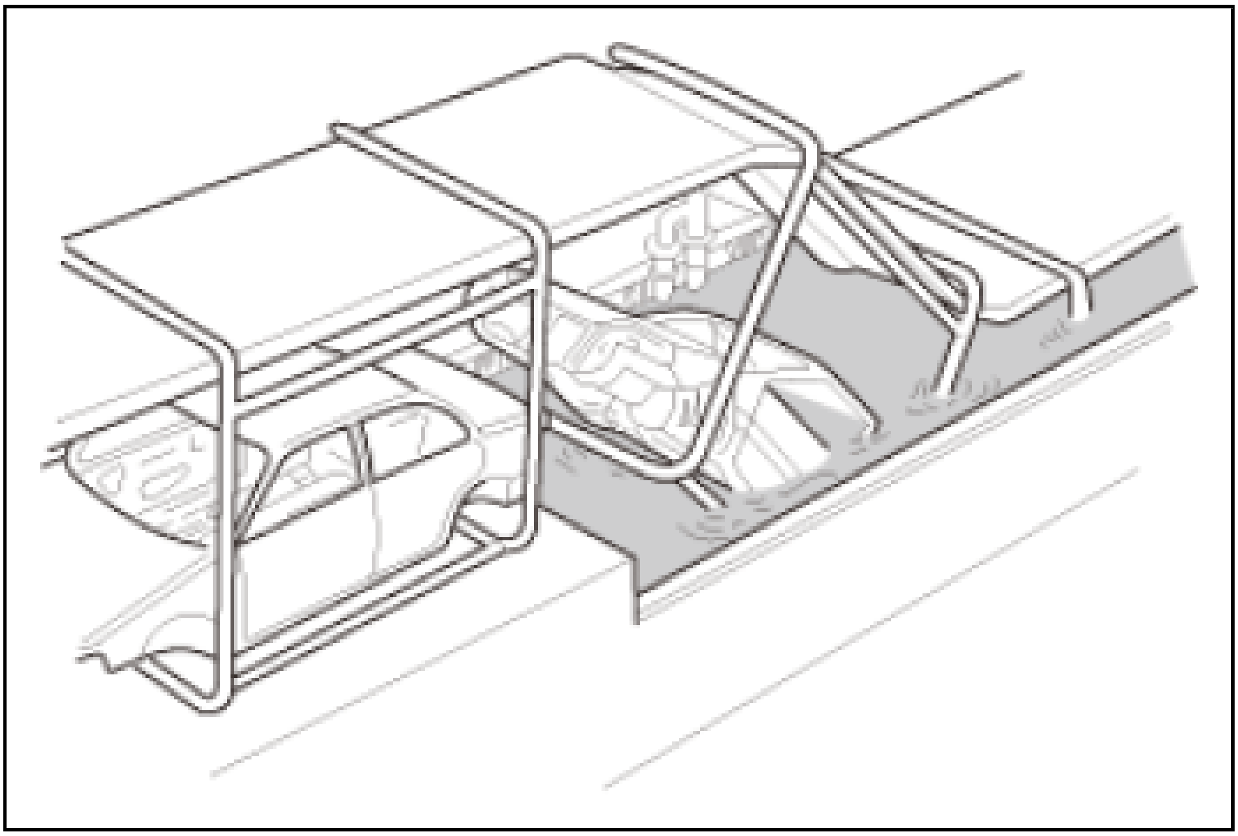
FACTORY PAINT FINISH INFORMATION

Factory Paint Finish Application Process

There are many requirements for body coating such as external finish (appearance), durability, corrosion resistance and others, as it has a significant impact on quality and marketability of the vehicle. Mass production vehicles go through a multi-layered painting process, including chemical conversion coating and basecoating for corrosion resistance and improved durability. The middle and topcoats provide a high quality external finish. There are also many more paint processes require to produce high quality automobile bodies and parts.

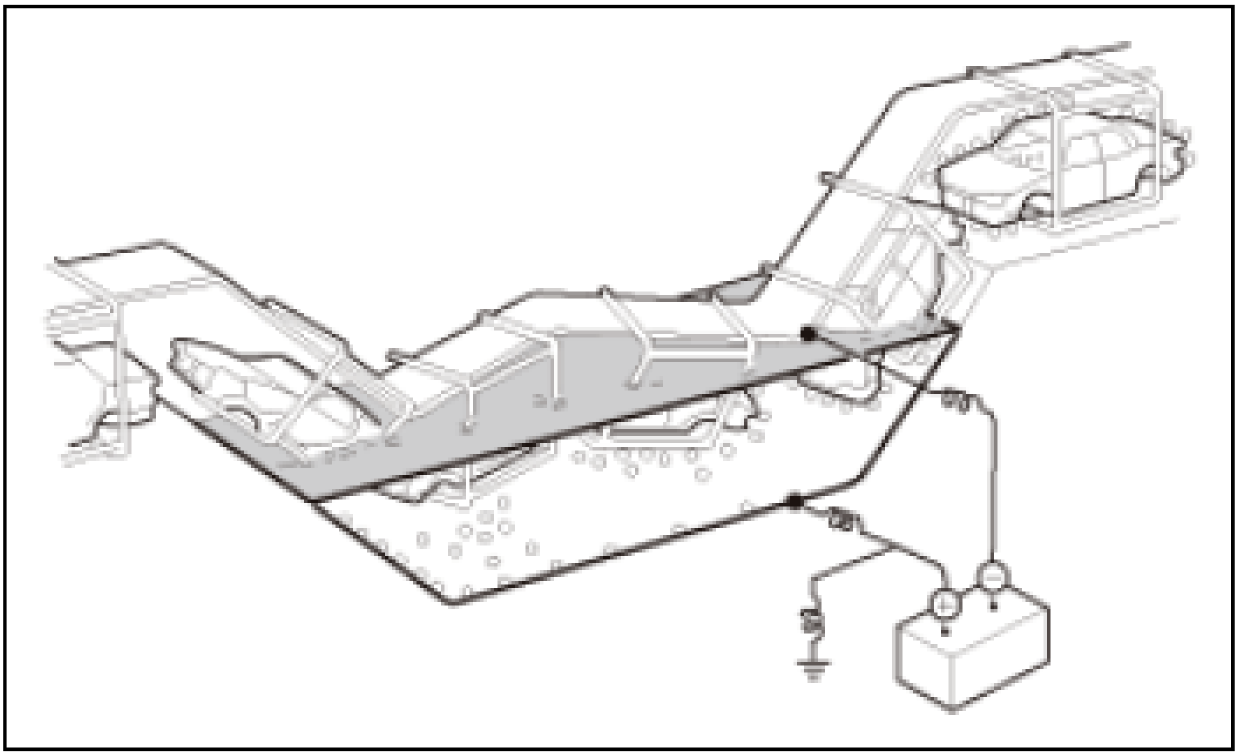
1. Chemical Conversion Coating Process:

   The vehicle body is fully immersed (dipped) into acrylic washer fluid to remove oil and contaminants. This also form a crystalized film of zinc phosphate similar to the dip method.



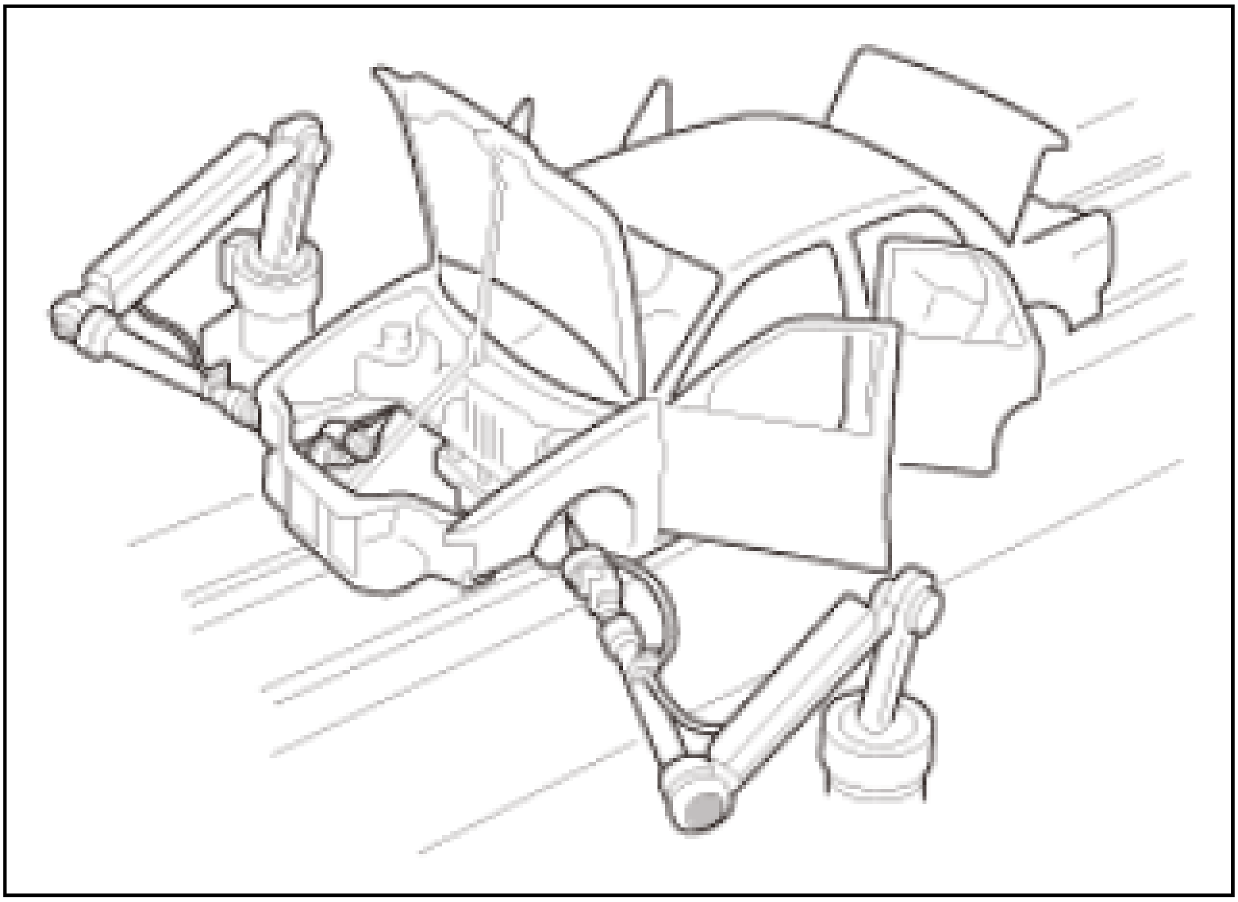
2. Basecoat Process:

   The vehicle body is fully immersed (dipped) and electrodeposition (ED) coating is applied. Primer or paint coats the entire part without missing any areas, which improves anti-corrosion durability. ED coating uses epoxy group resin paint.



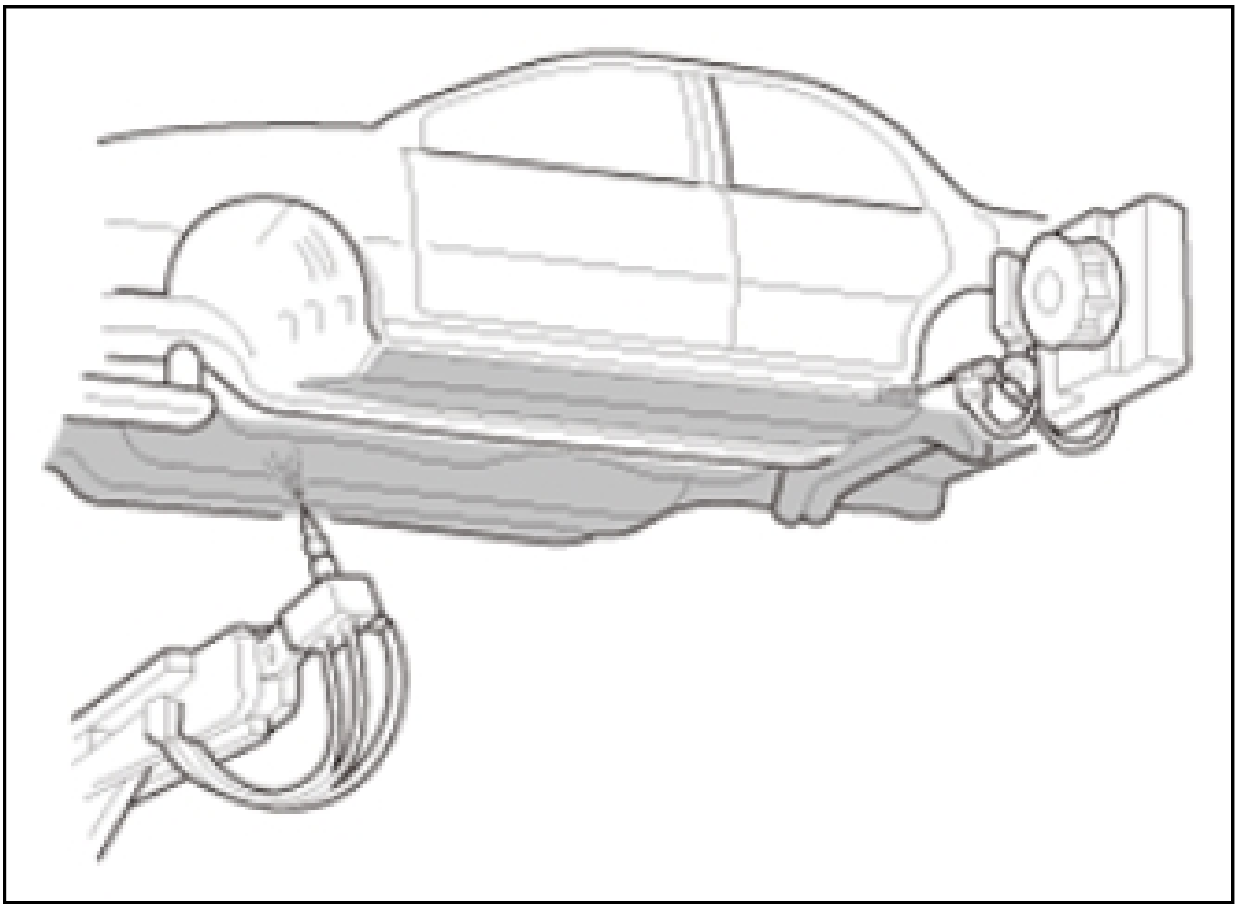
3. Sealing Process:

   Seals fitted parts of the body after welding and in joint areas such as hemmed parts like doors force-fed sealer gun. Body sealer helps prevent dust and water entry and also improves corrosion resistance.



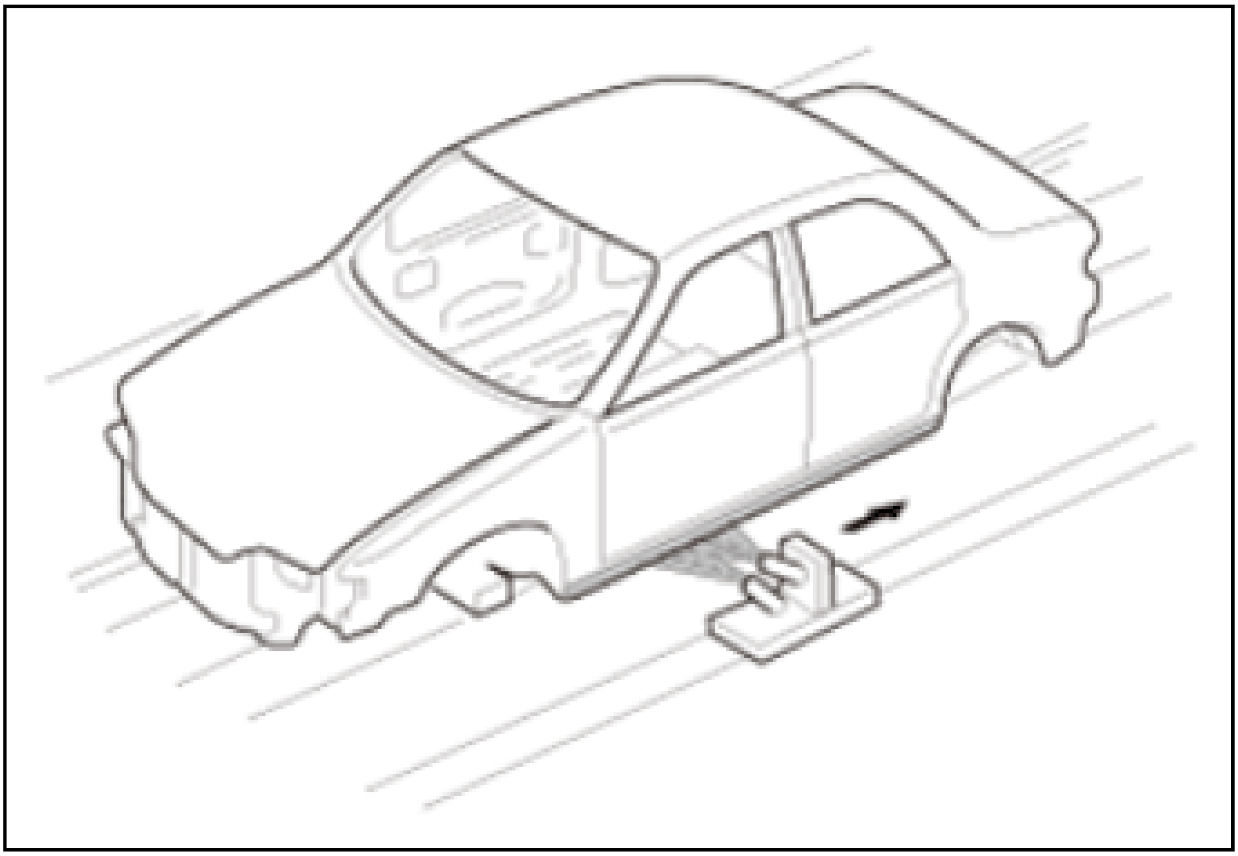
4. Undercoating Process:

   PVC (polyvinyl chloride) is applied to the lower body including the front and rear wheel houses. Helps prevent paint and body damage from rock chips and other causes. Also contributes to sound, heat, and vibration control.



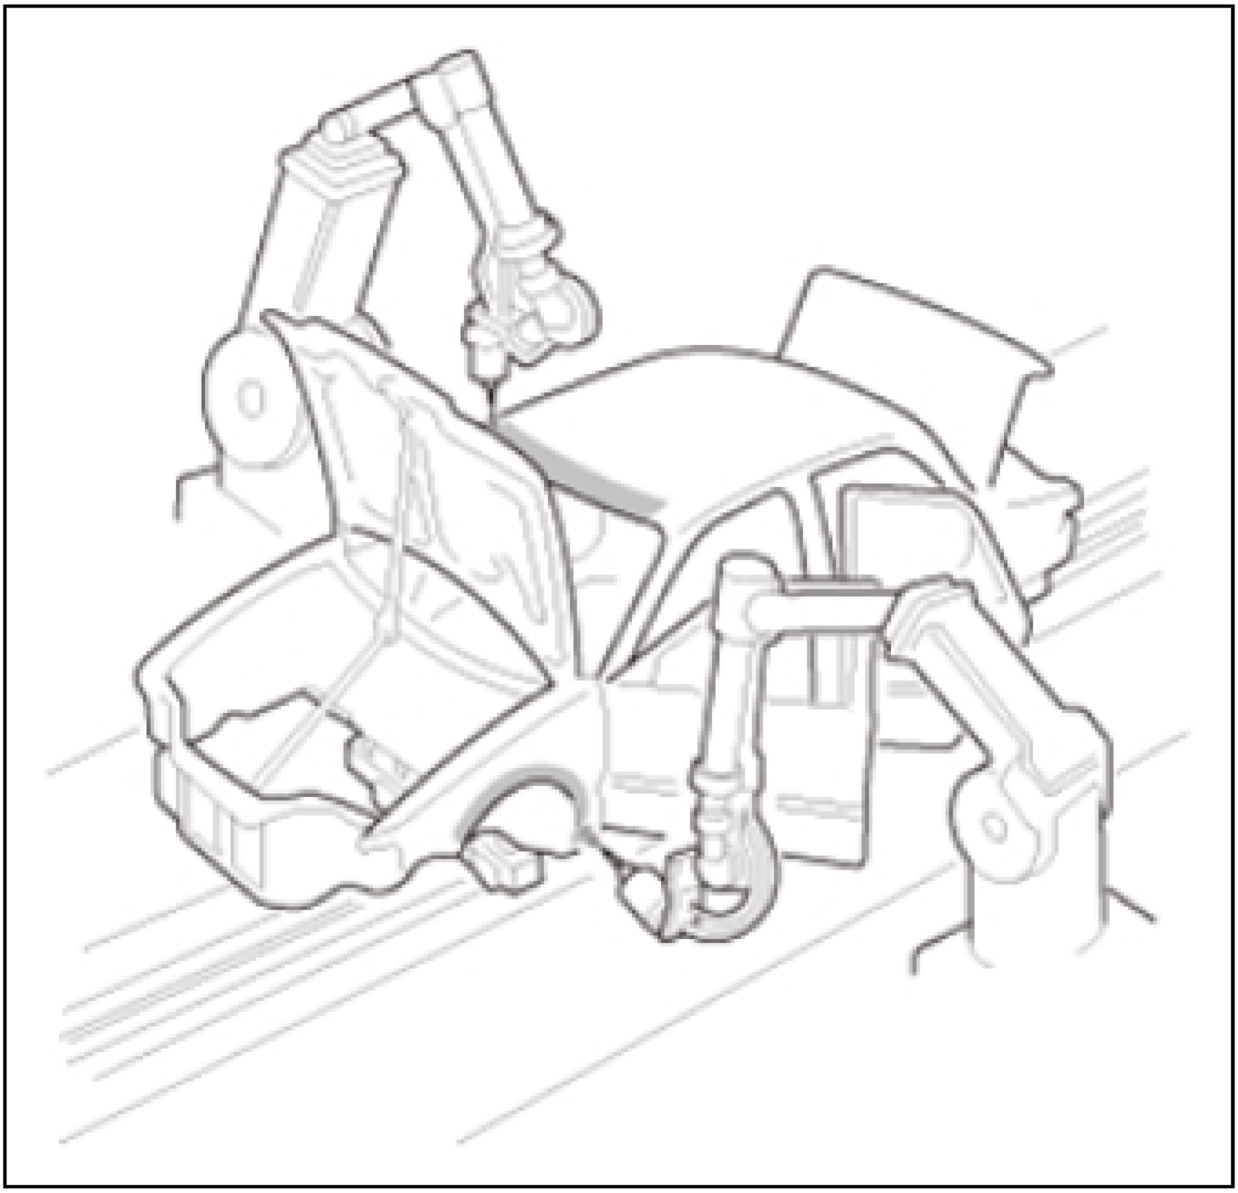
5. Hard Chip Guard Coating Process:

   Chip guard primer is applied to side sill surface. It helps prevent paint film damage to side sill caused by rock chips, etc.



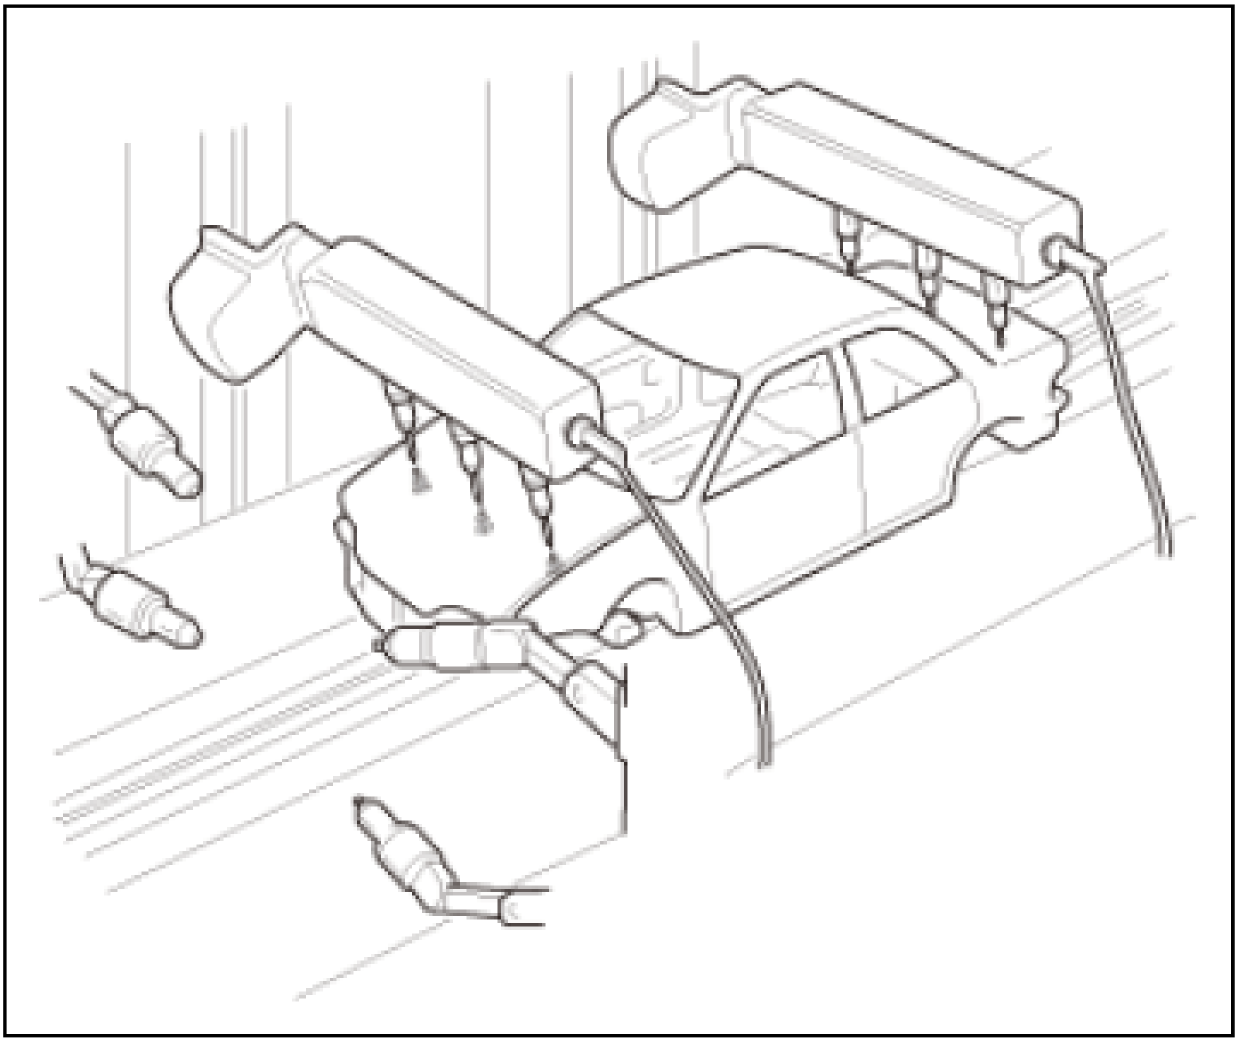
6. Soft Chip Guard Coating Process (only for high corrosion areas):

   Soft chip guard primer is applied to the edges of hood, roof and doors etc. It helps preventing paint film damage and rust cause by rock chips.



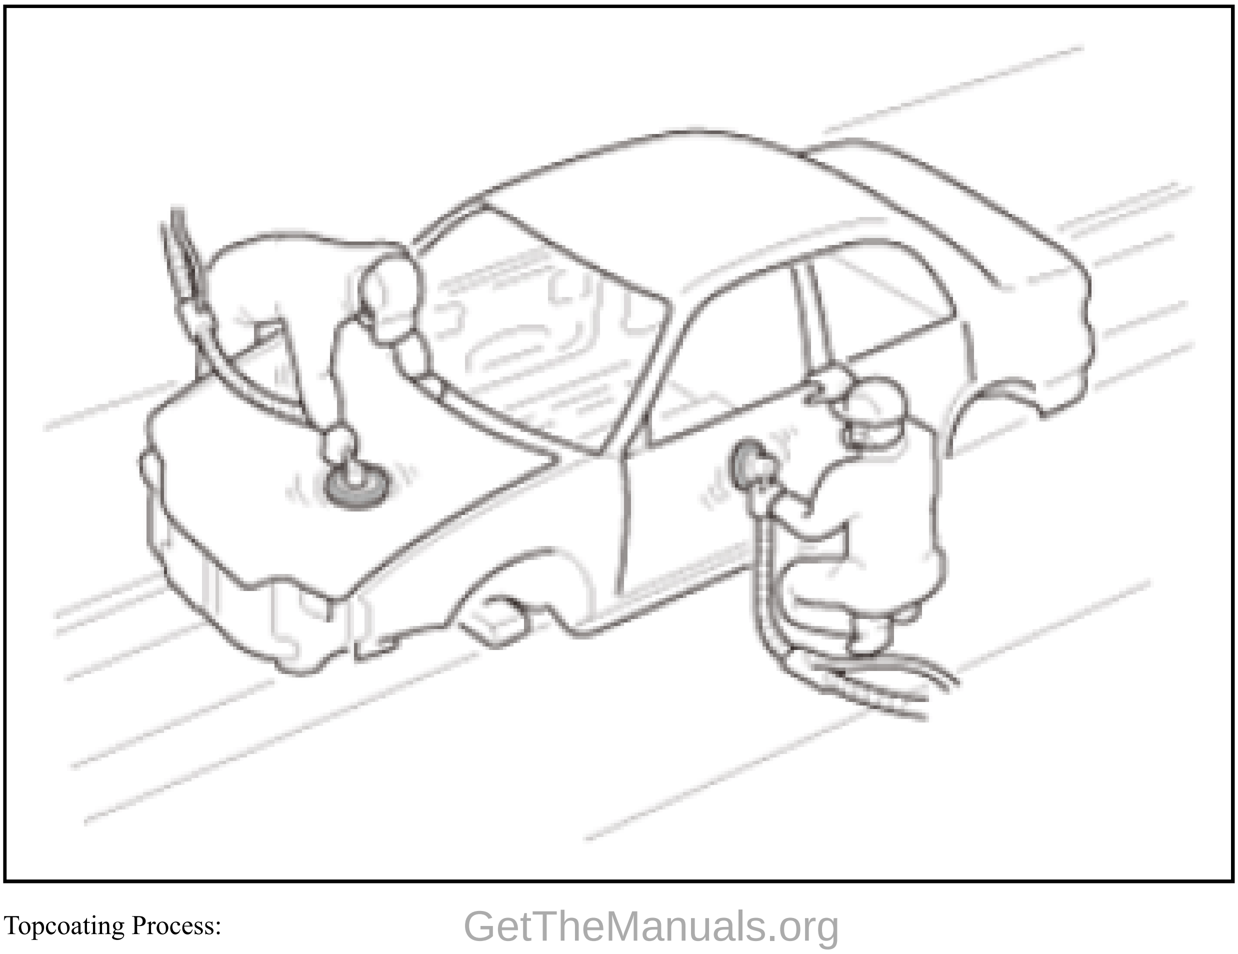
7. Intermediate Coating Process:

   Maintains paint film thickness and improves clarity and corrosion resistance of the total body paint film, including the topcoats. Bell type coating conveyor lines maintain film thickness consistency.



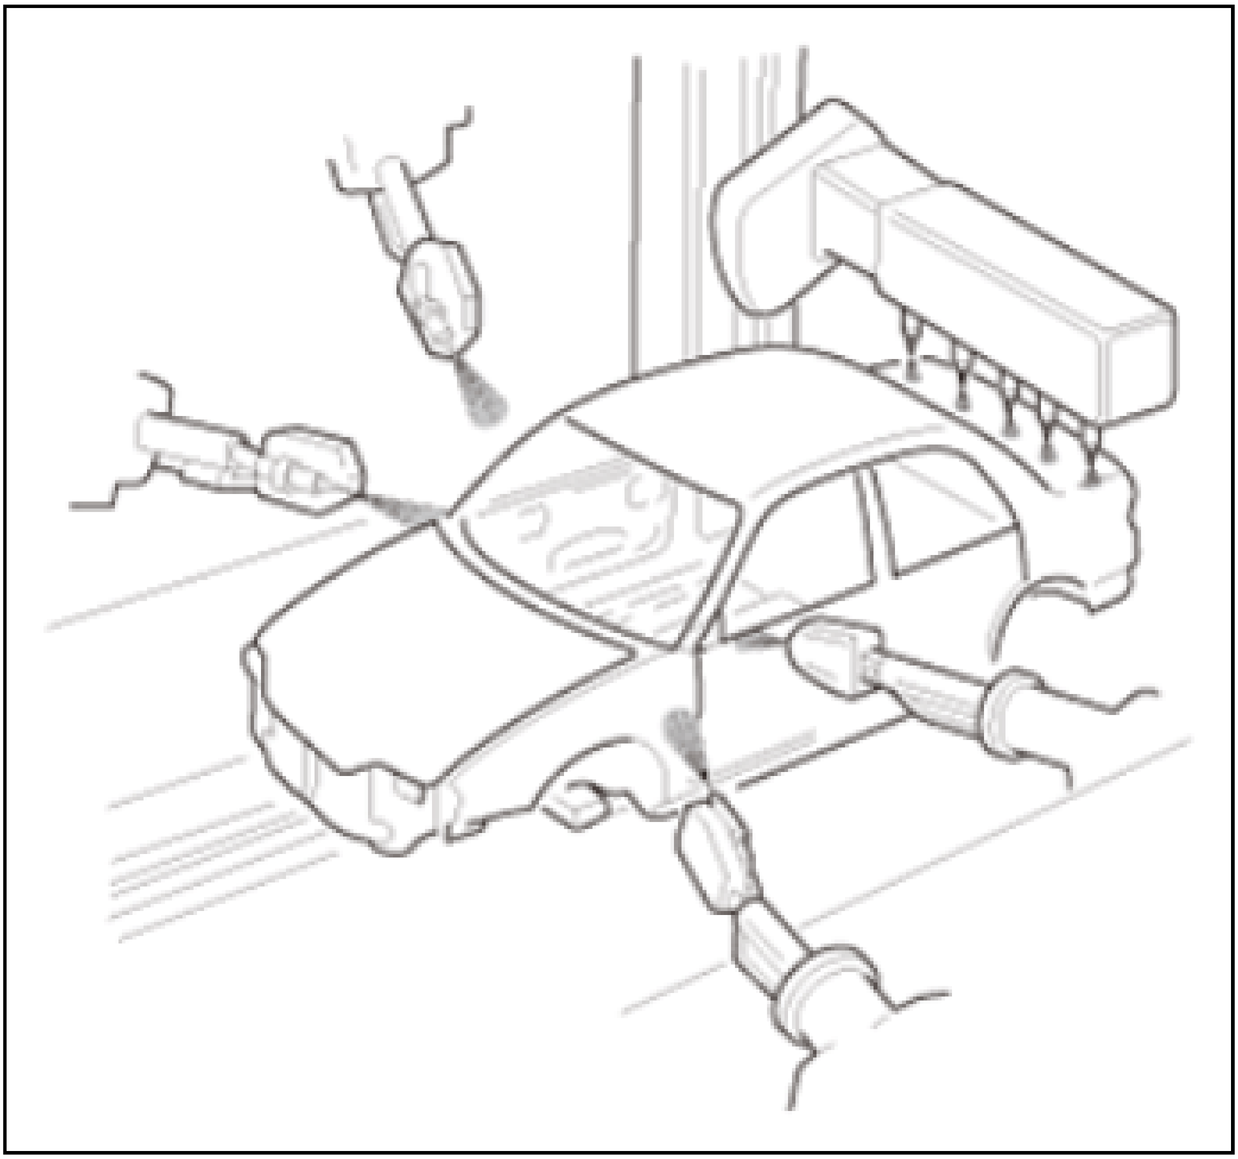
8. Intermediate Coat Sanding Process:

Intermediate coating paint film is sanded in order to improve the smoothness of the film surface and adhesion of the topcoats.



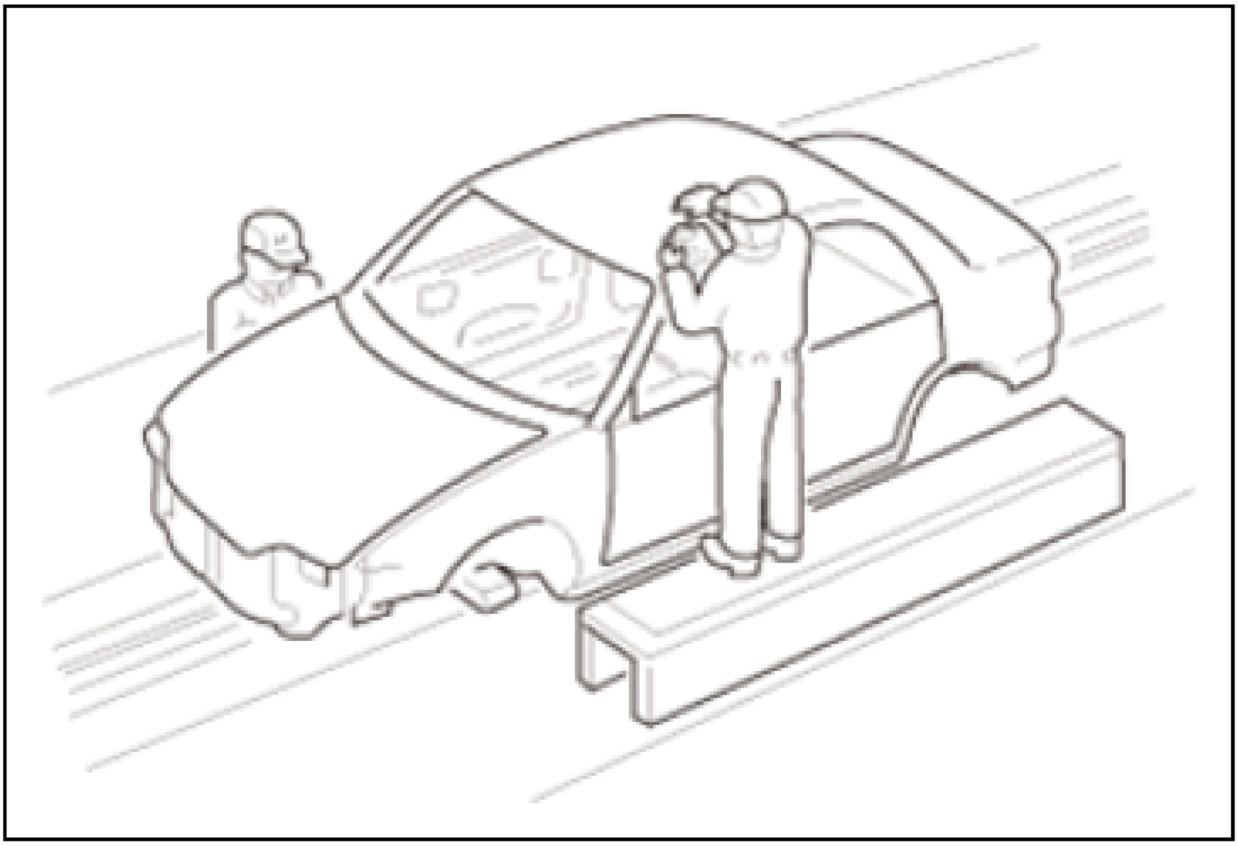
9. Topcoating Process:

Enamel paint is applied to inside and outside of body using robotic painting equipment. For metallic and pearl paint, a clearcoat is applied after the enamel paint. A high quality baked acrylic type paint or waterborne paint is used to improve corrosion resistance and appearance.



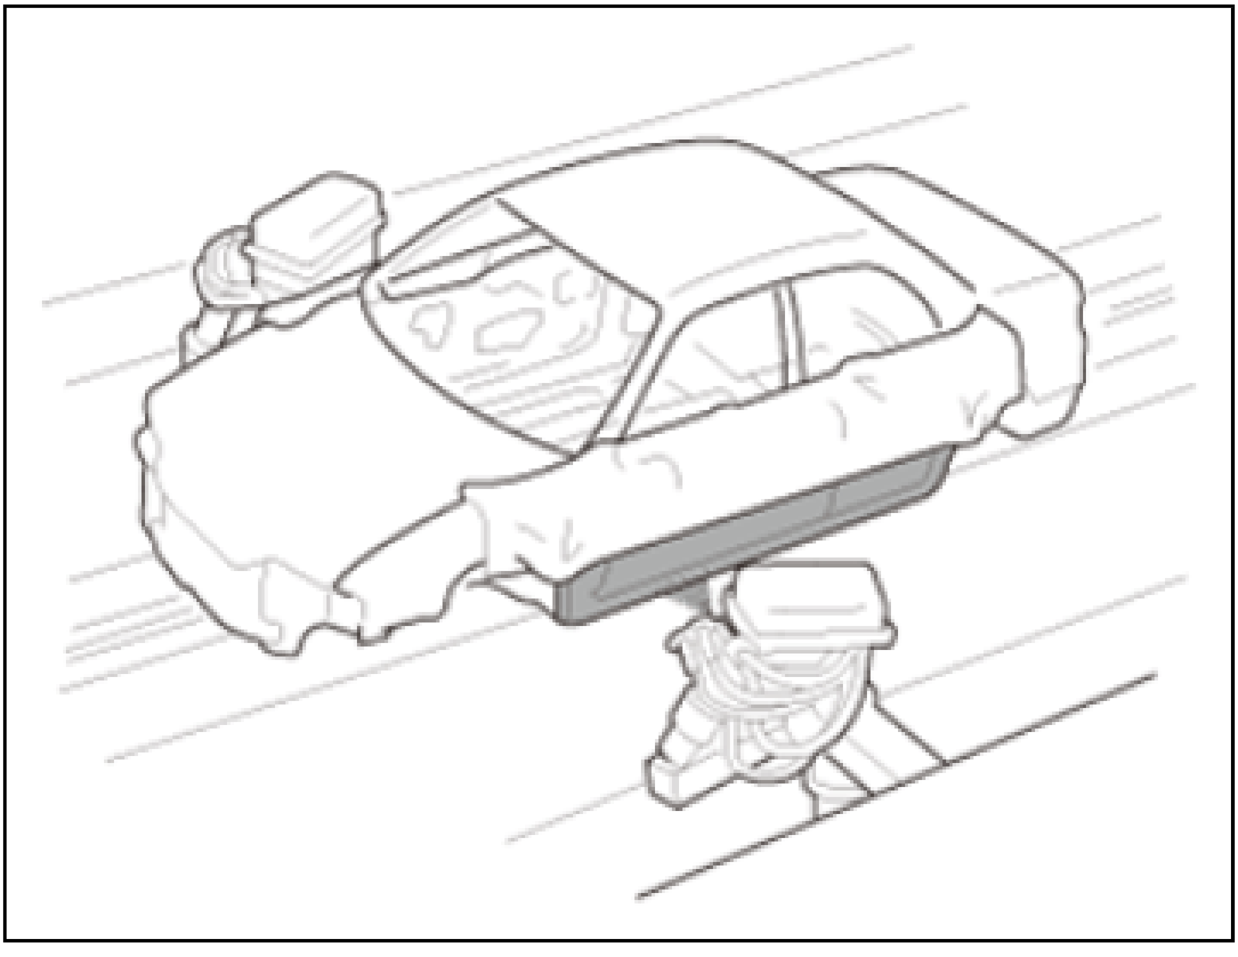
10. Paint Inspection Process:

    Paint quality is inspected to judge OK/NG based on the inspection criteria. Coating condition, film thickness, film hardness, adhesion, etc. are thoroughly checked by visual and mechanical means.



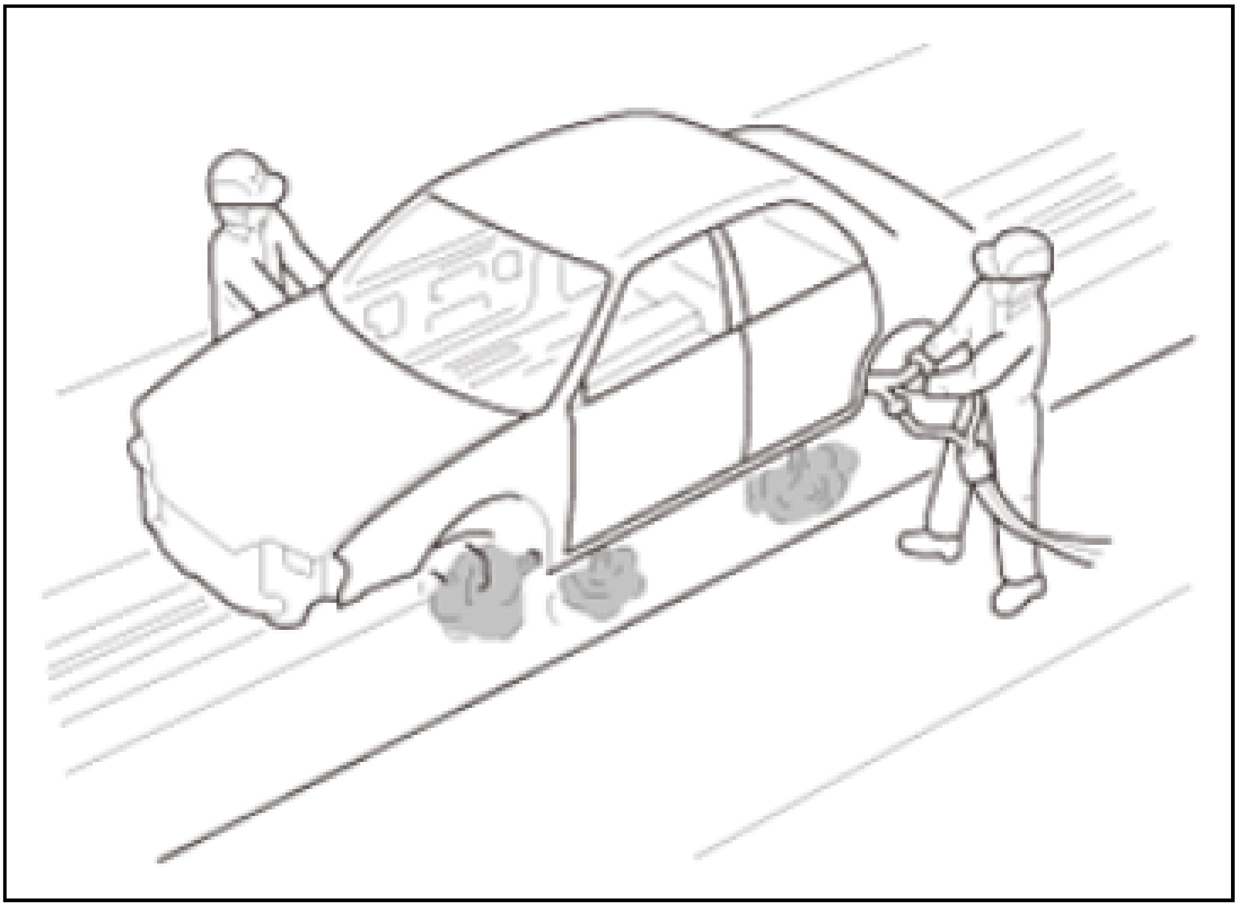
11. Two-Tone Paint Process (Special Paint):

    (Example) Two-tone paint may be applied after topcoating depending on specifications.



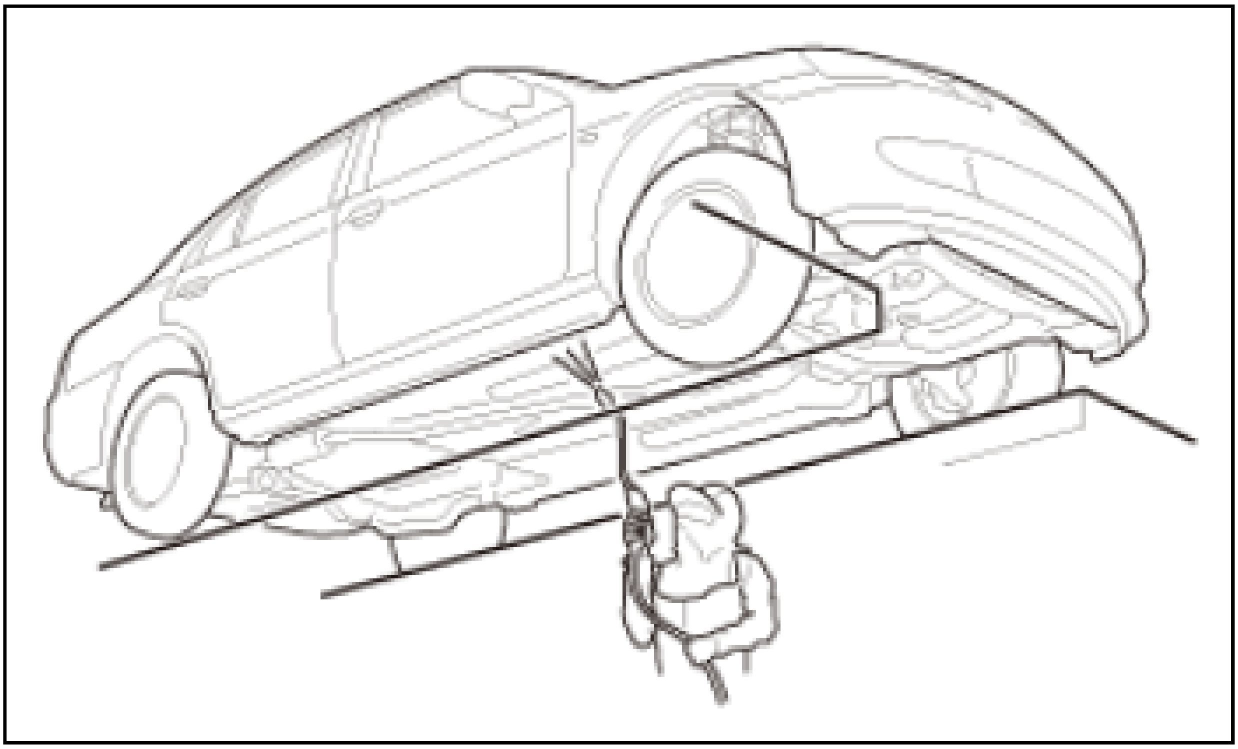
12. Internal Rust Proofing Process:

    A special zinc-based rust proof paint or wax is applied to the critical areas that requires rustproofing treatment using spray guns in order to further enhance anti-corrosion performance.



13. Complete Build Unit Rust Proof Process:

    Inside and outside rustproofing. The wax coating is even applied inside the tail gate, doors, and to the underbody for anti-corrosion performance enhancement.



Paint Film Structure

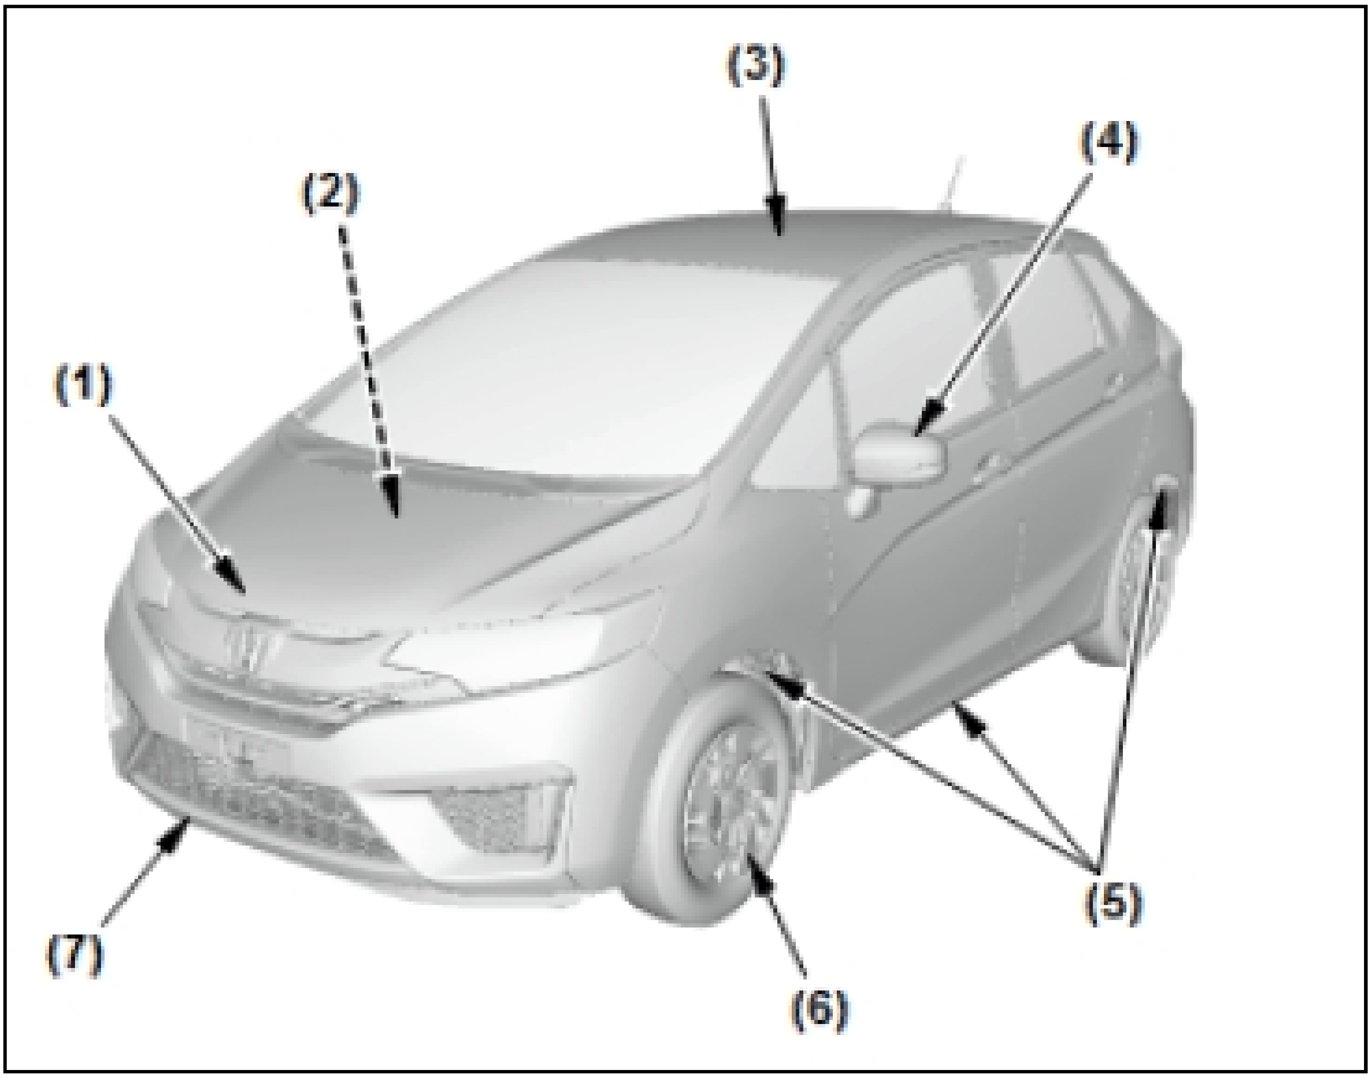
Paint Film For General Mass Production Vehicles

Many different paints are used on vehicles. They are chosen based on the requirements of each part such as:

- Rust prevention
- Sound insulation
- Anti-chipping

- Cosmetic appearance
- Adhesion promote

The following information show the different coating layers commonly used on new vehicle bodies.



1. **Soft Chipping Guard Primer Coating**

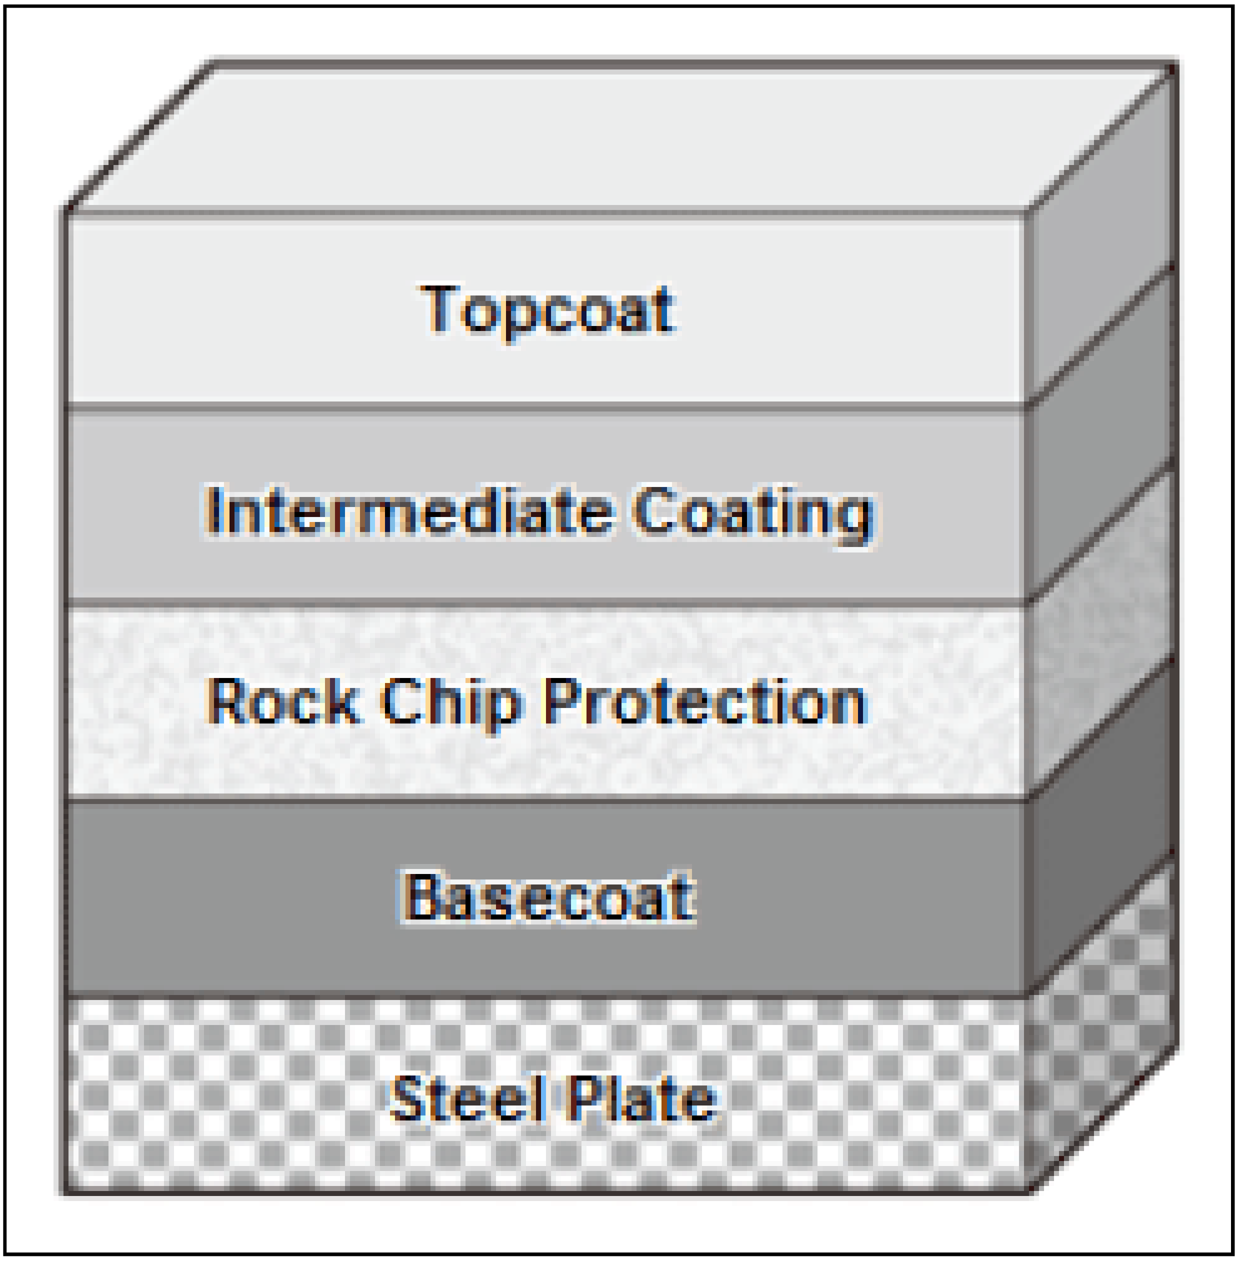
   Topcoat: Thermoset aluminum alkyd resin paint

   Intermediate Coating: Polyester resin paint

   Rock Chip Protection: Chipping guard primer

   Basecoat: Polybutadiene resin paint, epoxy resin paint (primer)

   Steel Plate



Topcoat

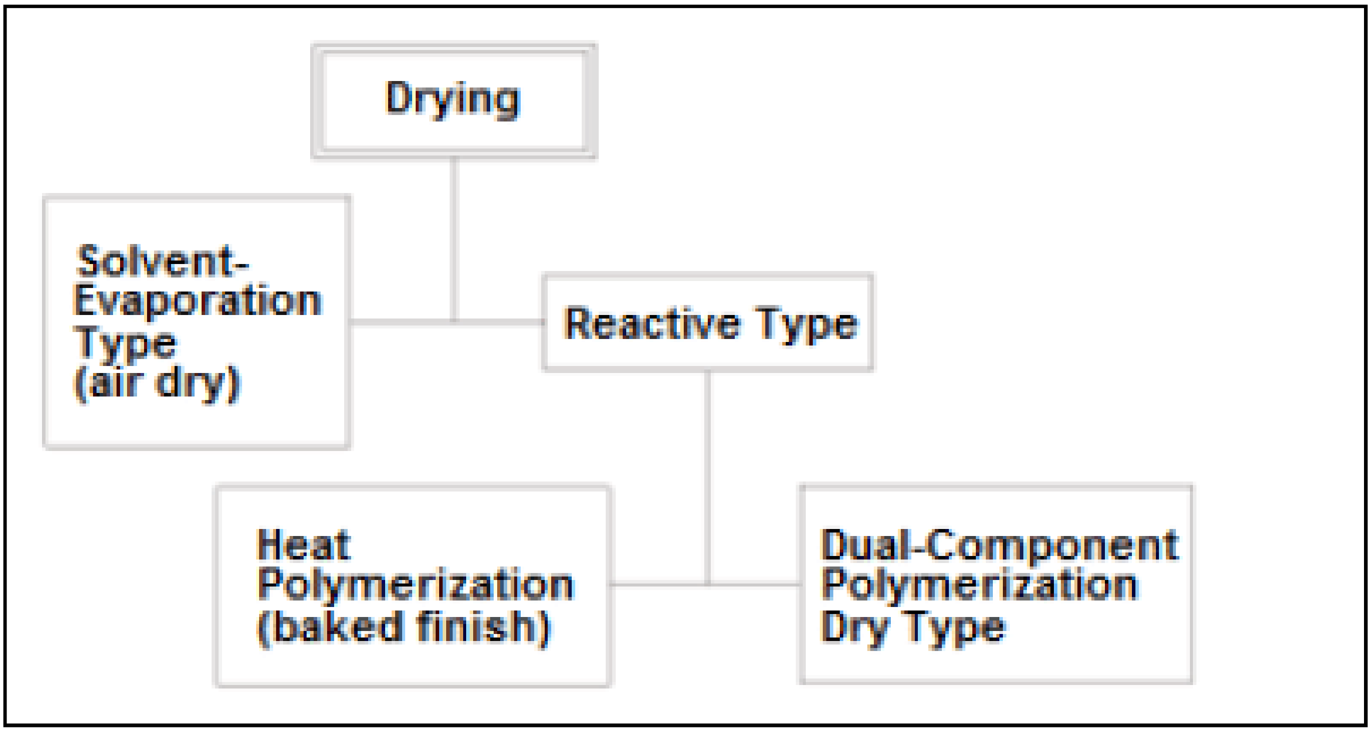
PAINT DRYING AND CURING

Drying Processes

The process in which a liquid-like paint is hardened and forms a hard coat is called drying. The chemical structure of paint changes between before and after drying.

Paint can be categorized as shown left based on the drying method.



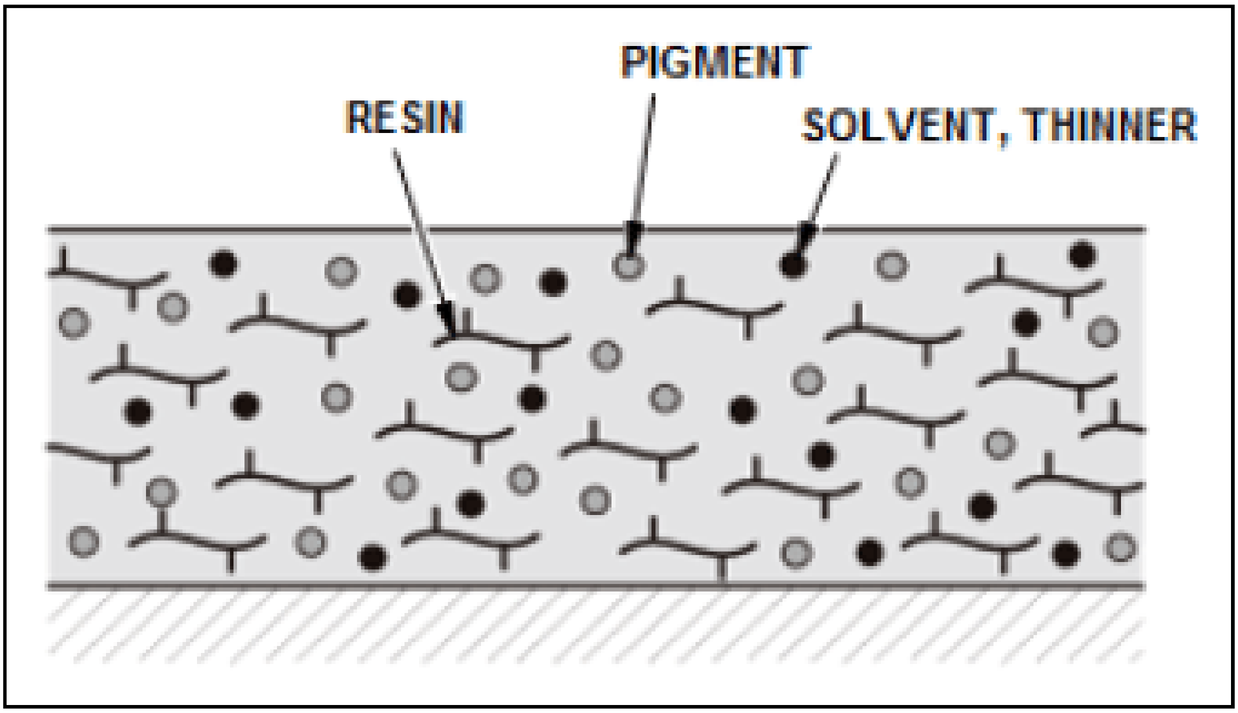
Drying
Solvent-Evaporation Type (air dry)
Reactive Type
Heat Polymerization (baked finish)
Dual-Component Polymerization Dry Type

Reactive Type

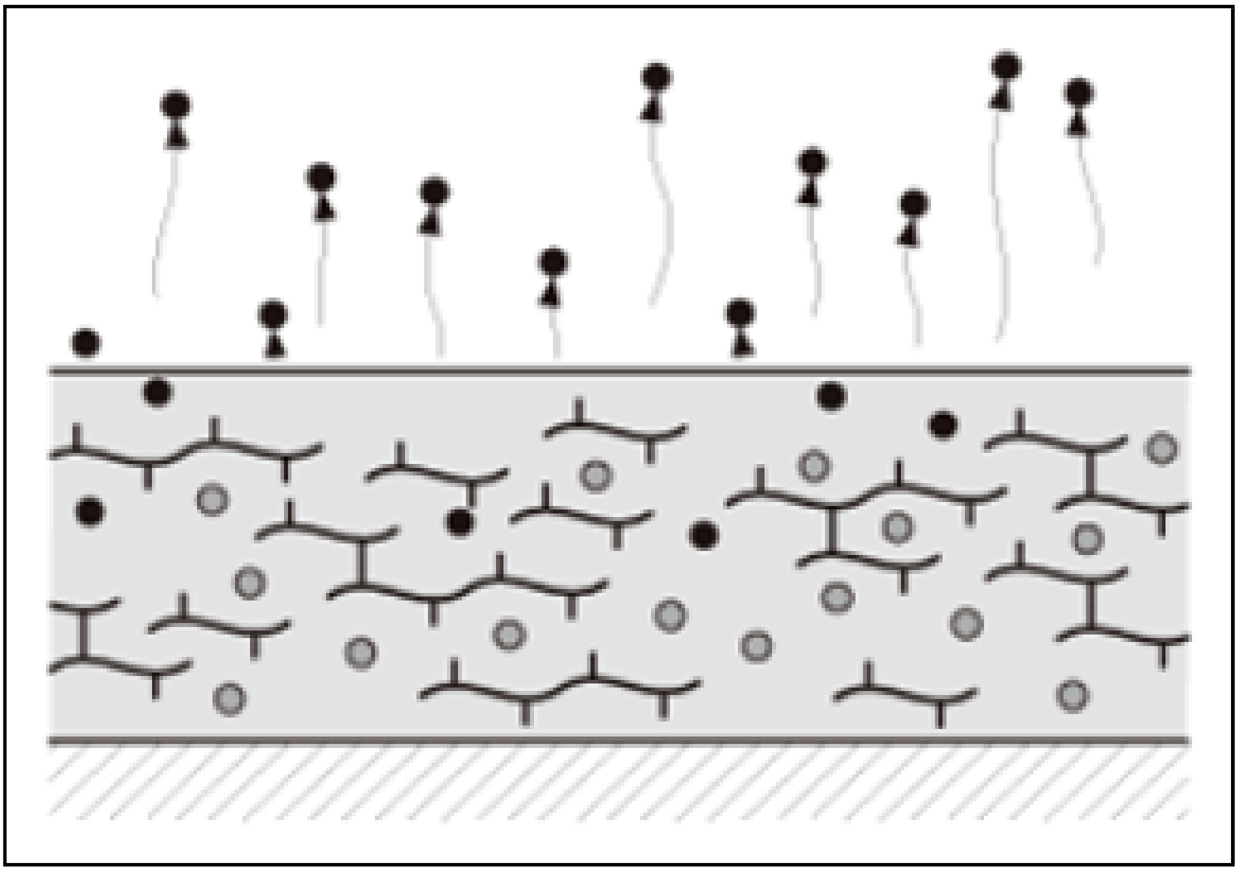
In this type of paint, the solvent and thinner in the paint evaporate and, in addition, resins are hardened and dried by a chemical reaction (called polymerization):

- While heat is not required to dry and from a film, applying heat will accelerate the chemical reaction. The paint's structure also changes from a paint molecule to polymer coating. It then becomes a high performance, weatherproof, and solvent resistant paint film.
- Resin molecule forms high-molecular-weight compound through chemical reactions and binding of low-molecular-weight compound.

1. Coating condition immediately after painting.



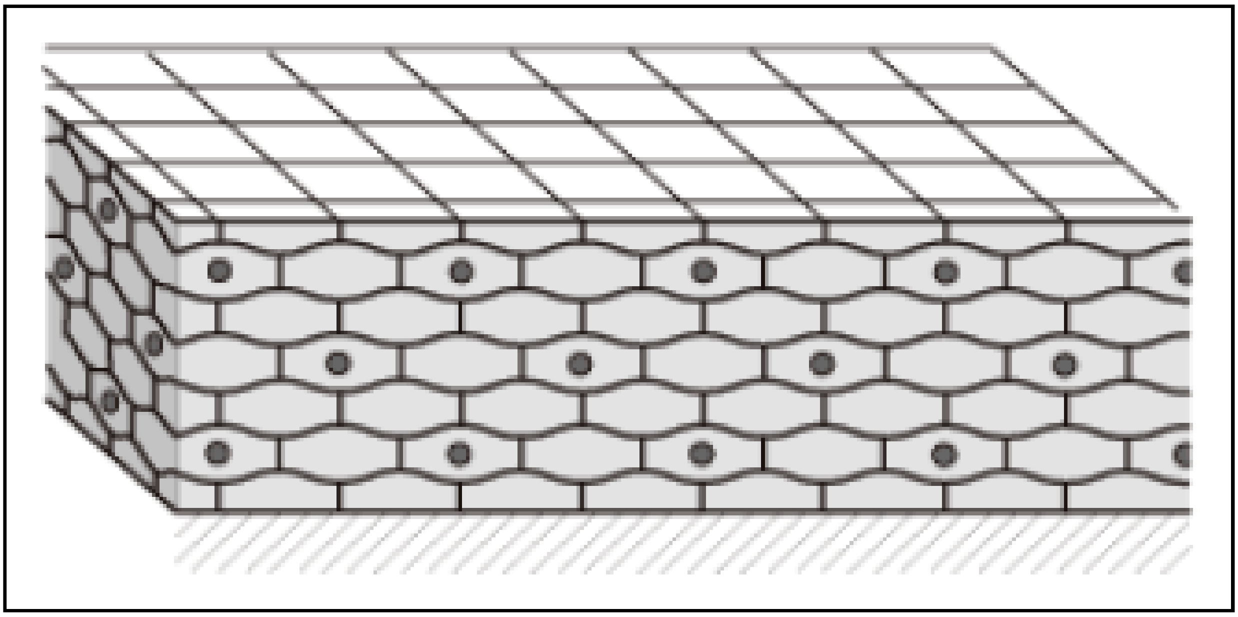
2. Resin molecules in the paint start to react along with the evaporation of paint reducer/thinner and solvent during drying process.



3. The coat is completely free of solvents or thinners. The chemical reaction of the resin molecules is completed and they form a net-like coat (3D paint structure).

Heat Polymerization:

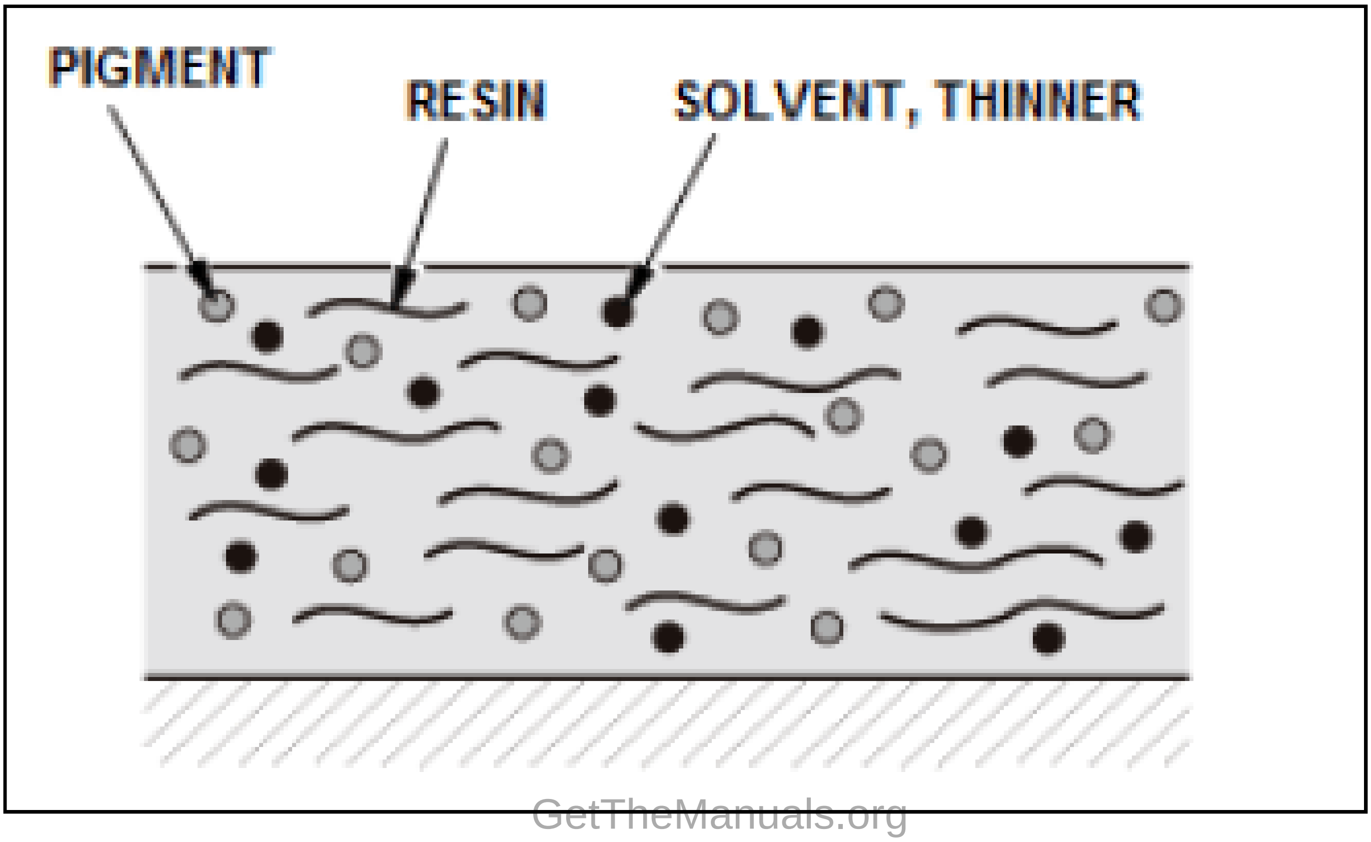
- This type of paint is called baked finish paint. These paints start a chemical reaction when heated (typically over 248Â°F (120Â°C) for 20 to 30 minutes) after application. This forms a net-like structure as the paint hardens, ensuring outstanding coating performance and are high solvent resistance once completely dried.
- Most of the paint used for automobile production is the heat polymerization type, including thermoset aluminum alkyd (baking melamine) and thermoset acrylic.
- This paint type is rarely used for repairs because plastic parts and electric components would need to be removed from the affected area in the car, or otherwise protected from heat.



Dual-Component Polymerization (Dual-Component Paints):

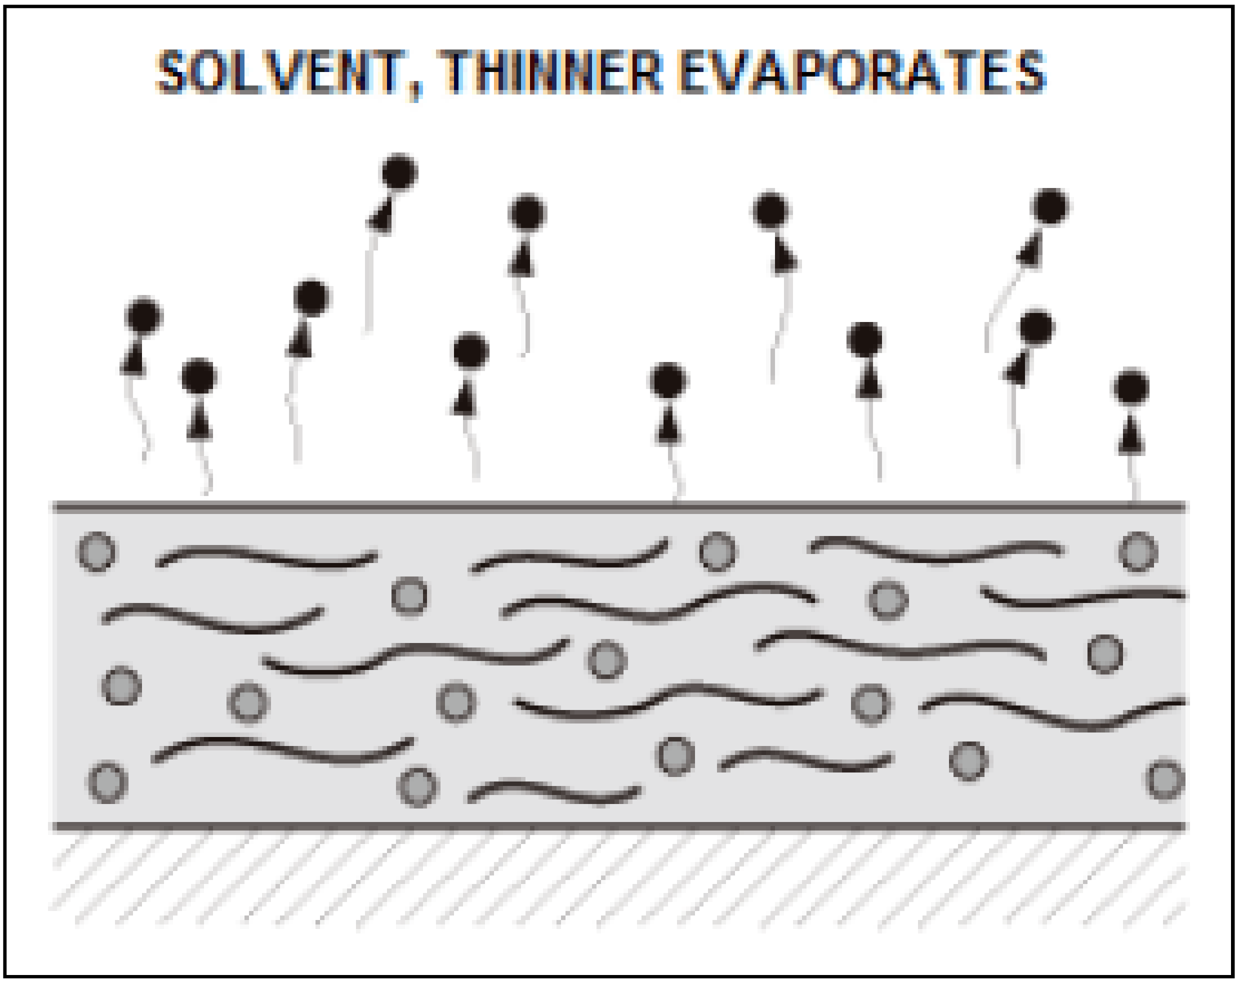
- This type of paint is commonly known as dual-component paint because an additive called hardener (kept in a separate container) is added to the paint to start a reaction and form a hard netted coat. This reaction takes places at a normal temperature, although it can be accelerated at higher temperatures 104-140Â°F (40-80Â°C).

Solvent-Evaporation Type (Air Dry)

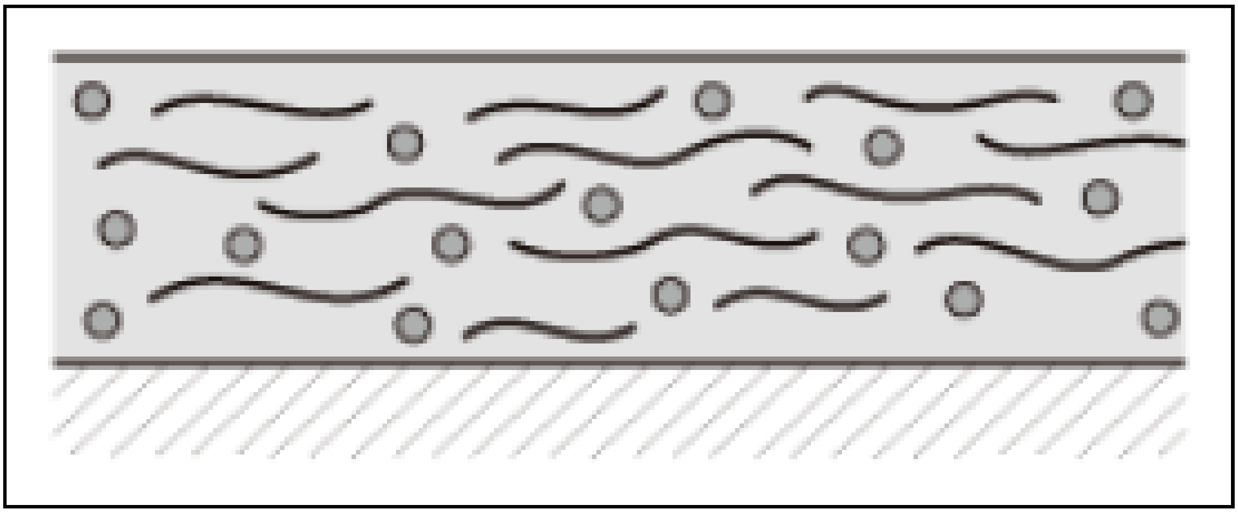


- This type of paints forms a coat when the solvent and thinner in them evaporate. Resins remain unchanged after the formation of the coat. Therefore, the hardened coat can be wiped off easily with a reducer/thinner.
- Air dry type paints are not used often anymore due low solvent and weather resistance.

1. Coating condition immediately after painting.



2. A layer of paint film is formed through air drying process as paint thinner and solvent evaporate.



3. Resin molecule reaction stops when completely dried, and a horizontally aligned paint film gets formed (2D paint structure).

PAINT FINISH COMPONENTS

Hardener

Hardener reacts and molecularly-bonds with the main resin component to form the paint film:

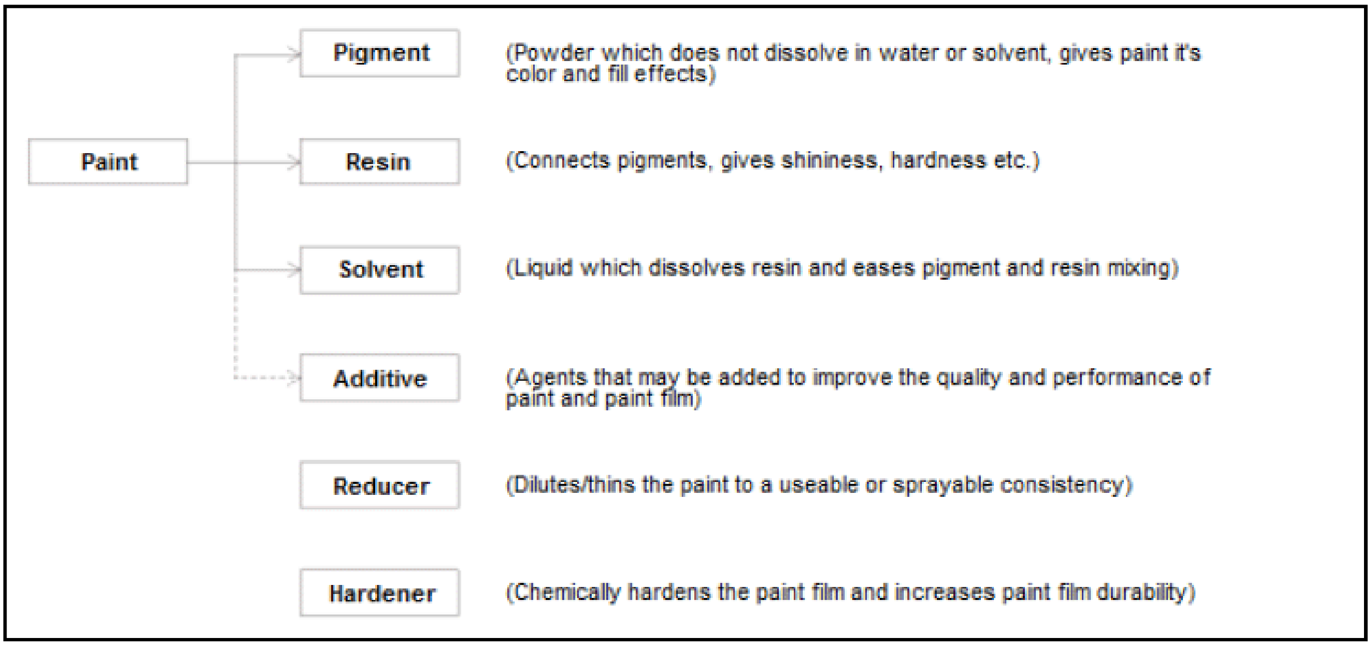
- Two pack paint requires hardener to be mixed with the base resin to achieve complete paint film performance.
- Acrylic urethane is mainly used for automobile repair along with an Isocyanate-based hardener.

(Reference)

Pay an extra attention when handling and storing isocyanates, such as hardener. They react very easily with water (H-O-H) and alcohol solvents (-OH group).

Paint Structure

Paint is a high viscosity liquid with the mixed constituents such as shown below. It normally is mixed with reducer or thinner to a sprayable and/or usable viscosity and combined with a chemical hardener. In addition, the paint can be categorized into clear (without pigment), enamel with pigment and basecoat.

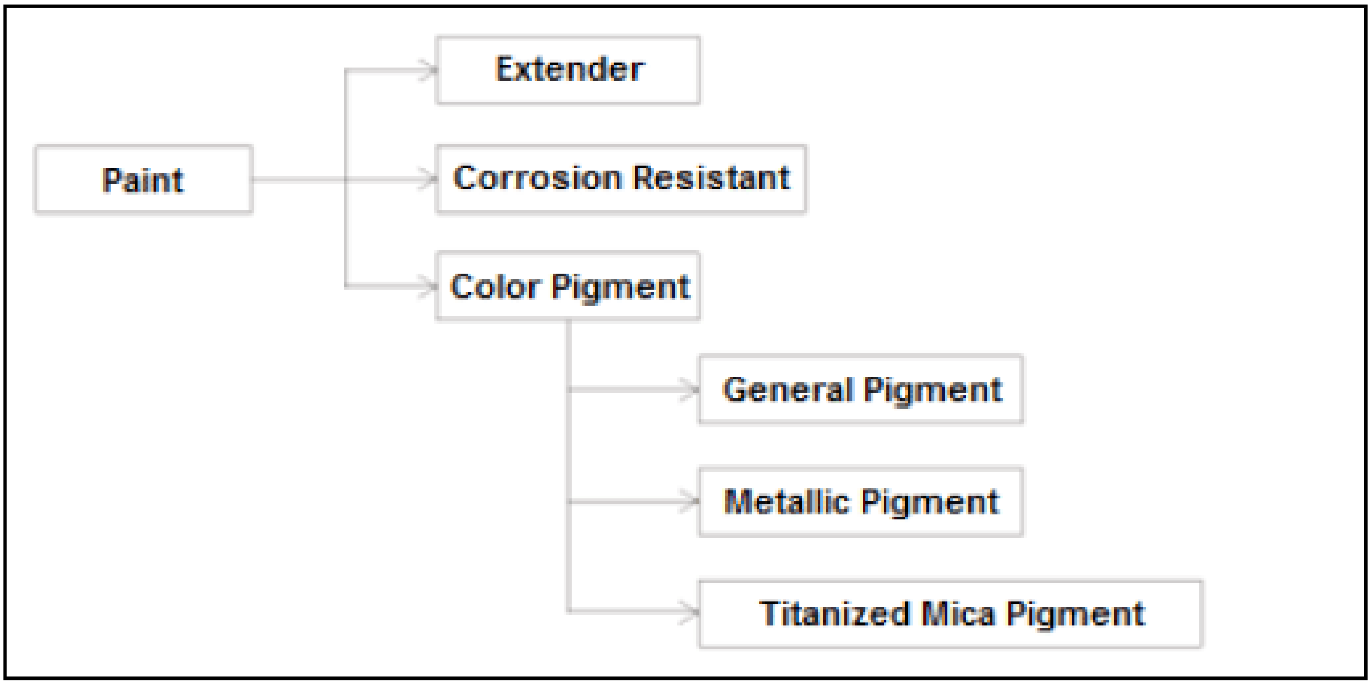


Pigment	(Powder which does not dissolve in water or solvent, gives paint it's color and fill effects)
Resin	(Connects pigments, gives shininess, hardness etc.)
Solvent	(Liquid which dissolves resin and eases pigment and resin mixing)
Additive	(Agents that may be added to improve the quality and performance of paint and paint film)
Reducer	(Dilutes/thins the paint to a useable or sprayable consistency)
Hardener	(Chemically hardens the paint film and increases paint film durability)

Pigment

Pigment is solid powder and does not dissolve in or solvent. It is kneaded into resin (film forming component) and dispersed so that the paint becomes usable.

Categories Of Pigment



Extender

Mostly used for base coat to reinforce and add body to the paint film.

Corrosion Resistant

Mainly used in basecoats to prevent rust.

Color Pigment

Color pigments are used mainly in top-coat paints to give colors and hiding power to the coating:

- **General Pigment**

  Gives various colors to paint such as red, blue and yellow.

- **Metallic Pigment**

  Metallic pigments are tiny flakes of aluminum and are used to give shiny and metallic look to the coating.

- **Titanized Mica Pigment**

  These pigments consist of flakes of mica coated with titanium oxides and give pearl-like luster to the coating.

Resin

Resins, together with pigments, are main components of coating. Generally a resin is a viscous and transparent liquid which is applied over an object and forms a coat when dried.

Types of Resin

Natural Resins

A type of resin extracted from plants or animals, mainly used for lacquer type finishes.

Synthetic Resins

A type of resin made through chemical synthesis. It can be categorized as thermoplastics resin and thermosetting resin:

- **Thermoplastic Resins**

  Thermoplastic resins can be softened repeatedly by heating and hardened again on cooling. Most of them are highly flexible, and are dissolved by solvents. Typically they include such materials as nitrocellulose, cellulose acetate butyrate, polypropylene and nylon.

- **Thermosetting Resins**

  Thermosetting resins are initially soft but change irreversibly to a hard rigid form when heated. They are generally very hard but brittle, and resistant against solvents. Typically they include amino resins, polyurethane resins and epoxy resins

Solvent Or Paint Reducer/Thinner

Solvent is a liquid that dissolves another substance to form a solution. In the process of making paints, a solvent is used to dissolve resins so that pigments are mixed easily with the resins. A thinner is a mixture of solvents. It is used to dilute paints to an appropriate viscosity level for application. Solvents and thinners evaporate as the paint is dried, and do not remain in the coating.

Because of this, the specific blends of several types of solvents are required for specific paint types. In addition, reducer/thinners are available in different evaporation rates to compensate for ambient temperatures and conditions.

Type	Solvent
Alcohol	Methanol, isopropyl alcohol (IPA), butanol
Ester	Ethyl acetate, butyl acetate
Ketone	MEK, acetone, MIBK, DIBK
Ether	Ethyl cellosolve
Aromatic Hydrocarbon	Toluene, xylol
Aliphatic Hydrocarbon	Petroleum benzene, solvent naphtha
Water	Water

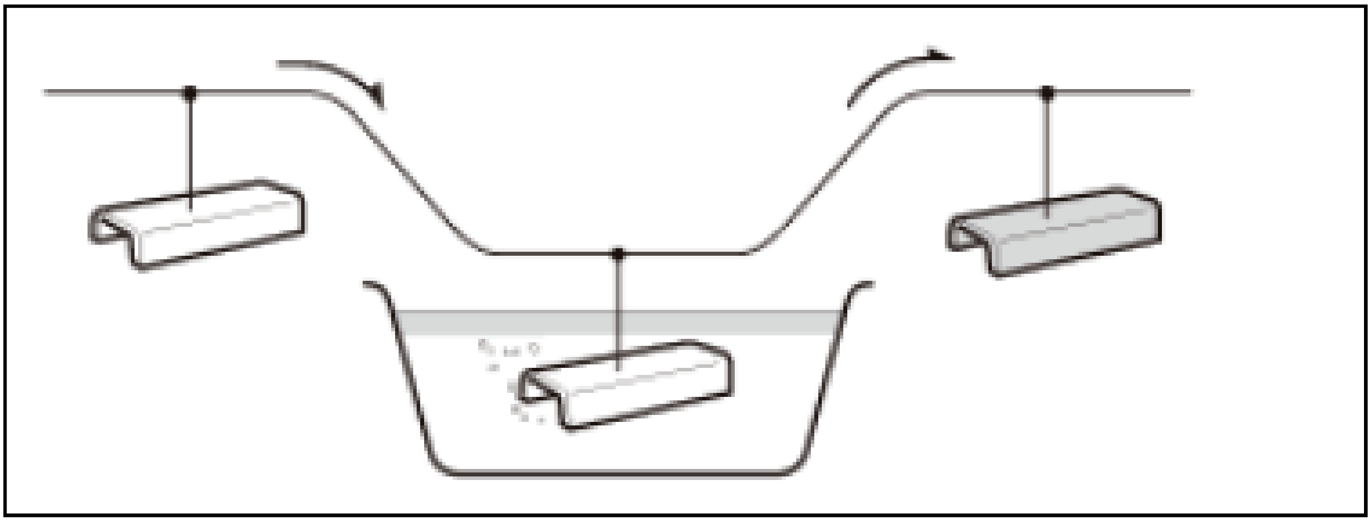
REFINISH METHODS

Dip-Type Methods

Painting method where parts are immersed in a paint bath. This is done either by dipping or electrodeposition. These processes are best suited for large scale production rather than repairs.

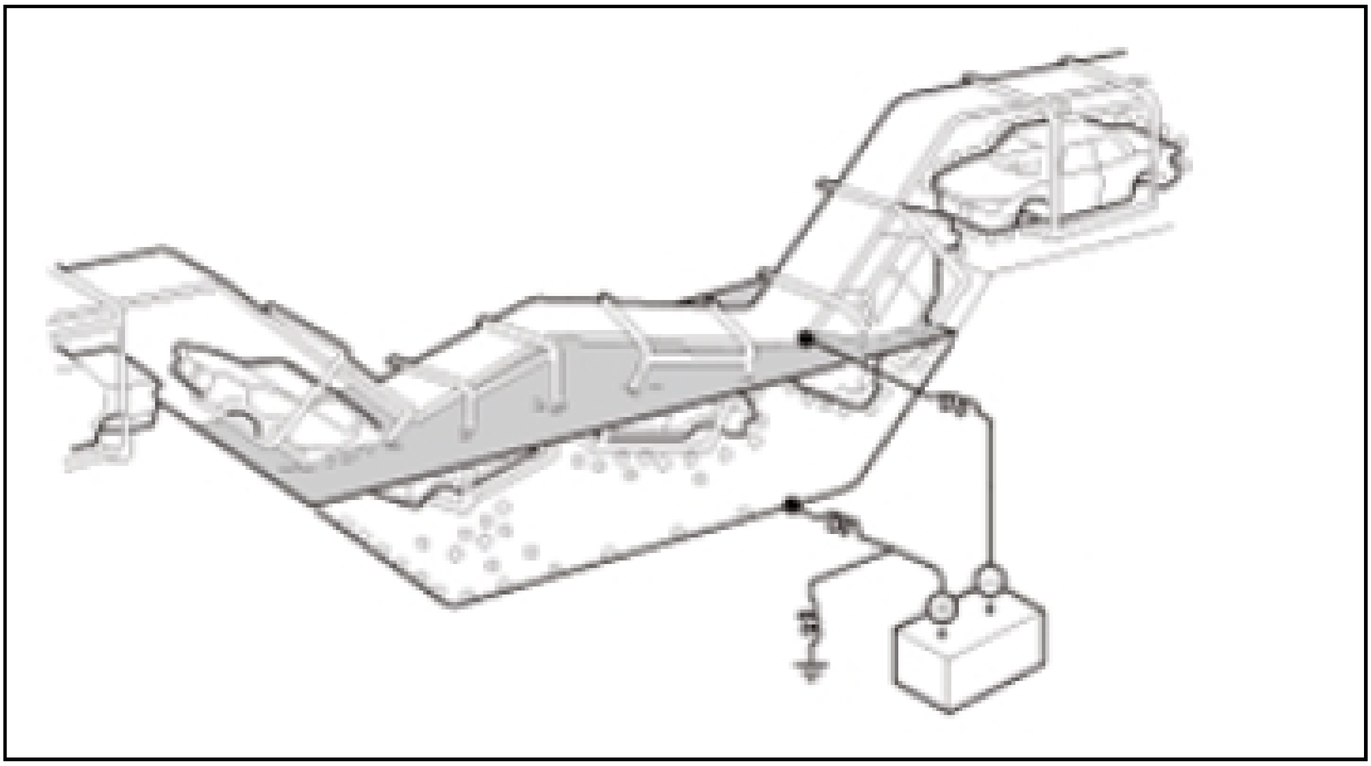
Dip Coating

Vehicle body parts are coated by dipping them into a tank filled with paint.

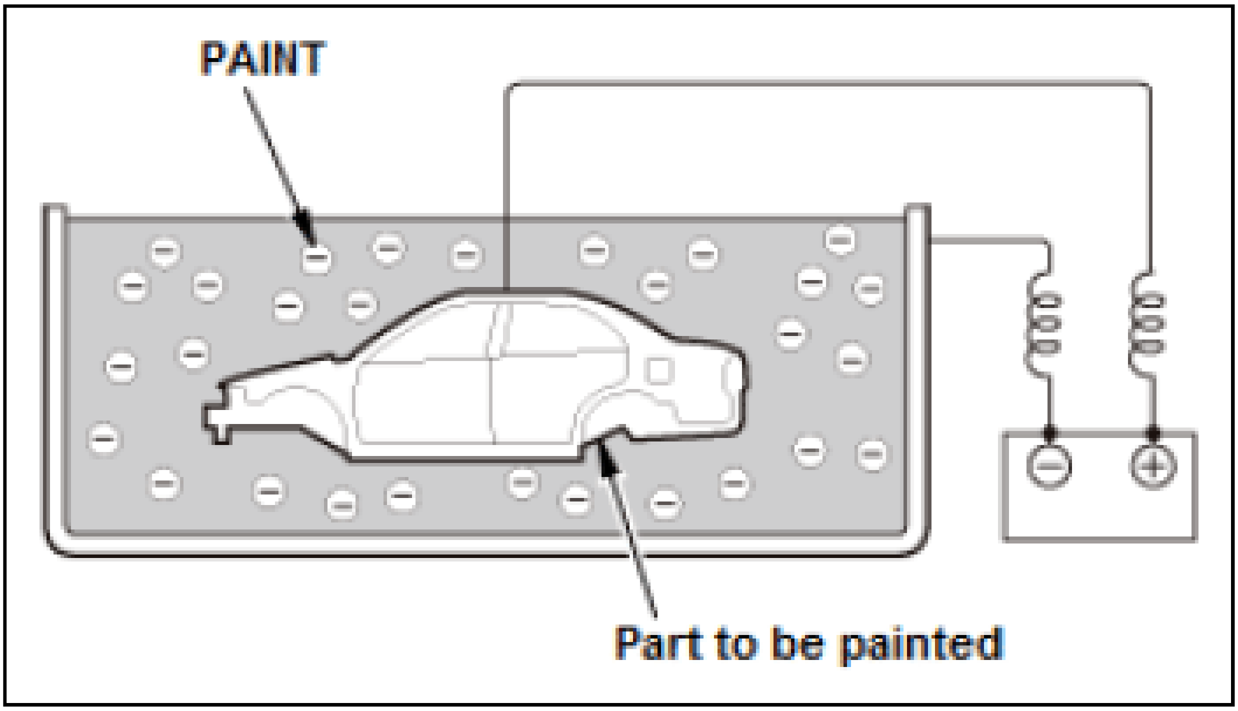


Electrodeposit Coating

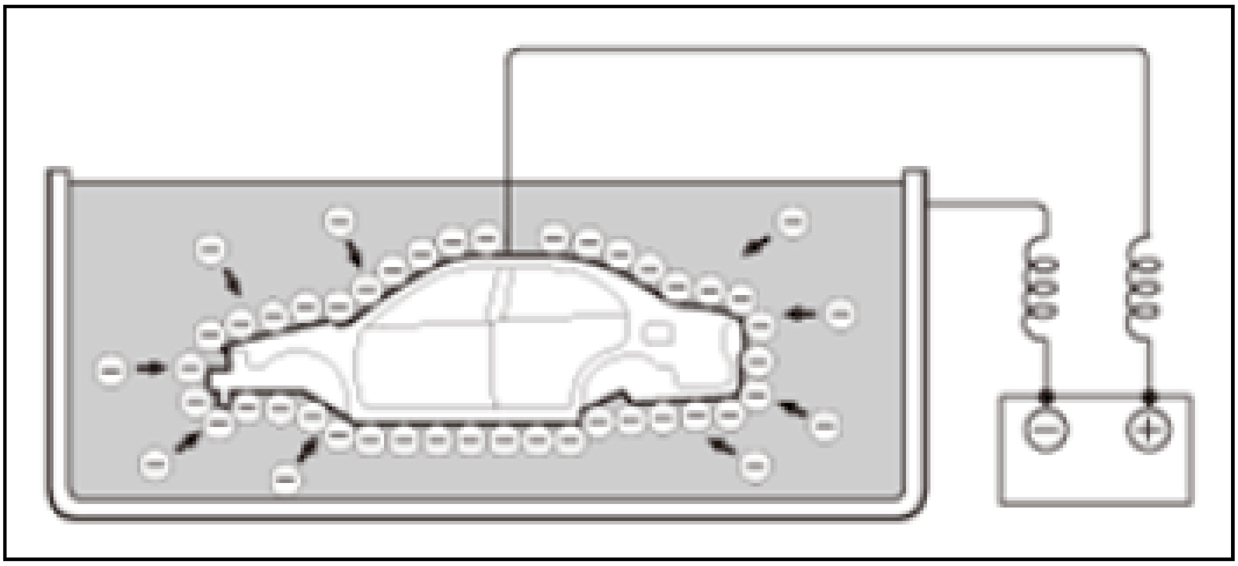
Painting method also known as ED coating, in which electricity is applied to a tank containing the parts being coated and the primer or paint. The coat is formed by adhesion of the paint to the parts through a process called electrocrystallization. Electrodeposition ensures an even coating thickness, relatively free of drips and runs because the coating thickness can be controlled accurately by regulating the electric current. It also ensures coating in invisible sections and seams.



1. Tank is filled with water-based primer or paint. Parts soak inside the tank. Connecting the positive charge electrode to the part charge the tank with the negative electrode.



2. Electrical current passes between the electrodes and primer or paint electrically adheres to the surface of the part because of opposite charges.



NOTE: **Electrodeposit coating is normally called ED paint or primer. It is used to apply the black colored basecoat on replacement steel body parts.**

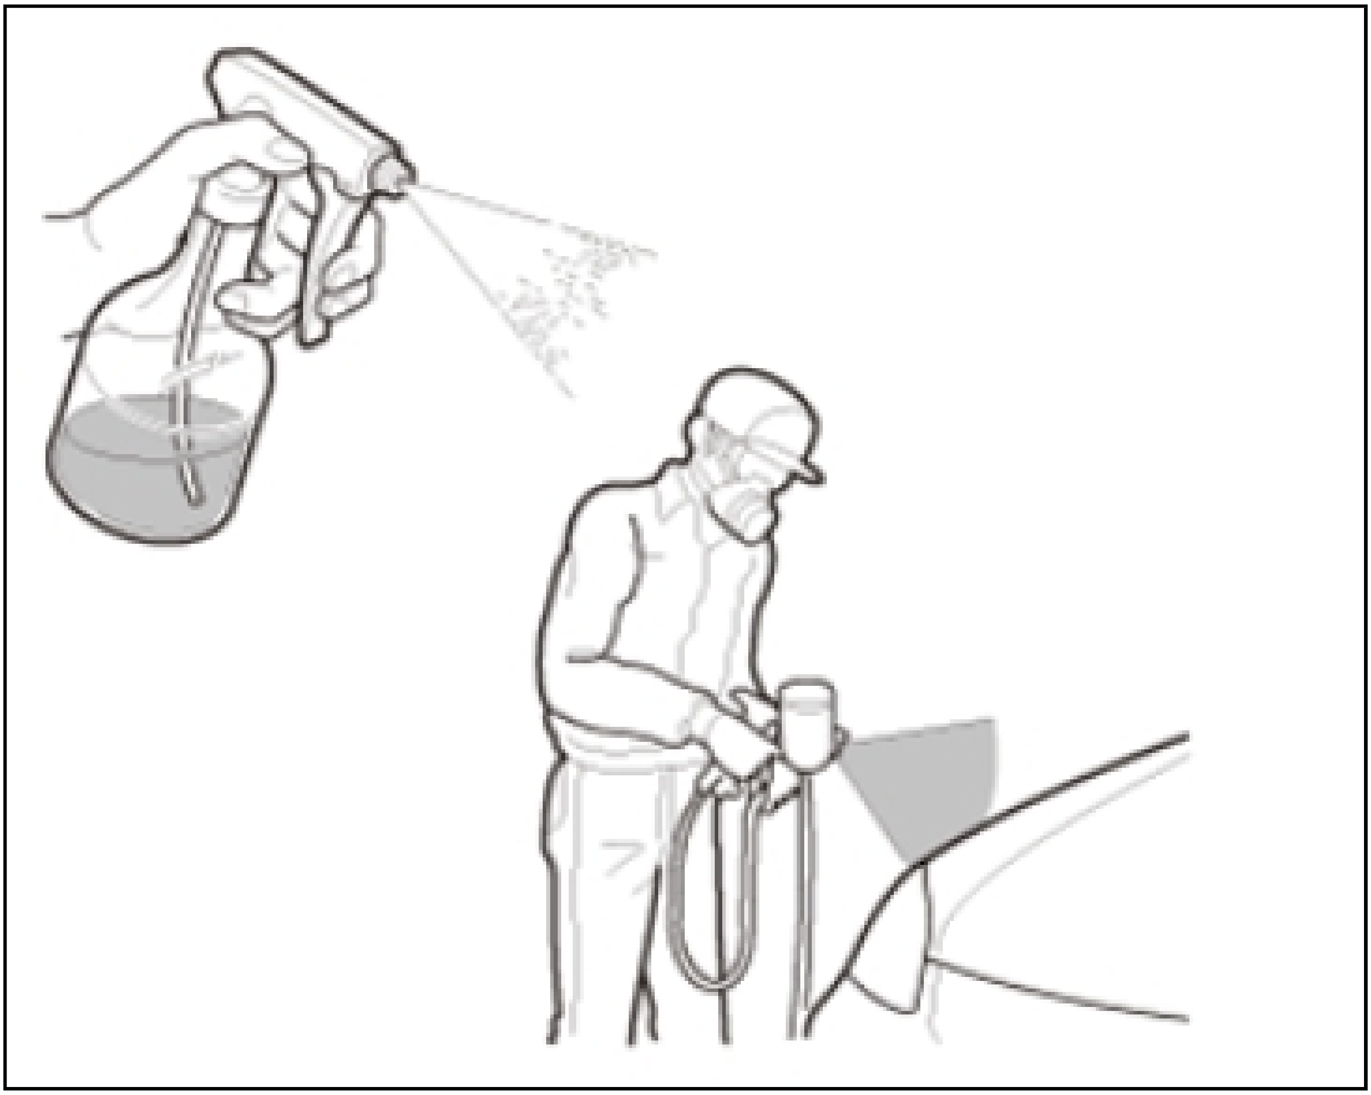
Spray-Type Methods

Spray painting is a way to apply small particles of paint to objects by a spray gun with compressed air.

Spray Gun Coating

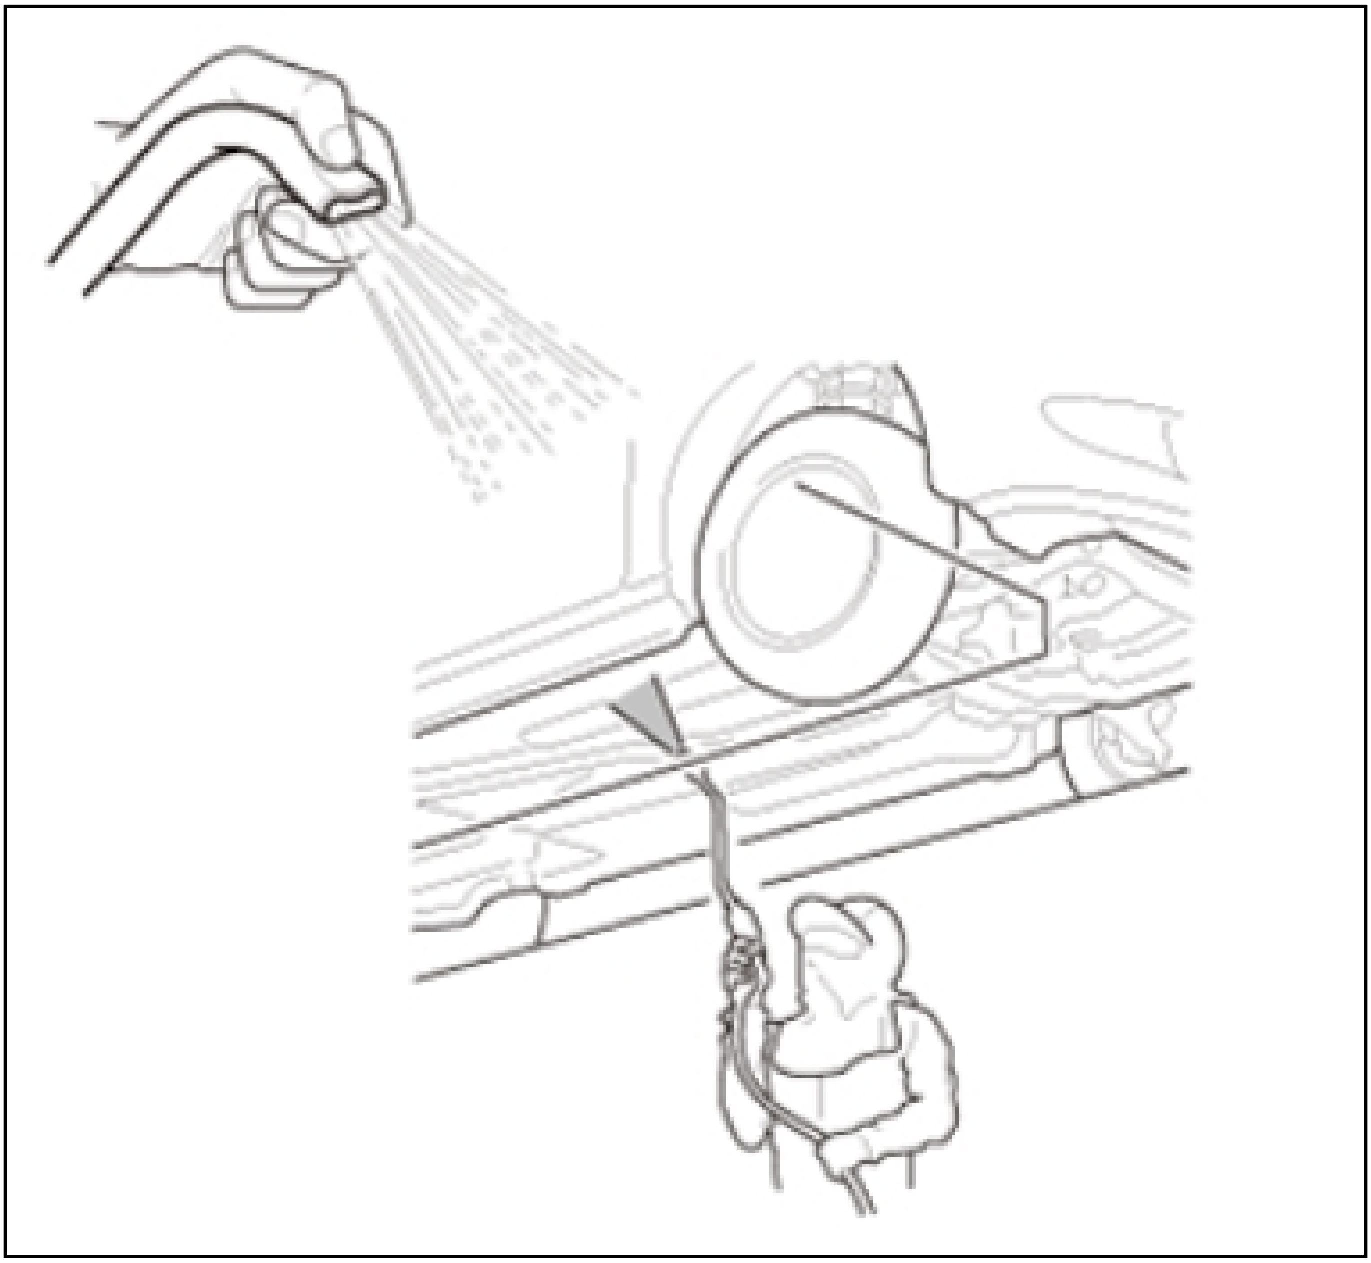
The same mechanism with as a spray bottle. Compressed air blows out from outside the paint nozzle and the air at the tip of nozzle gets pushed away. This creates a vacuum condition and paint gets suctioned out.

This process atomizes the paint into a mist of tiny particles. This is the most popular method today.



Airless Spray Gun Coating

Airless spray gun applies a high pressure to paint which discharges through a small nozzle. When doing so, air is forced into the paint to atomize it. Overspray is minimal and large spray patterns are possible. This method is efficient and able to handle high viscosity paints.



Electrostatic Coating

Electrostatic painting is a method based on the principle that the positive and negative electrical charges attract while like electrical charges repel each other. The paint is charged negatively in a high voltage generator while the body is charged positively as it is grounded. Since paint particles from the paint applicator are charged negatively they repel each other and are atomized. These negatively-charged particles are attracted by the positively-charged body and adhere to it.

PAINT REPAIR TOOLS AND EQUIPMENT

PAINT REPAIR EQUIPMENT

Air Compressor

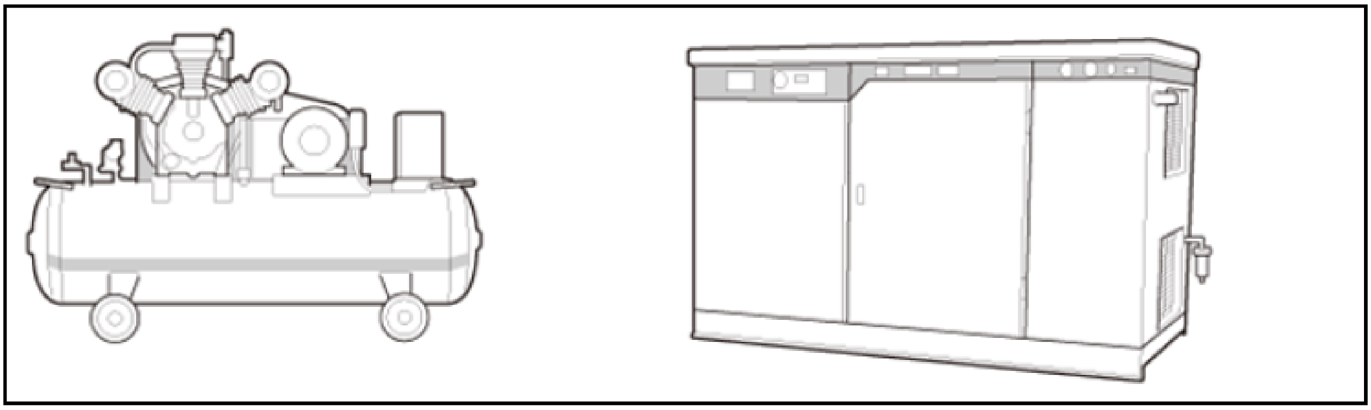
The air compressor is one of the most important pieces of equipment used in paint repair.

An air compressor is a machine that squeezes air and raises its pressure, enabling you to use spray guns and other air powered tools.

Select the compressor type to meet your shop's requirements. Air compressors are classified as follows:

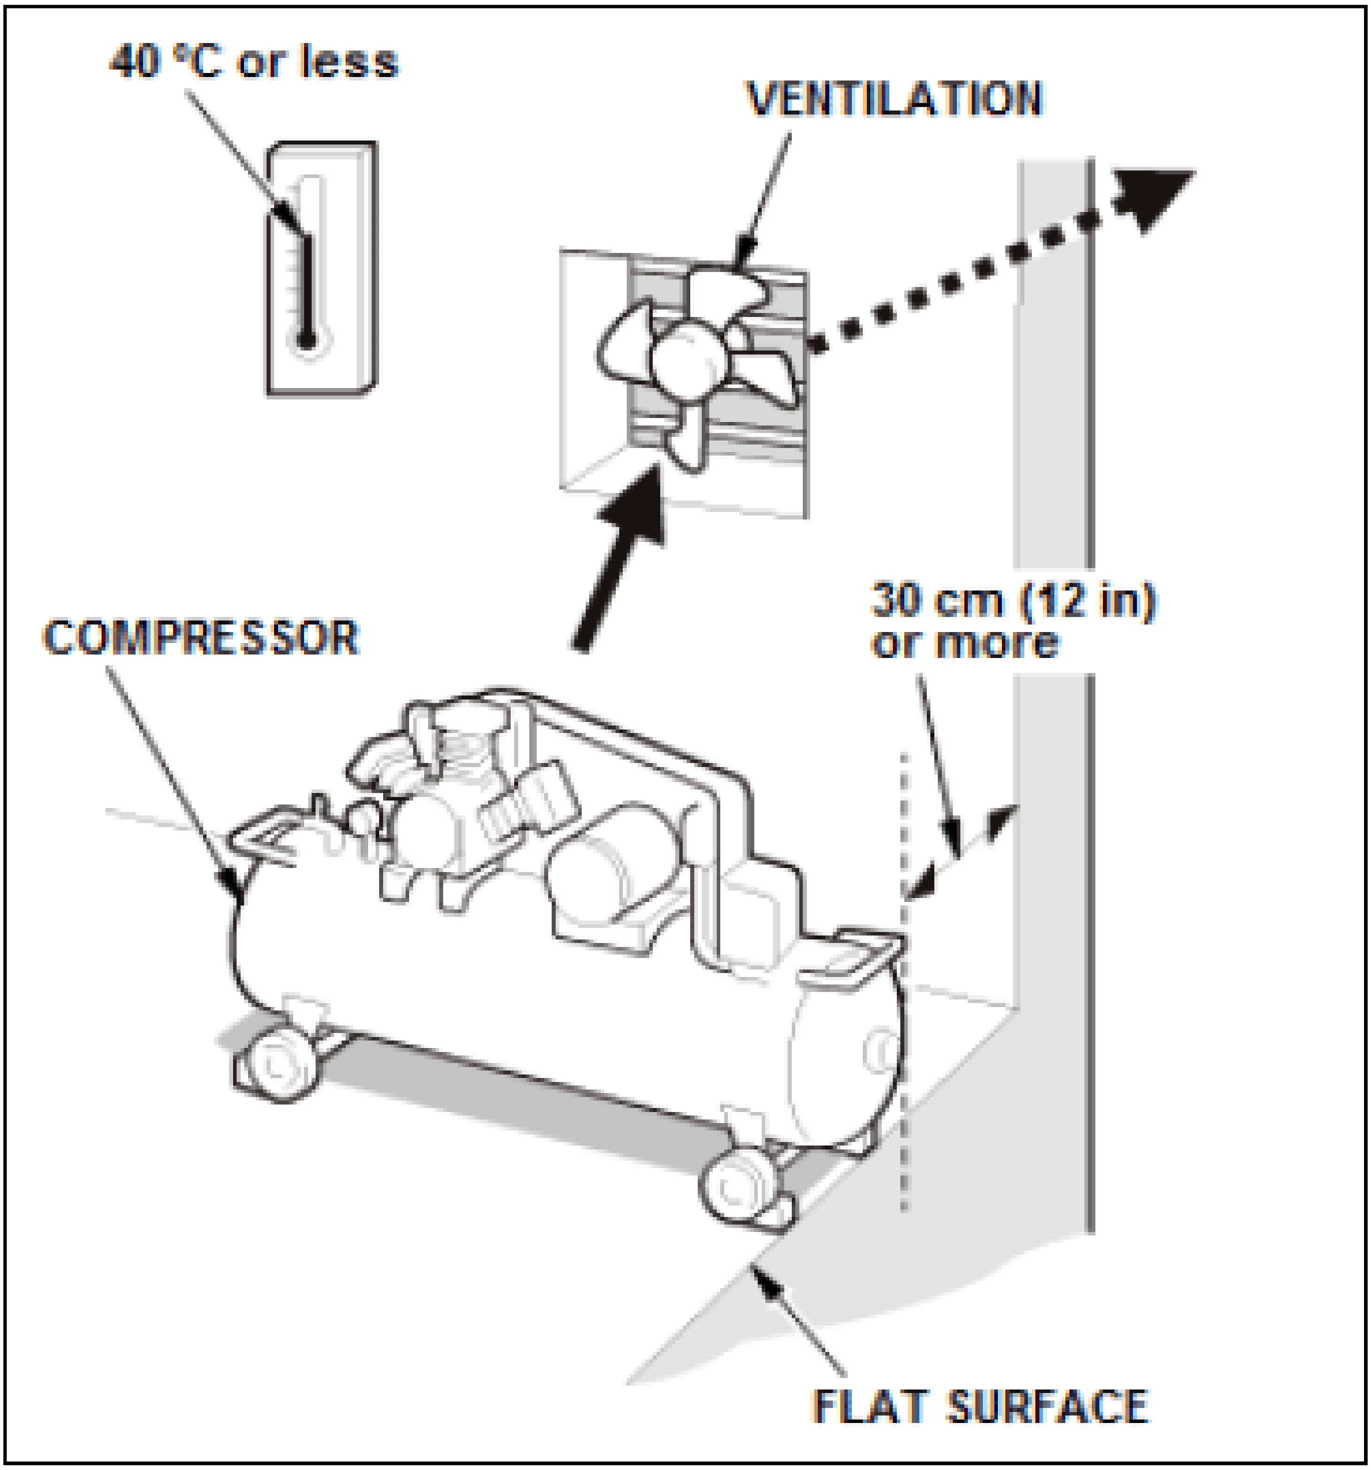
Stages	Single Stage Pressure	Dual Stage Pressure
Application	Use when compressed air consumption is comparatively small.	When air pressures exceeding 980 kPa (10 kgf/cm^2 , 142 psi) are constantly required. Also best when constantly using multiple high consumption air tools, or when air supply pipes are very long.

Method	Start/Stop	Load/Unload
Operation	Intermittent Operation	Continuous Operation
Feature	• The motor shuts off when the air pressure exceeds its specified value, and it resumes its operation automatically when the pressure drops below the cut-in pressure. • This is suitable for applications where a single operator operates an air toll repeatedly with the air pressure ranging from 785-980 kPa (7-10 kgf/cm^2 , 114-142 psi).	• Unloader valves allow no-load compressor operation when the air pressure exceeds a prescribed level. The compressor begins developing air pressure when the air pressure drops below the cut-in pressure. • This is suitable for continuous and simultaneous use of several air tools with the air pressures ranging from 490-686 kPa (5-7 kgf/cm^2 , 71-100 psi).



Compressor Installation Location

- Should be located on a level floor and protected from rain or other water sources. The location should also have adequate ventilation and avoid excessive humidity and dust.
- The location's temperature should remain under 104Â°F (40Â°C), even during the hottest weather. Direct sunlight should be avoided.
- There should be enough space for maintenance and inspection. Maintain a distance of 30 cm (12 in), or more, from the wall.
- If the compressor is located inside the workshop, it must be an explosion-proof type to prevent fire and explosion hazards.



40 °C or less
VENTILATION
COMPRESSOR
30 cm (12 in)
or more
FLAT SURFACE

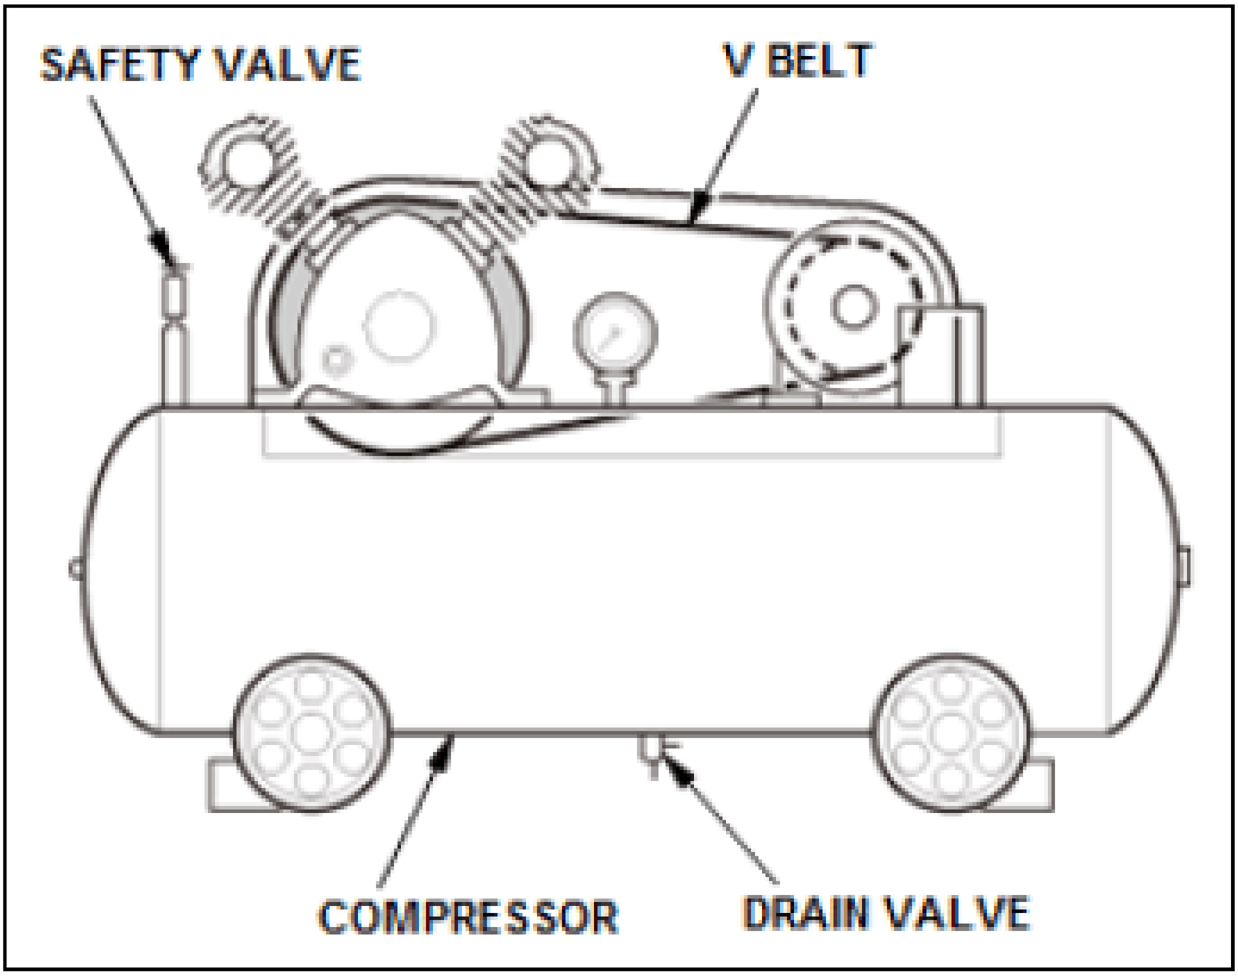
Inspection Of Compressor

Daily Checks

- Oil Level Check
- Open drain valve to remove water from tank Especially when using dual-component polyurethane resin coatings, you may need to open up the drain valve and drain the water and oil inside the tank more often because the hardener will react with water inside reducing the paint film's performance.

Monthly Checks

- Clean intake air filers
- Check safety valve operation
- Check the drive belt tension
- Change compressor oil



Air Pipes And Equipment

Observe the followings when you install air pipes in the workshop, or connect tools to air hoses.

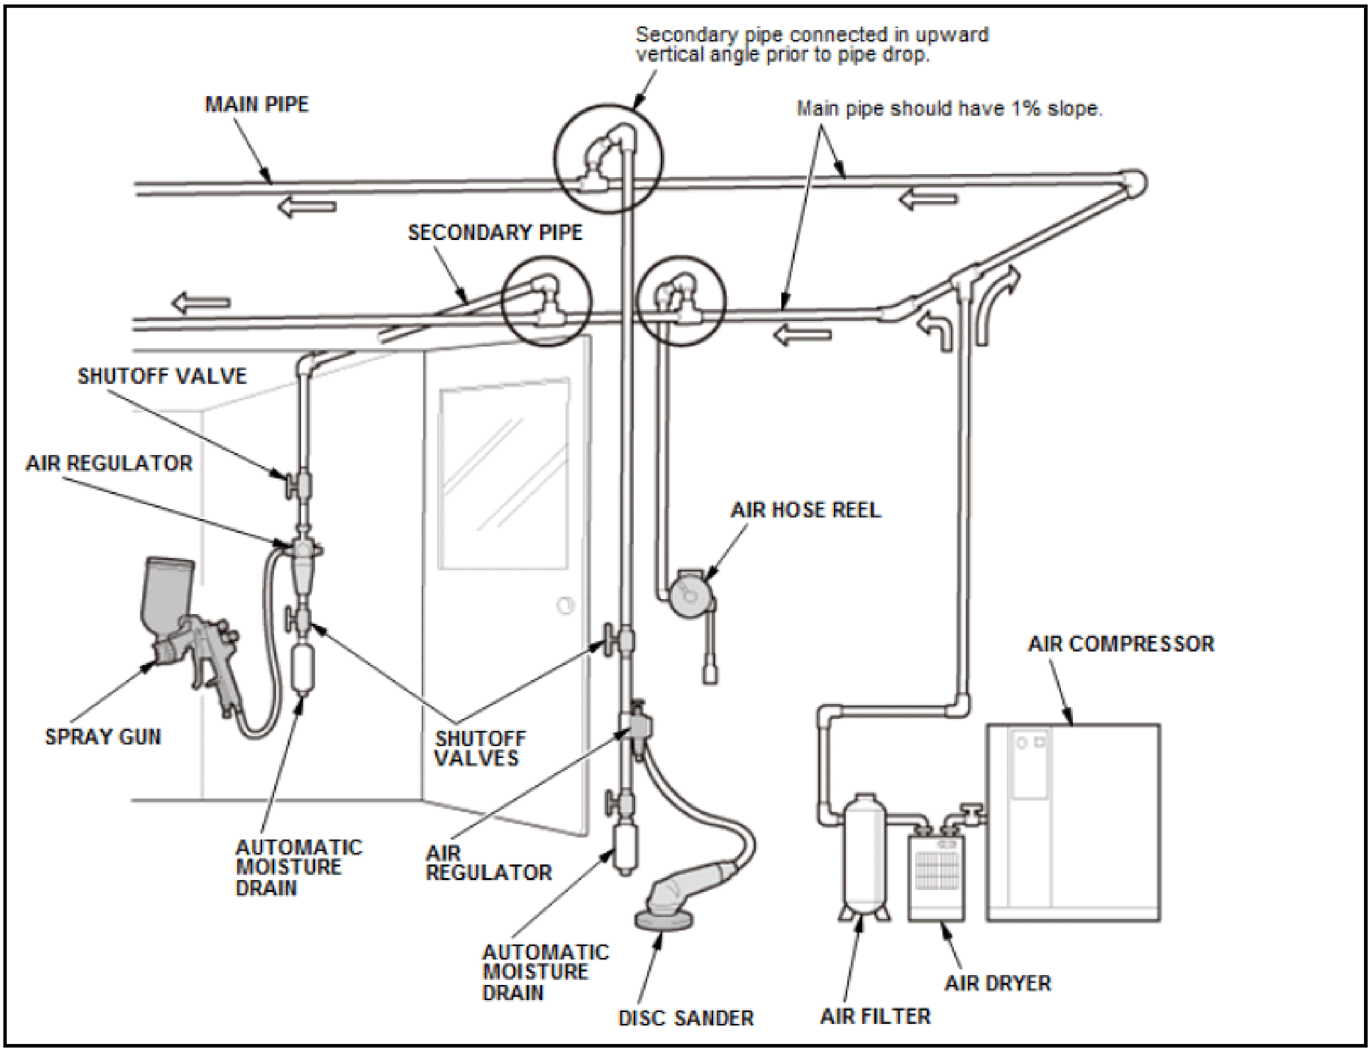
1. Air Pressure Drop:

   The smaller the inner diameter of the air pipe or hose, the larger the pressure drop and the poorer the water separating capability will be. Use larger diameter air pipes and hoses whenever possible.

2. Water Removal:

   All compressed air contains water which condenses into droplets as the air cools. Using a spray gun without a water separator will cause paint defects and possible equipment damage. Install water separators on air lines used for spray guns. Also slope the air supply pipe runs slightly to allow water drainage.

Shop Compressed Air Pipe Layout Example



Secondary pipe connected in upward vertical angle prior to pipe drop.

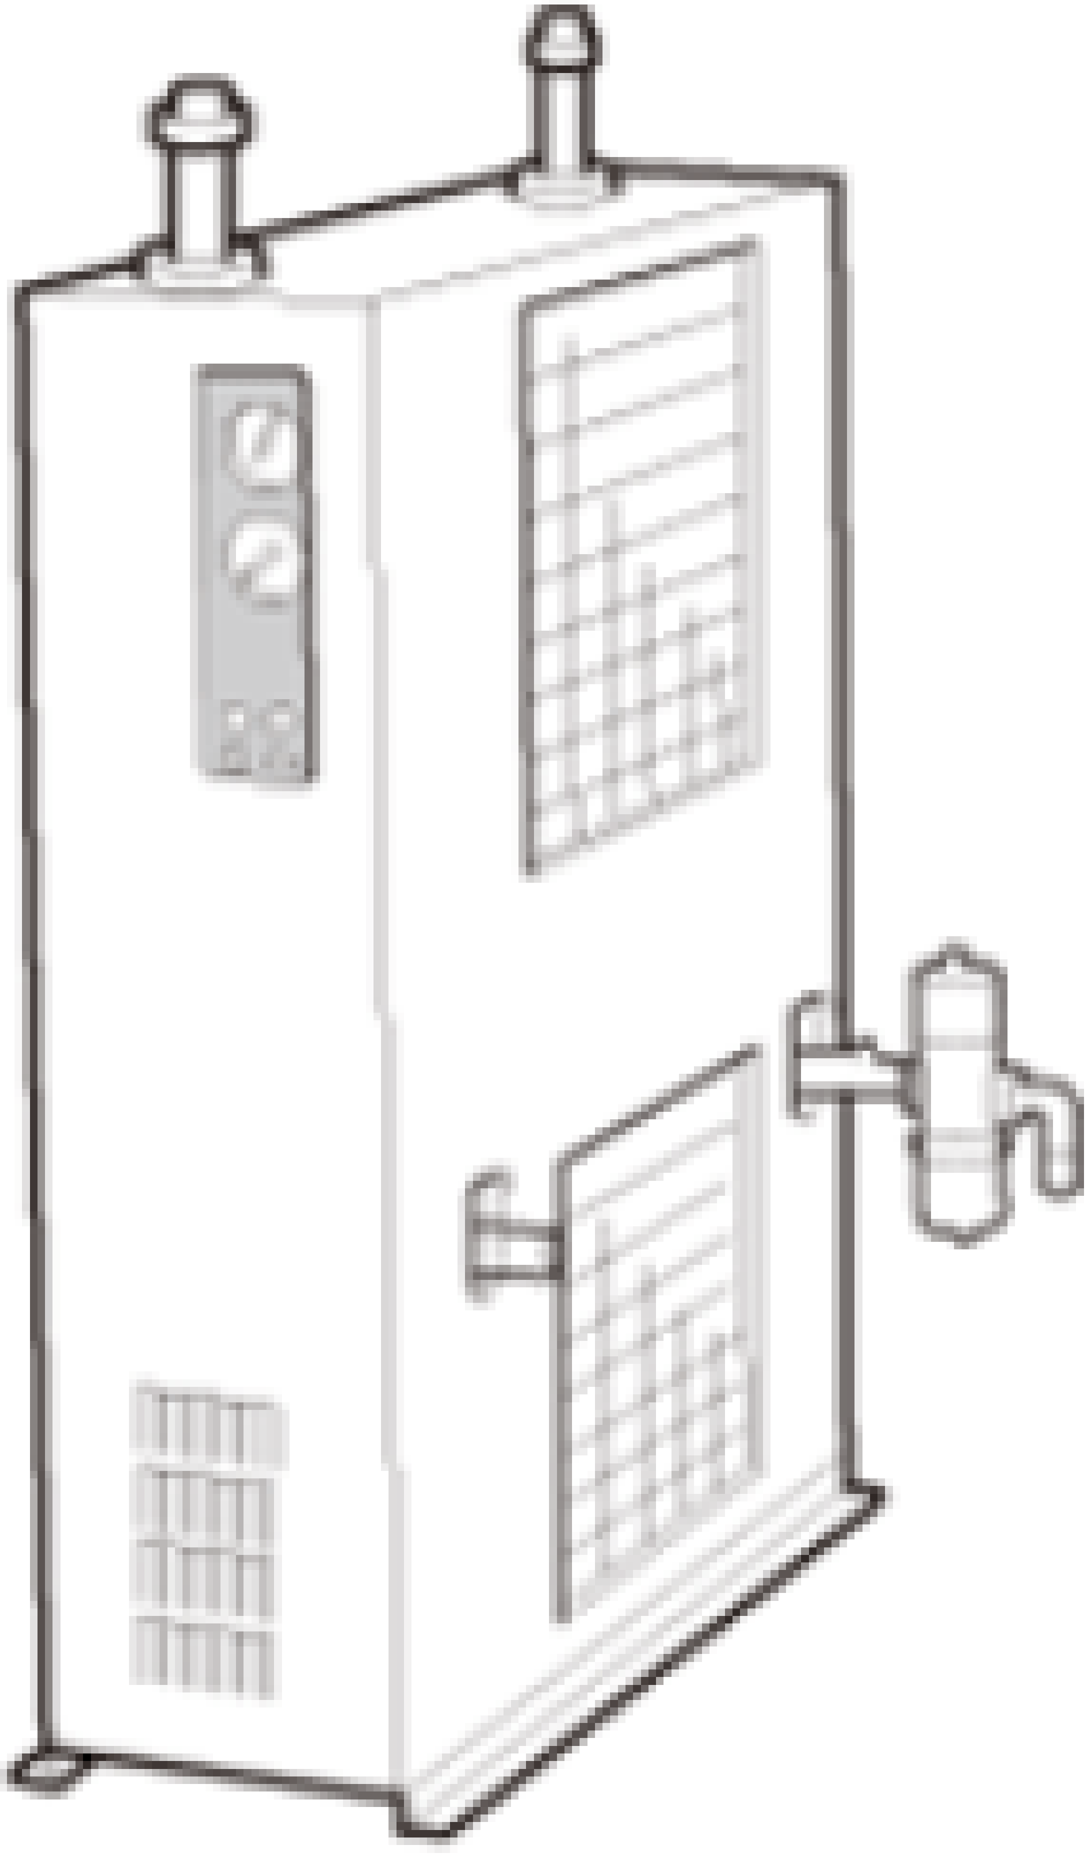
Other Air Handling Equipment

Air Dryer (Refrigerated Type)

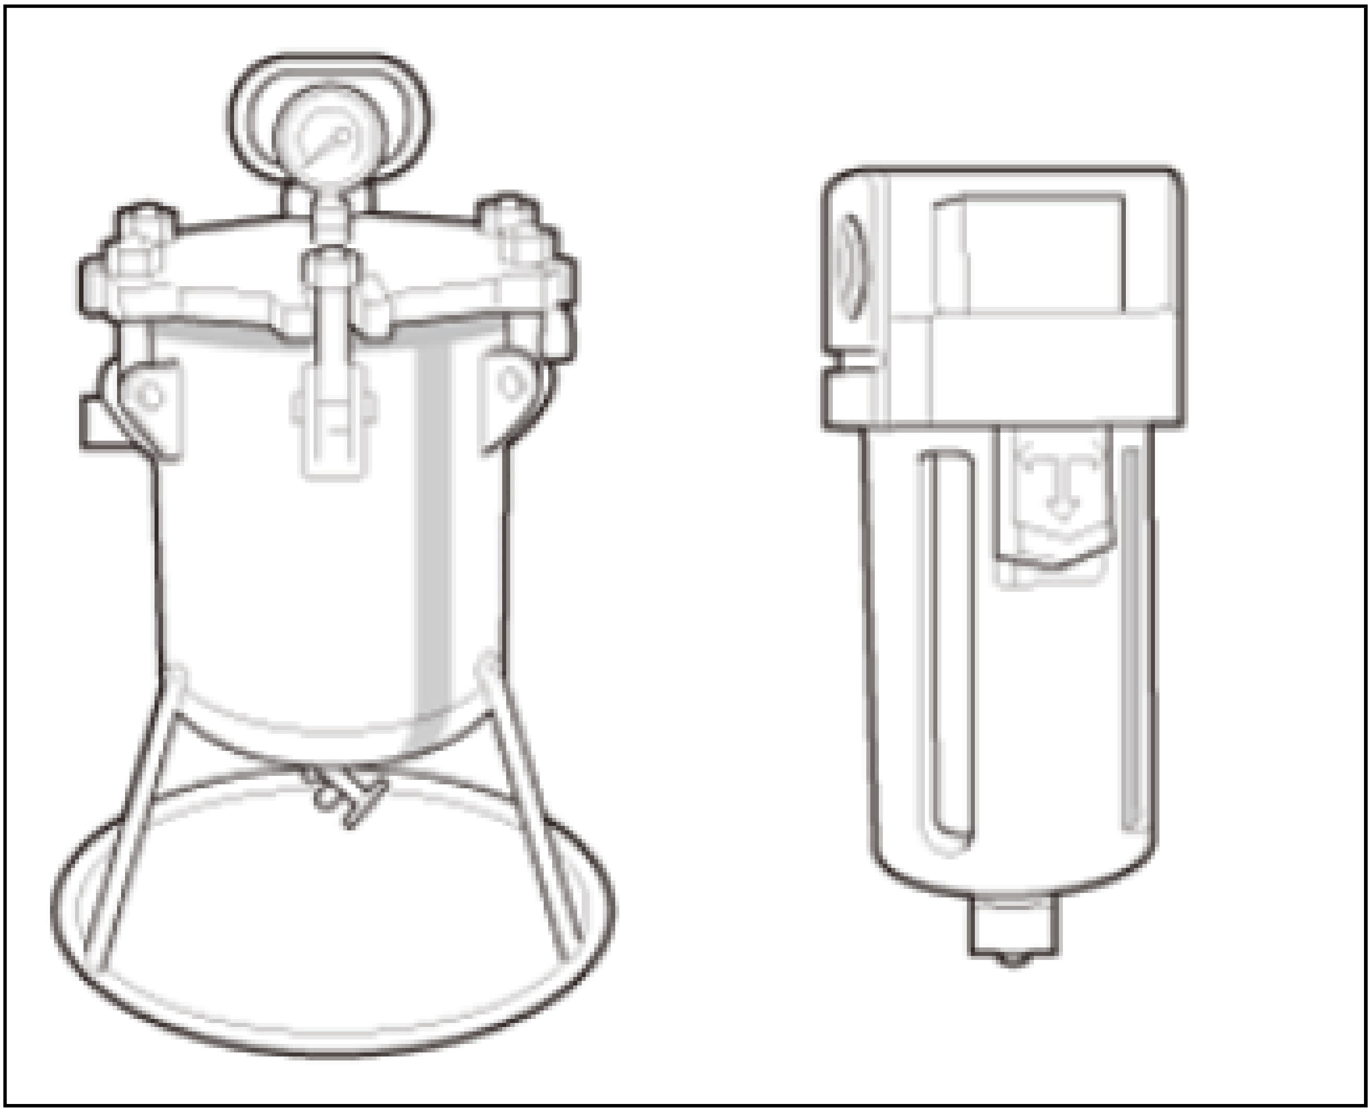


- Uses refrigeration equipment and heat exchangers to reduce the temperature of the hot air discharged the compressor.

- By reducing the compressed air's temperature significantly below ambient, the moisture it contains is condensed and removed.

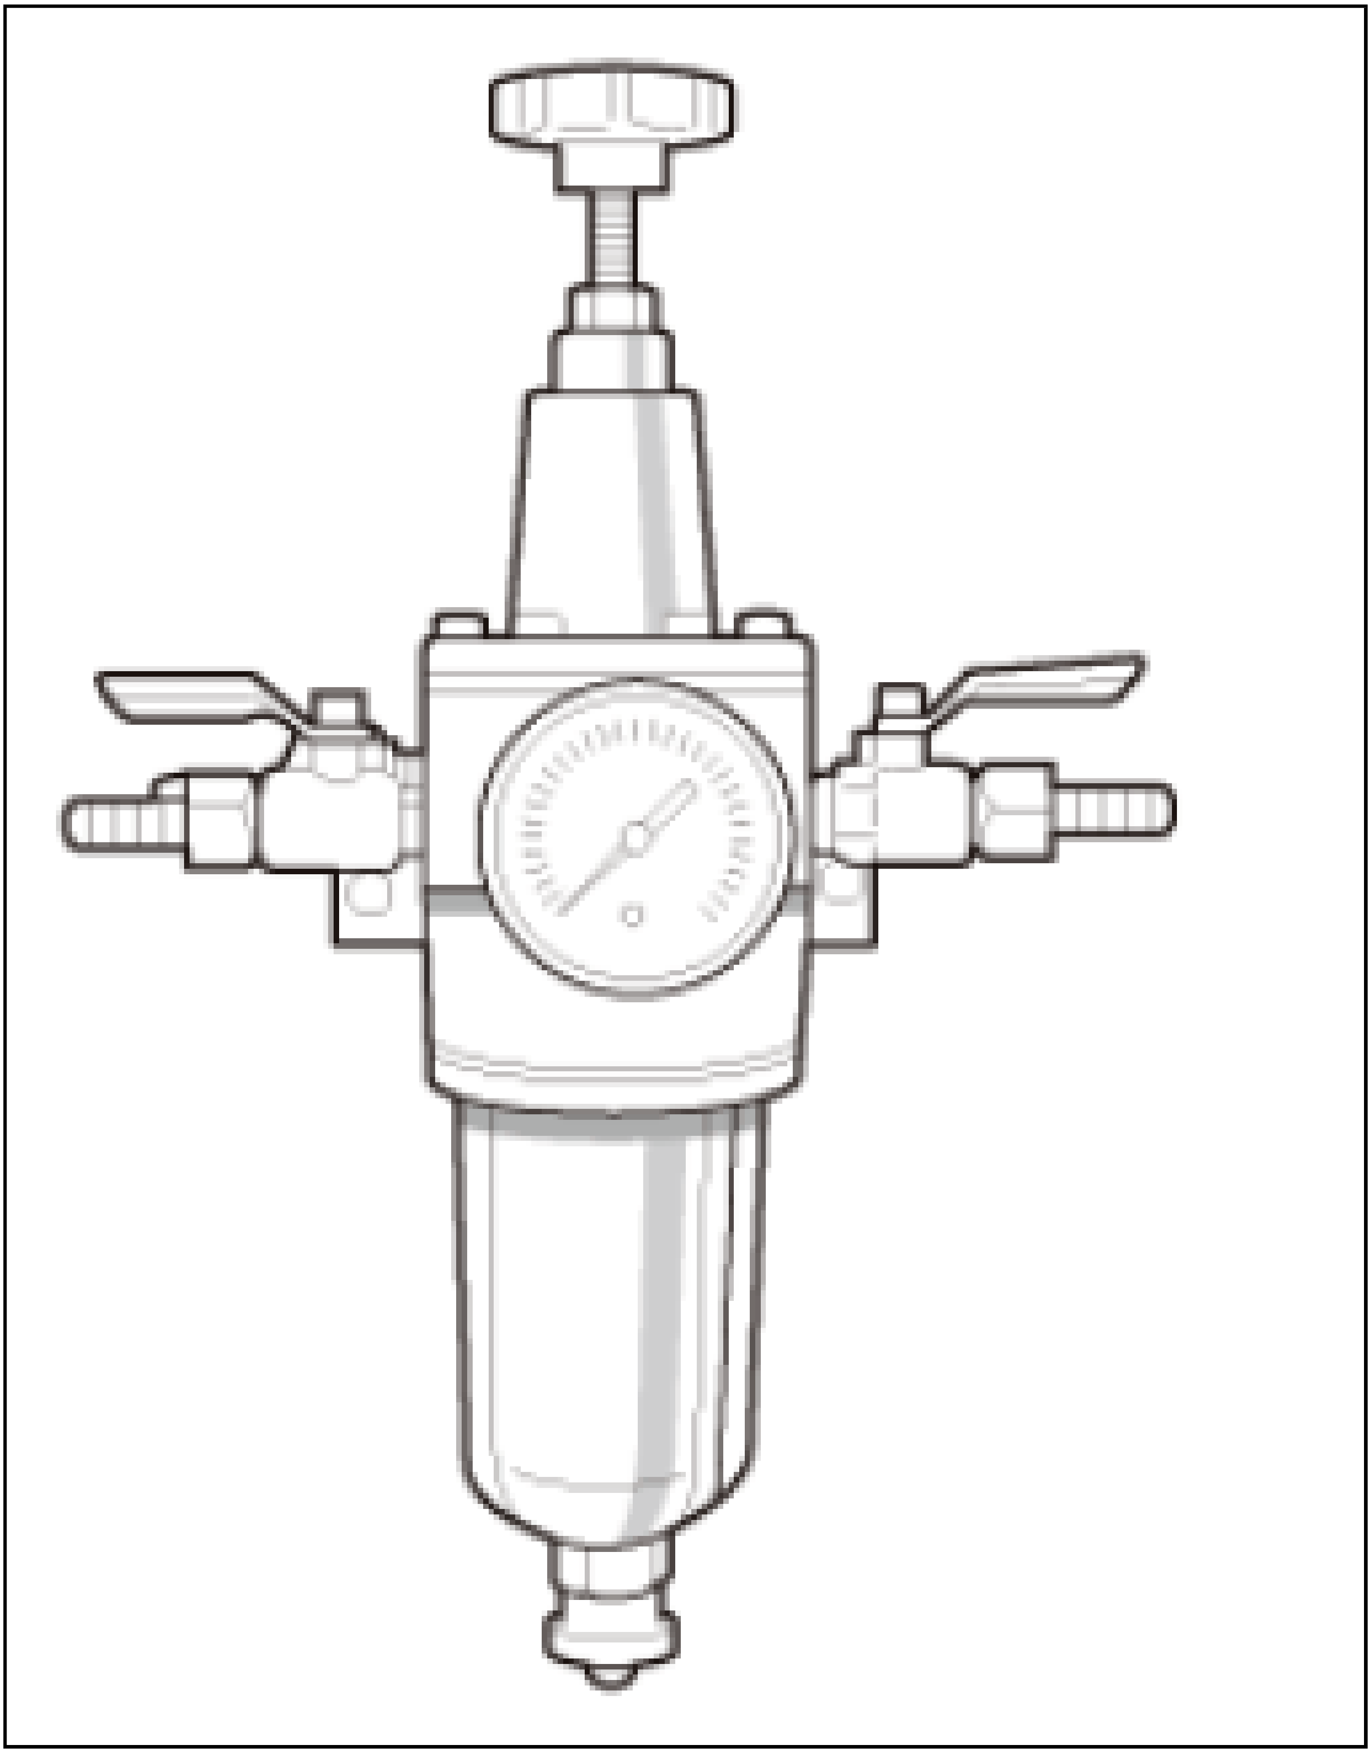
Air Separator

- The air separator removes moisture, oil and dirt from the compressed air by applying the cyclone motion of the built-in deflector.
- The air filter is installed between the air dryer and air pressure regulator. It is designed to remove even the very small droplets or mist of contaminants from the cooled compressed air.



Air Pressure Regulator

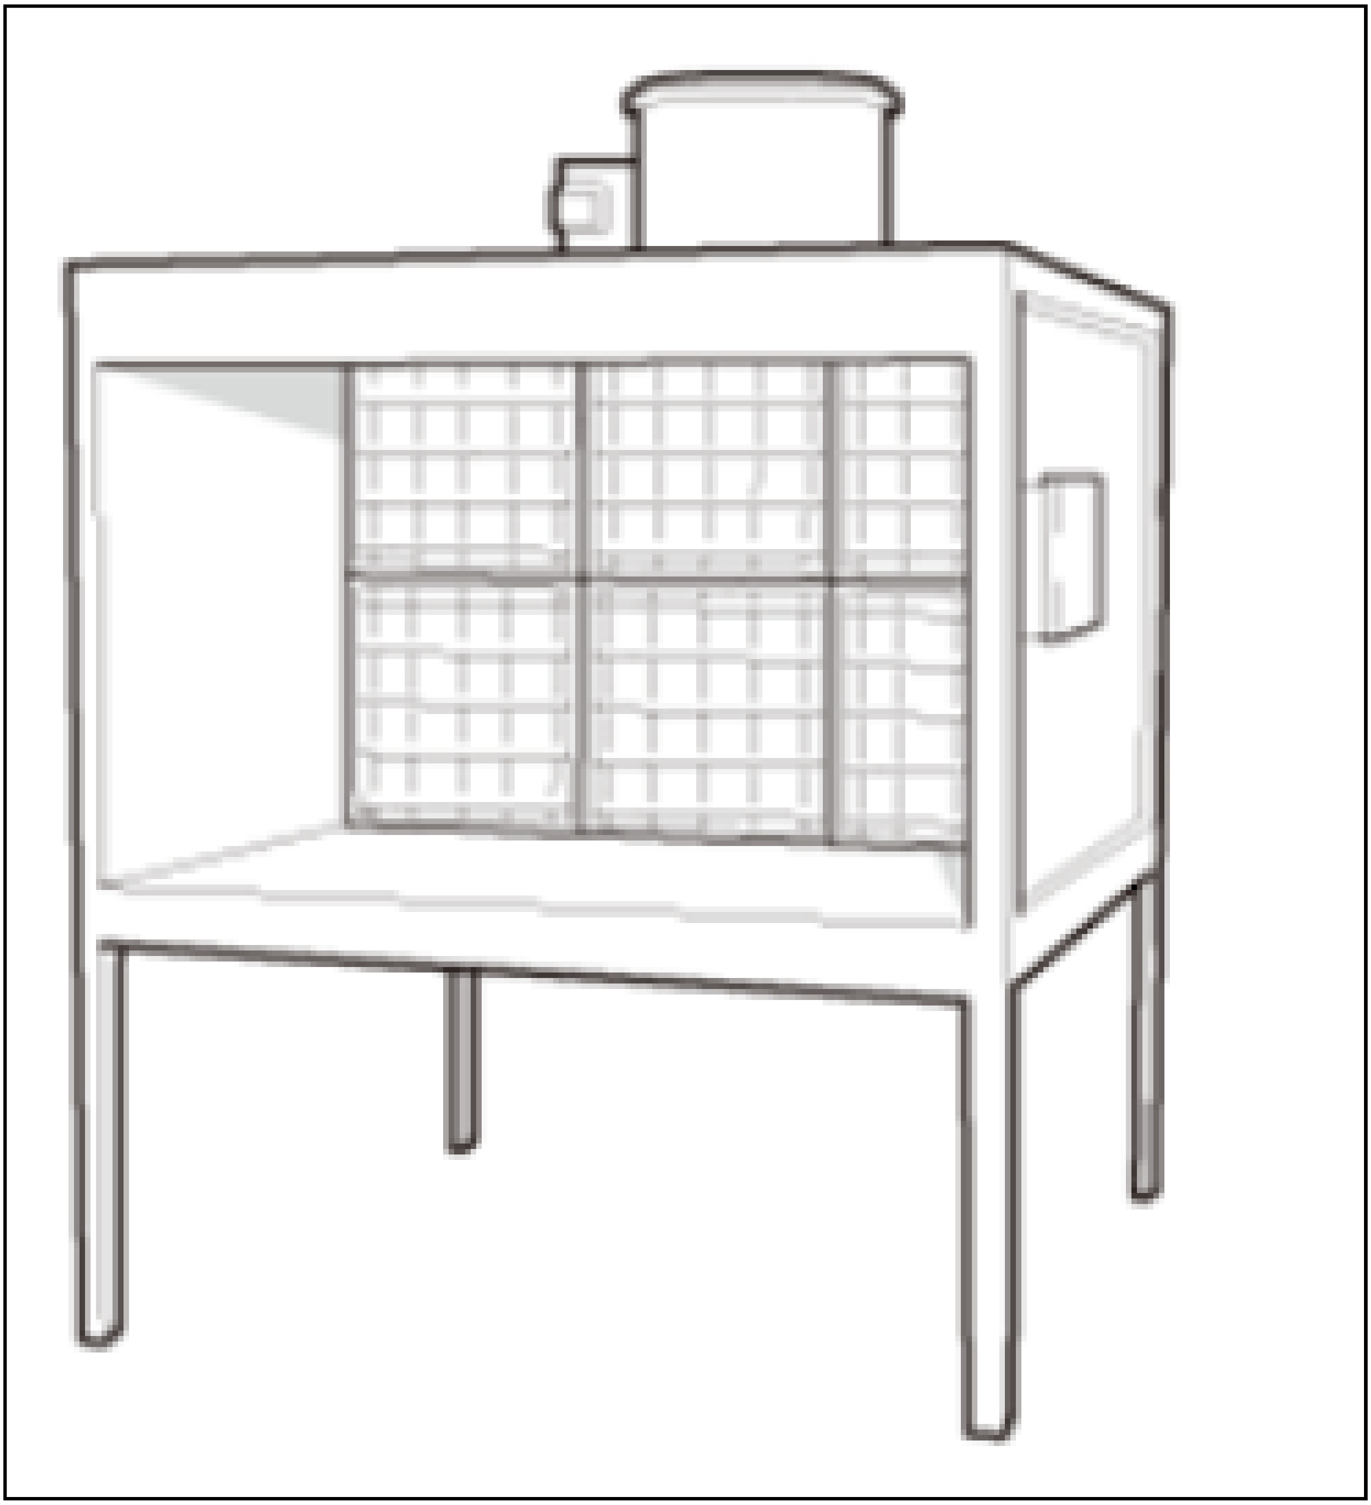
- Air pressure regulators are adjustable to drop the shop air pressure to a working pressure for spray gun or other air tool use.
- The built-in air filer can remove water, oil and dirt from compressed air.
- Regulators are positioned at end of an air pipe. An air hose generally connects directly to the regulator
- Check and drain the regulator daily.



Other Paint Drying Equipment

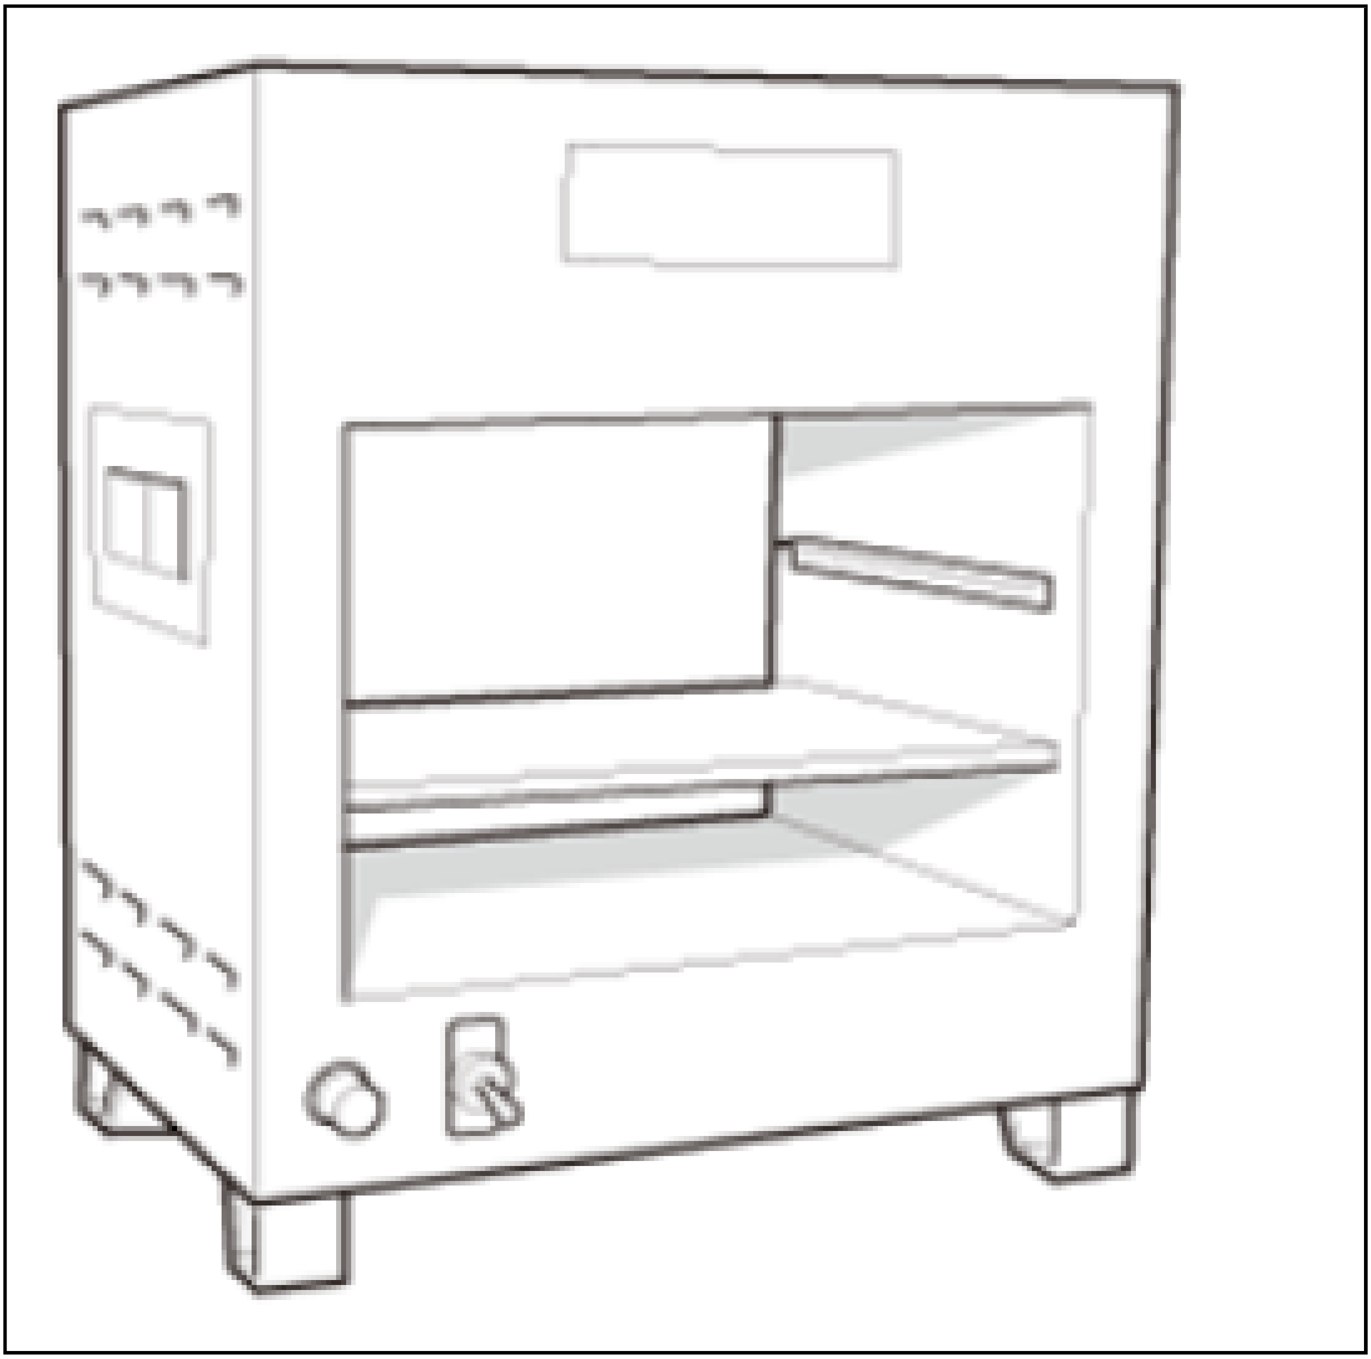
Exhaust Hood

When making colorimetric plates for tinting or paint matching, a small exhaust hood will be required. This is also helps keep the painting area clean.



Colorimetric Plate Drying Device

When tinting or matching colors, several fully dried colorimetric plates are needed. In order to reduce the drying time, a small sized drying device will be necessary for the colorimetric plates.



Paint Booth

Spray coating application generates considerable paint overspray mist and solvent vapors. These can be a health and safety issue, cause various paint defects, and pollute the environment. Therefore, paint and other coatings should only be applied in a specially designed paint booth.

Paint Booth Function:

- The forced ventilation system help protect painters from inhaling paint mist and hazardous organic solvent vapors.
- The intake air filters provide clean air to protect the surface being painted from dirt and dust.
- Exhaust air filters collect paint mist and prevent it's release into the shop and environment.

Paint Booth Types:

- Natural Intake/Forced Exhaust Type

  Force ventilates only the exhaust side, so the inside of the booth remains at the ambient air pressure. This booth type tends to allow more dust and dirt entry through doors and small openings.

- Forced Intake/Forced Exhaust Type (Push Pull Type)

  Force ventilates both intake and exhaust sides, so the inside of the booth is pressurized slightly above ambient. Because of this pressure differential, most dust and dirt are prevented from entering the booth.

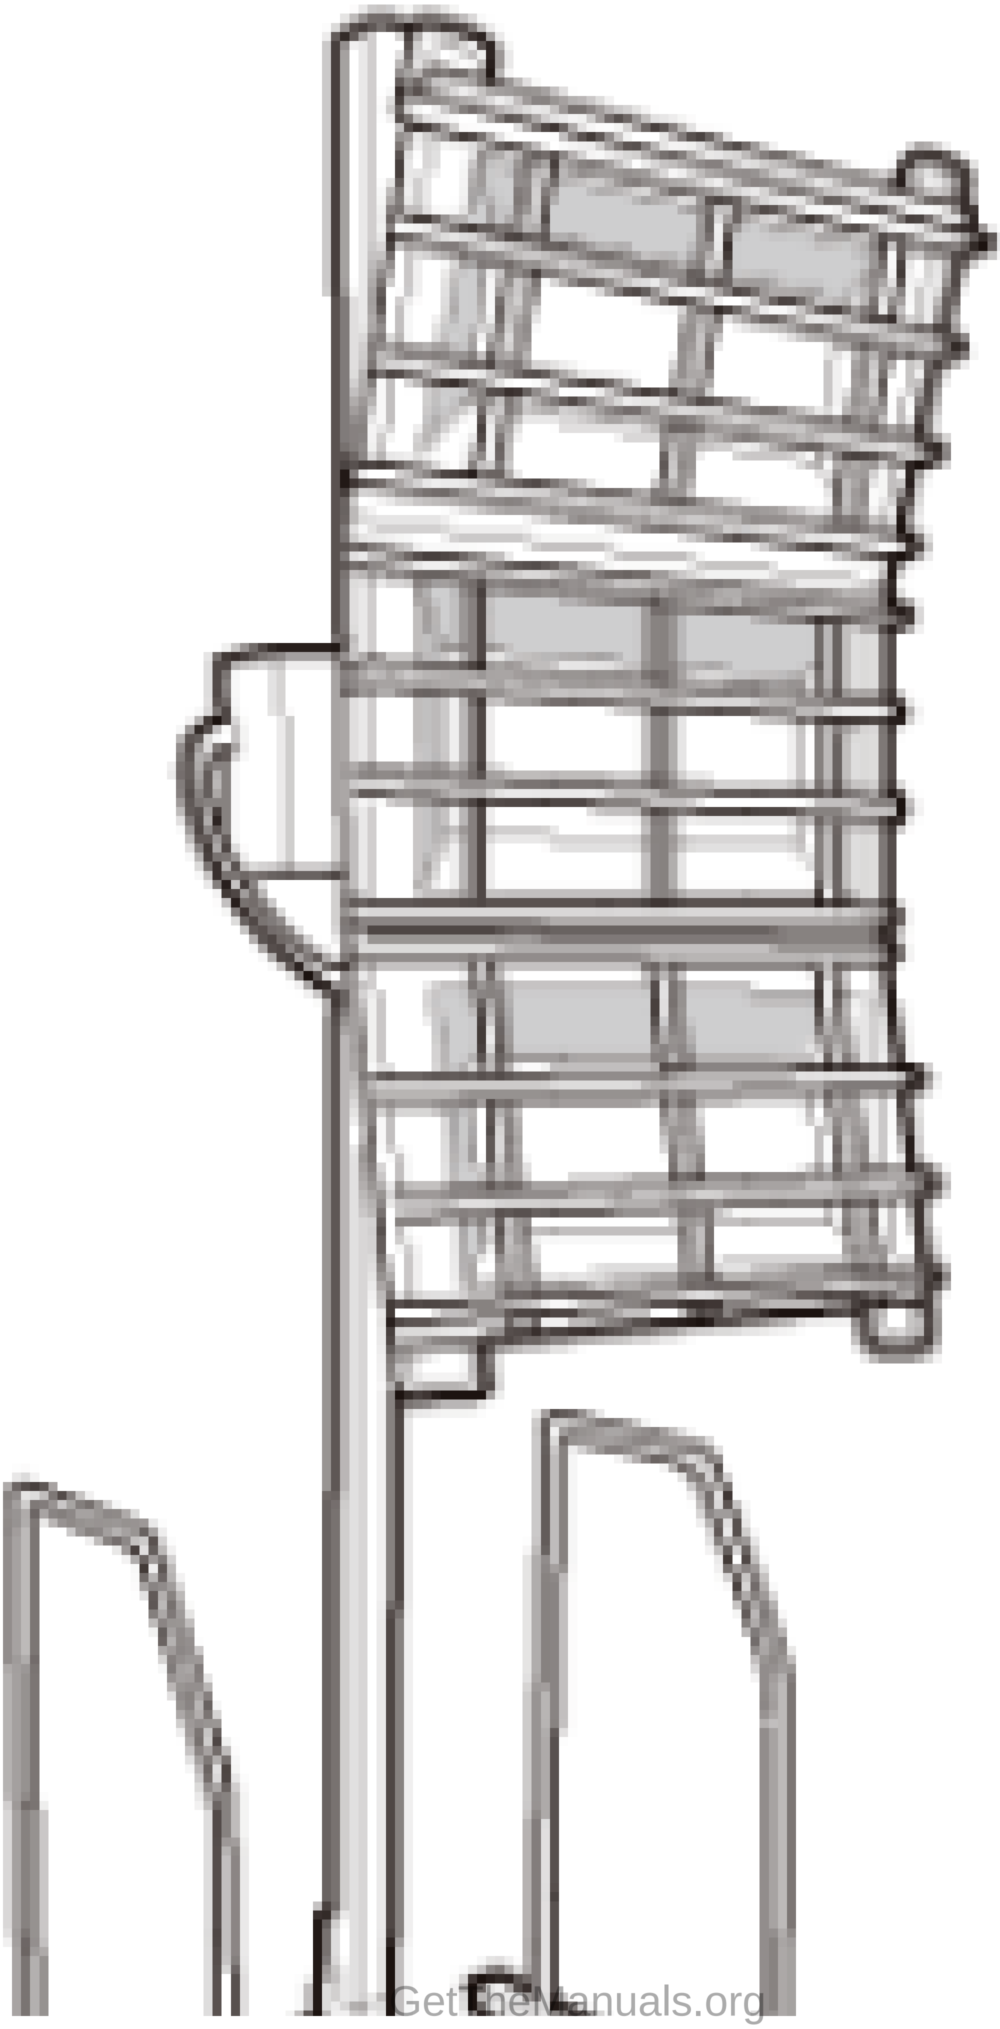
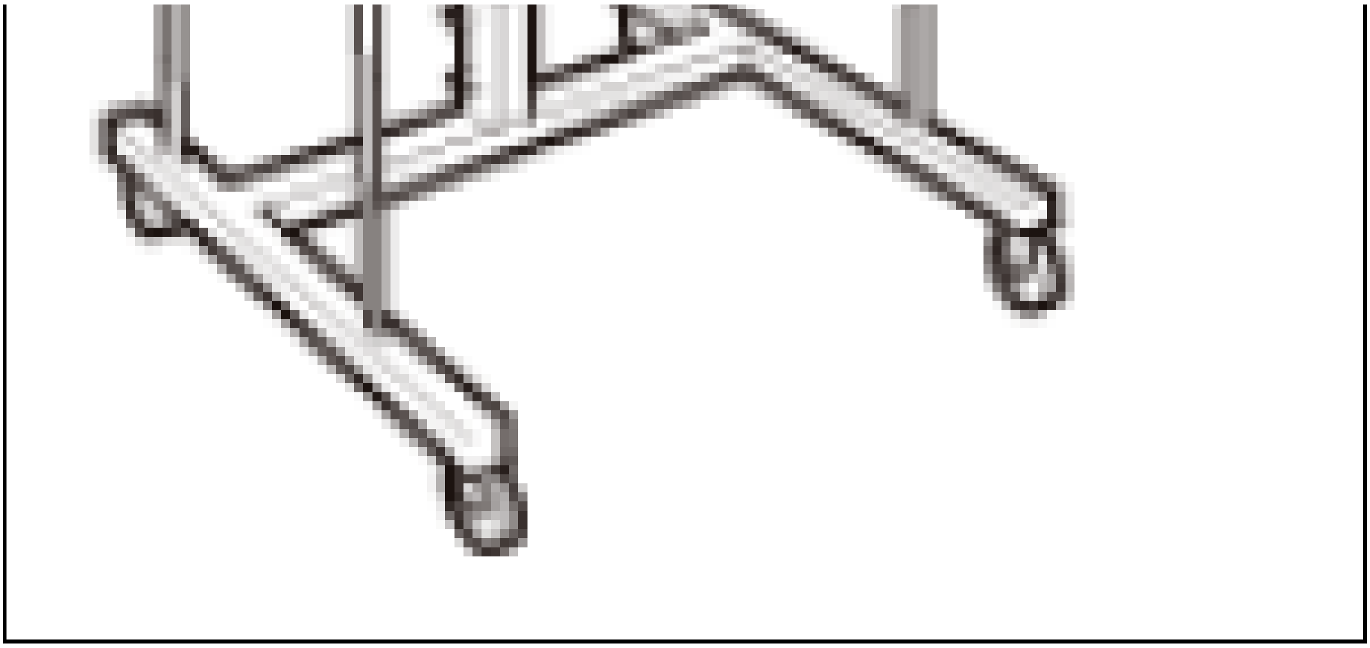
Paint Drying Tools And Equipment

- Force drying paint and other coatings with heat helps save time, provides better coating performance, etc. than ambient temperature drying methods.
- There are three types of heat transfer: thermal conduction, convection, and radiation. Convection and radiation of hot air and infrared rays are the most common drying methods for paint and coatings.
- Drying equipment should be chosen based on the repair requirements. A portable type dryer is generally used for paint repair. Hot-air blowers are usually used for complete paint jobs.

Near-Infrared Drying

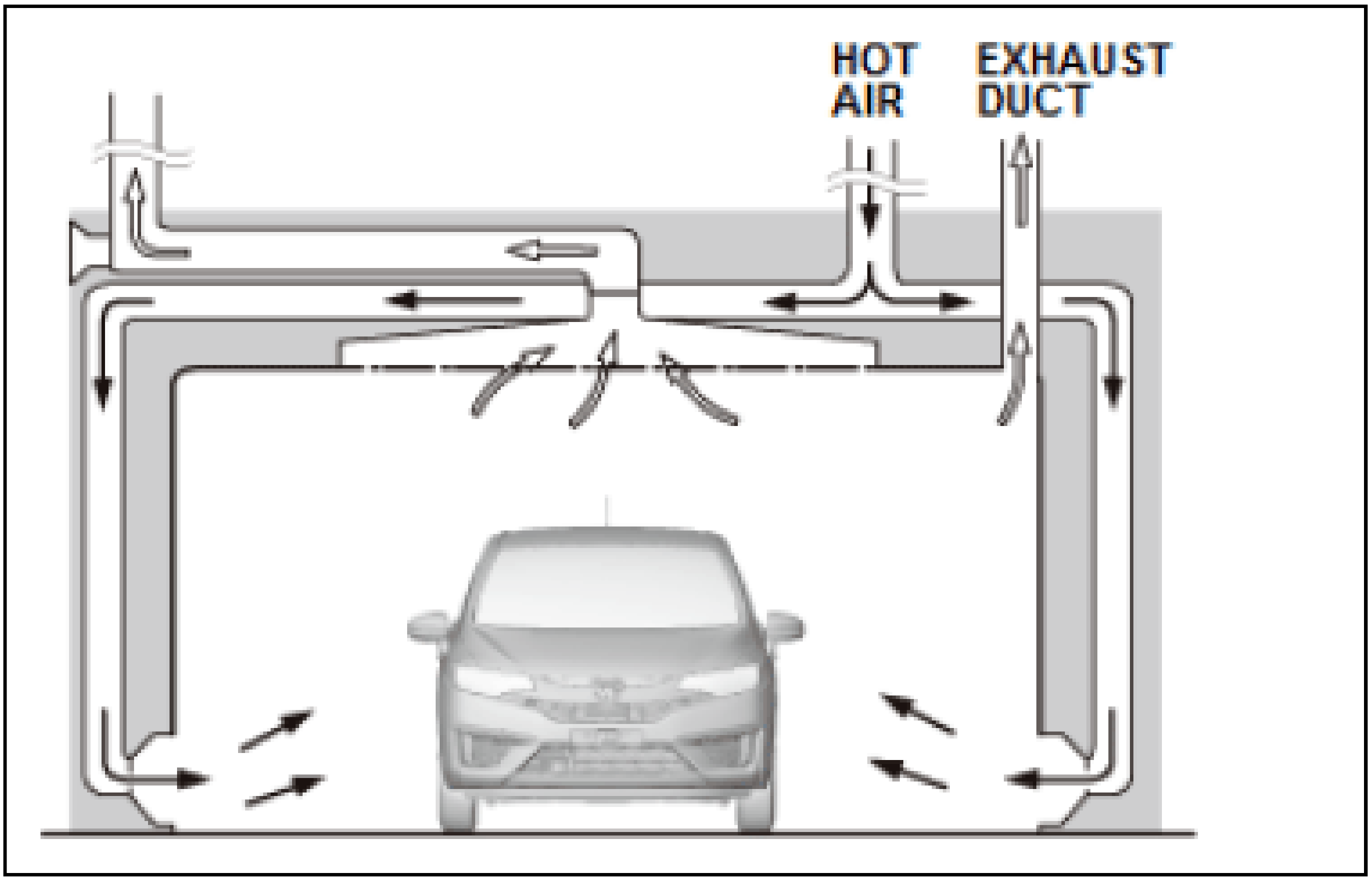
This uses infrared bulbs as its heat reservoir. They are portable, adjustable, and widely used.





Far-Infrared Drying

This equipment works by the radiant heating of far-infrared radiation from the tube and panel heated by gas or electricity.



Hot Air Type Drying Oven

- This enclosure is designed to use forced hot air to dry the paint film.
- Heat is created by burning fuel or consuming electricity.
- Generally forced air drying temperatures should be kept at or below 140Â°F (60Â°C).
- Some Baked finishes require higher curing temperatures of around 212-302Â°F (100-150Â°C).
- However, when using forced air drying during paint repair, it is recommended to dry at the lower 140Â°F (60Â°C) temperature to avoid damaging batteries and electrical components.

Direct Hot Air Oven

High thermal efficiency:

- Compact and inexpensive.
- Quick heat-up time.
- By-products of combustion may cause paint defects.

Indirect Hot Air Oven

A burner heats a heat exchanger that is circulating air through the oven:

- Low fire or explosion risk, flame is isolated from air circulating in oven.
- No potential contamination by combustion by-products.
- Low thermal efficiency.
- Longer heat-up time.
- Equipment is large and expensive.

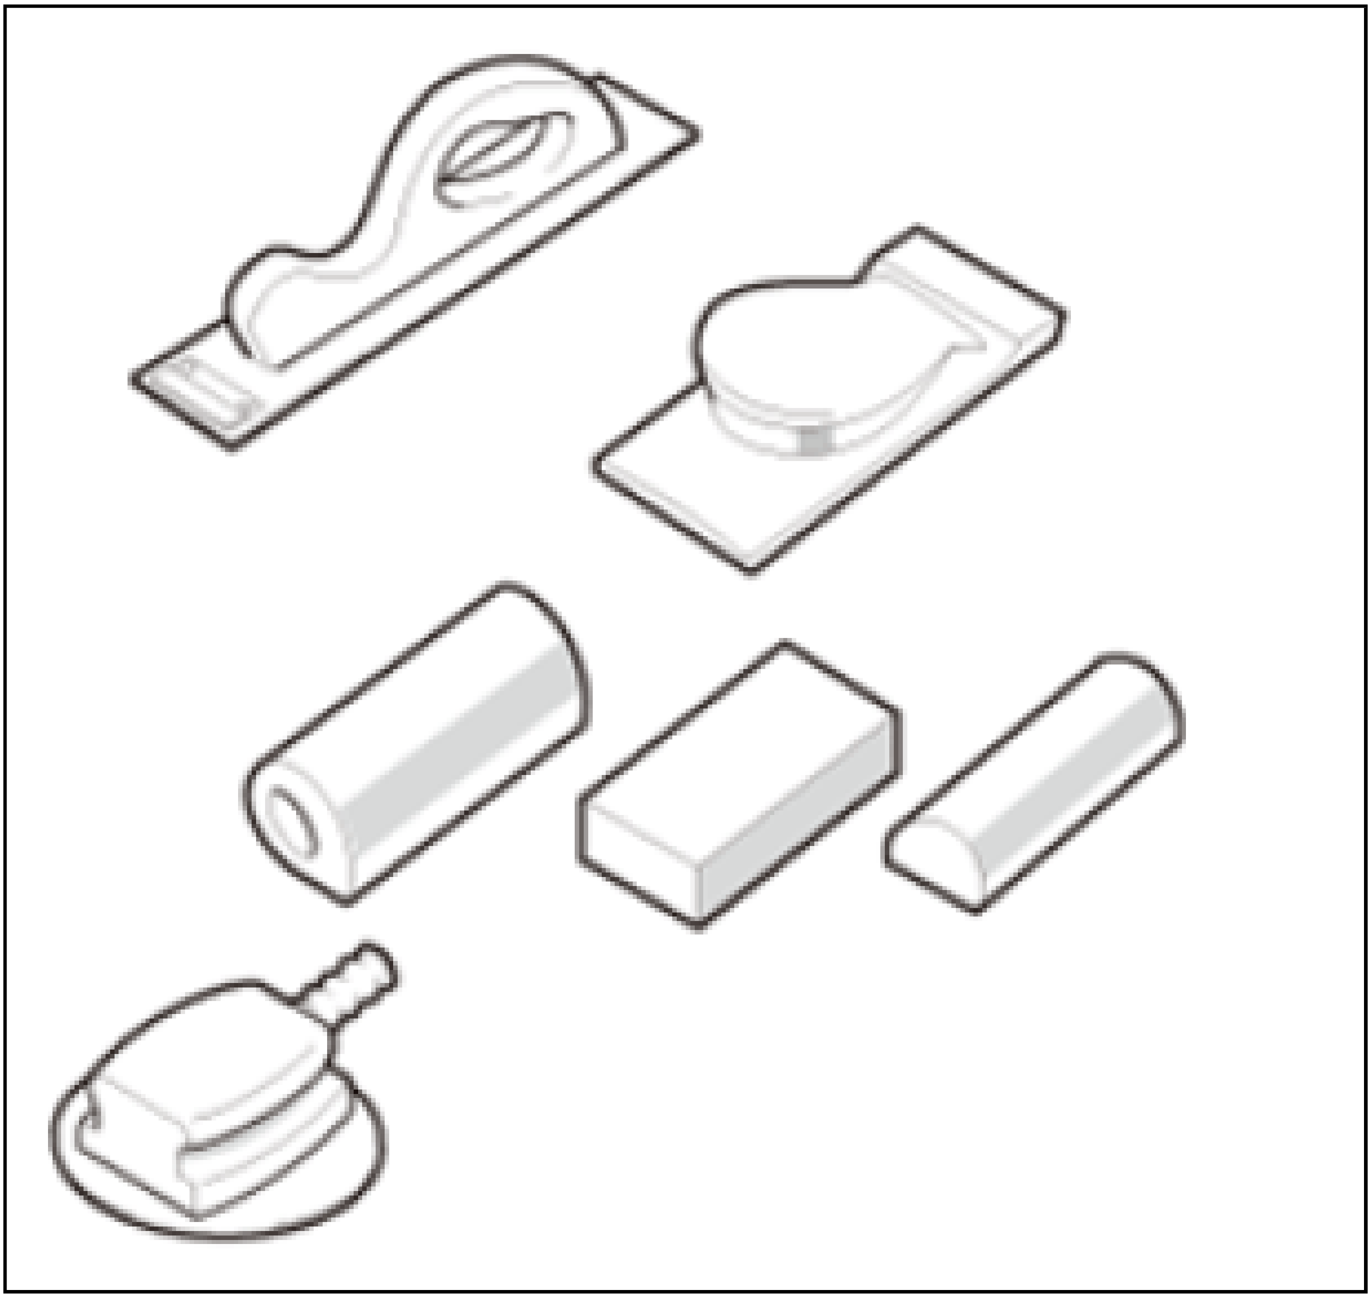
PAINT REPAIR TOOLS

Other Tools And Equipment

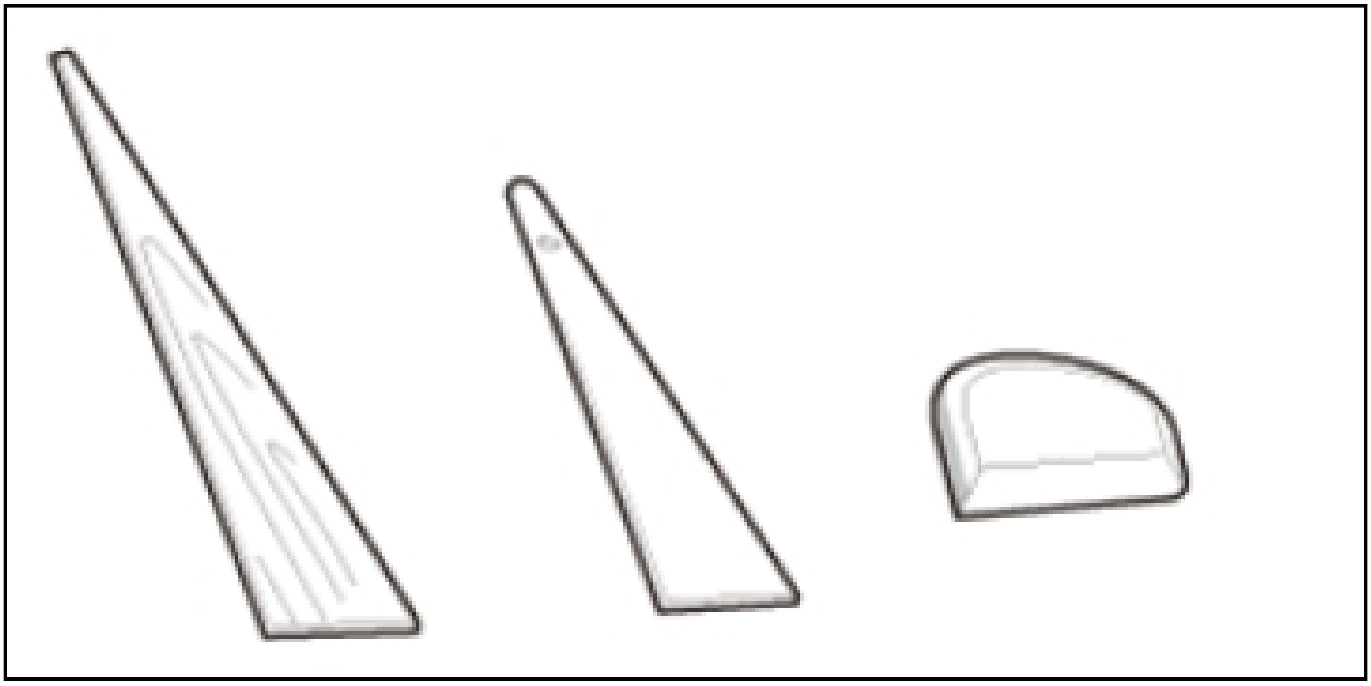
File, Sanding Block

Use to manually surface or sand body filler/putty and primer-surfacer coating.



Scoops and spreaders

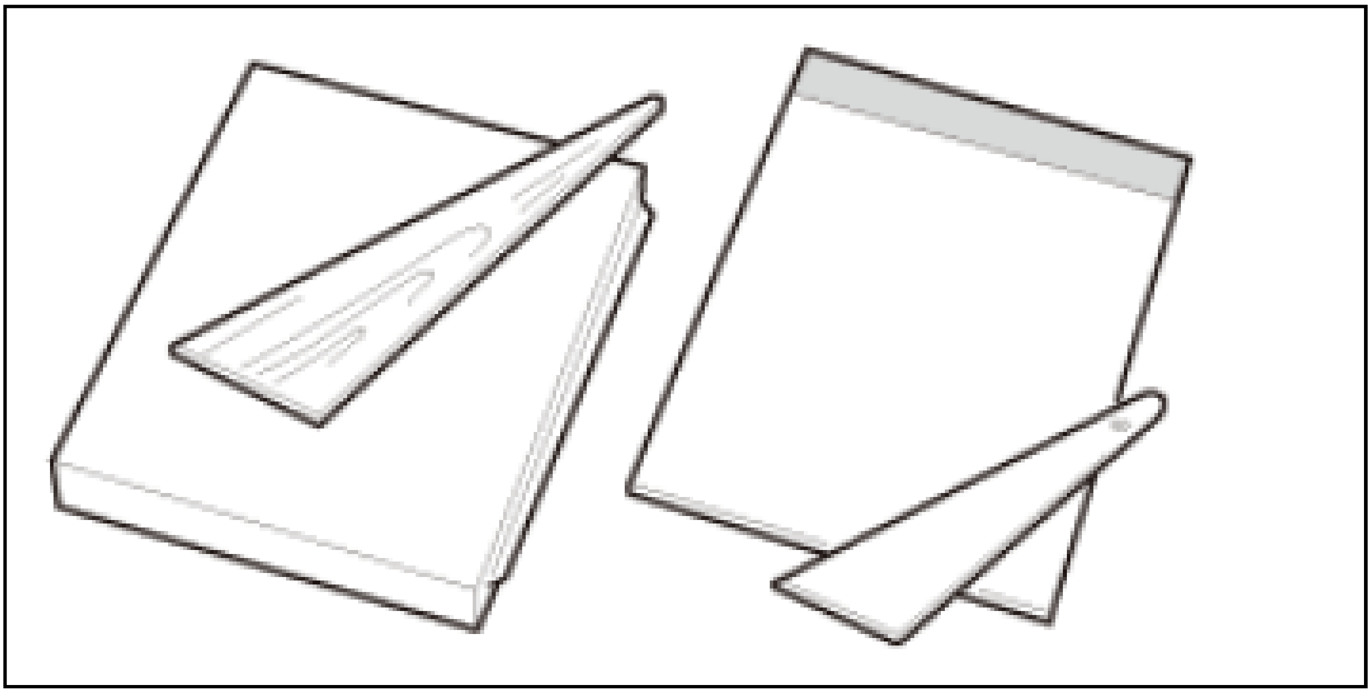
Used for building body filler/putty layers on dents, scratches and holes. Many different sizes and materials. Select the one most suitable for the surface characteristics (flat or curved) and the size of application surface.



Body Filler/Putty Mixing Board

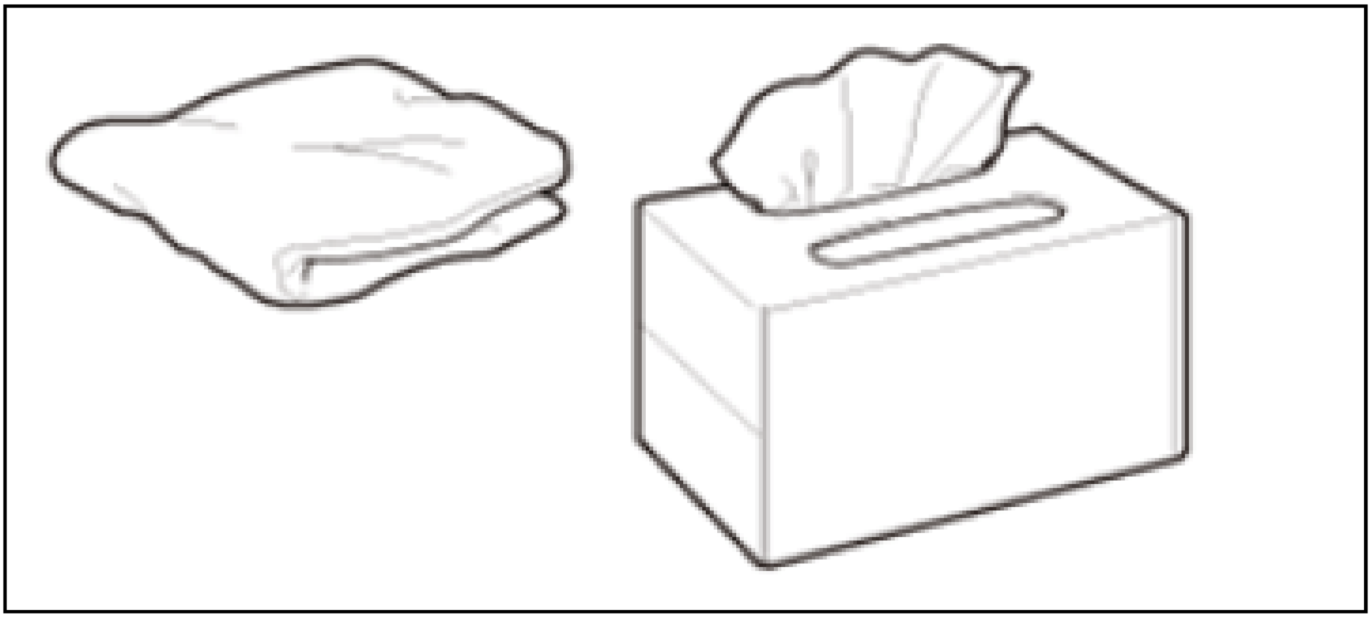
Used to mix body filler/putty and hardener.

Constructed of metal, plastic, and cardboard (disposable).



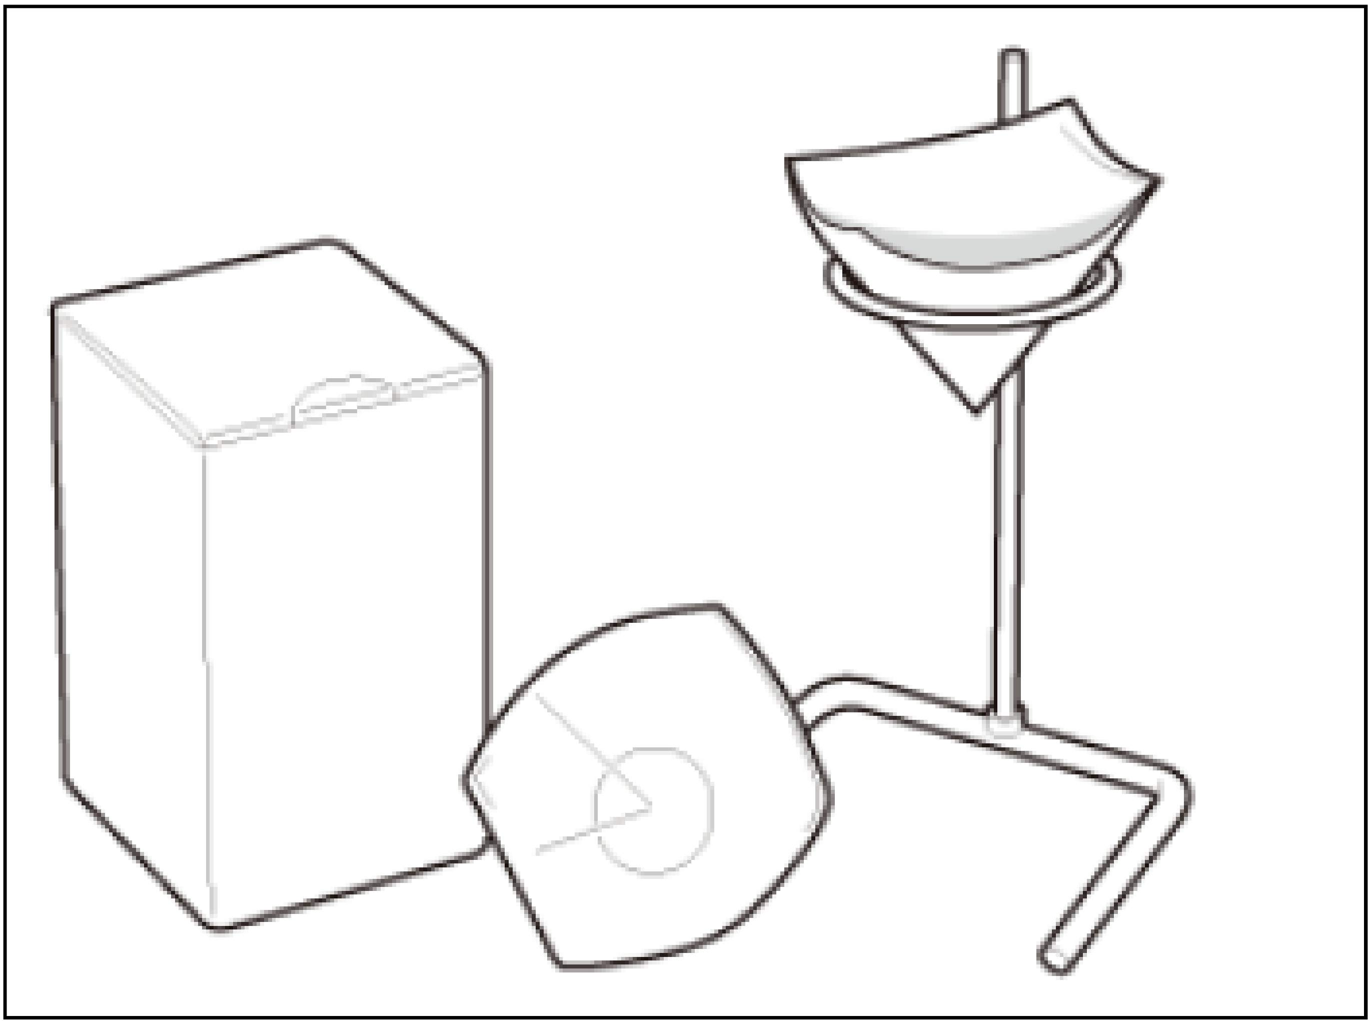
Waste Cloth (Wiping Cloth)

- Used but well washed cloth is suitable for paint repairs. New cloths tend to retain oils and other substances, so they are not effective for absorbing or wiping up fluids.
- Paper absorption twice its weight of water and oil, and is highly effective for wiping up fluids.



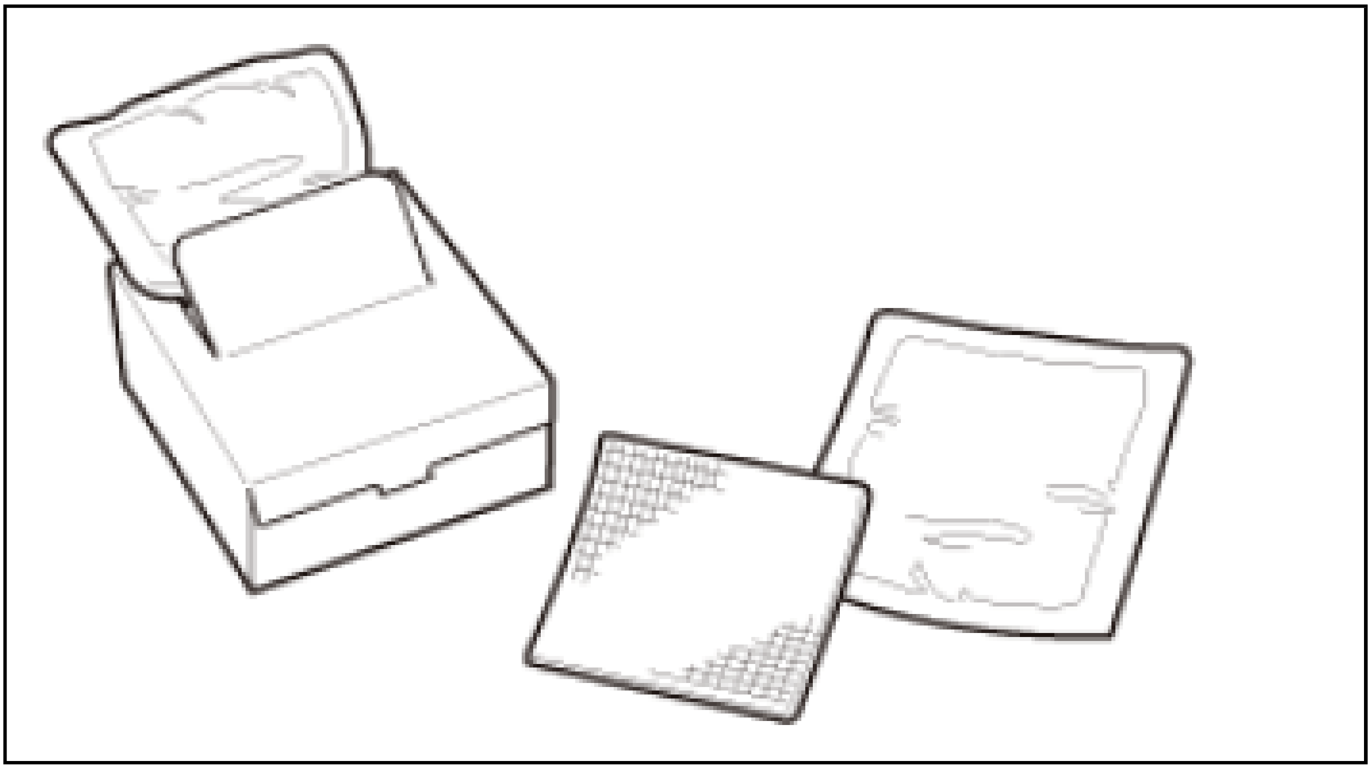
Paint Strainer

Used to filter dust and foreign substances from paint before application.



Tack Cloth

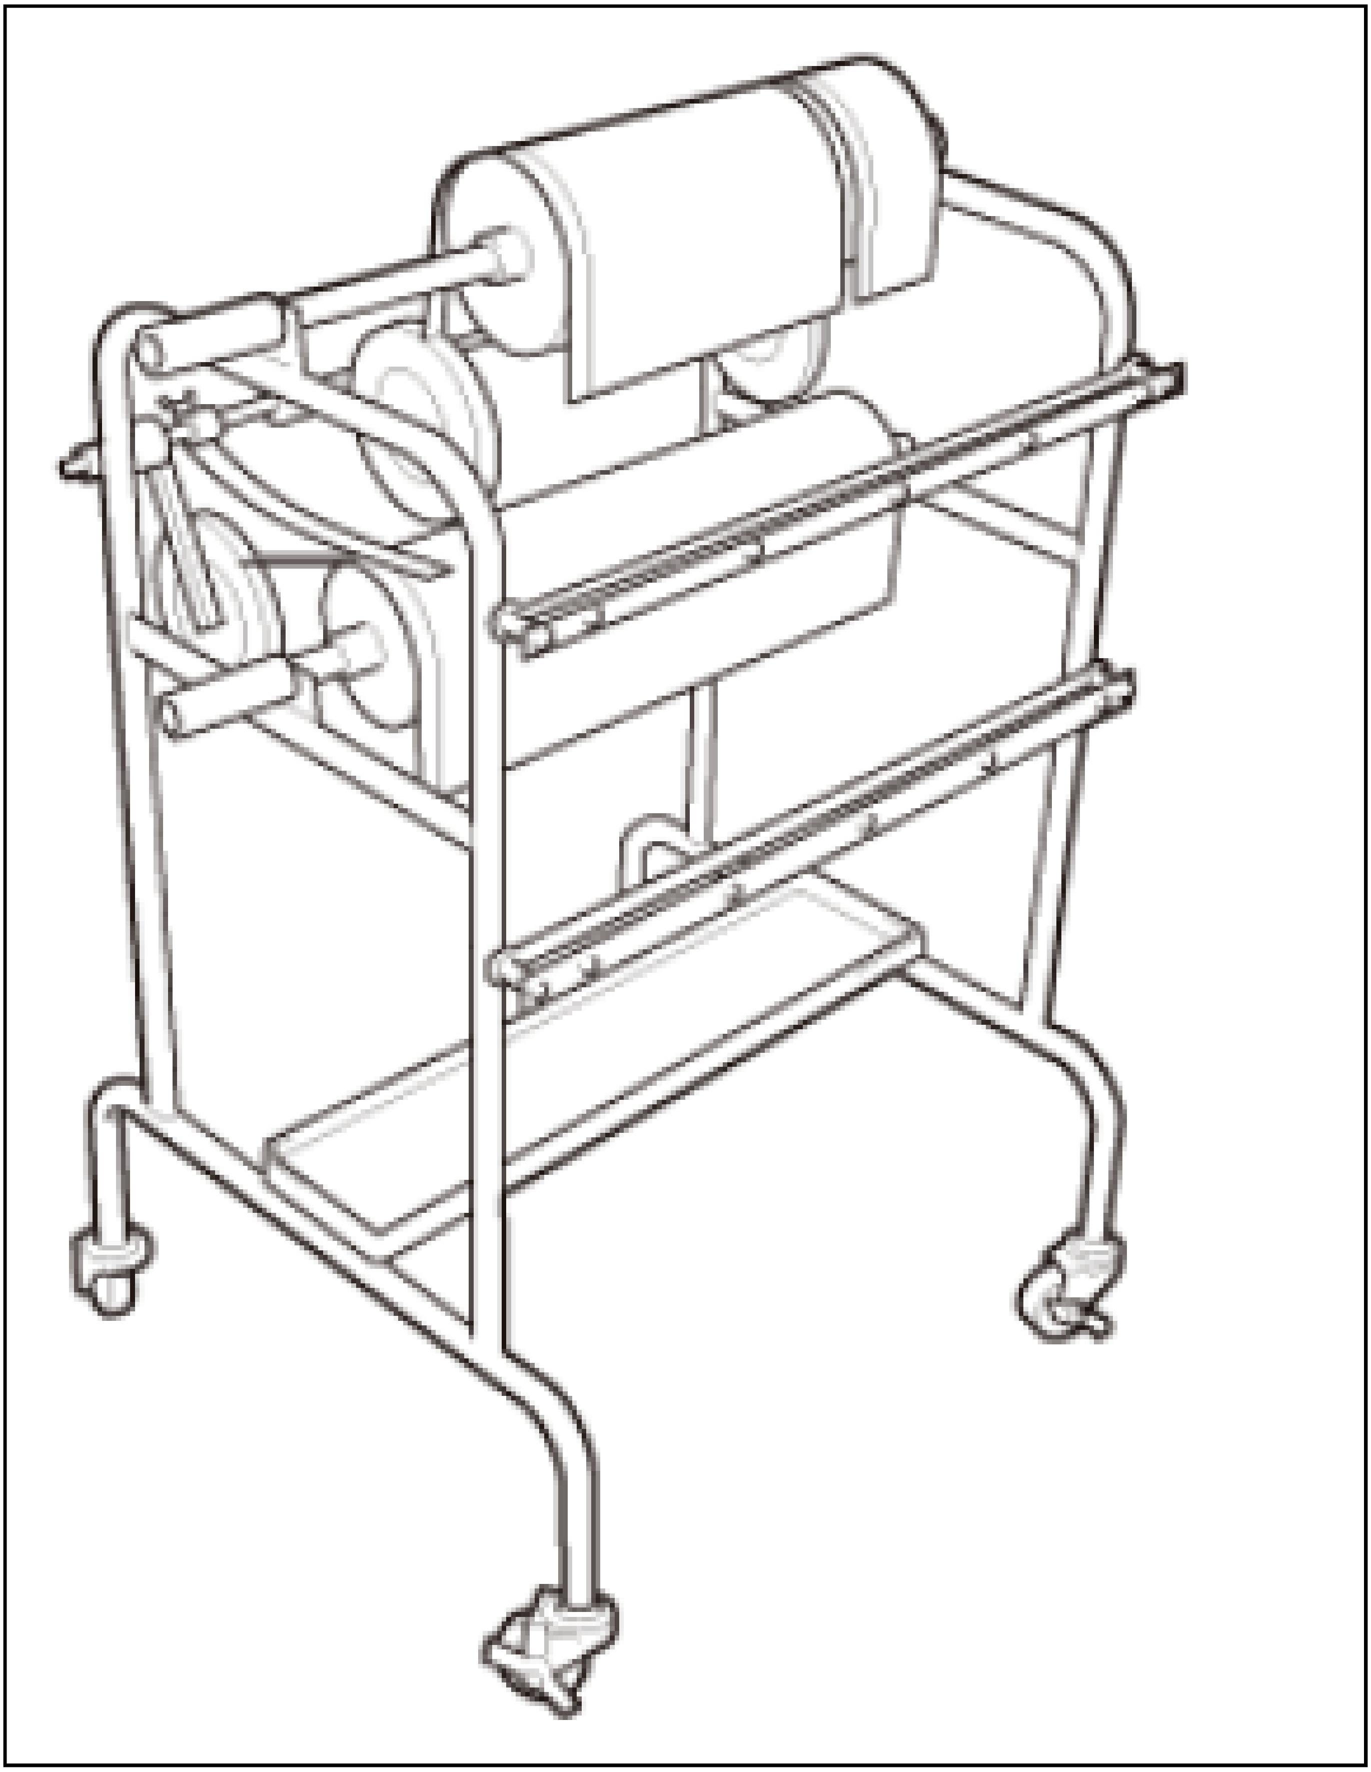
Cloth impregnated with high viscosity varnish. Used for removing dirt, dust, and sand from a surface before painting.



Masking Material

Refer to masking tools and materials:

- Masking tape
- Masking paper
- Other covers for masking

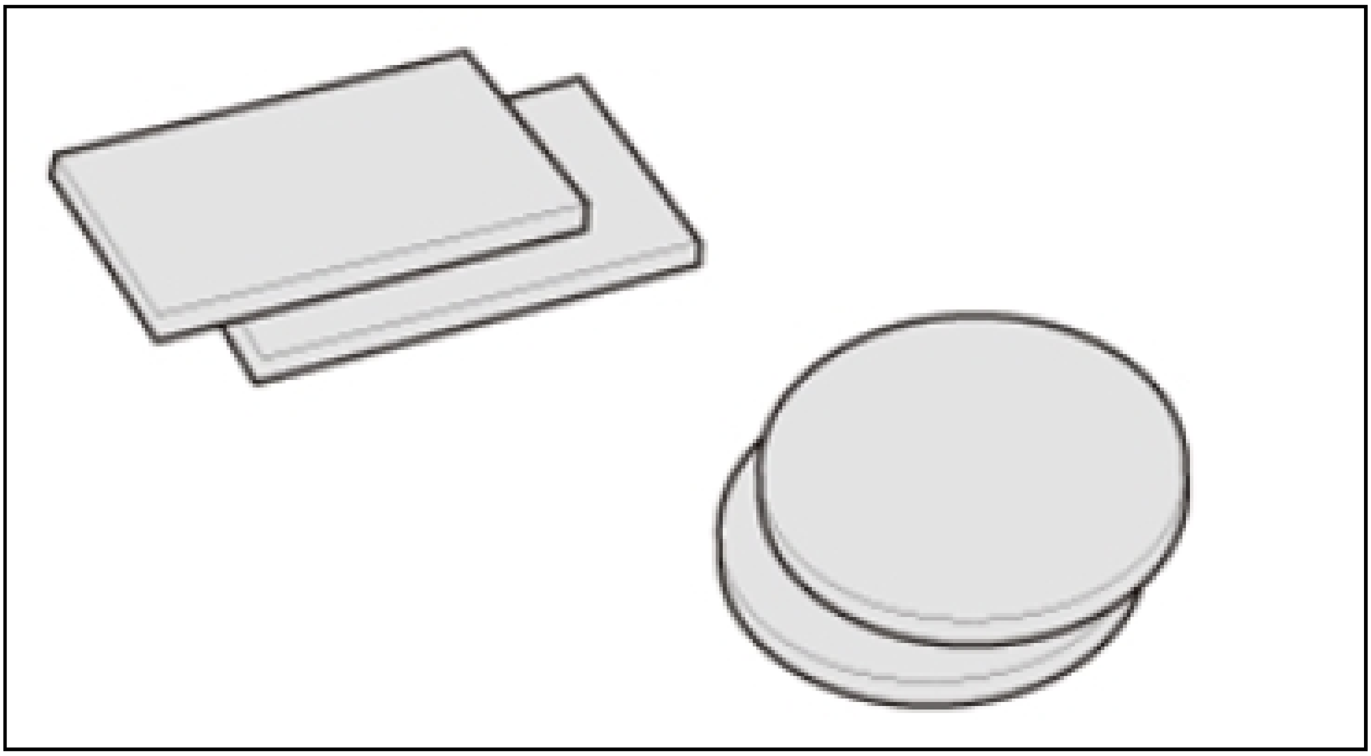


Tools for Color Mixing

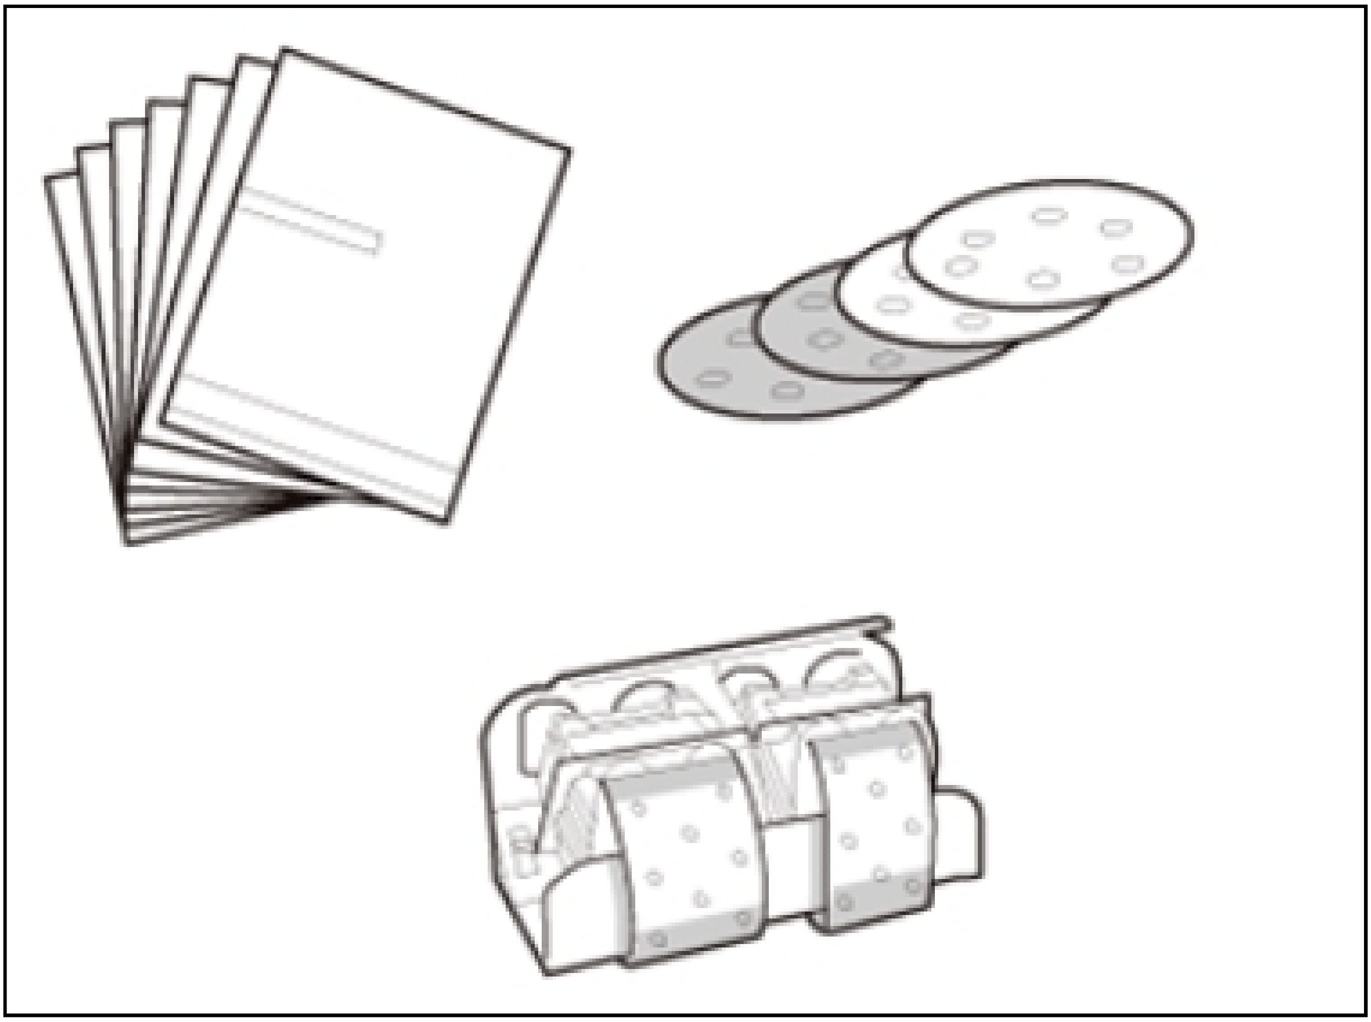
Refer to COLOR MIXING TOOLS AND EQUIPMENT.

Heavy Duty Scuffing Pad

Used for scuffing/polishing complex panel shapes where sander and sandpaper cannot be properly used. Abrasive particles are bonded to synthetic fiber, so they are very water resistant.



Sandpaper



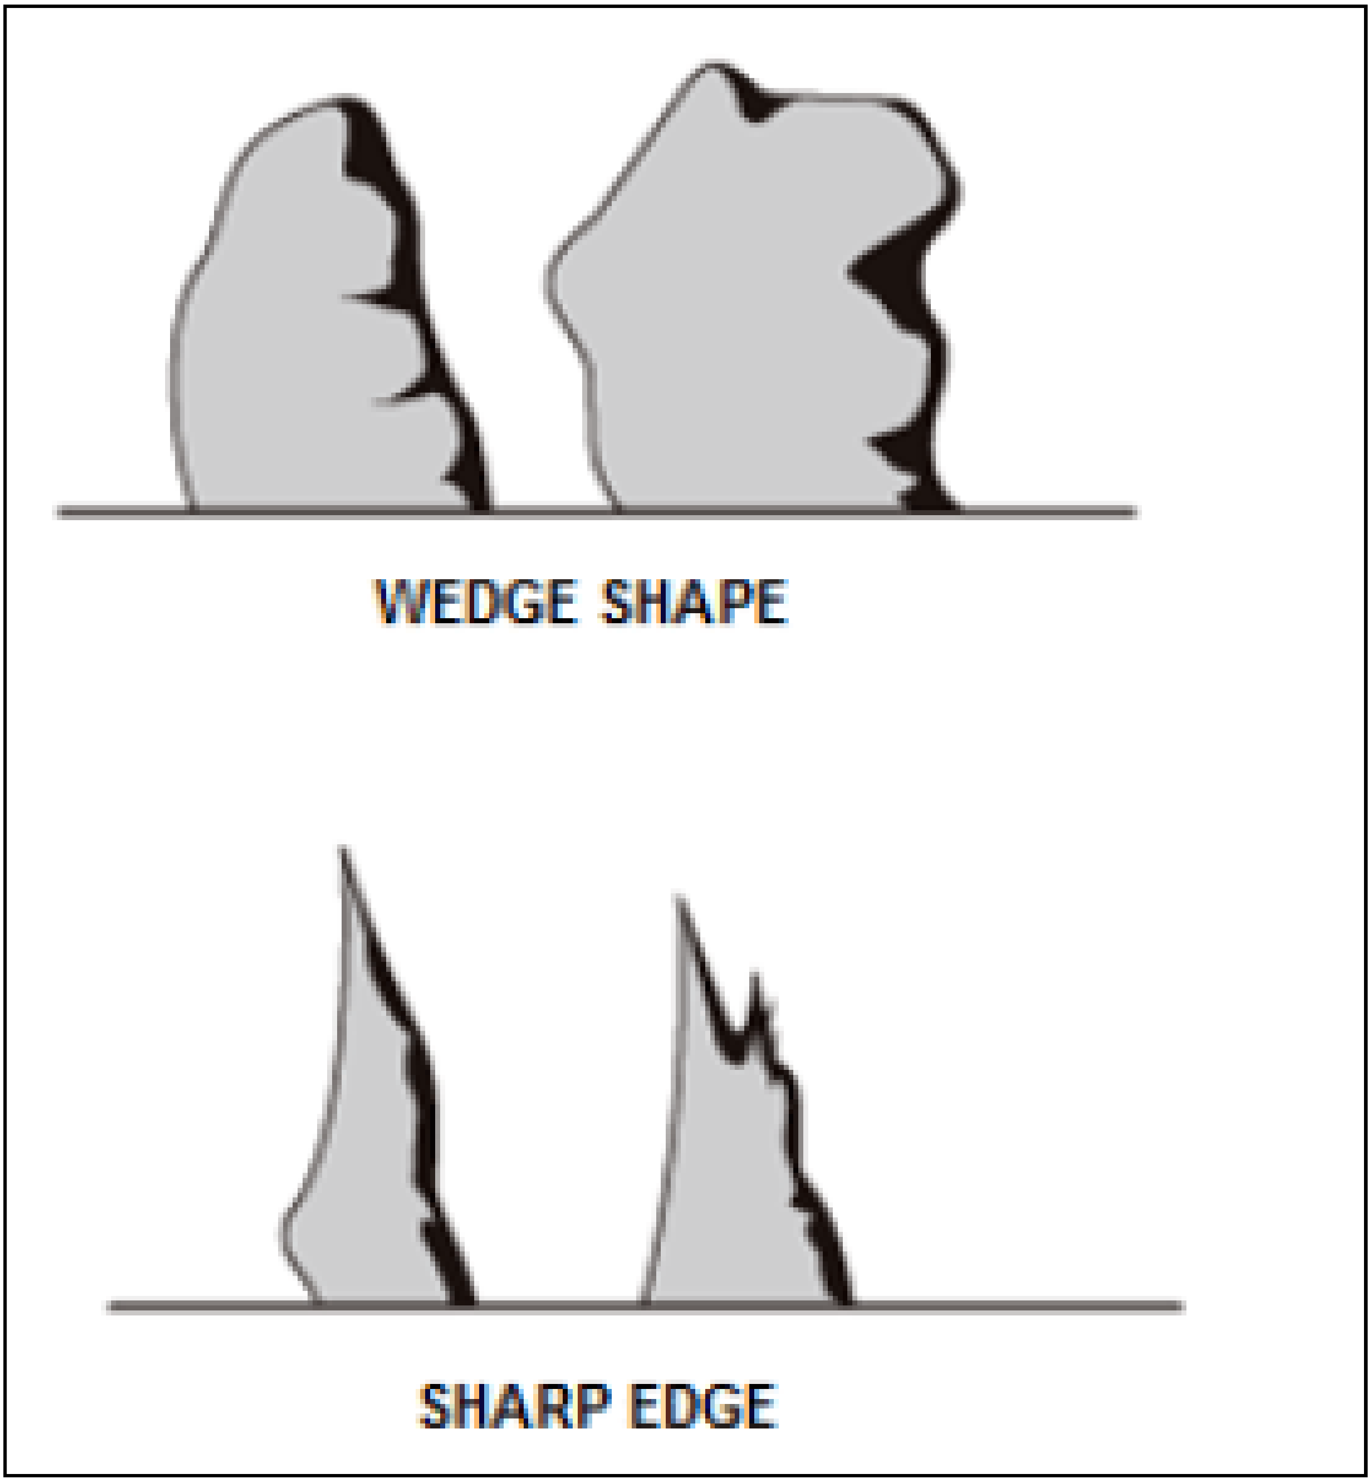
- Sandpaper is paper or cloth that has a coating of abrasives. There are a number of types and grits available.
- Sandpaper also comes in wet and dry types and should be applied accordingly based on the purpose. Generally, dry sanding is used on metal and polyester body filler/putty. Wet sanding is used on primer- surfacer and topcoats.
- Sandpaper is made for use with both sanding blocks and disc-type sanders.
- The grit size of sandpaper is defined as (P) and sanding capability differs based on this value. The smaller the (P) value is, the larger the grit size and the stronger the sanding power.

For Hand Sand	For Machine Sand	Usage
Â	P16-P40	Separation of old paint film/Rough sanding for rust removal
P60-P80	P60-P80	Metal putty sanding
P80-P120	P80-P120	Polyester putty sanding
P320-P800	P320-P600	Primer-surfacer sanding
P1000-P1200	Â	Contaminant removal before polishing with compound
P1200-P2000	Â	Color sanding and clearcoat dust removal

Structure And Material

Abrasive material:

- Aluminum oxide and silicon carbide are the main abrasive types used.
- Aluminum oxide is brown or white and suitable for polishing the hard film surfaces with a high abrasive capability.
- Silicon carbide is black. It is suitable for polishing soft film surfaces.

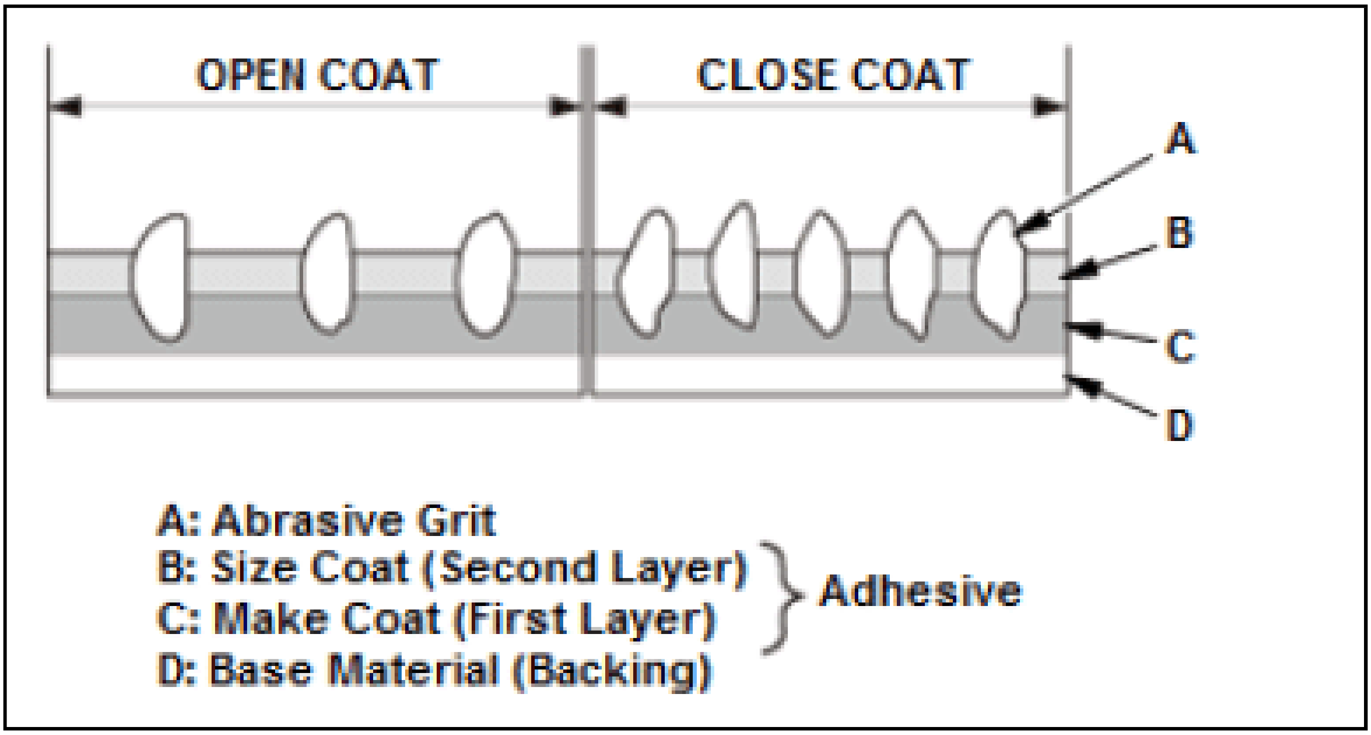


Backing

Sandpaper is abrasive grains are adhered to backing of paper, cloth, wet-or-dry paper, fiber, etc. The grit size, the thickness of the backing and grain material are usually indicated on the backing.

Grit Adhesive Methods

- There are two kinds of adhesives; open and closed coat.
- Open coat is mainly used for dry sanding because the grit distance is far apart to resist clogging.
- Closed coat is used for wet sanding because the grit is more densely distributed.



OPEN COAT
CLOSE COAT

Adhesive

Sanding And Polishing Tools

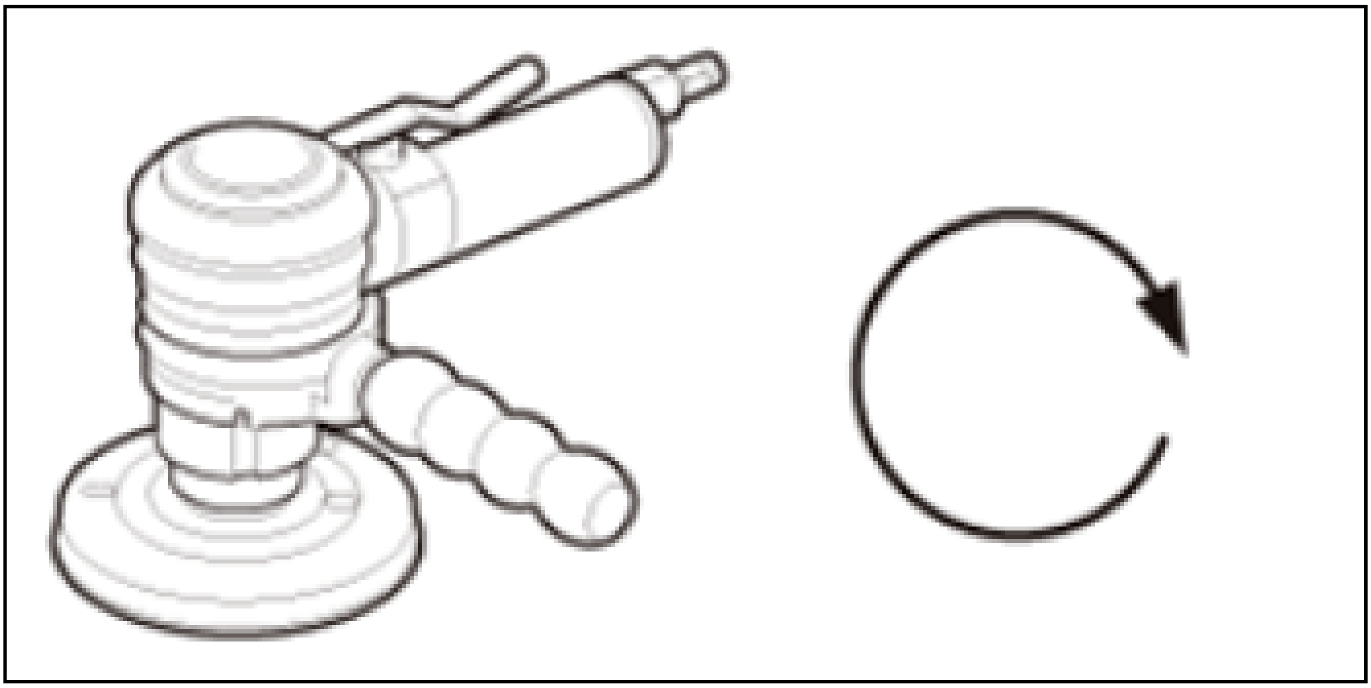
Sander

- Generally used for removing rust from an old paint layer, basecoat layer, or steel plate.
- Sandpaper is mounted on the back-plate which circulates and reciprocates for abrasion.
- Available in both electric and air powered types.

Sander Types and Usage

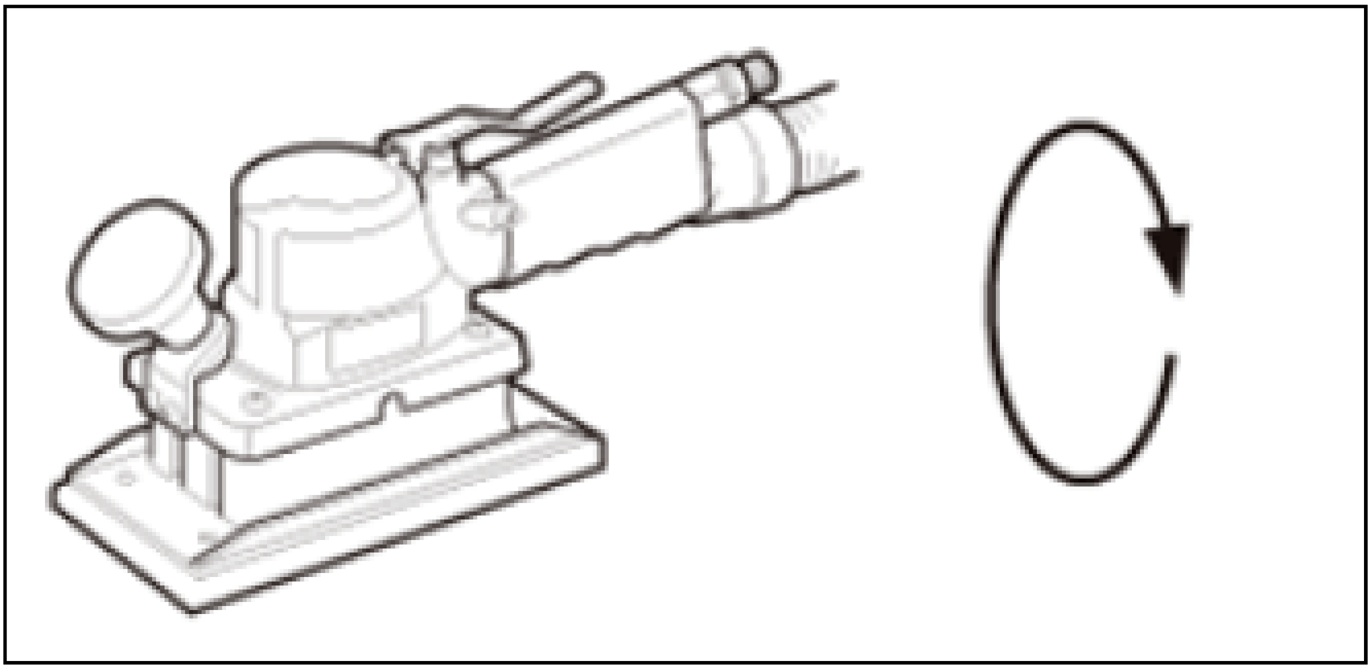
Disc Sander:

- Removal of old paint layers
- Removal of rust from steel plate



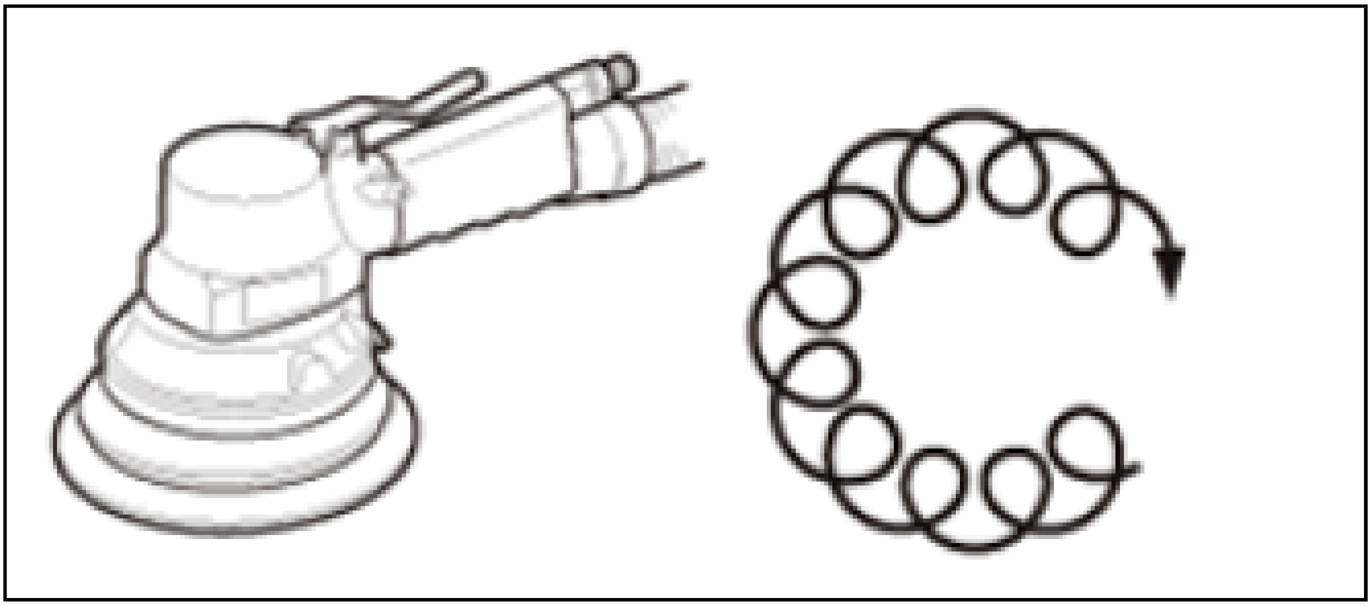
Orbital Sander:

- Rough sanding of metal filer/putty polyester body filler/putty
- Sanding of primer-surfacer, old pant layers

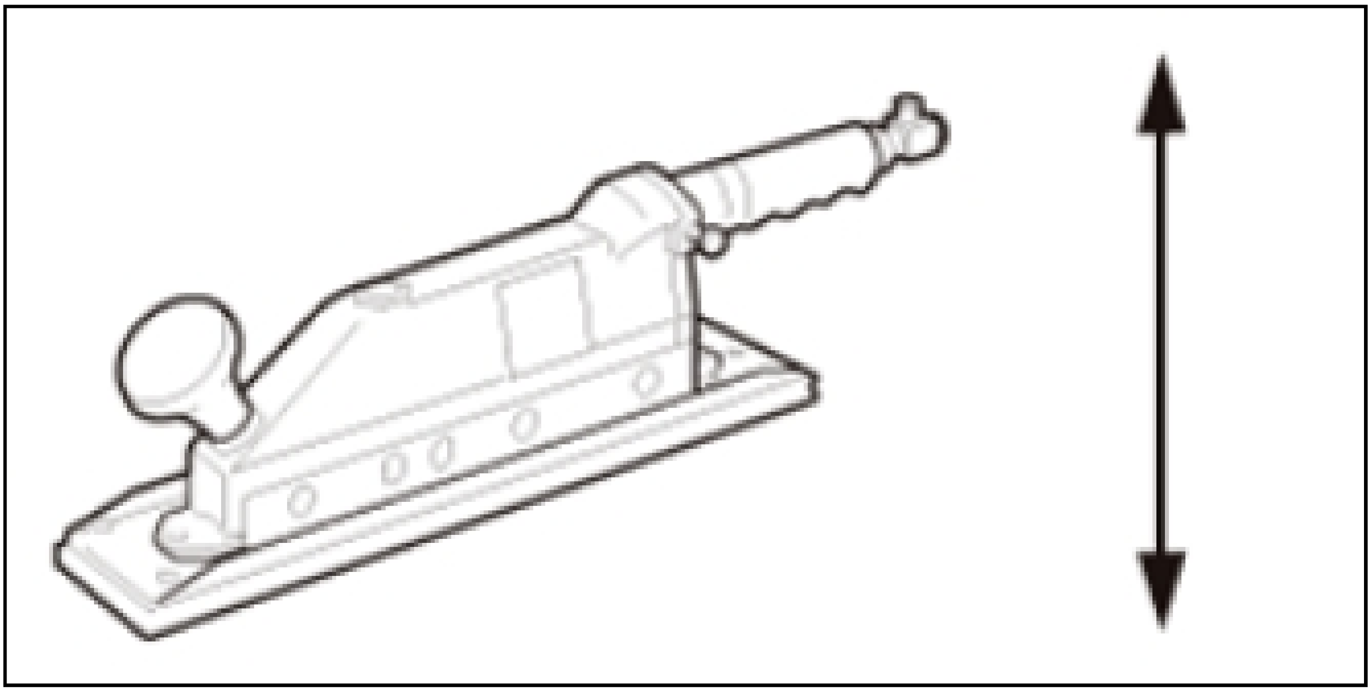


Dual-Action (DA) Sander:

- Sanding of metal filler/putty, polyester body filler/putty, surfacing
- Feather-edge sanding
- Sanding of primer-surfacer, old paint layers



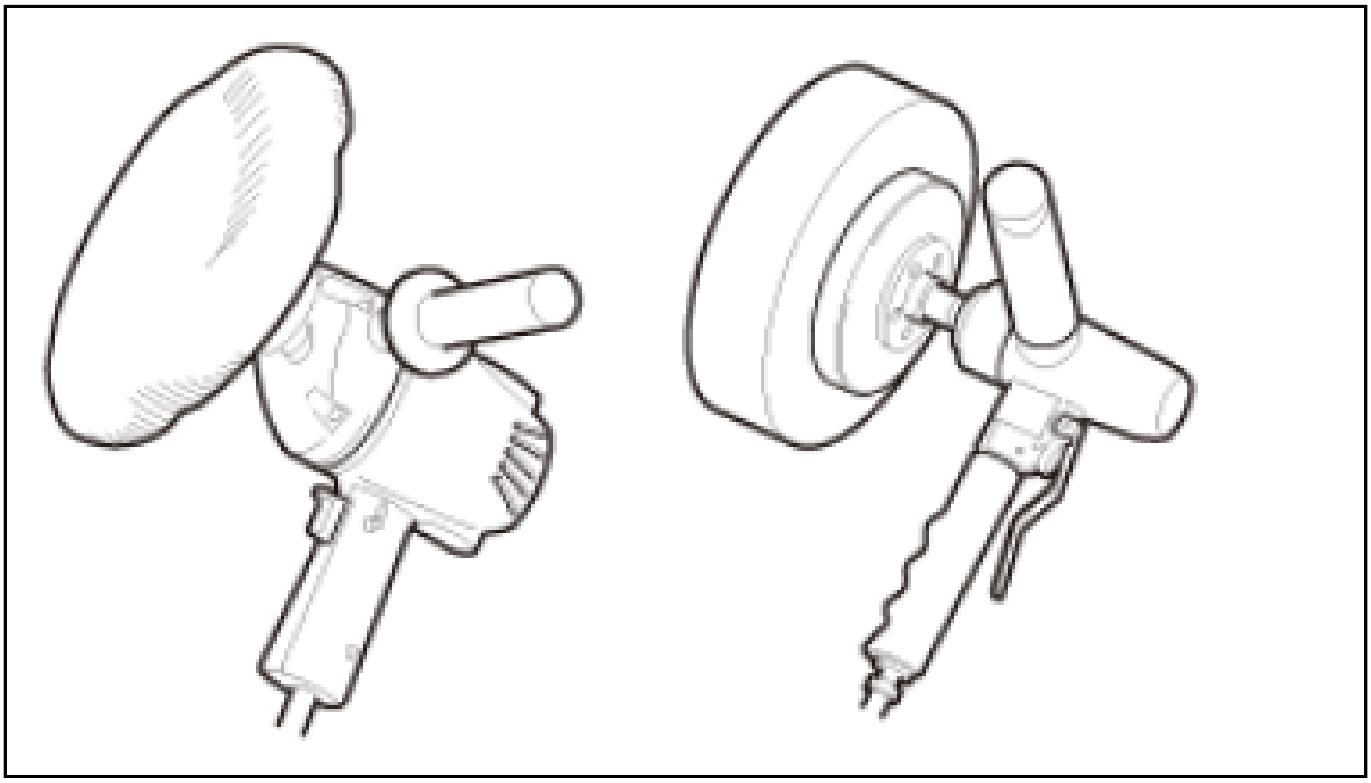
Straight-Line Sander:



Sanding of metal filler/putty polyester body filler/putty, surfacing

Polisher

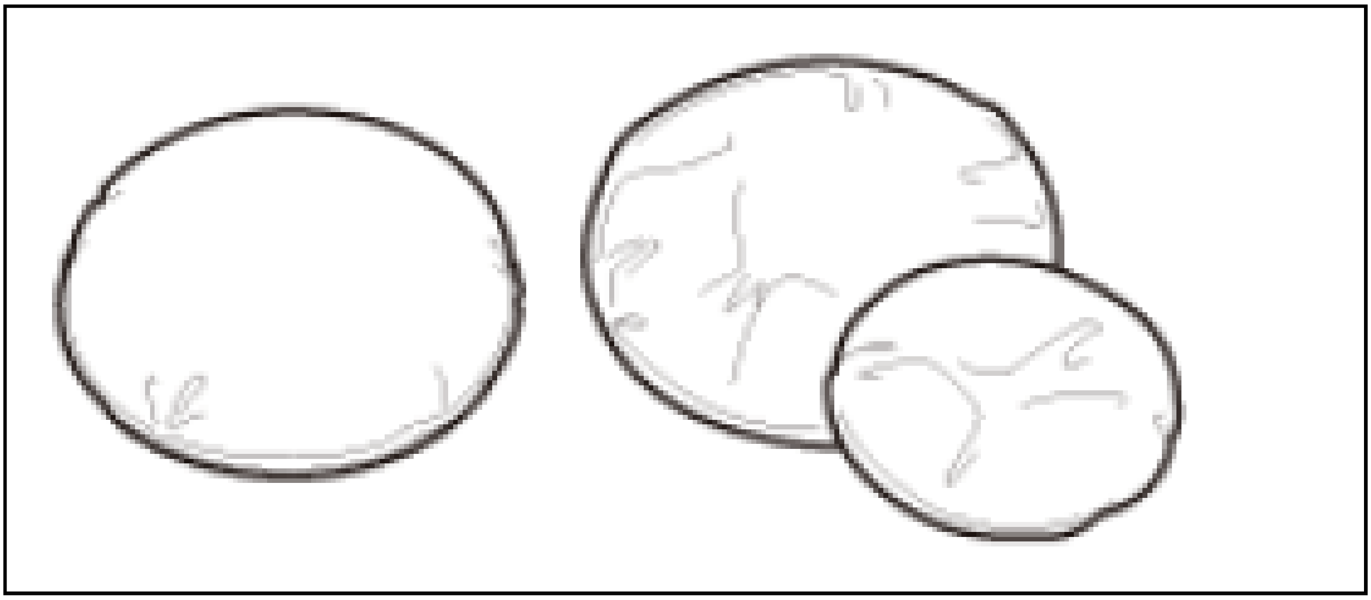
- Polishers are used to finish topcoat paint film for sanding and polishing work.
- Various kinds of buffing pads can be attached to the polisher's pad.
- Available in both electric and air powered types.



Kinds of Buffs and Usage

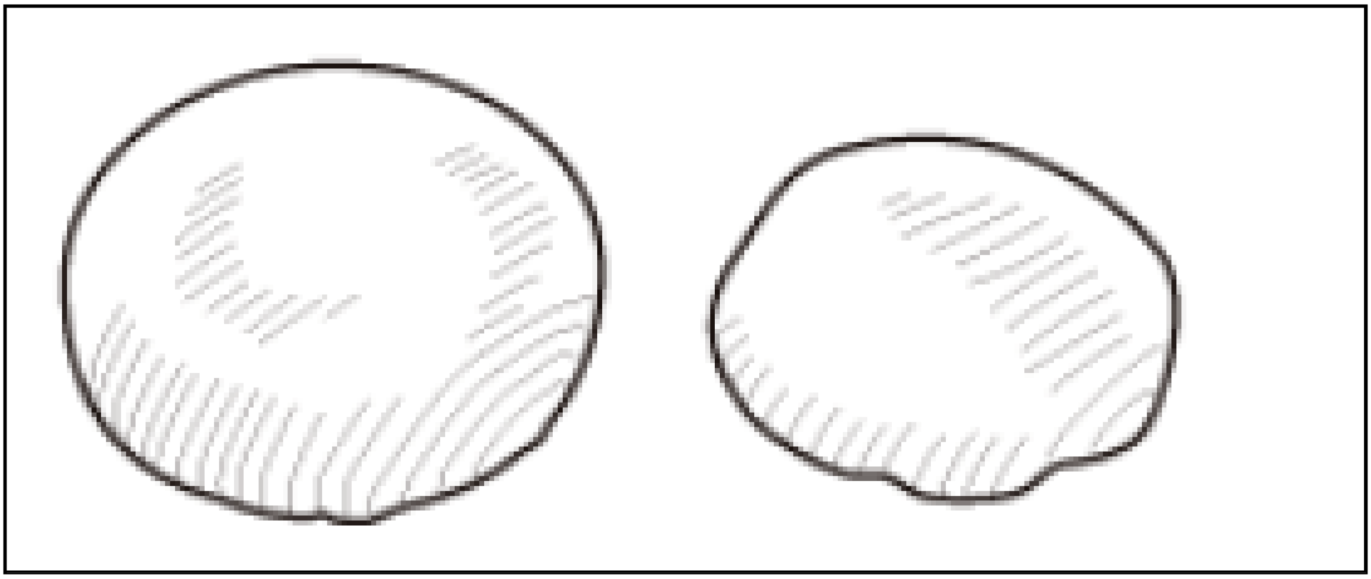
Towel Buff:

- Suitable for buffing rough and medium compounds.
- Buffing power is relatively strong.



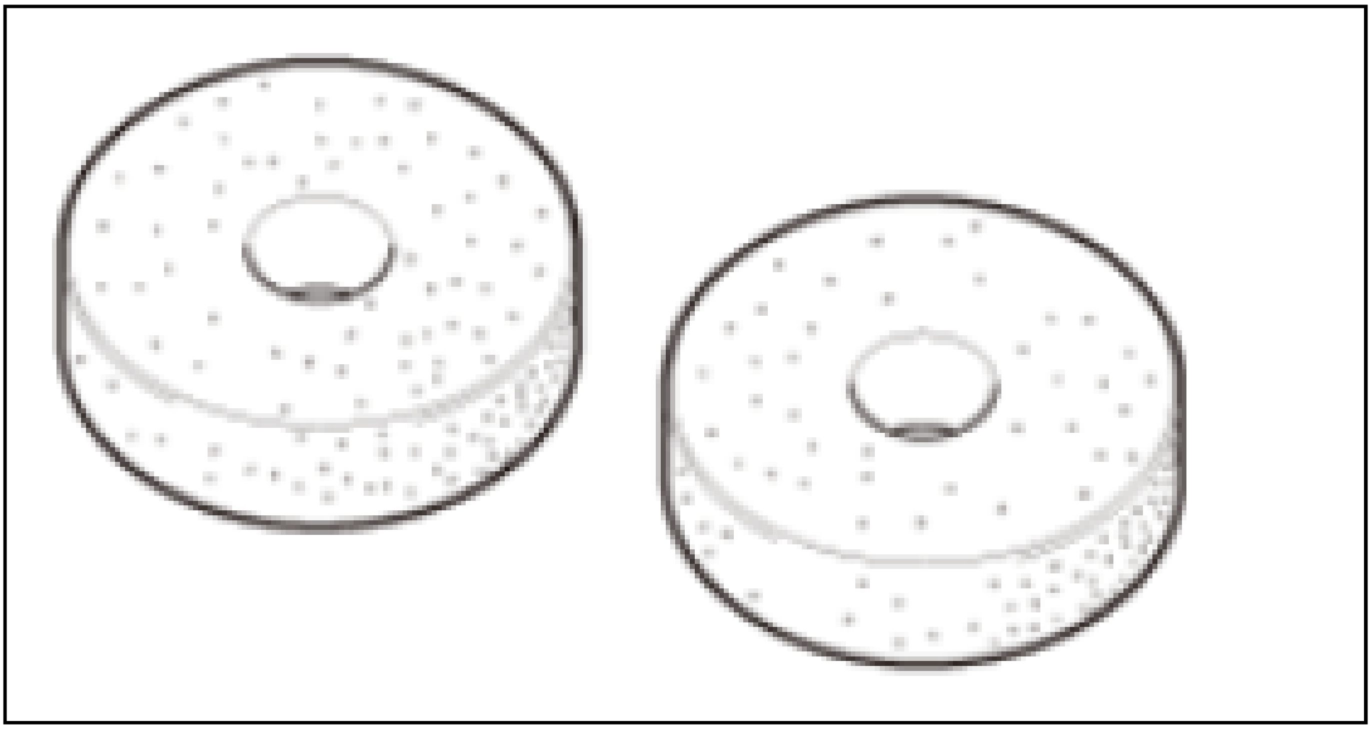
Wool Buff:

Suitable for buffing fine or extremely fine polishing compounds.



Sponge Buff:

Suitable for buffing ultra fine particle polishing compounds for final finish.



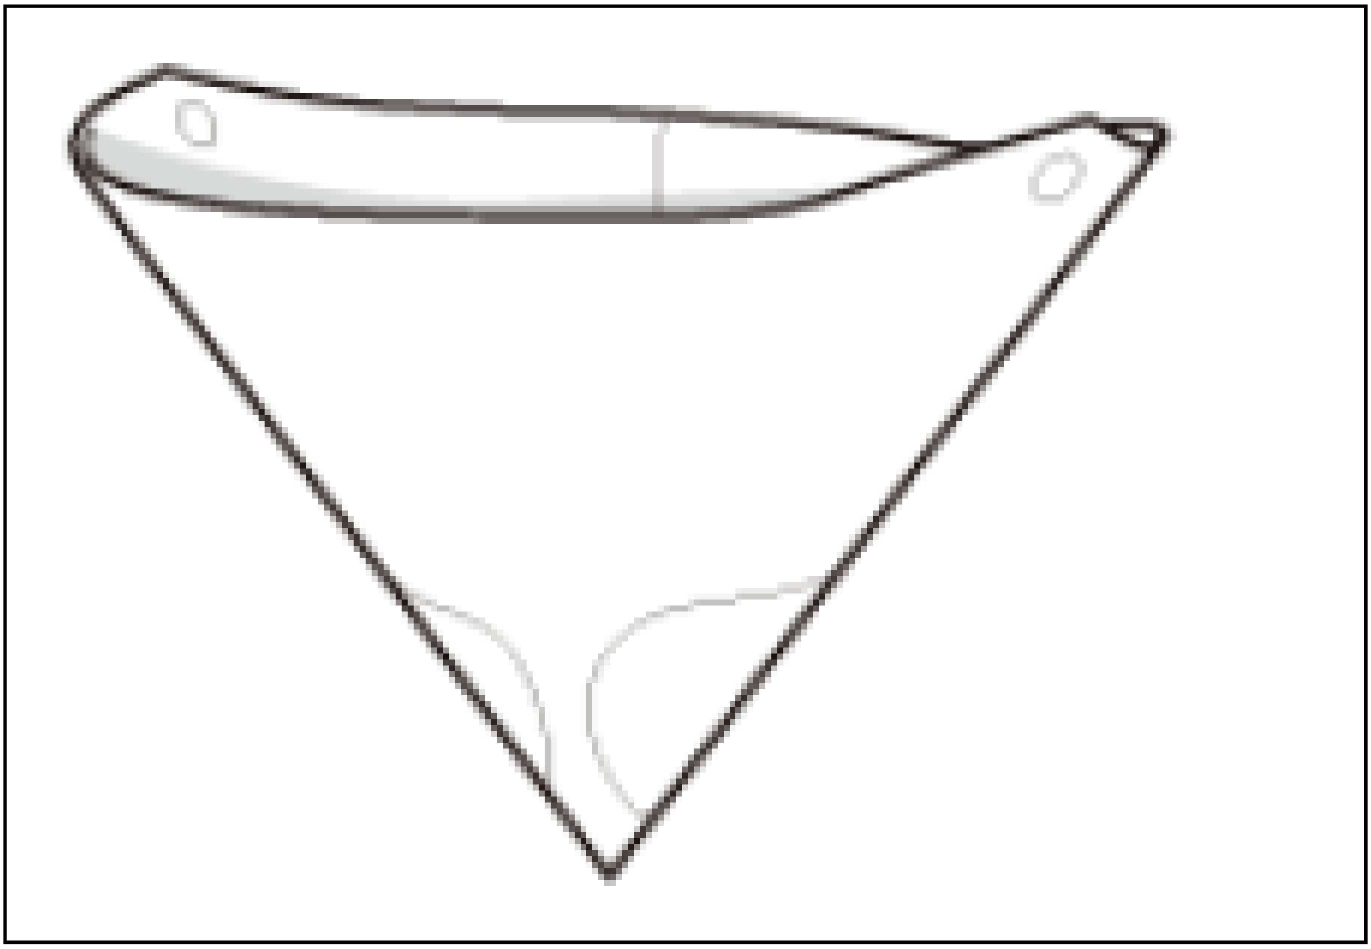
WATER-BASED PAINT REPAIR TOOLS AND EQUIPMENT

Most collision repair shops should have no problem handling water-based paint. However, water-based paint is much more sensitive to air quality than the solvent-based type. Contaminated compressed air may cause paint defects. Be sure to maintain the air compressor and supply pipes thoroughly and use well-maintained water and oil separators.

Other Tools

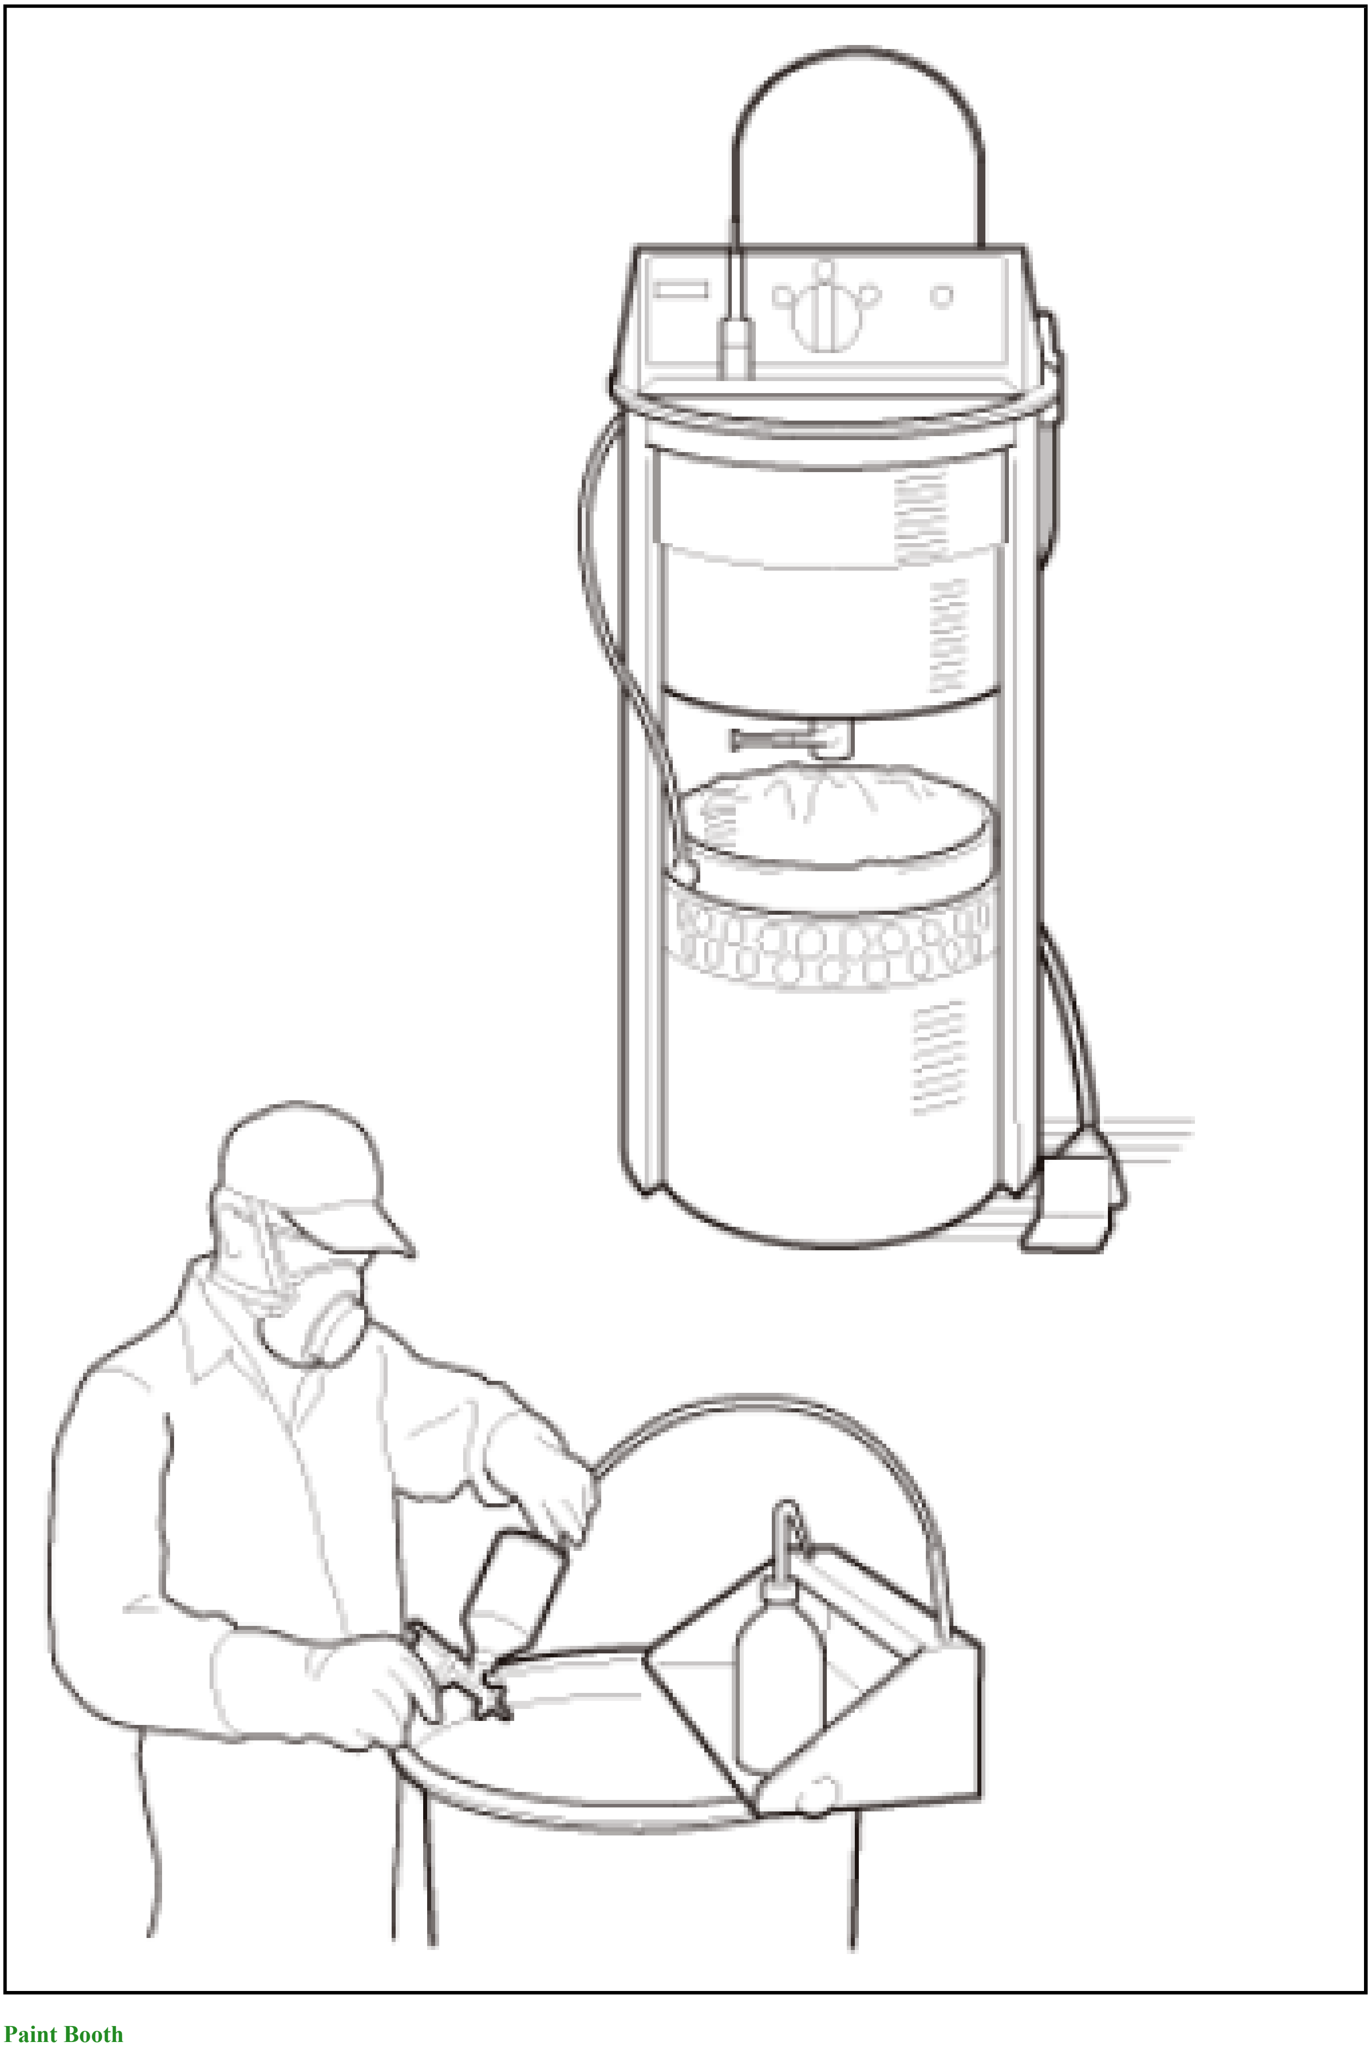
Paint Strainer

Normal paint strainers use water-soluble glue and may come apart during use. Choose a paint strainer specifically designed for water-based paint.



Gun Cleaner

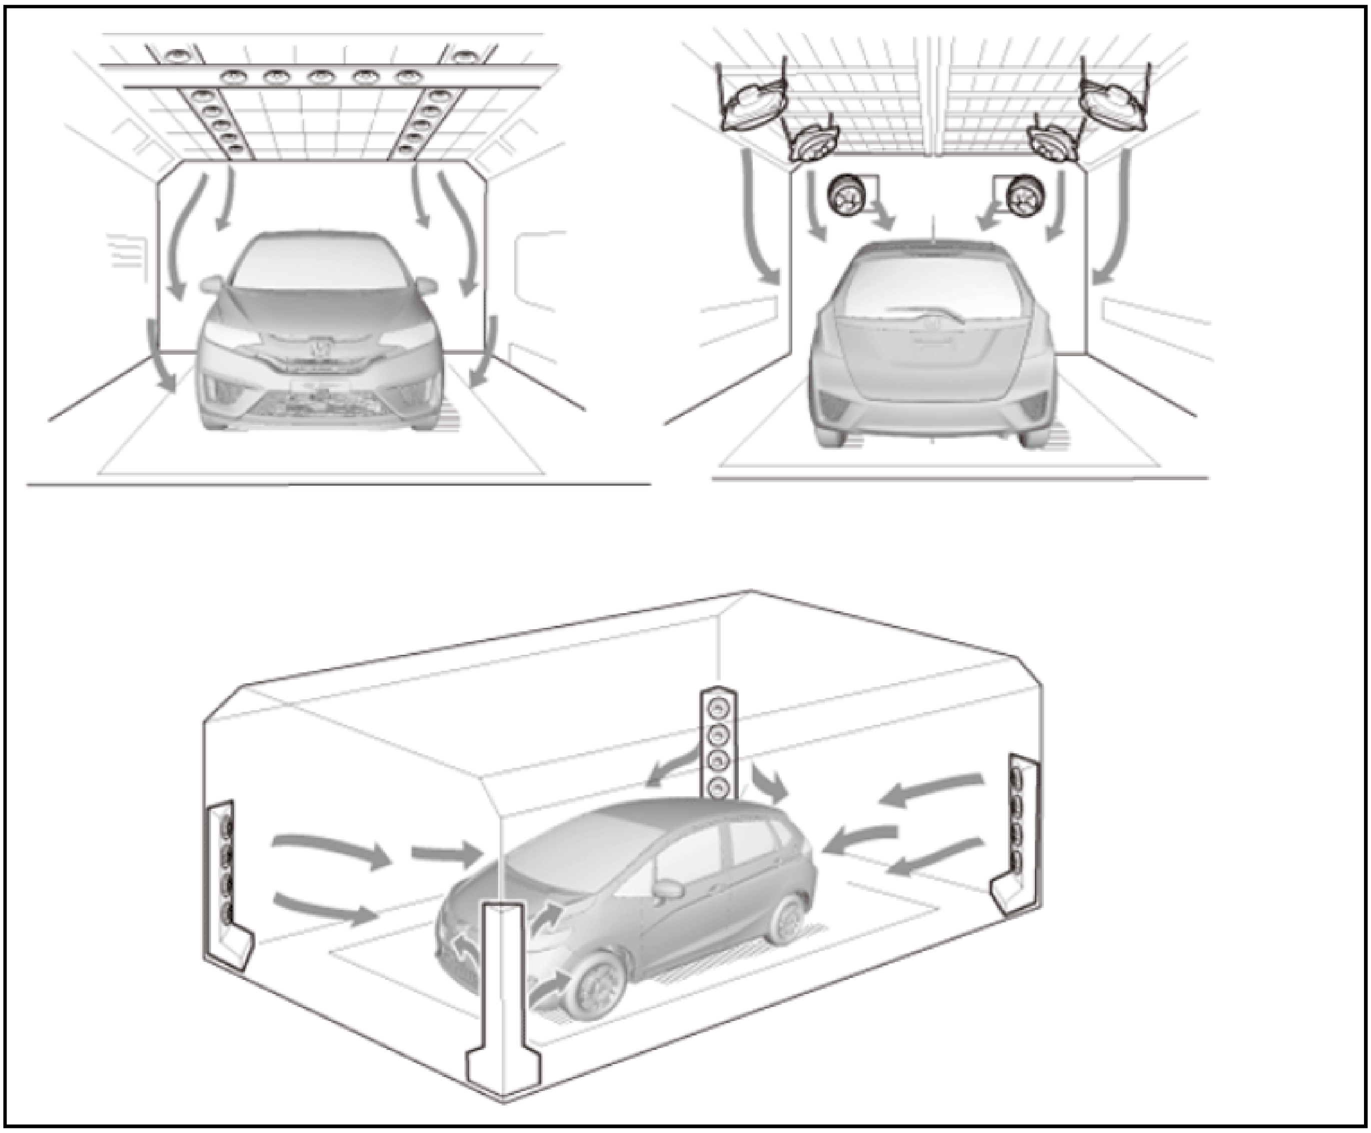
- Water-based paint residue is much harder to remove than solvent- based paint residue. A special high pressure spray gun cleaner is required for water-based paint. Use care when using solvent or other cleaning agents for cleaning spray guns as it may cause paint residue buildup inside the gun.
- The water used for cleaning should be filtered and reused where possible. Dispose of cleaning water according to local regulations.



Paint Booth

Converting a traditional paint booth into the one that can handle water-based paint requires additional equipment to generate a strong flow of air inside the booth. Dedicated water-based paint booths are more expensive, with fewer choices available. Some have intake and exhaust fan motors to increase internal air velocity. Others have blowers that mount to the booth ceiling or walls. It is also possible to install a fan inside a traditional paint booth to create the required air flow. In all cases, confirm the spec information issued by suppliers and select the most appropriate equipment.

Paint Booth for Water-Based Paint (Example)

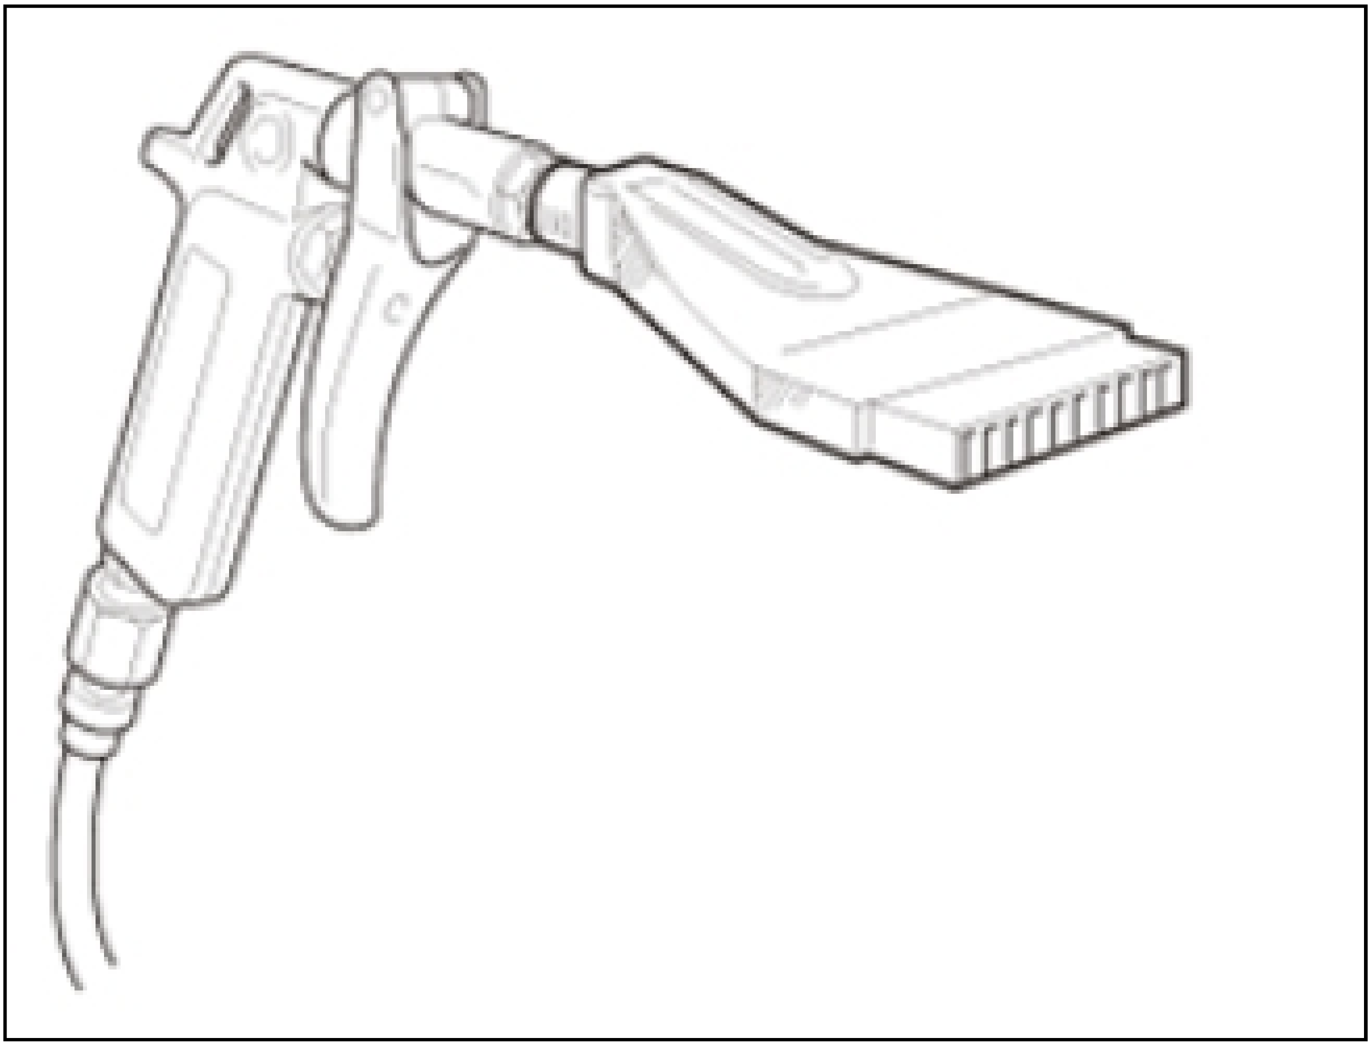


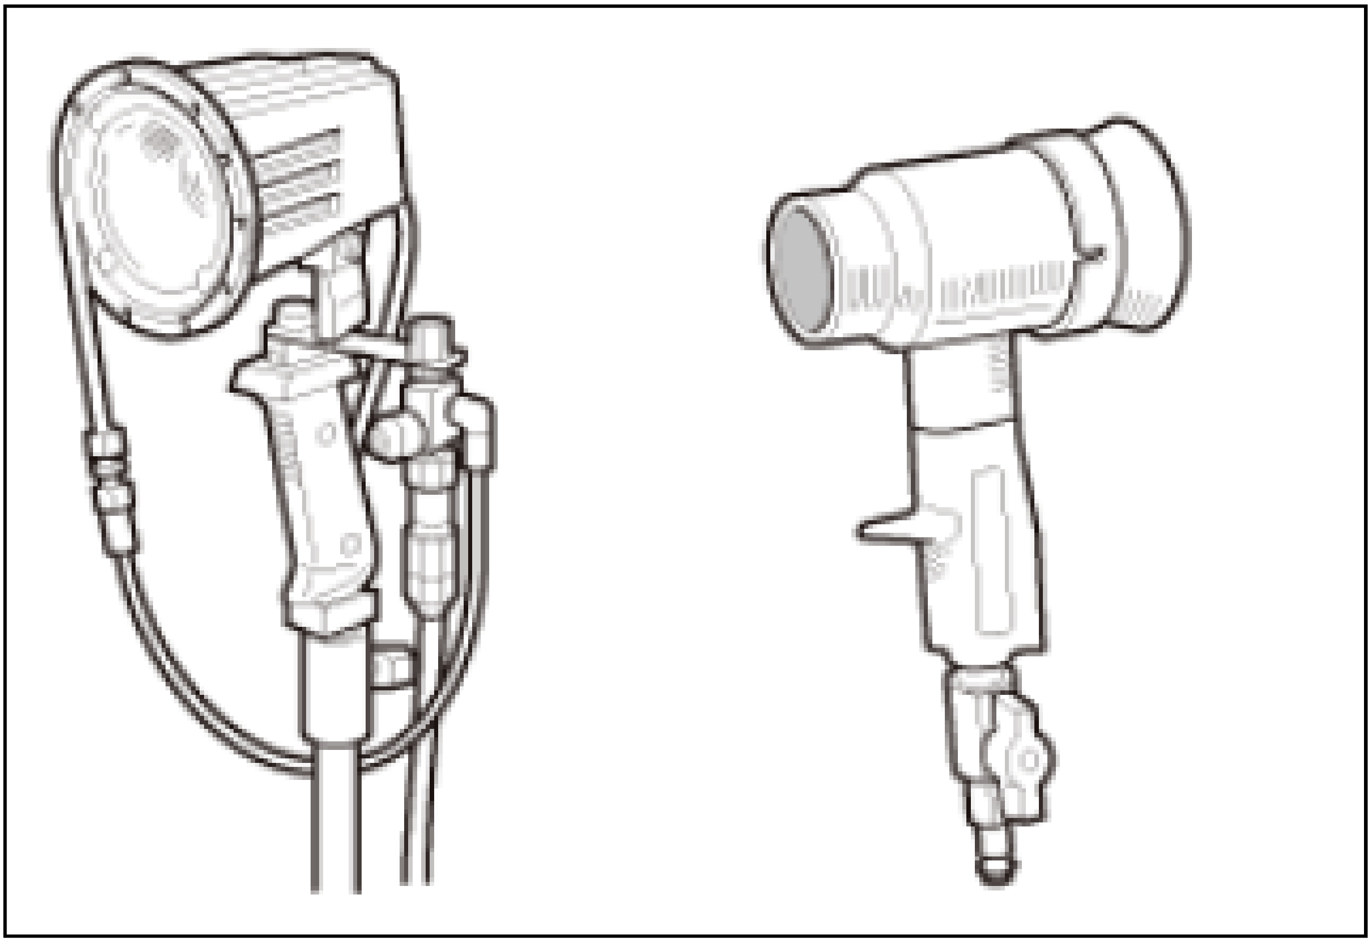
Paint Drying Equipment

Portable dryers used to dry small to mid-size painted surfaces.

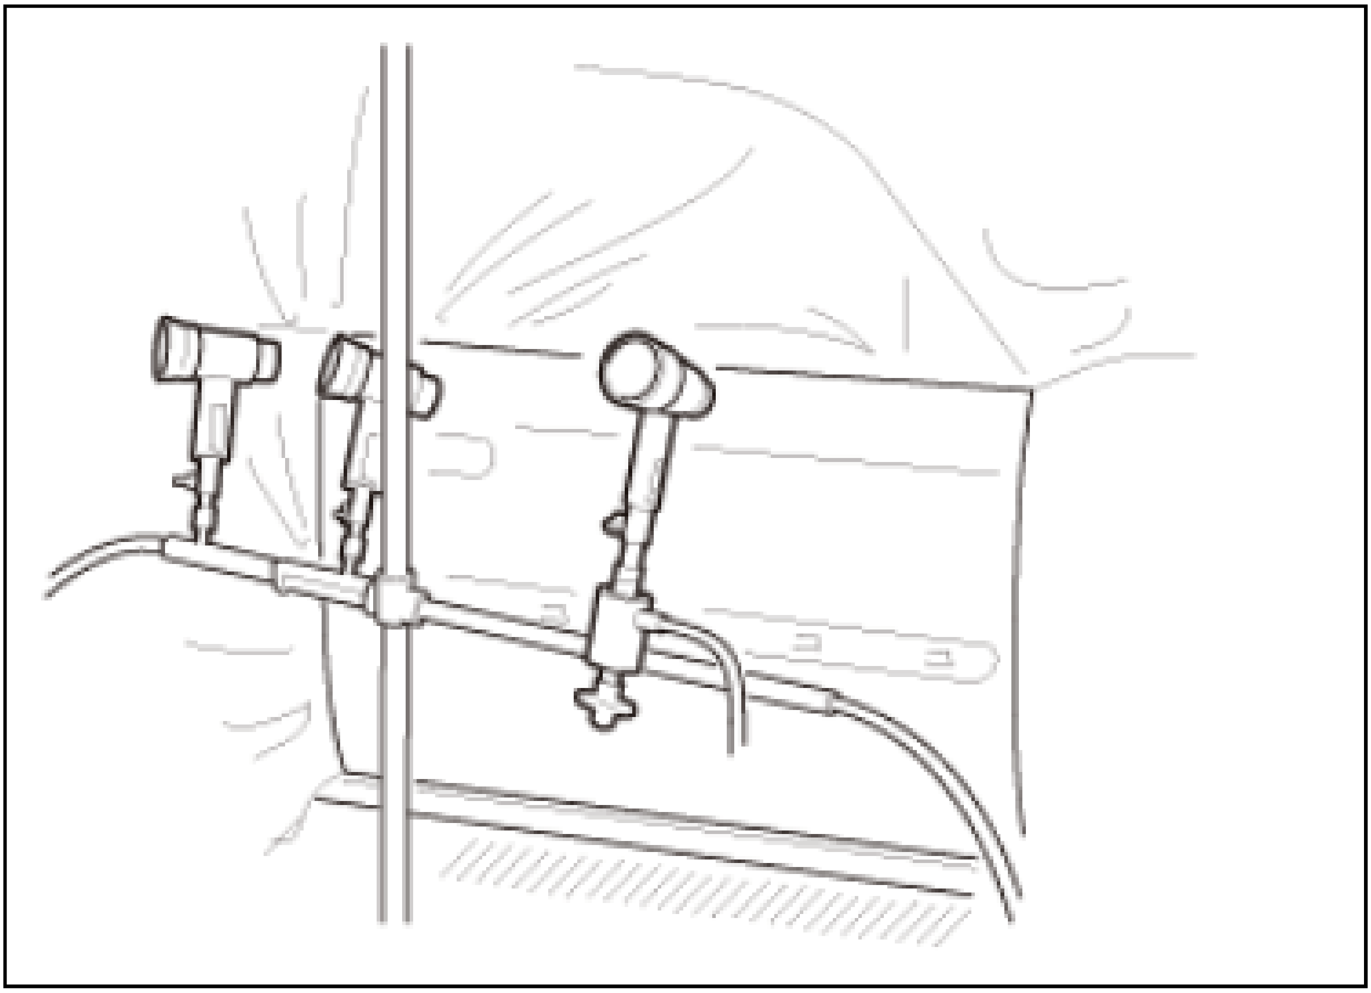
Blower Attachment

It can be used anywhere an air hose and gun are available, Capable of drying small repaired areas of 1 or 2 panels.





With a Stand (Example)



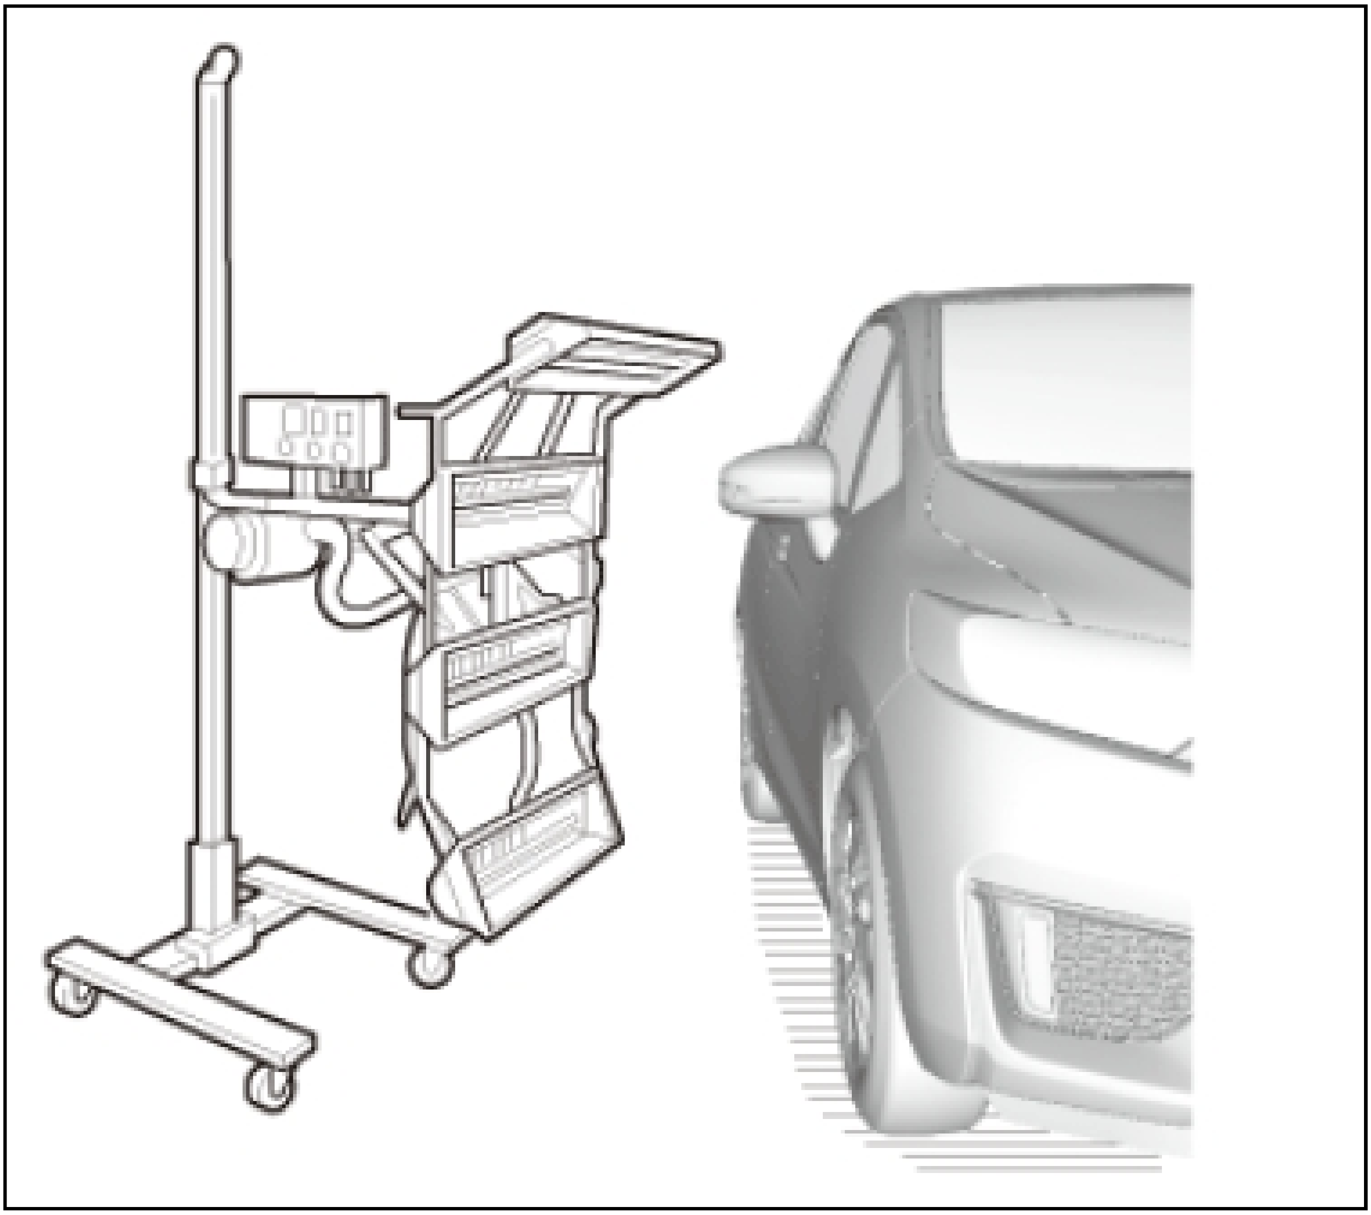
Handy-Type Blow Gun

Use by hand or with a stand. Capable of drying small repaired areas of 1 or 2 panels.

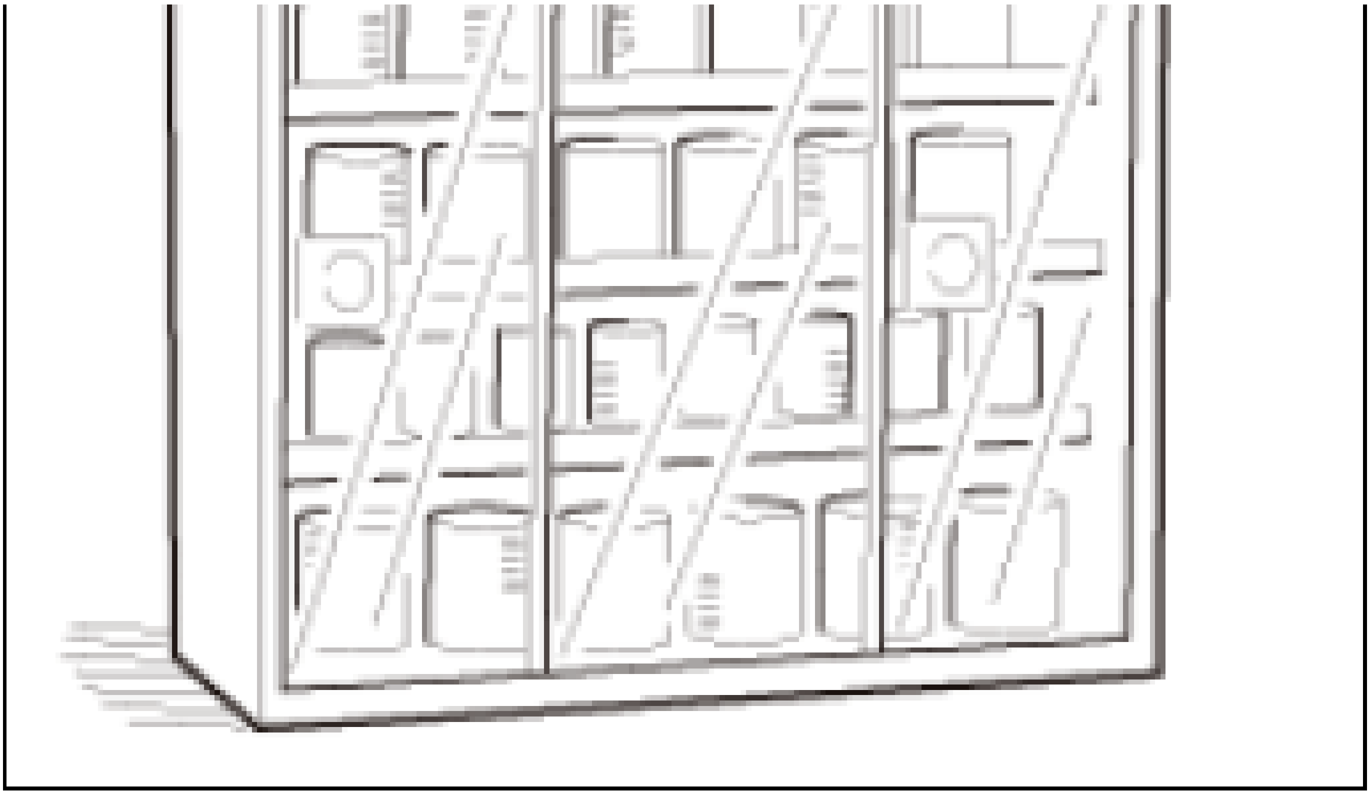
Electrical Resistance Heater/Blower

Uses carbon-based heating elements with air blown across them by an electric blower motor. Suitable for drying midsized paint repair areas.

NOTE: **Be sure to confirm the product spec issued by the paint manufacturers for drying temperature.**

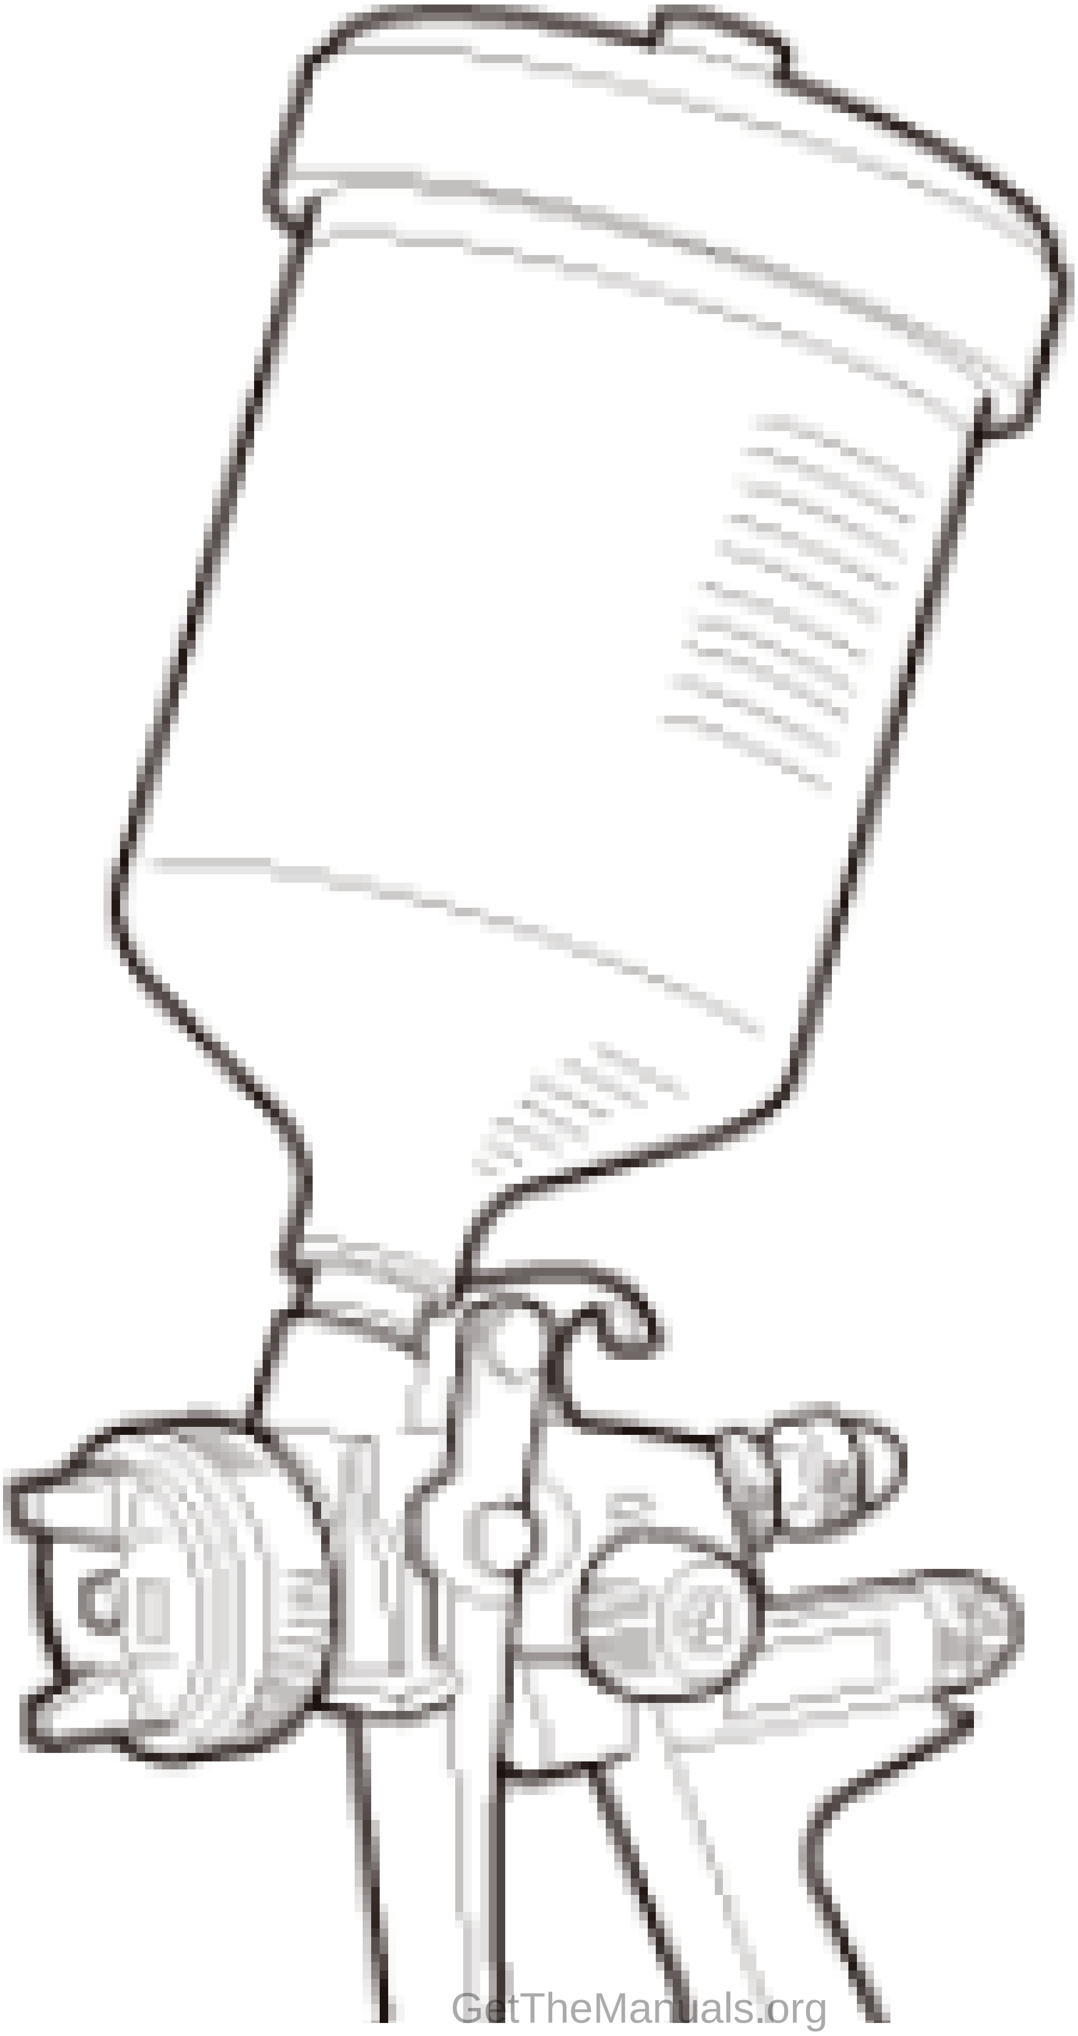


Paint Storage And Handling



- Water-based paint may freeze at low temperatures. It is no longer usable if frozen.
- Avoid direct sunlight and store in a low humidity area with a temperature range of 41 - 95Â°F (5 - 35Â°C). In areas where the temperature drops below 41Â°F (5Â°C) a heated storage area may be required.
- The ideal storage temperature is the same as for painting 68 - 77Â°F (20 - 25Â°C).
- In order to avoid paint quality deterioration due to corrosion, store the paint in plastic containers, or steel ones with anti-corrosion coating.
- Water-based paint is highly resistant to pigment and resin separation, but always stir it thoroughly before use.
- There is no special fire prevention precautions when using water- based paint. Its ignition point is much higher than solvent-based paint.
- Handling and storage methods may differ depending upon paint type. Refer to product spec issued by the paint manufacturer.

Spray Gun



- Spray guns used for water-based paint should not be used for solvent- based paint.
- Generally, use a high volume low pressure (HVLP) type spray gun for water-based paint.
- HVLP type is designed to be eco-friendly by operating at lower pressures than a conventional spray gun. This creates less overspray, reducing VOC emissions.
- Different nozzle diameters and cup volumes are commercially available. Select the best suitable spec for the work being done.

*HVLP Type is a high-flow-rate/low-pressure spray gun which offers superior paint adhesion capabilities. Normal spray guns only apply 20-30% of the paint sprayed to a surface. HVLP spray guns apply 65% of the paint sprayed higher. Less paint volume is required when using a HVLP type gun, reducing material costs.

MIXING AND TINTING (MIXING COLORS)

PAINT MATCHING (COLOR MIXING WORK)

Before Mixing Colors

Confirming Paint Colors For Honda And Acura Vehicles

Confirm the paint ID on the exterior color label, model type and frame No. plate which can be found in the various places listed below. Check the vehicle service information for specific location.

(The location of model type information and frame No. plate differ depending on the vehicle model; driver's door jamb, front bulkhead, front damper housing, dashboard upper etc.)

Exterior Color Label Location

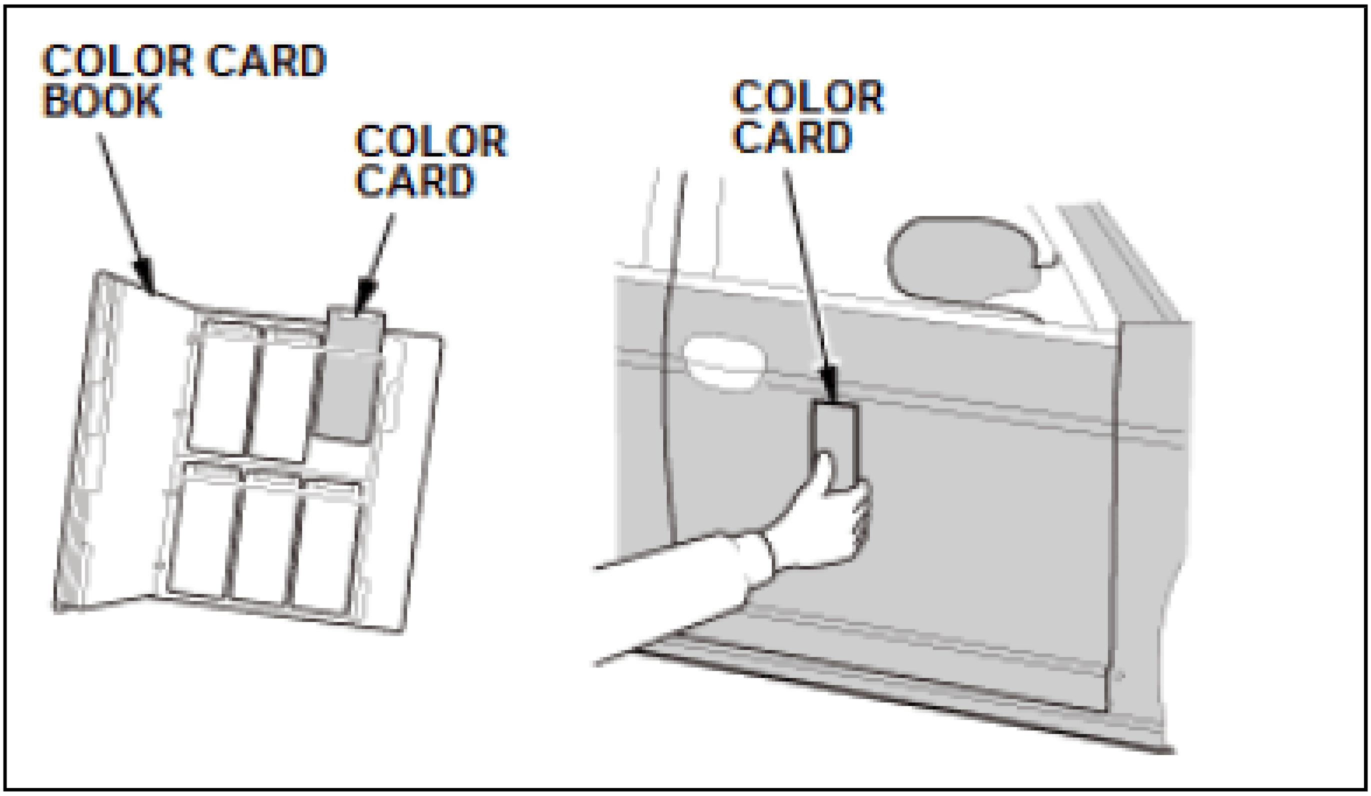
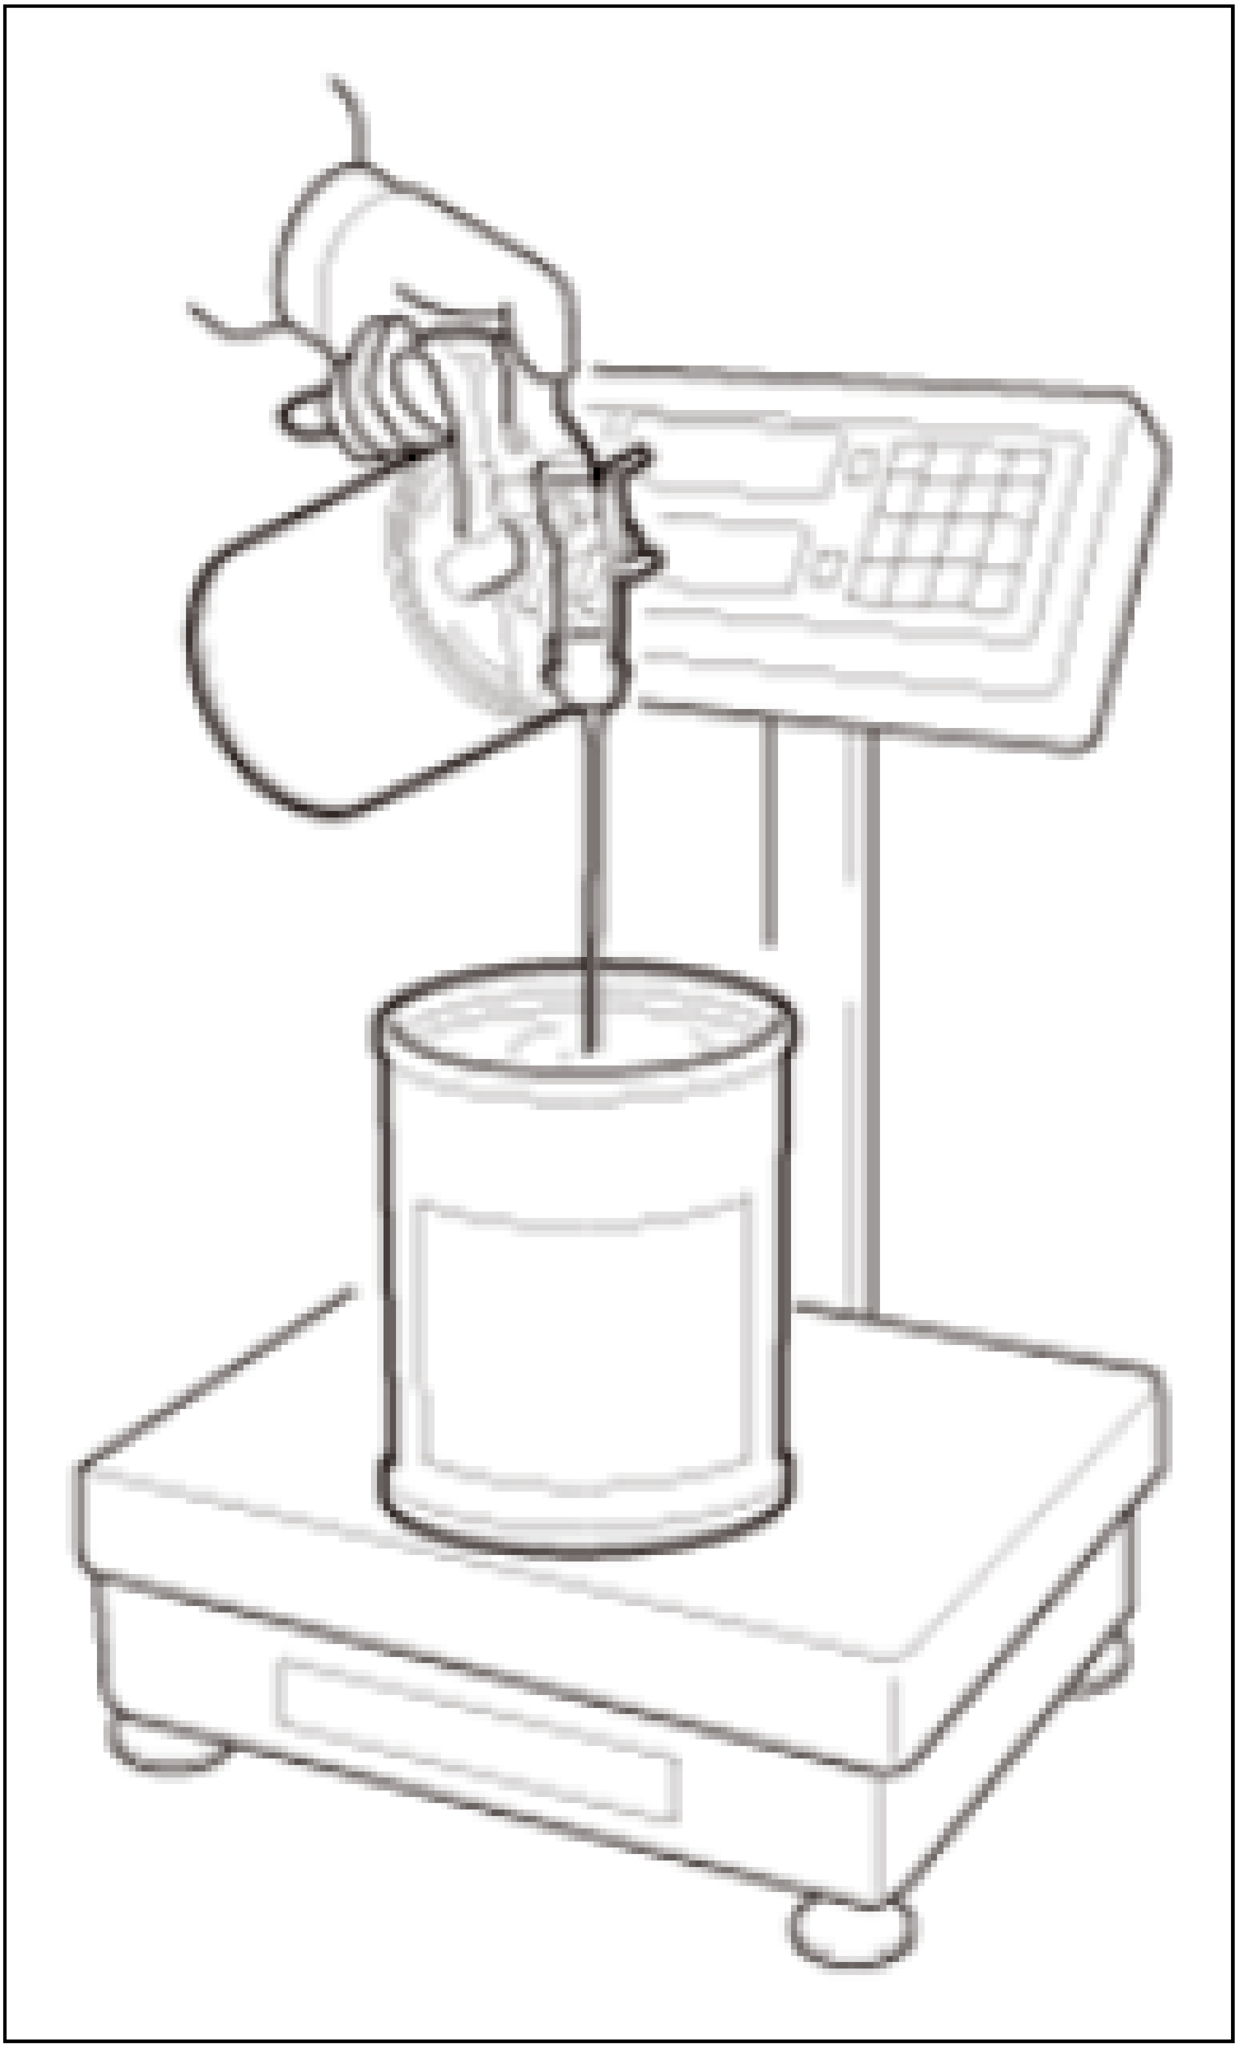
Compare Color Card and Body Color
Use Scale to Mix Colors
Adjust
Test Paint, Colorimetry
Complete

Color Mixing Steps

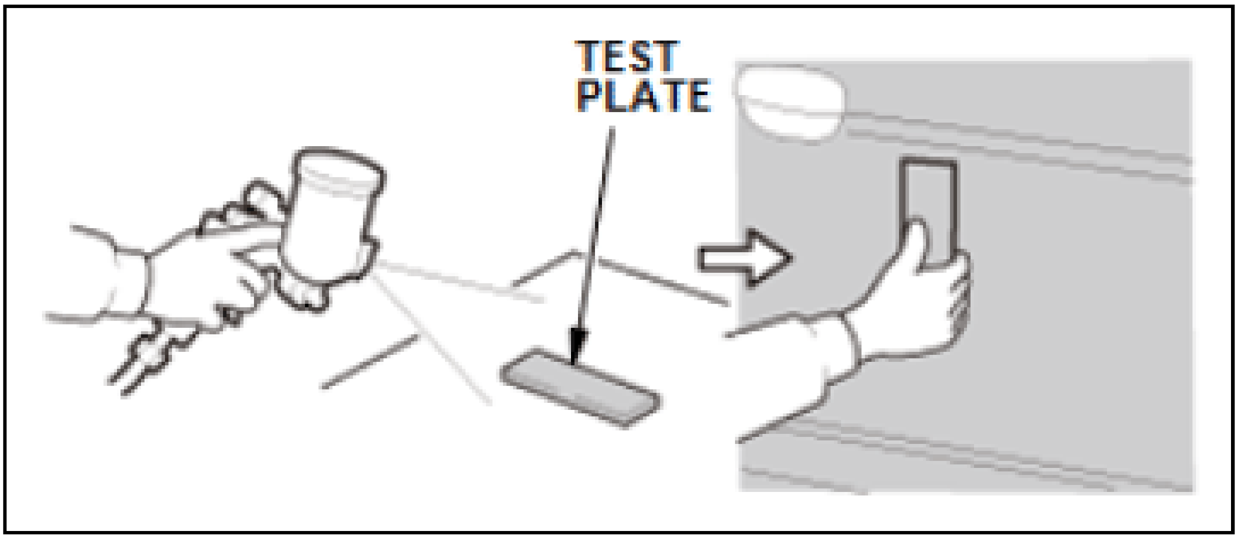


1. Comparison of Color Code and Body Color:
    - Confirm the color difference between the color card attached to the color sample book and the color surrounding the damaged area on the actual car.
    - If no color sample is available but color mixing specs are available, use a small amount of paint to mix some sample color. Test spray the sample to create a sample plate and compare against the actual color on the vehicle.
    - If the color sample and actual vehicle colors difference is too great, check availability of a different and/or new color mixing spec.

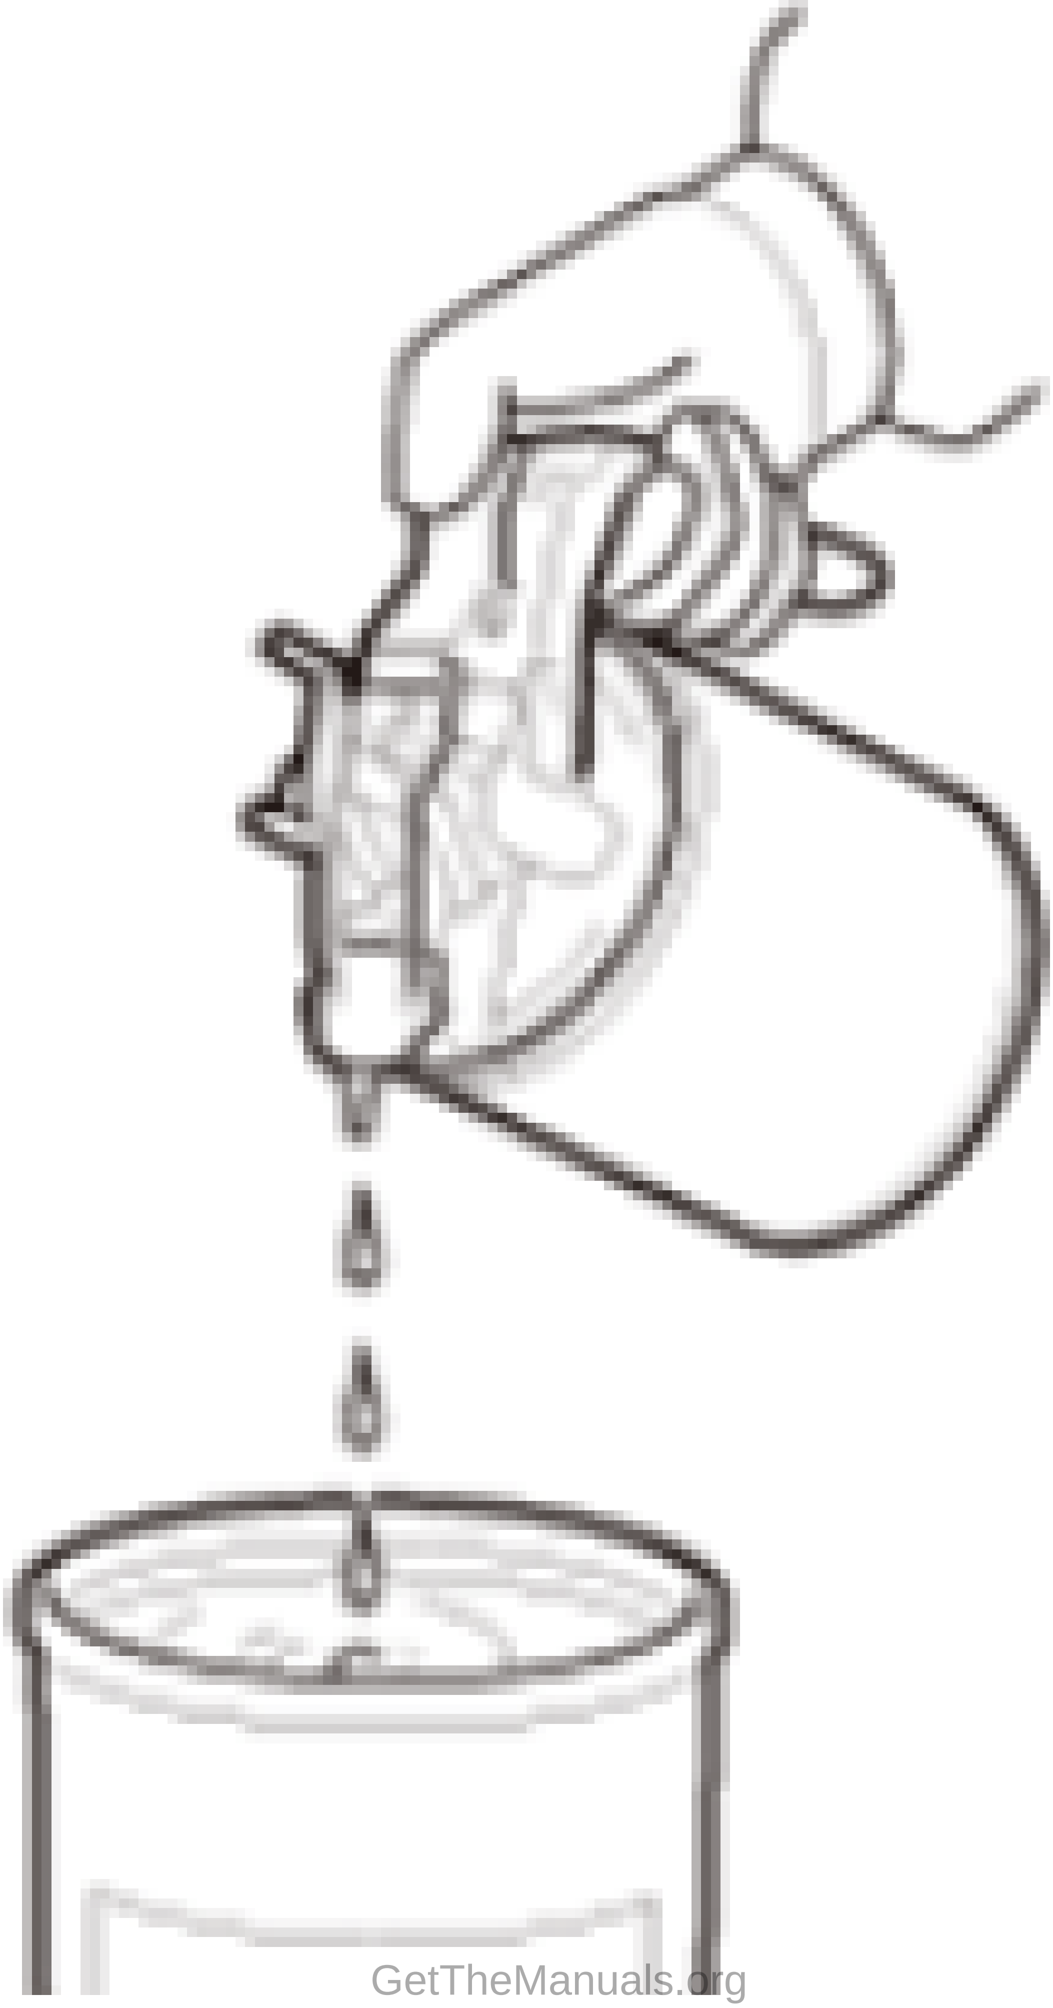


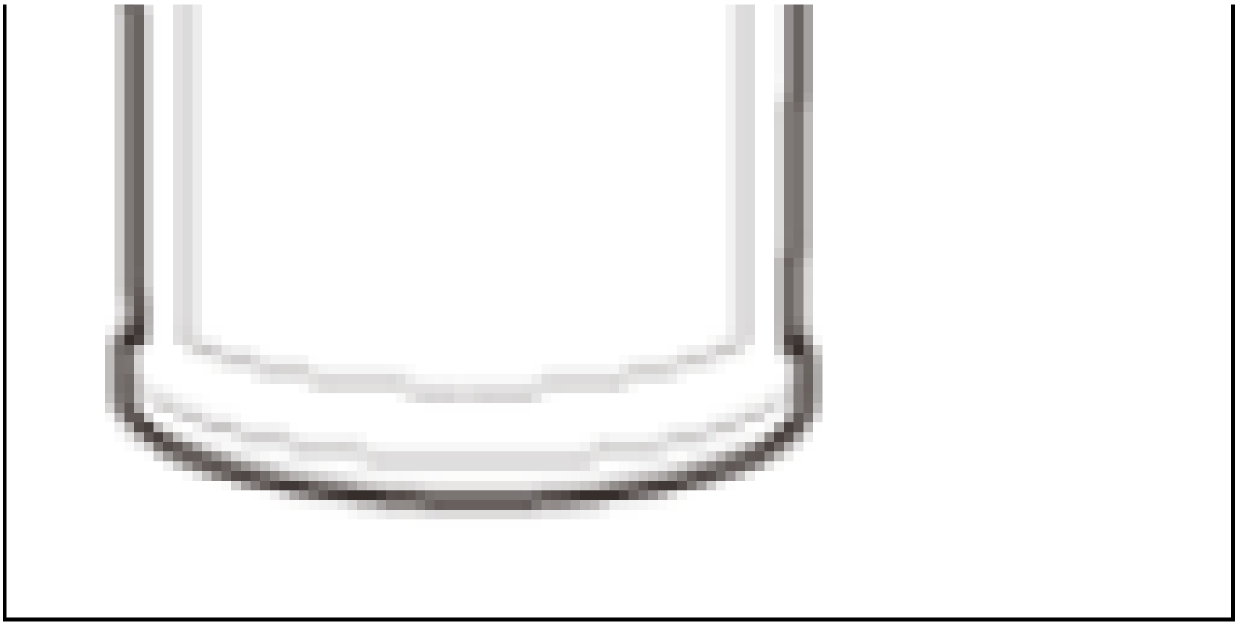
2. Measured Color Mixing:

- Compare the color code against the actual color on the vehicle and when there are no significant differences in hue, shade of color and direction, mix the colors according to the mixing color spec.
- If the difference is too great, adjust the color using primary colors.



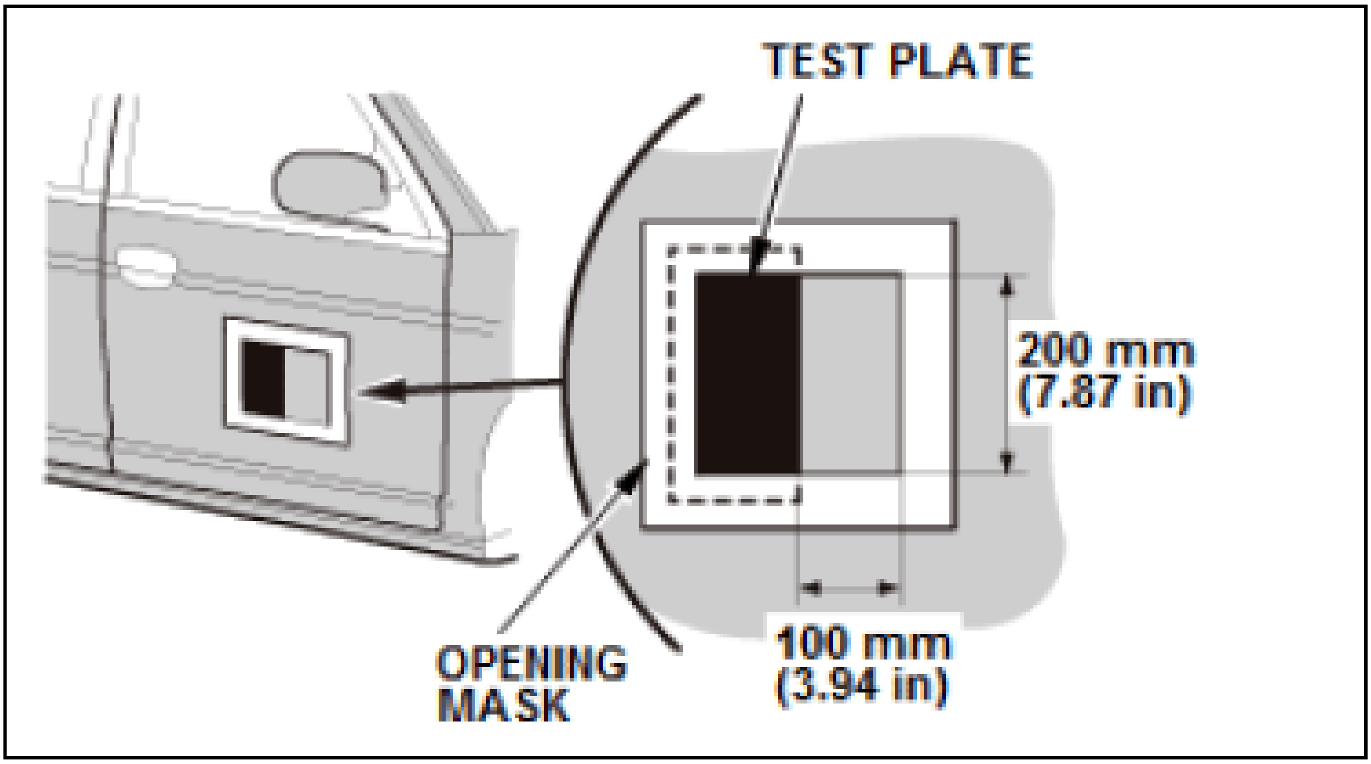
3. Test Painting, Colorimetry:
    - Test paint should be conducted under the same conditions as the actual paint repair. In particular, pay extra attention in handling pearl and metallic colors as painting conditions can greatly impact the results.
    - Compare fully dried test plates against the actual vehicle color for color difference, conditionally identical colors, direction, size of metallic or pearl grain and brightness, etc. under various light sources.



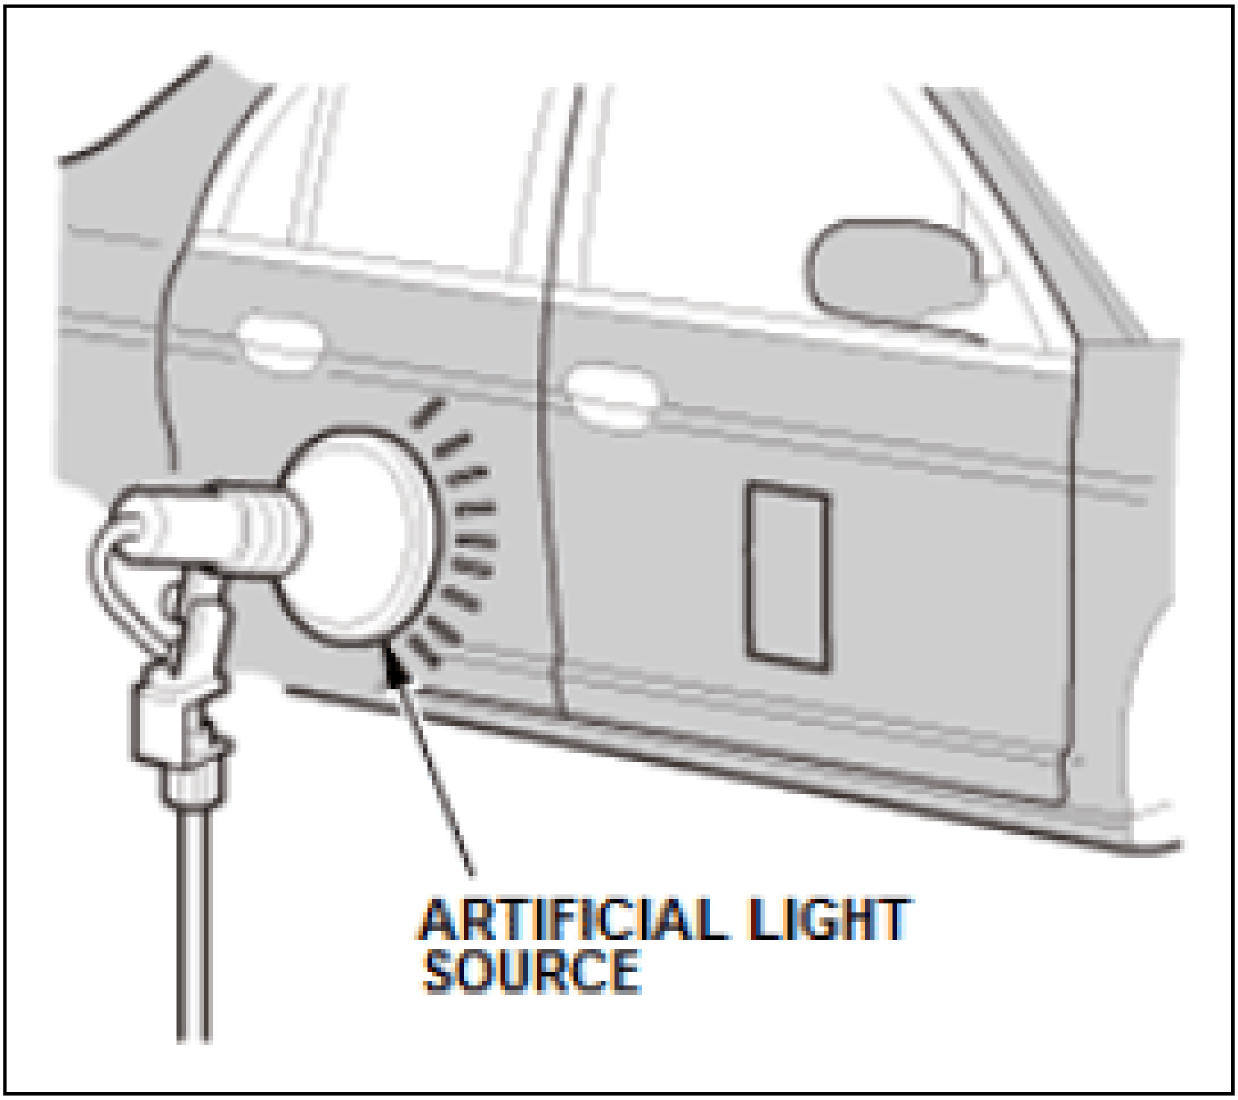


4. Fine Adjustment of Color:
   - As a basic rule, use a small amount of the paint indicated in the color mixing spec to make an adjustment. However in some cases a new color can be added if necessary
   - Repeat the test paint, colorimetry work and adjustment until the desired color is obtained.
5. Complete.

Key Points In Color Comparison And Matching

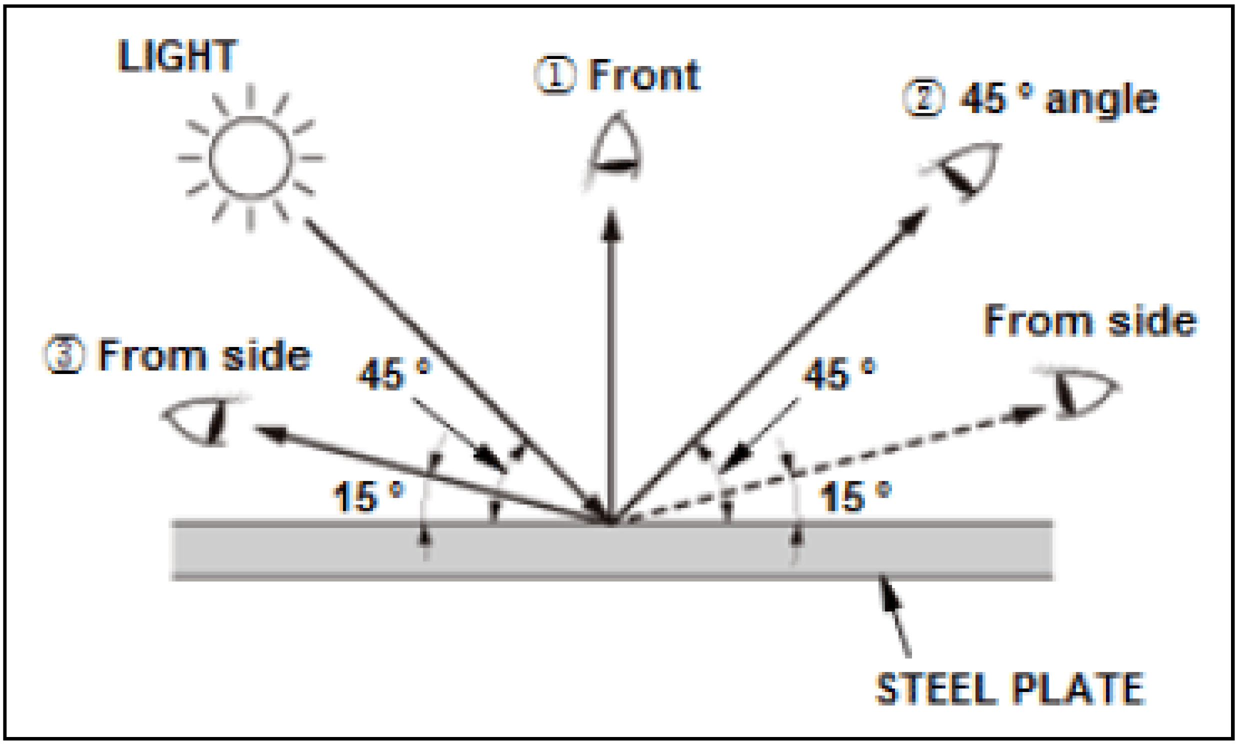


1. Colorimetry Steps:
   - When comparing colors, usually the body panel right next to the repair area is used. Make sure to remove any stains on the panel by polishing with a very fine compound for an accurate comparison.
   - Prepare a test piece of the same material and size. For ease of comparison, pace the test plate on top of the actual vehicle panel. Then place an achromatic colored magnet sheet with an opening on top.



2. Lighting and Environment:
   - The ideal type of light when comparing colors is diffused daylight. However, color matching is not always done outside under daylight. In such cases, use an artificial light source which offers a wavelength very close to sunlight.
   - In case of using an artificial light source to compare colors, prepare a light with 1500 to 3000 lux of illuminance. The actual required level of illuminance differs by color.

NOTE: **The definition of diffused daylight is a light from a North facing window that avoids direct sunlight from three hours after sunrise until three hours before sunset.**

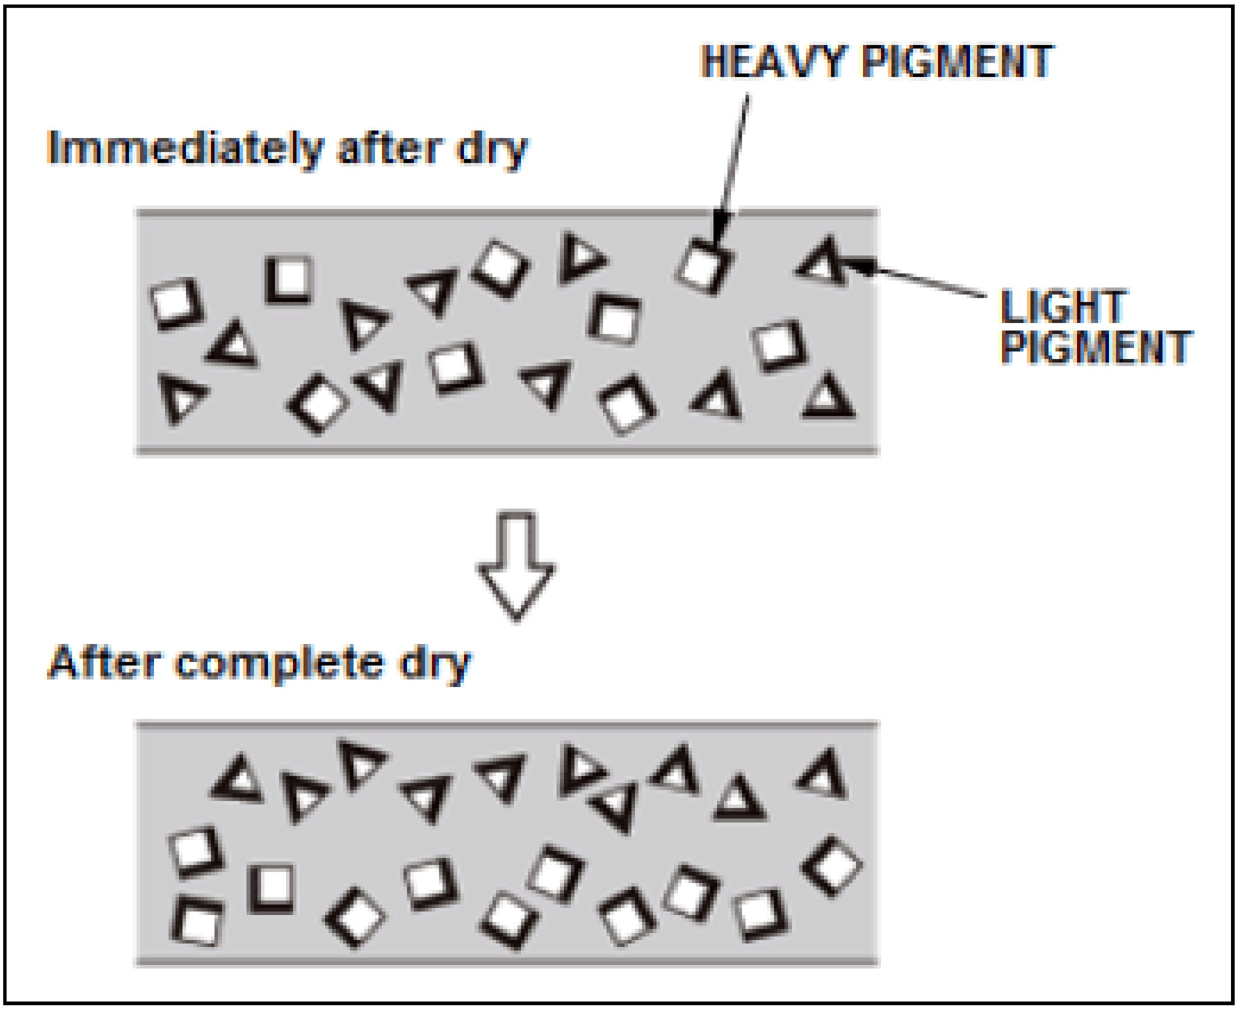


LIGHT
① Front
② 45 ° angle
③ From side
From side
45 °
45 °
15 °
15 °
STEEL PLATE

3. View Angle and Distance:

   Check from at least three different directions at a distance of 3-5 m (10-16 ft) away.

4. Color Change Between Immediately After Painting and After Dry:



HEAVY PIGMENT
Immediately after dry
LIGHT PIGMENT
After complete dry

- The color on the test plate immediately after painting and after complete drying will be different. This is due to specific weight of pigment. Pigments with light specific weight will rise to the surface when the paint dries
- In normal cases, solid colors tend to be darker and metallic pearl colors tend to be lighter as they dry. Make sure to compare colors for matching only after they are completely dry.

5. Color Changes Caused by Clearcoat:

   Metallic, pearl, and solid colors change their hues after clearcoat application. When working with clearcoat paint, only compare the colors for match only after clearcoat is applied when using clear coating.

Paint Colors		**After Clearcoat**
Solid	General Colors	Becomes yellowish if painted repeatedly
	Black	Looks whitish when seen from the side angle
Metallic, Pearl	Silver Metallic	Looks whitish when seen from the side angle, darken from 45Â°
	Colored Metallic, Pearl	Becomes deeper and brighter

6. Color Changes Caused by Polishing:

   Some paint colors change after polishing. For these types of paint, fully dry then polish the test piece. Compare the colors after polishing.

7. Mixing Hardener:

   Dual-component paints tendency to lighten the base resin color when mixed with a hardener. Compare the color match only after the specified amount of hardener has been mixed with the paint.

8. Color Change as the Result of Spray Condition:
   - In particular, metallic and pearl colors may change hue according to the paint particle arrangement. This can be affected by the type and amount of paint reducer/thinner dilution or spray gun adjustment.
   - Generally, because a wet paint coat has a systematic arrangement of metallic particles, dense pigments stay close to the surface of the paint layer which makes the paint look deeper. Dry paint coats have an irregular arrangement of metallic particles, where irregularly arranged pigments stay close to the surface of the layer. This makes the paint appear lighter.

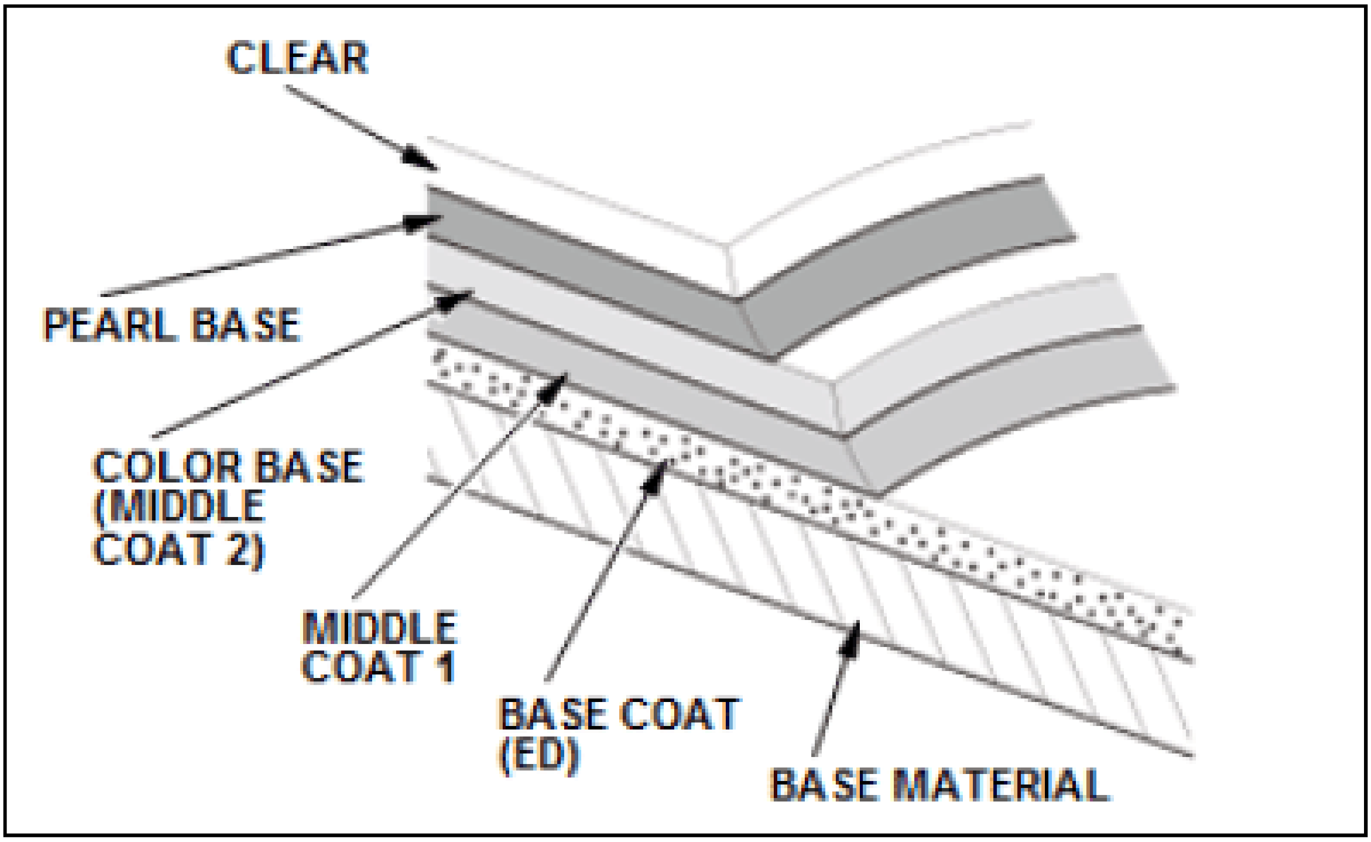
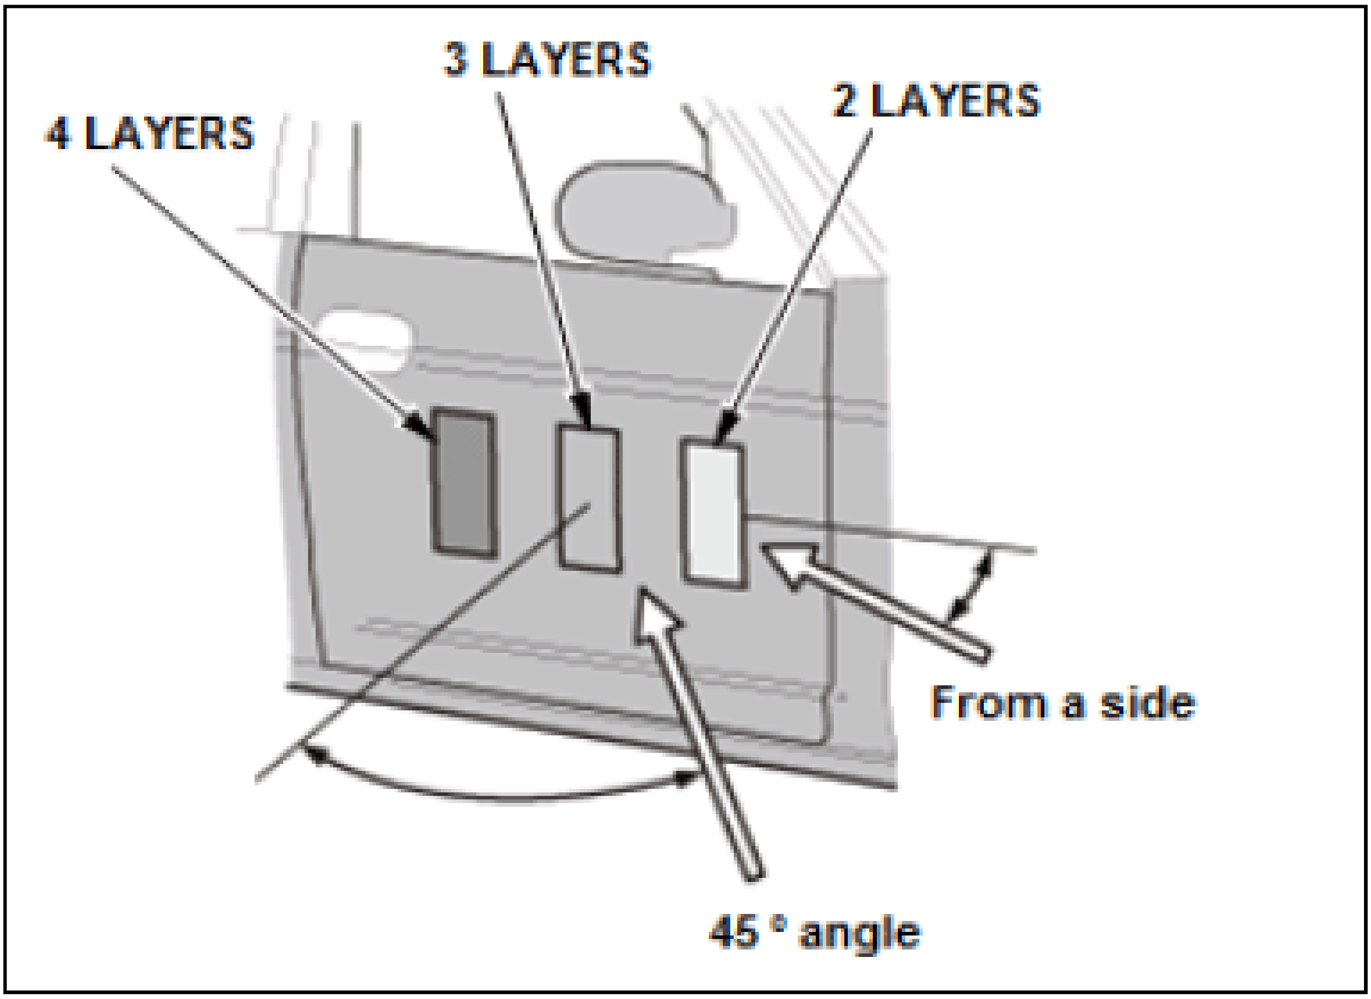
Key Points In Mixing And Matching Pearl Colors



CLEAR
PEARL BASE
COLOR BASE (MIDDLE COAT 2)
MIDDLE COAT 1
BASE COAT (ED)
BASE MATERIAL

Three-Coat Pearl: Color Base Mixing

Because these pearl colors look transparent through the color base, it is necessary to match the color to the color base film (intermediate coat 2) after polishing the top coat down to the color base layer (intermediate coat 2).



4 LAYERS
3 LAYERS
2 LAYERS
From a side
45 ° angle

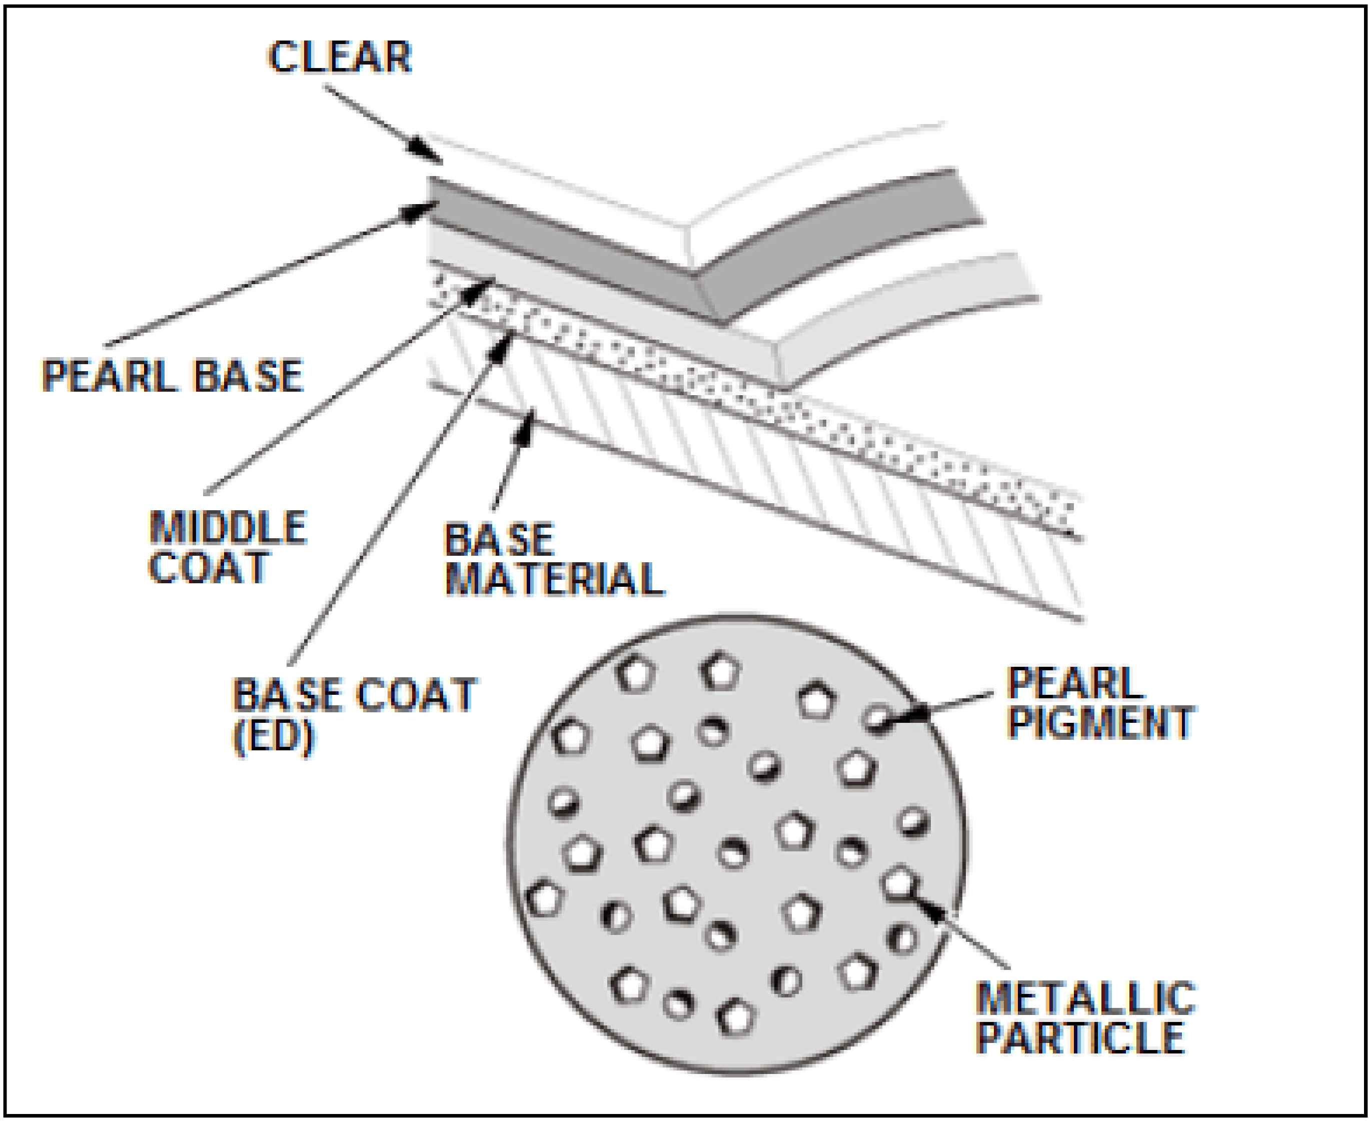
Pearl Base Film Thickness

- Because the color changes greatly due to the thickness of pearl base paint film, prepare 3 to 4 test paint pieces, each with a different number of spray gun passes of pearl base paint. Then choose the one closest to the actual body color. When applying paint to the repair area, use the number of spray gun passes as the matching test piece.
- Generally with the white pearl colors, thicker paint layers increase the brightness as viewed from a 45Â° angle. However, the color viewed from the side becomes deeper. Interference pearl paints show a deeper hue when viewed from a 45Â° angle, and its complementary color becomes deeper when viewed from the side.

Two-Coat Pearl

- Some two-coat pearl paints have a metallic base in addition to pearl mica. Select the necessary metallic base in addition to the pearl base for these type paints.
- The colors of paints with only pearl mica are greatly affected by paint viscosity and spray pressure. When viscosity is low and spray pressure is high, the color becomes lighter because the pearl mica content becomes stronger.

  When the paint contains both pearl mica and metallic bases, it should be applied the same way as a metallic base paint.



Work Environment

A good work environment is necessary for matching colors, colorimetric work and test painting:

- The most important factor is a brightness. Abundant natural light including direct sunlight is required.
- Fluorescent light with high color rendering properties should be used.
- The work area should be painted in a soft achromatic color, such as white or gray
- Driers, spray devices and other necessary tools should be organized for efficient workflow.

TINTING BASICS (MIXING COLORS)

Basic Color Features

Light And Colors

- While a very wide spectrum of light rays come from the sun, human eyes can only see the visible rays within a wavelength range of 380 to 780 nanometers (nm). Light rays with wavelengths shorter than 380 nm are called ultraviolet rays. These cause deterioration of paint layers and fade colors. Light rays with wavelengths longer than 780 nm are called infrared rays. Beyond that with even longer wavelengths are far-infrared rays. Both infrared and far-infrared rays are called heat rays. These are often used for the heat sources of paint dryers and room heaters.
- Visible rays in the sunlight look white. When sunlight is passed through a prism, the visible rays become a spectrum of different colors ranging from red to violet.

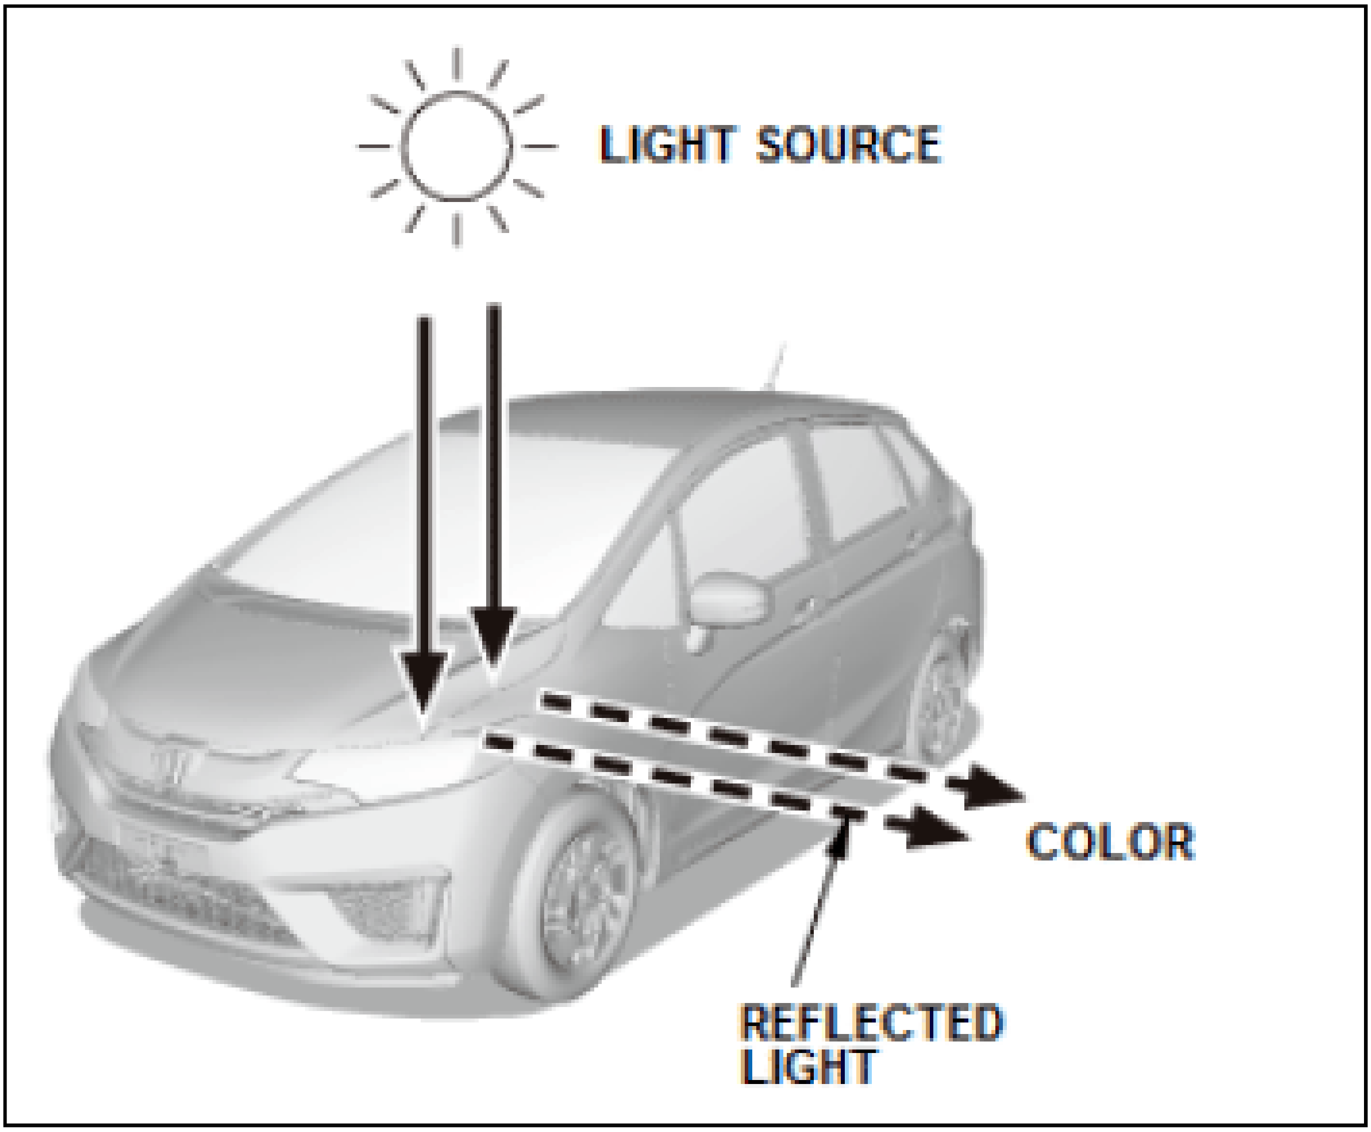
VISIBLE LIGHT
ULTRAVIOLET
PRISM
SUN LIGHT
nm*=1/1000 µm



- When a visible light ray hits an object and is reflected, the light ray reaches the human eye and its color is recognized. If only long wavelength light rays are reflected, the color is recognized as red. And if only short wavelength light rays are reflected, the color is recognized as blue.
- Colors can be generally divided into two groups, chromatic colors and non-chromatic colors. Chromatic colors: Red/Blue/Yellow: colors that have hue or tint.

  Non-chromatic colors: White/Gray/Black: colors that have no hue or tint.

Three Factors Of Colors

A chromatic color is comprised of three factors: Hue, Value, and Chroma. Non-chromatic colors have only one value: Brightness

- Hue: The feature that characterizes each color like red, blue, yellow, and green.
- Value: The degree of brightness.
- Chroma: The degree of freshness, apart from the degrees of hue and value.

Indication Of Colors

Hue Ring

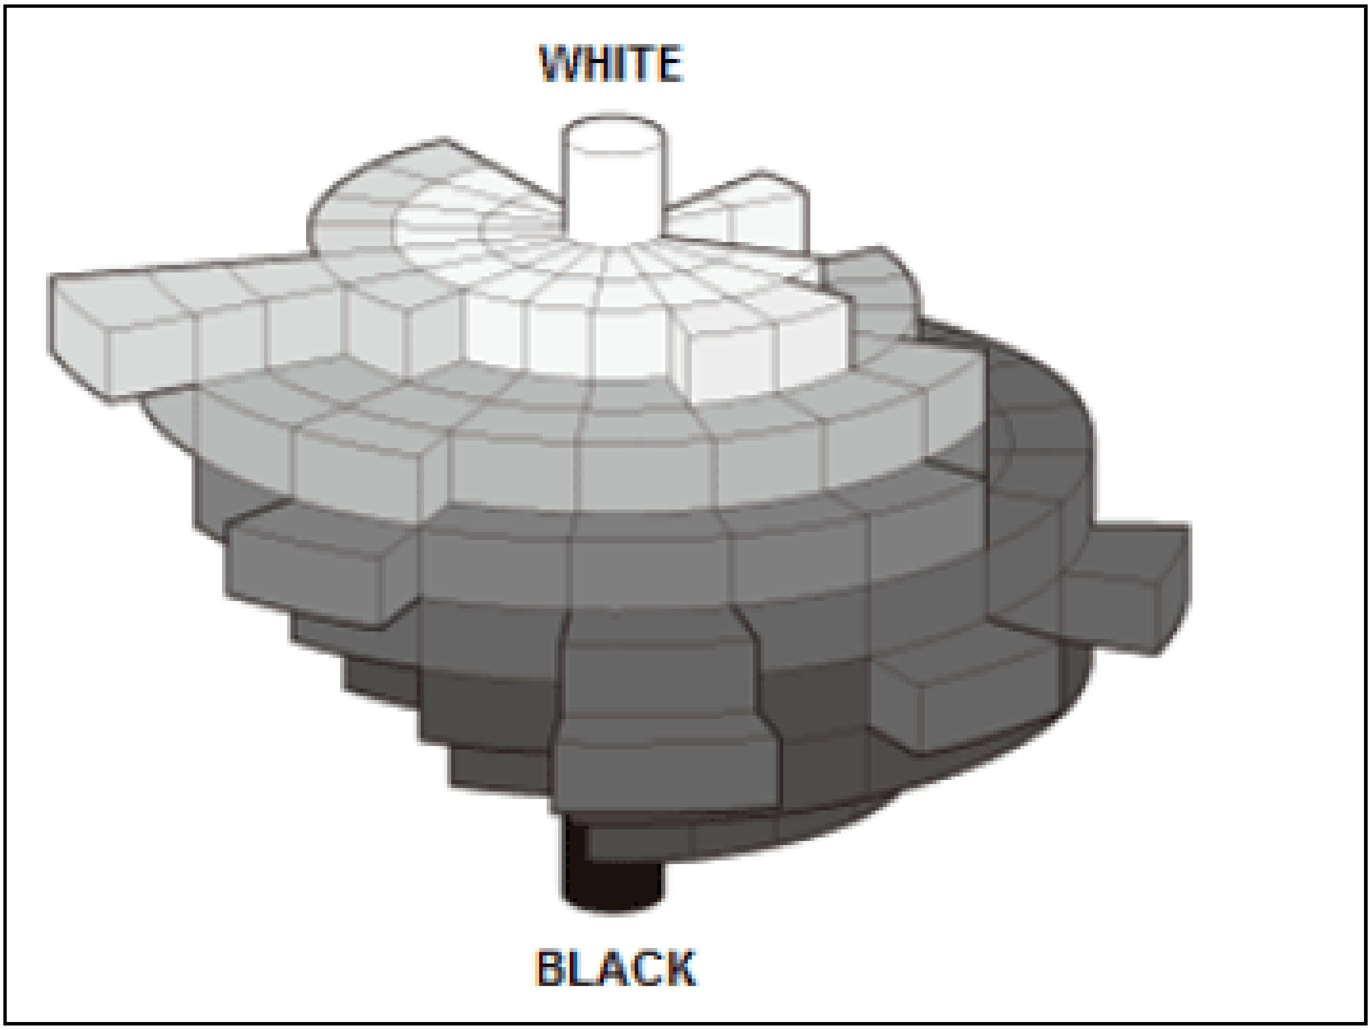
Hue Ring is a ring shaped relative arrangement of ten main colors. There are five main colors: Red (R), Yellow (Y), Green (G), Blue (B), and purple (P). Another 5 colors are relatively placed between the main colors: Yellow red (YR), Yellow green (GY), Blue green (BG), Blue purple (BP), Red purple (RP). Each hue is divided into 4 even spaces with an interval of 2.5 and the center is shown at 5.

Munsell Color System

Munsell Color System is a color measurement system introduced by Abert H. Munsell, an American an artist and professor (1858-1918). In this system, colors are measured in the three dimensions of Hue, Value, and Chroma. Munsell published the 1st edition of Munsell Atlas of Color in 1915. Then he later revised it a few times, and in 1943, he introduced the revised color system that is still used.

Indicated Code (Munsell Code)

Non-chromatic colors are indicated in N. Chromatic colors are designated in the order of hue, value and chroma.



Example: N-3

5R 4/10

where:

5R: Hue; 4: Value; 10: Chroma

Accurate paint color mixing cannot be attained using only the Munsell code. Always use actual color samples.

Complementary Color

- In the Hue Ring, the two colors located directly opposite from each other are termed as complementary colors. If red and blue green, or yellow and blue purple are mixed in an appropriate ratio, they turn out to be a non- chromatic color.
- It is possible to use the relationship of complementary colors in order to weaken a color's degree of the hue. This can be done by adding a small amount of its complementary color. Because the color may become slightly muddy or hard to return to original, this is not recommended.

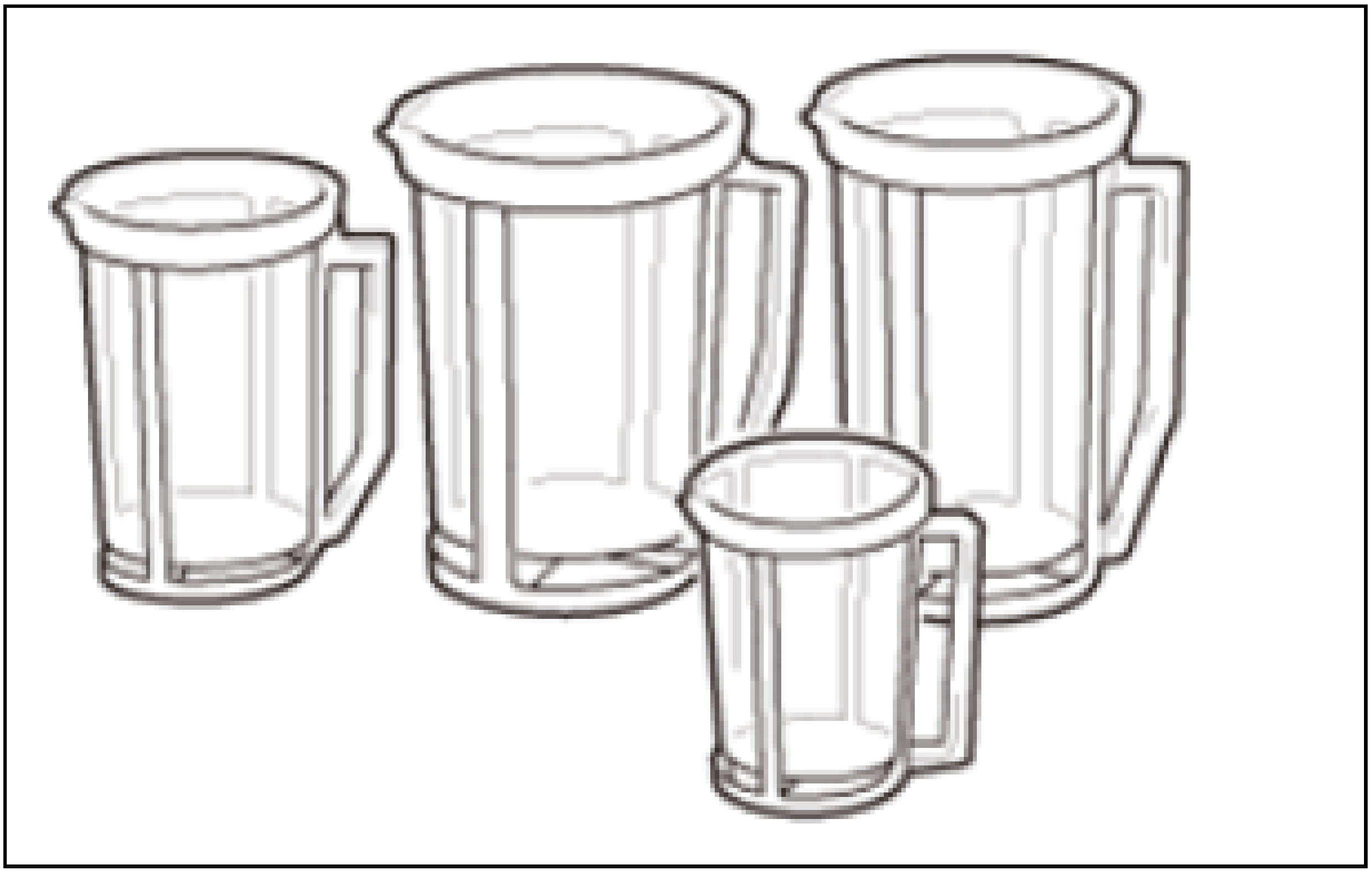
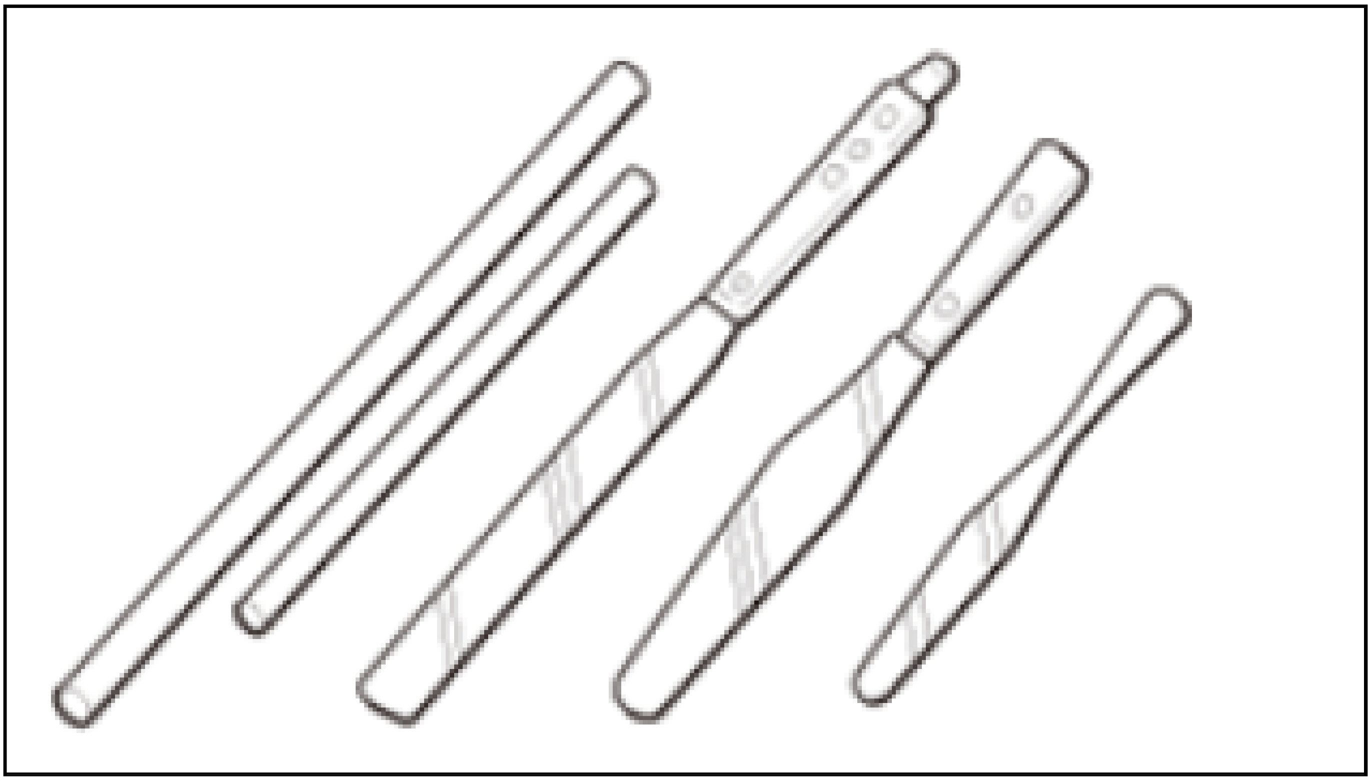
Color Mixing Tools And Equipment



In order to mix paint colors as needed accurately and quickly the following tools and equipment are necessary.

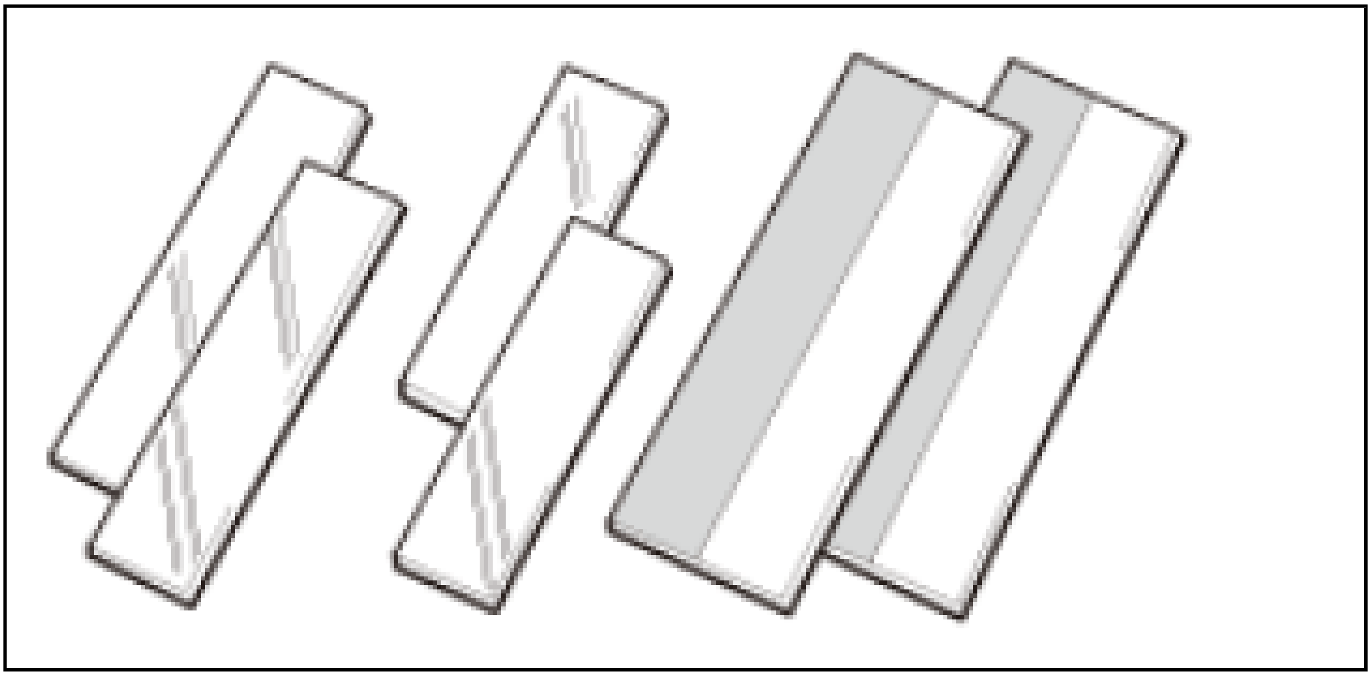
Color Mixing Containers

- According to the amount of paints needed, prepare several cans or plastic containers sized from 0.2 - 18 L (6.76 fl oz - 4.76 gal).
- Plastic disposable containers are used most often.



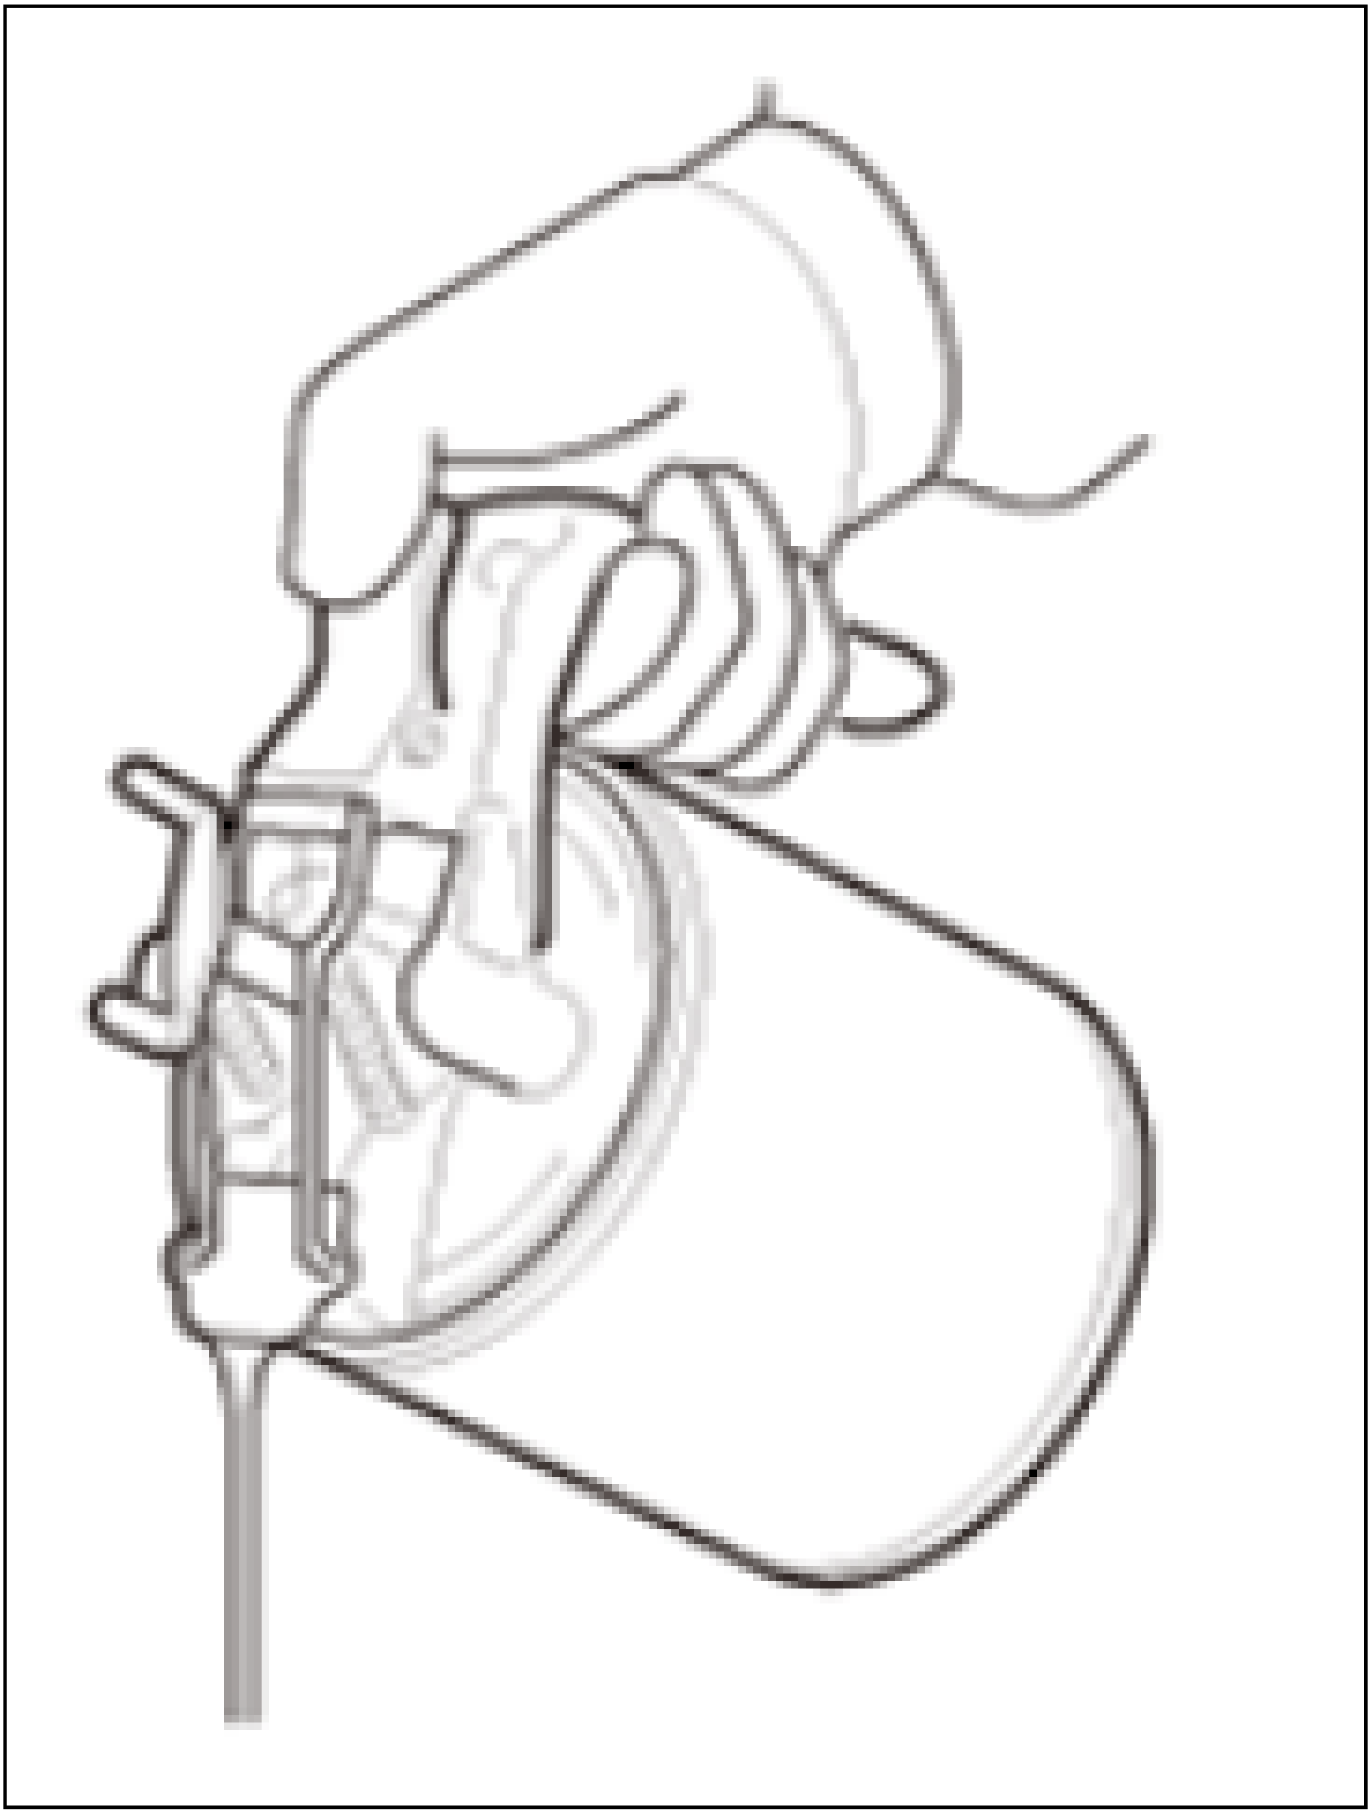
Stirring Sticks, Spatula

- There are also some stirring sticks combined with spatulas. Depending upon the amount of paint required, select the proper lengths and sizes.
- Both plastic and metal types are available.



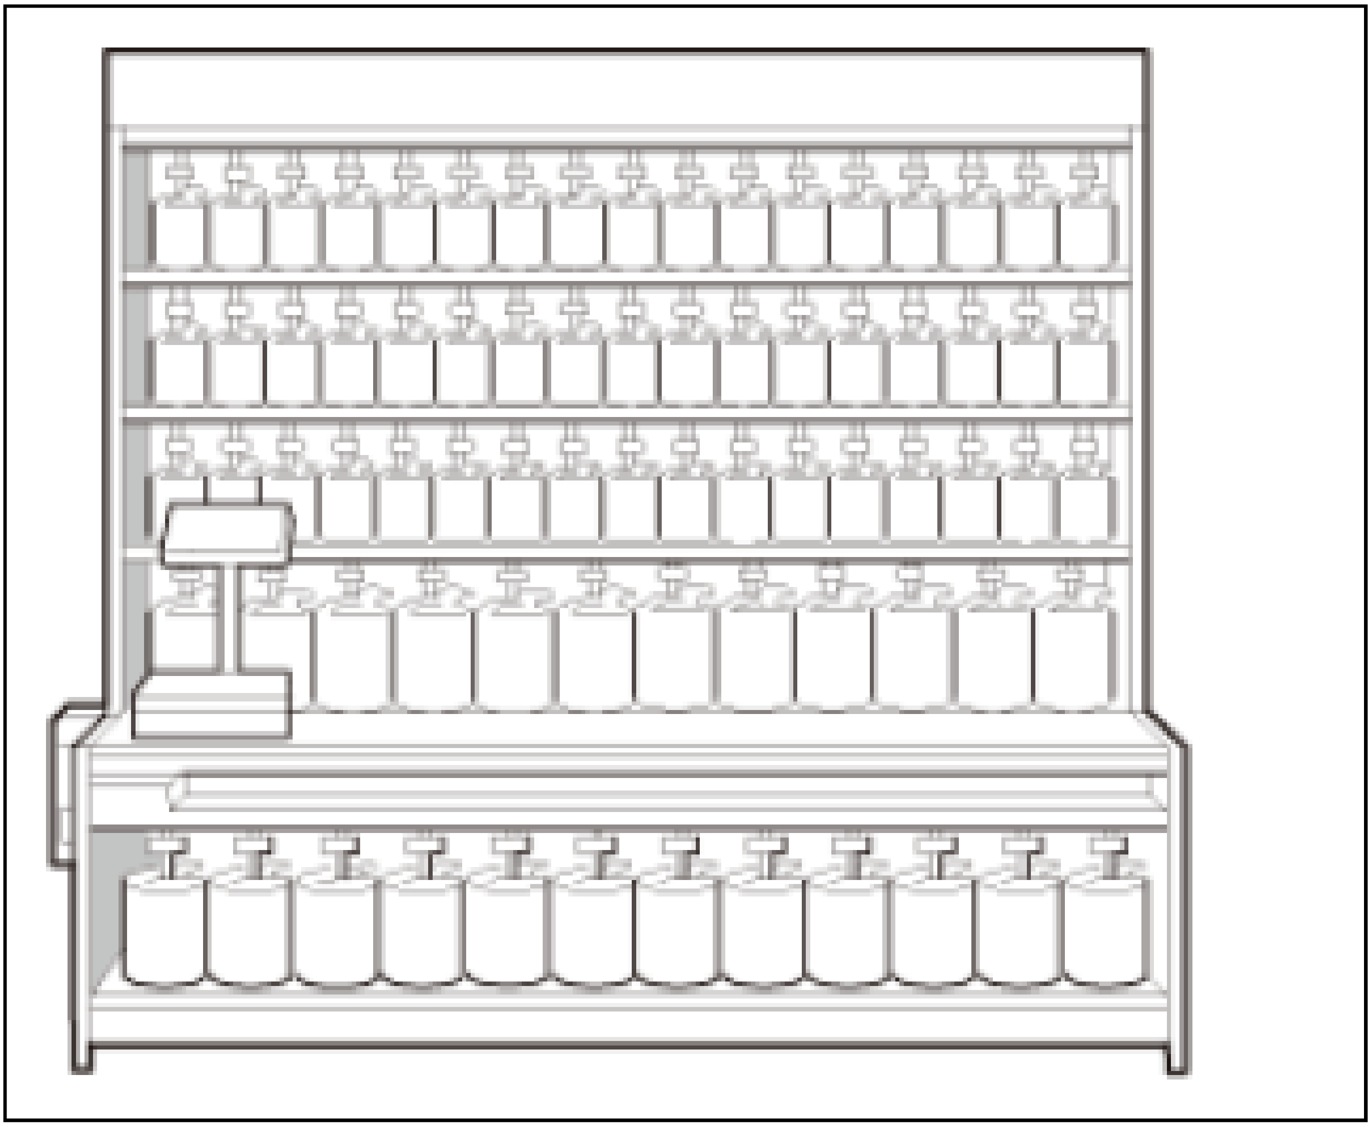
Test Plates

Tinplate, thick papers or magnetic sheets. Used for paint match testing to check color combinations



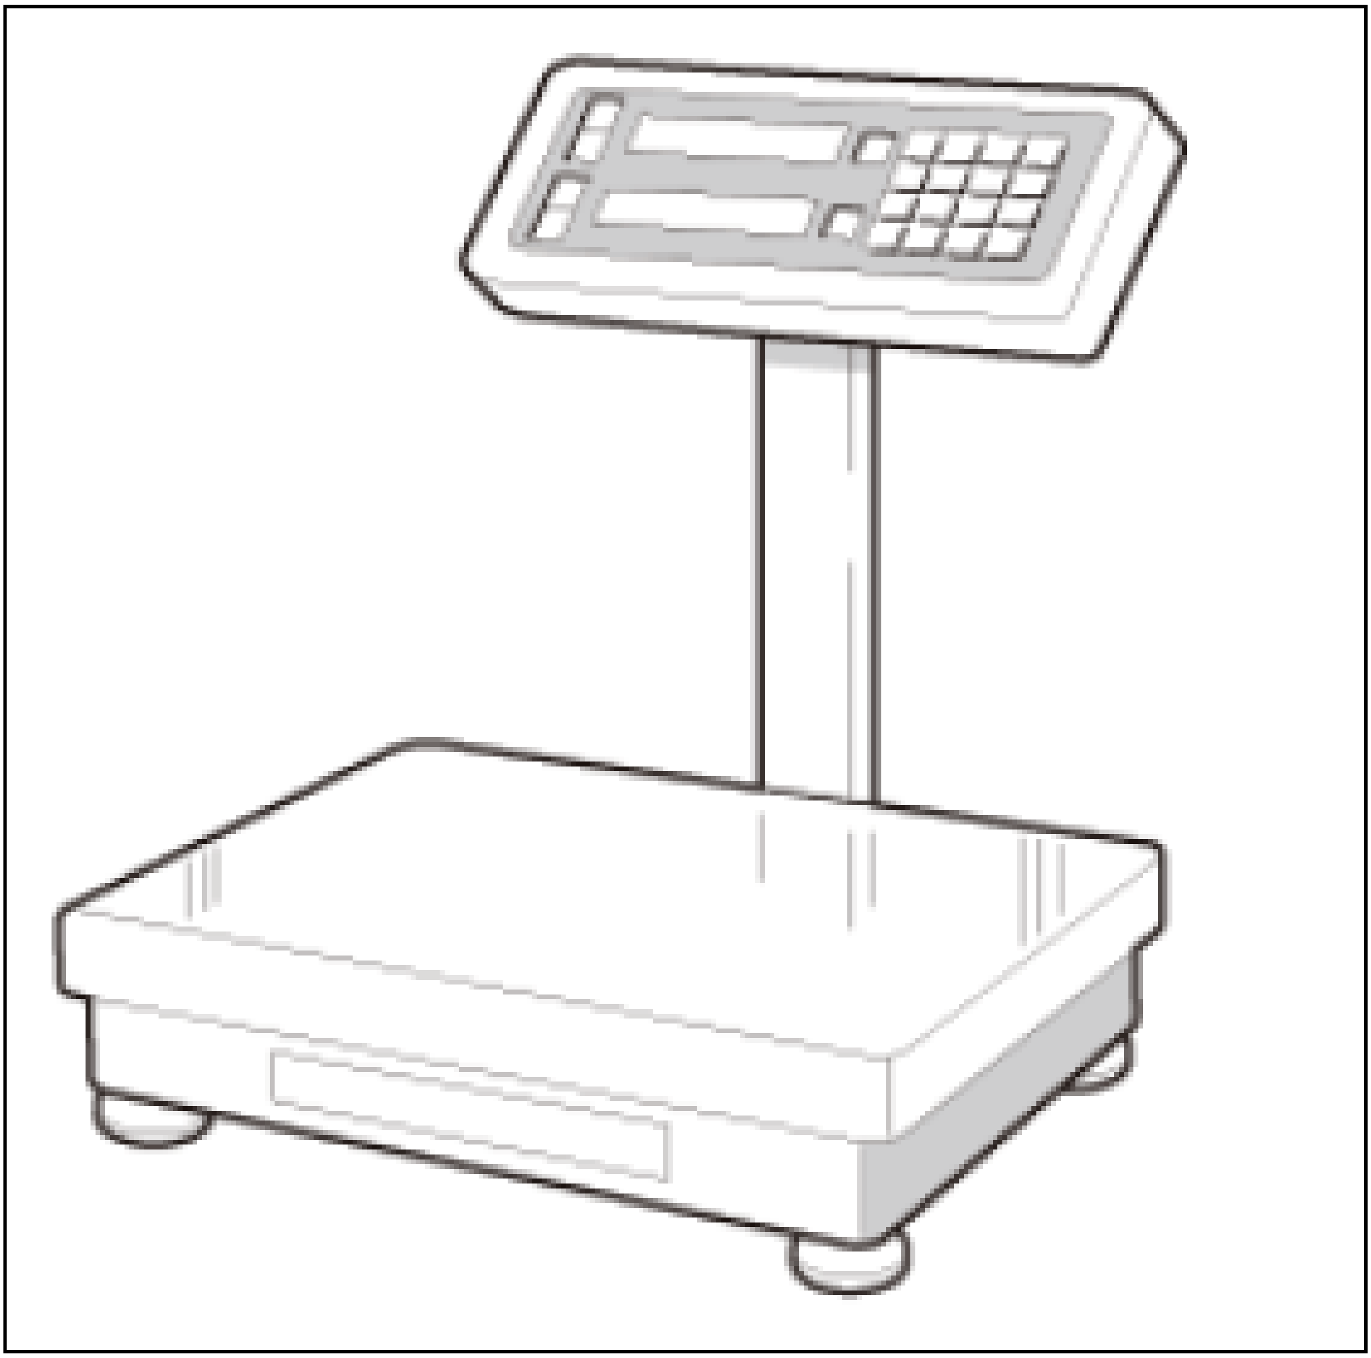
Agitator Covers

- Used to prevent the solvent content in the paint from evaporating. It helps easy stirring and pouring of paint. It is absolutely necessary for measured color mixing.
- Stainless steel is used for covers designed for water-based paint, to prevent corrosion.



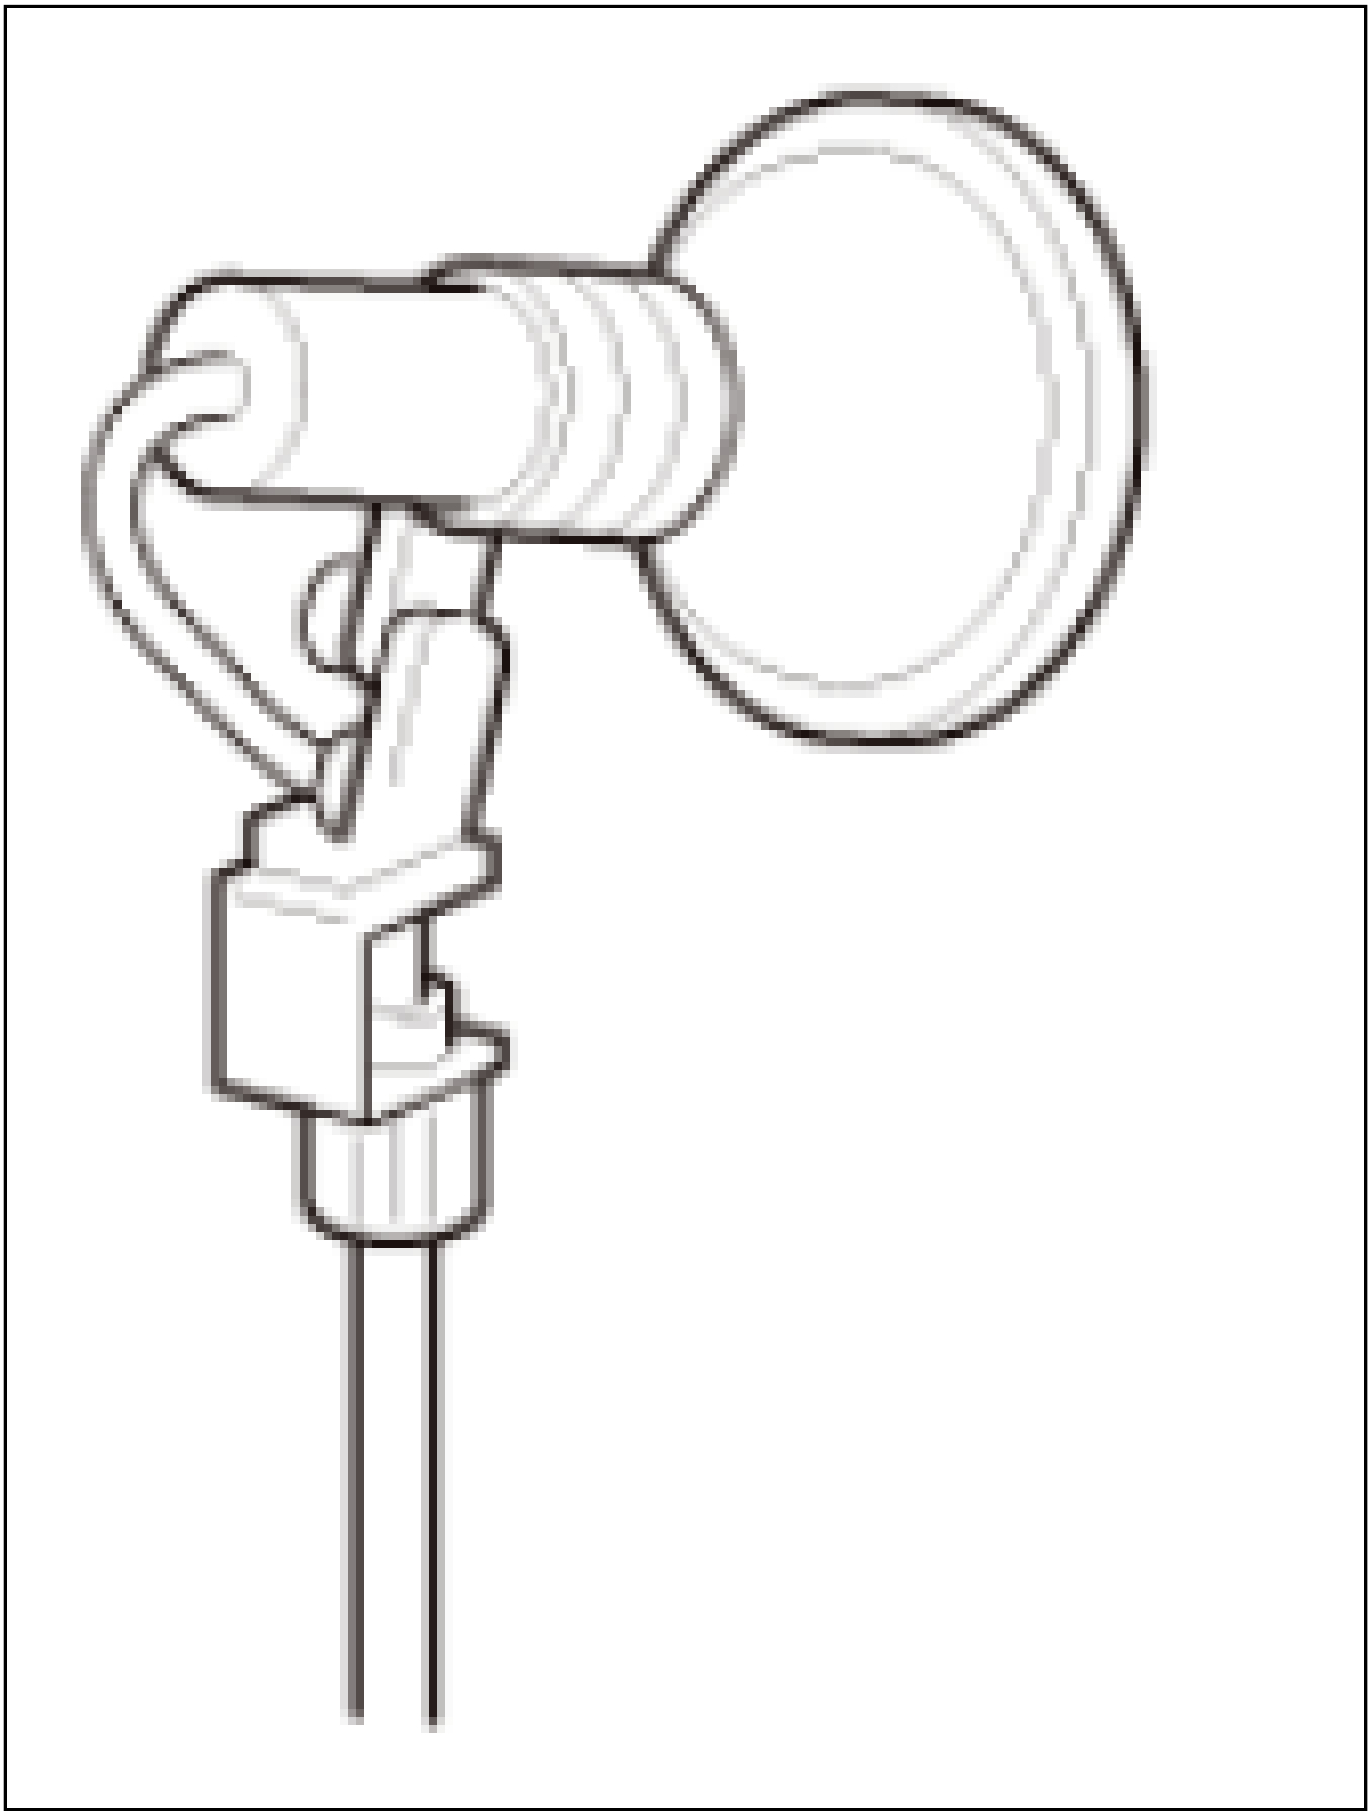
Paint Stirring Machine

Electrically powered shelf which enables to stir multiple paint containers at once.



Color Mixing Scale

Microcomputer scale offers multiple functions and accurate measurement for mixing colors. It should measure up to 6 kg (13.23 lb) in increments of 0.1 kg (0.22 lb). The scale can also be used for mixing dual-component paint and paint reducer/thinner.

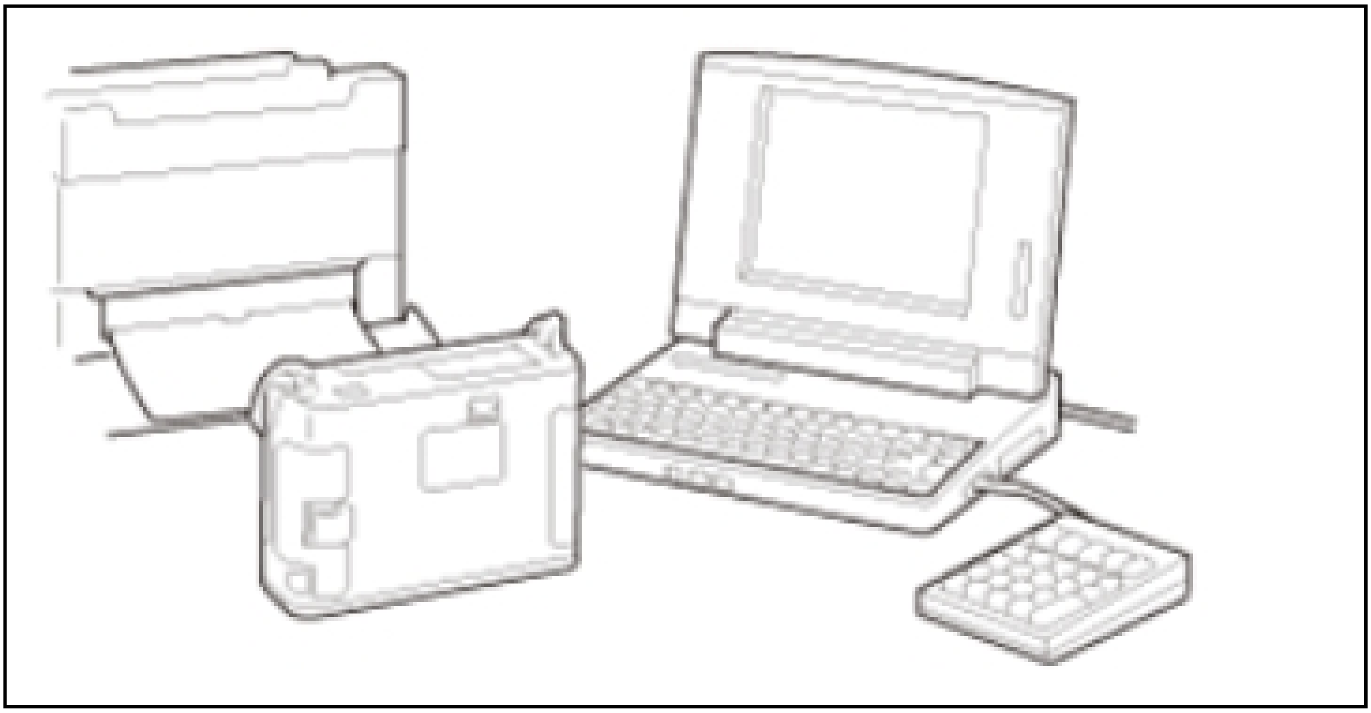


Color Mixing Light

This light offers a wavelength distribution very close to natural sunlight and is suitable for mixing colors indoors.

Colorimetry

Example of mechanical color measuring device (Computerized color measuring machine)



Comparison of two different colors is Colorimetry, which is very important for paint repair. There are two methods to do Colorimetry. One is visual comparison and the other is by using a colorimeter. During paint repair, especially for metallic and pearl colors, it is extremely difficult to use a mechanical device to accurately measure color. The visual approach is most common in shops.

Visual Color Colorimetry

- Vehicles are viewed under all sorts of light sources including the sunlight, florescent light, mercury lamp, etc. The repaired color on a car body must be perfectly matched with the surrounding color under any light source. Therefore, the mixed color must be compared under all possible light sources.
- The color of the light source is stipulated by CIE (Committee of International Electric Lighting).

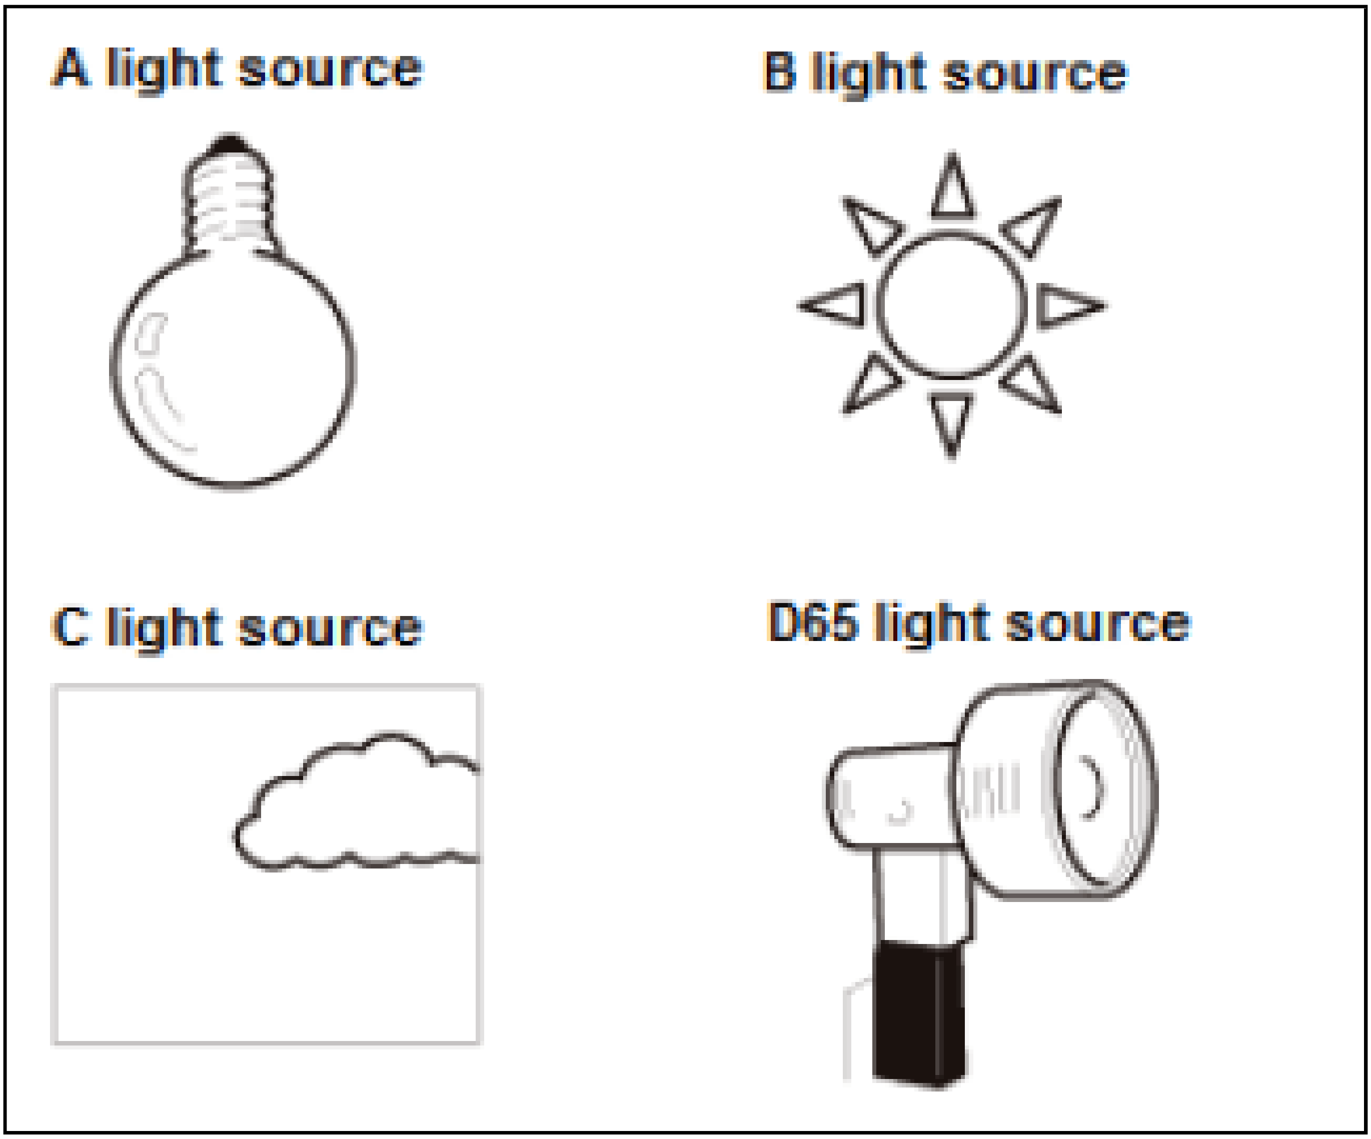
A light source: Electric light equivalent to that of a tungsten electric bulb.

B light source: Light equivalent to that of the direct sunlight at noontime.

C light source: Daylight including the light from the blue sky.

D65 light source: Artificial light equivalent to the light at noontime.

(Source) CIE light sources



A light source
B light source
C light source
D65 light source

Color Viewing Angle

When comparing colors, it is not sufficient to check the color only from one particular angle. For metallic and pearl colors in particular, the color will look different according to the direction of sight. Always check colors from different angles.

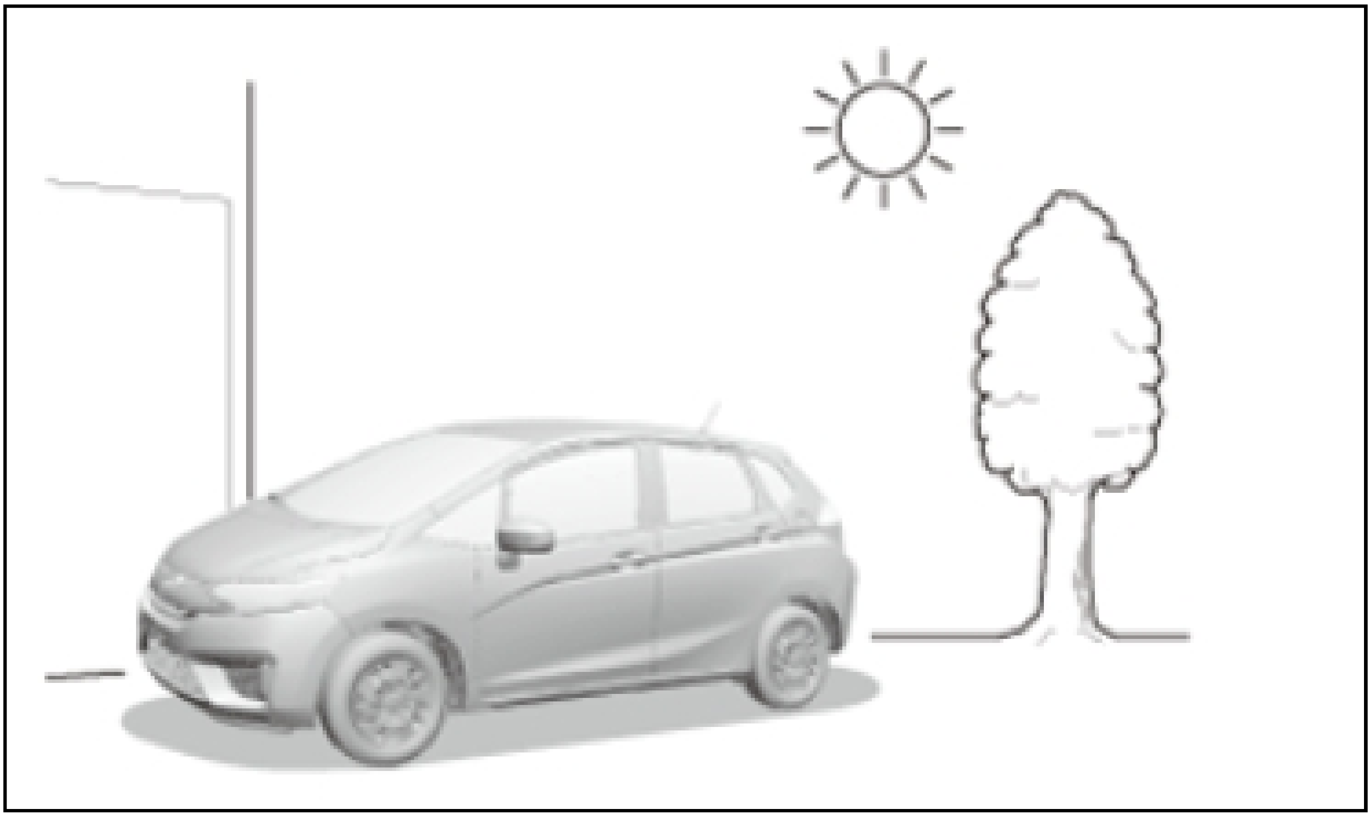
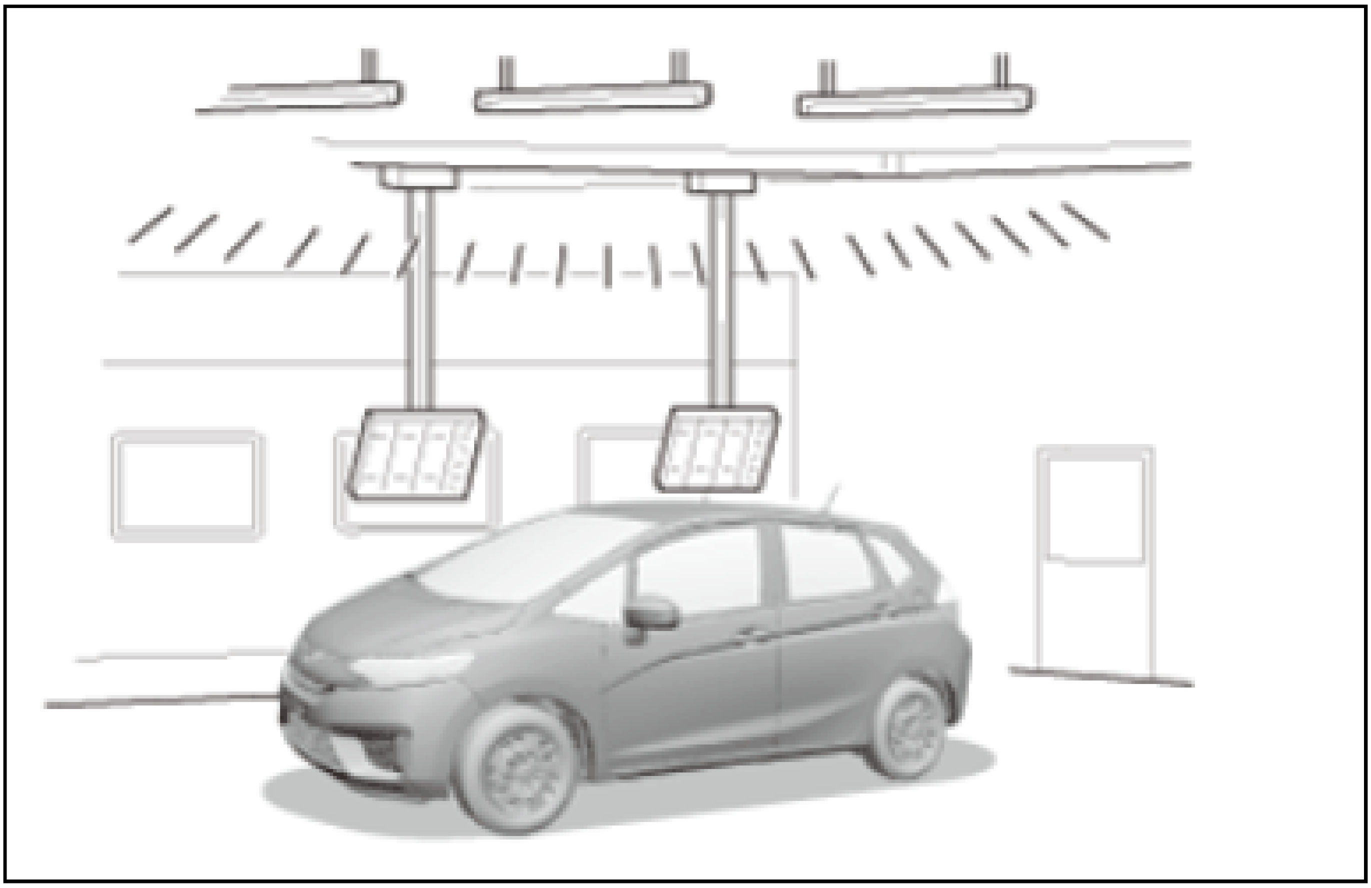
2. At a 45Â° angle
3. Side (at 15Â° angle)

Outside



Inside



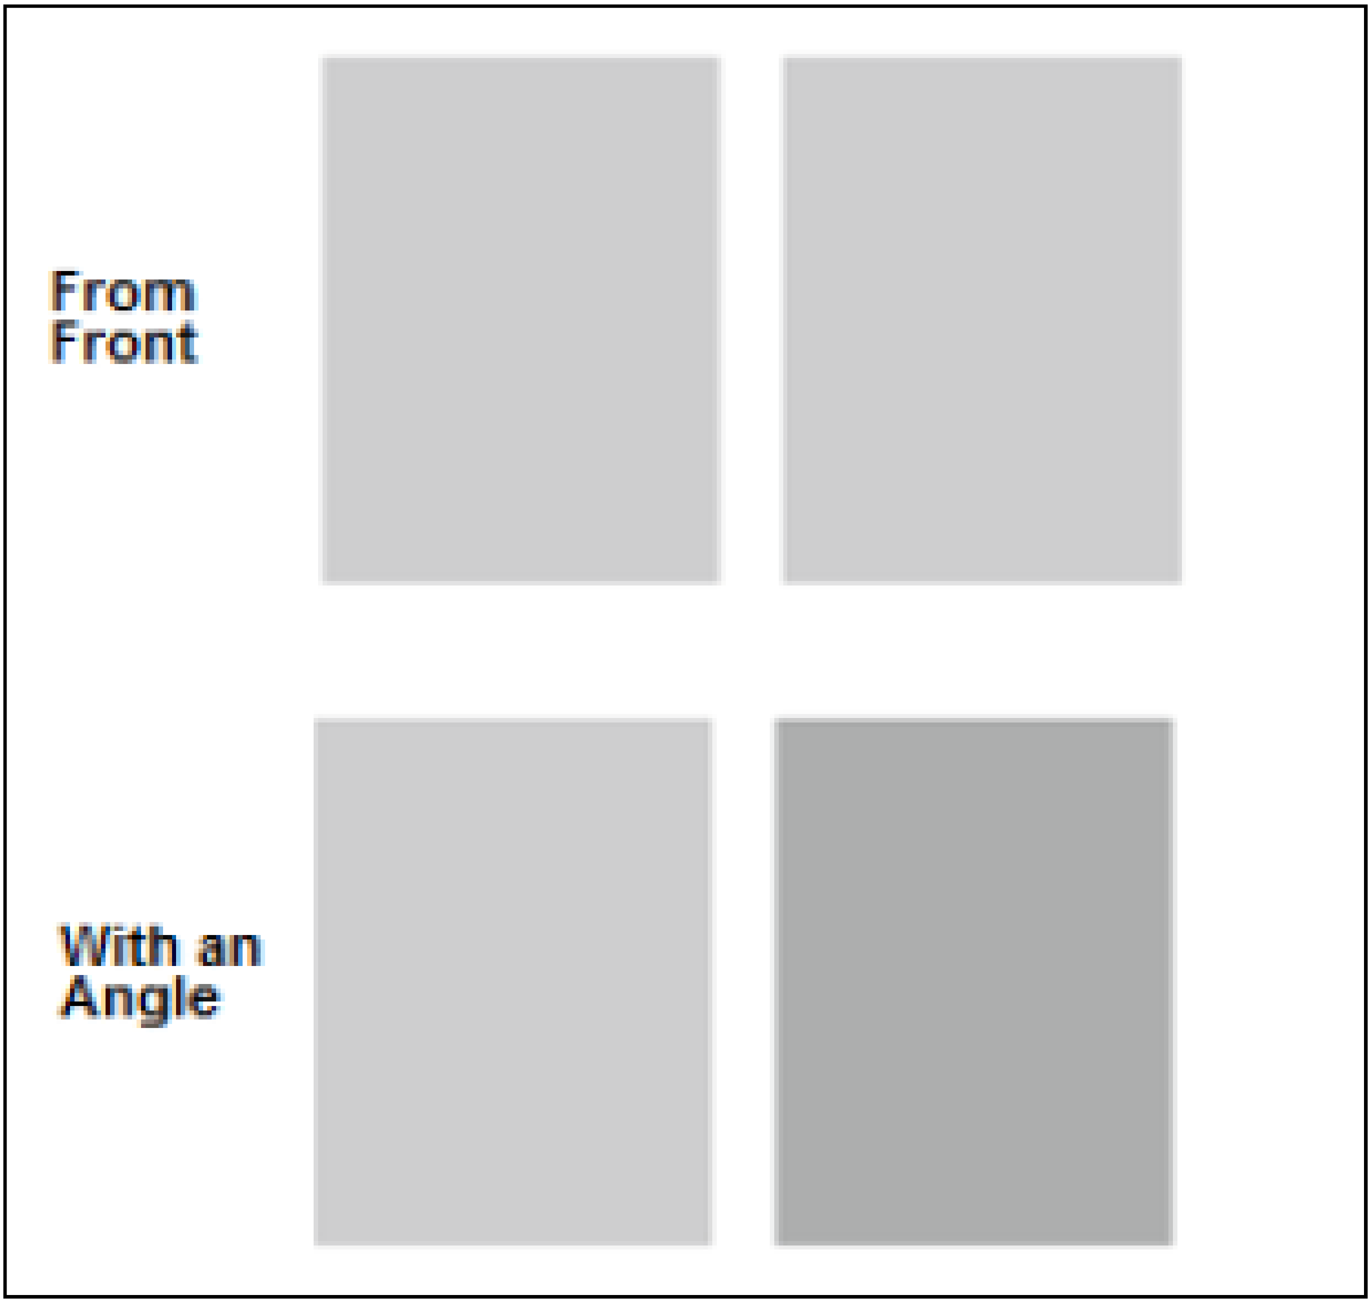
Conditional Identical Color (Metamerism)

- A phenomenon where two different colors look the same under a certain light source. This phenomenon occurs because of the spectral diffraction between the two colors. To avoid errors caused by this phenomenon, always use the same color pigments as those used in the color samples.
- In order to confirm whether the colors are conditionally identical or not, compare the colors under the natural light (outdoors), and then again under the florescent and/or infrared lights (indoors).

Flip-Flop Phenomenon

A phenomenon where two colors that look the same from a certain angle are seen differently when viewed from different angles. This phenomenon is caused by the differences in the levels of transparency caused by the kinds and sizes of pigment used.

It often happens that the two colors look the same when viewed straight ahead, but different when viewed at an angle.



Primary Color Characteristics

When mixing colors, it is important to recognize the characteristics of primary colors in whitening, transparency, and weather resistance, etc. Unless the problems of conditionally identical colors and the directions of metallic colors are well understood, correct color matching is unlikely.

White Mixing Of Primary Colors

The hue produced when white is mixed to a primary color is called "Whitened tint" of the color. It is very important to understand the nature of tone and its direction of the primary colors, particularly for mixing metallic base with primary colors, and mixing primary colors with white.

Transparency

The transparency of a certain color depends upon the amount of pigment in the primary color, but more than that, upon the size of pigment particles. Even if the same pigments are used, the more transparent it is, the finer the size of the pigments are. Transparency level is one of the main factors effecting the direction of the metallic color.

Weather Resistance

Most primary colors have good weather resistance. But they can also fade quickly if incorrectly handled.

Bleeding

Bleeding is a phenomenon in which the old paint layers' color blots into the newly painted surface.

Bronzing

Bronzing is a phenomenon in which a golden metallic luster appears on the surface of a newly painted layer. It tends to occur when blue or green colors are used without being diluted mixed other colors or liquid.

Metallic Base

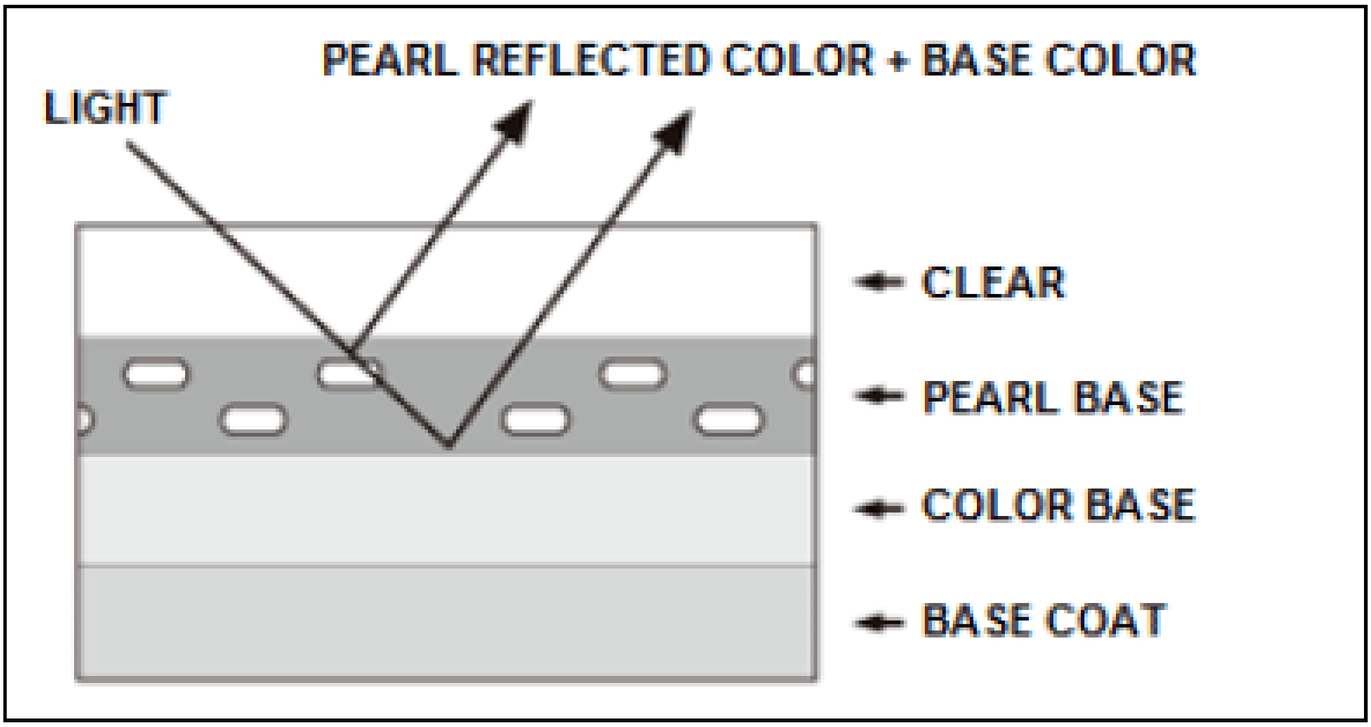
Metallic paint has tiny dispersed aluminum particles. There are many types of metallic paints. When shooting metallic colors, it is important to understand their characteristics such as direction, size of particles, luster, brightness, whiteness, etc. It is also extremely important to compare the color from various angles and under different light sources.

Pearl Base

- A special kind of paint containing pigments with pearl luster (pearl pigments). There are many different kinds depending upon colors, size of pigment particles, etc. When mixing paint, the most appropriate pearl base must be used that corresponds to the color sample
- There are two methods of applying pearl paints, three-coat pearl painting and the two-coat pearl painting. Unlike normal metallic painting, deep tone color layers can be achieved, depending upon the luster and tint of the pearl pigments

Three-Coat Pearl Painting

This paint is a compound of base colors and pigments with pearl luster. The paint layer visible to the eyes is comprised of color base, pearl base, and clear base.



Two-Coat Pearl Painting

This paint is a compound of pearl pigments, chromatic pigments and aluminum power. The paint layers are the same as standard metallic colors.

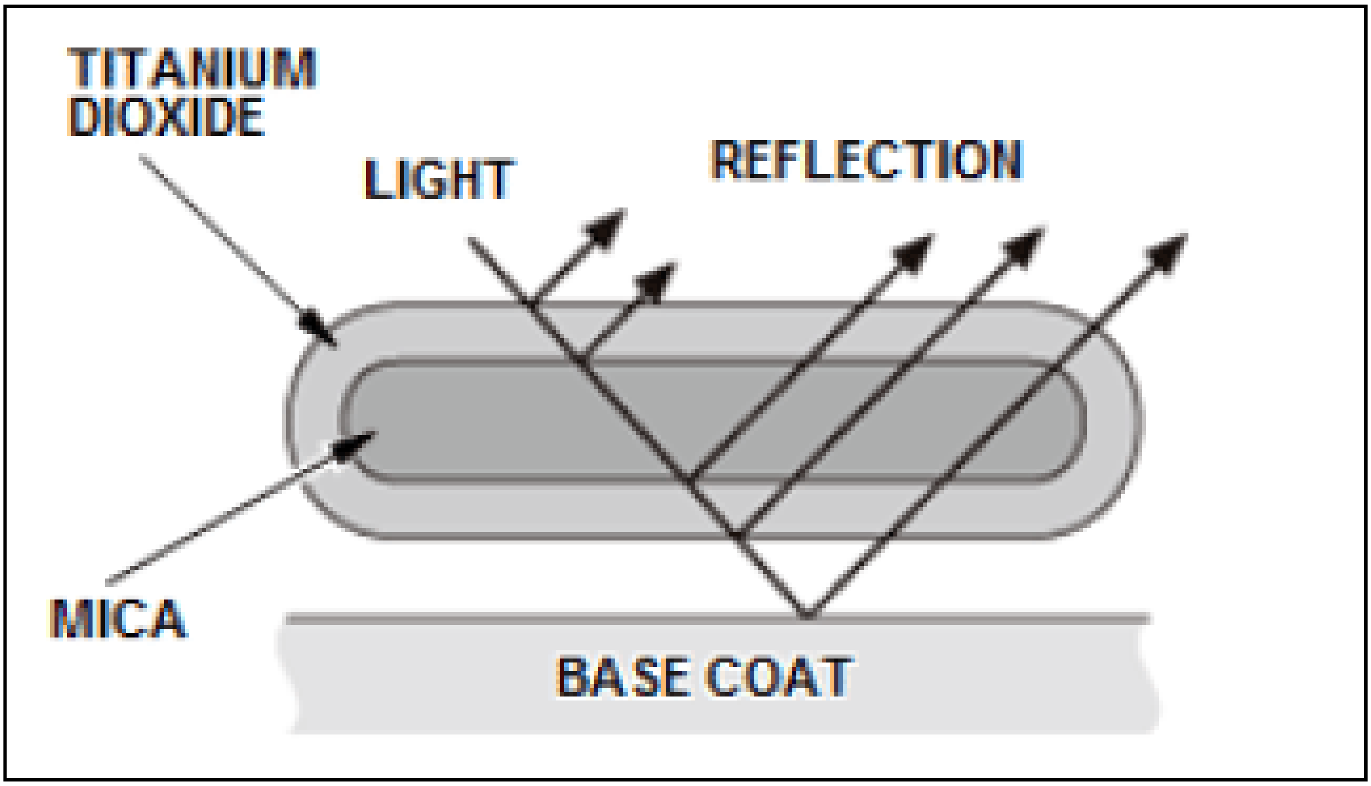
Differences Between Pearl Pigments And Aluminum Pigments

Pearl Pigments

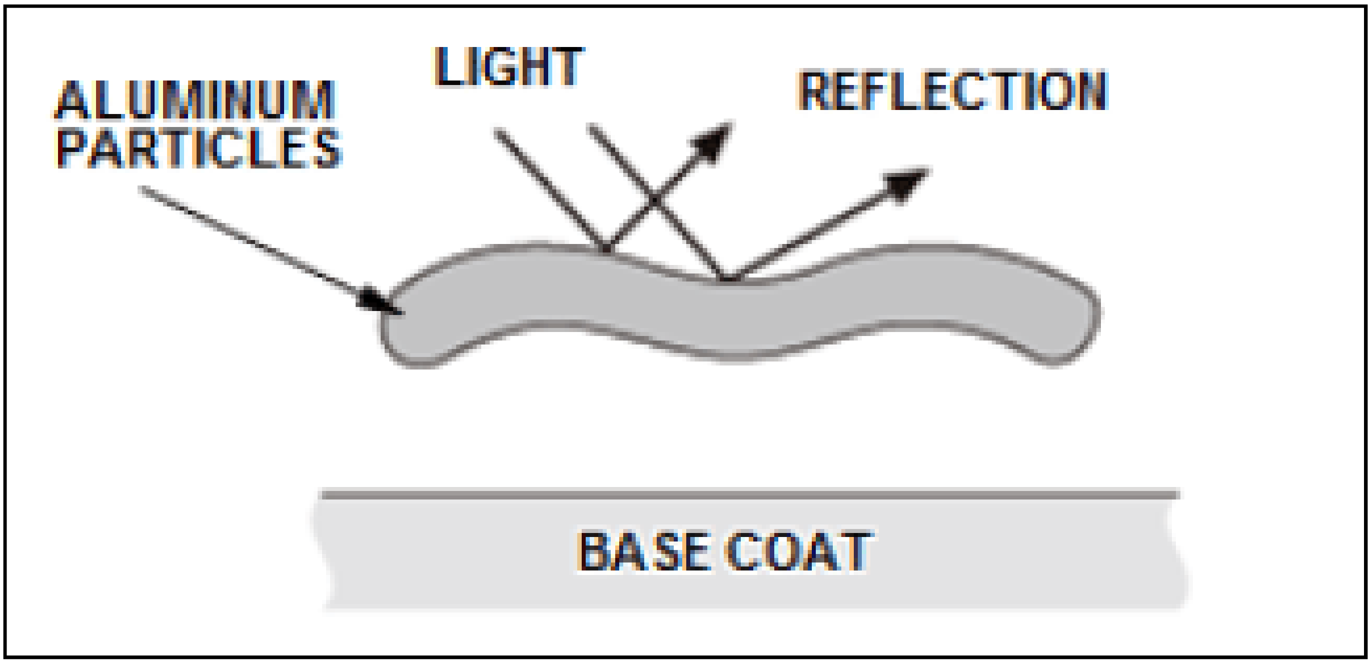
Mica is a colorless and translucent mineral with pearl-like luster. It has been widely used for cosmetic products. The pearl pigments used for vehicles includes mica filmed with titanium oxide to give brightness. The pearl pigments used in pearl paint, are also called mica paint.



TITANIUM DIOXIDE
LIGHT
REFLECTION
MICA
BASE COAT

Aluminum Pigments

Aluminum foil is powdered and ground into a fine flake form, and it gives brightness in the paint film by reflecting light. There are many sizes in aluminum flake particles (mostly 10 to 20 µm) available. The larger flakes provide a more garish brightness and the smaller flakes provide a smoother brightness.



ALUMINUM PARTICLES
LIGHT
REFLECTION
BASE COAT

Graphite Base

- Graphite pigment is one of the graphite allotropes. It has been traditionally used as a pigment for flexible primer for plastic parts. However it is now also widely used in paint topcoat colors.
- The particle size of graphite is almost 5 times of a carbon pigment, which is widely used for black. In spite of its dark gray luster, the gap between particles is too large to have a high covering capability.

Comparison between graphite color and metallic color

When viewed from straight ahead, metallic or pearl shininess is visible in low light over the whole for metallic or two-coat pearl paint. Mixed with graphite pigment and viewed from low angles, its luminosity becomes much lower and deeper with less brightness and shine.

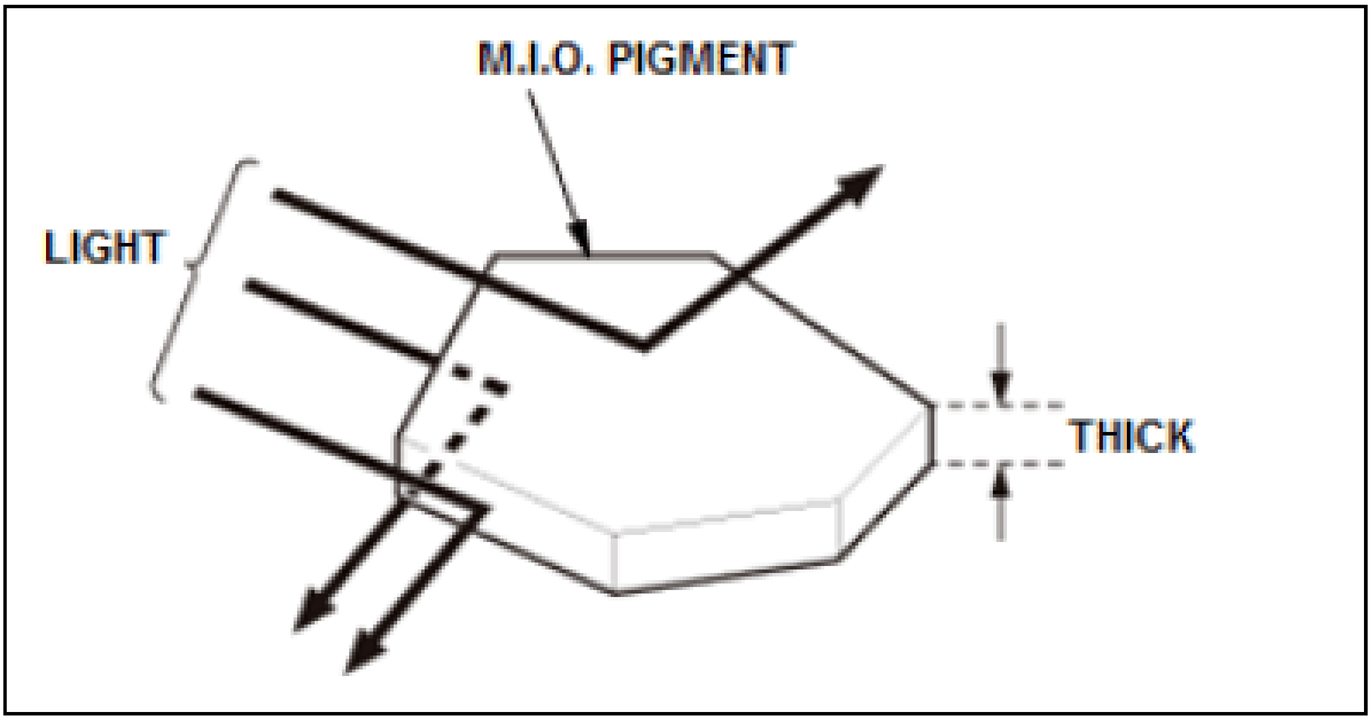
M.I.O. Base

MIO (micaceous iron oxide) is a ferric oxide of a crystal structure of size 15pm. This pigment has unique features that are not shared with the conventional pigments as follows:

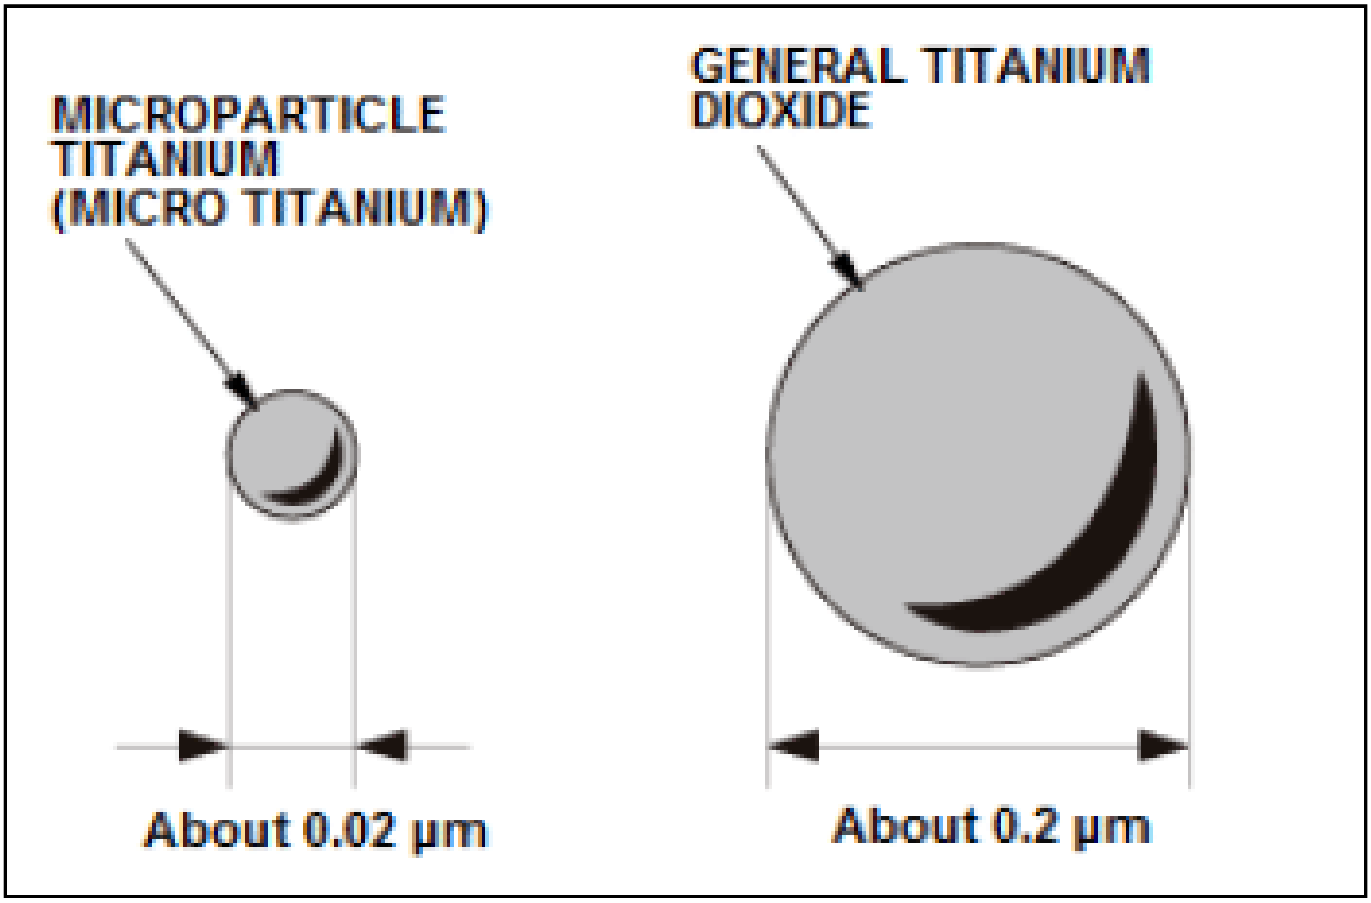
- It is very thick (almost ten times that of aluminum pigment) and reflects light on its side surface strongly
- The paint surface is very smooth and reflects light strongly.
- When exposed to light, it shines strongly and three dimensionally like a diamond.
- Its drawback is that, because of its heavy specific gravity it tends to be deposited in the paint.
- Indoors or in shade, it appears to be a dark and deep solid color. However under direct sunlight, it shines like many diamonds buried under the paint's surface. Because of this unique feature, this color cannot be accurately mixed using a metallic or pearl base substitute.



M.I.O. PIGMENT
LIGHT
THICK

Opal White

Though the composition of pigments are the same as that for ordinary white paints, this paint is translucent as the titanium dioxide pigment's size is very small. Because of this, coverage capacity is limited. It is normally used as opal base (opal color), with other colors or mixed with aluminum pigments.



MICROPARTICLE TITANIUM (MICRO TITANIUM)
GENERAL TITANIUM DIOXIDE
About 0.02 μm
About 0.2 μm

Features of Opal Color

This paint has the same paint layer structure as that of metallic paints with fine grain titanium (micro titanium) used as a base coat. When this paint is applied, the yellowish metallic base color is seen from straight ahead. When viewed from a low angle sideways, it looks bluish. As a whole, it has a charm of a two-color opal tone

MICRO TITANIUM PIGMENT

Crystal Blue (Phthalocyanine Flake Pigment)

The phthalocyanine pigment used as ordinary blue color is crystallized and flaked for this crystal blue pigment. The light reflected on the surface shines like bronze and light penetrated through the paint surface reflects blue.

Crystal Brown (Plate-Like Iron Oxide Pigment)

The main component of this pigment is a flake-like iron oxide that is also used for red rust colored pigment. It is thin and shines like pearl mica.

BODY PAINT REPAIR

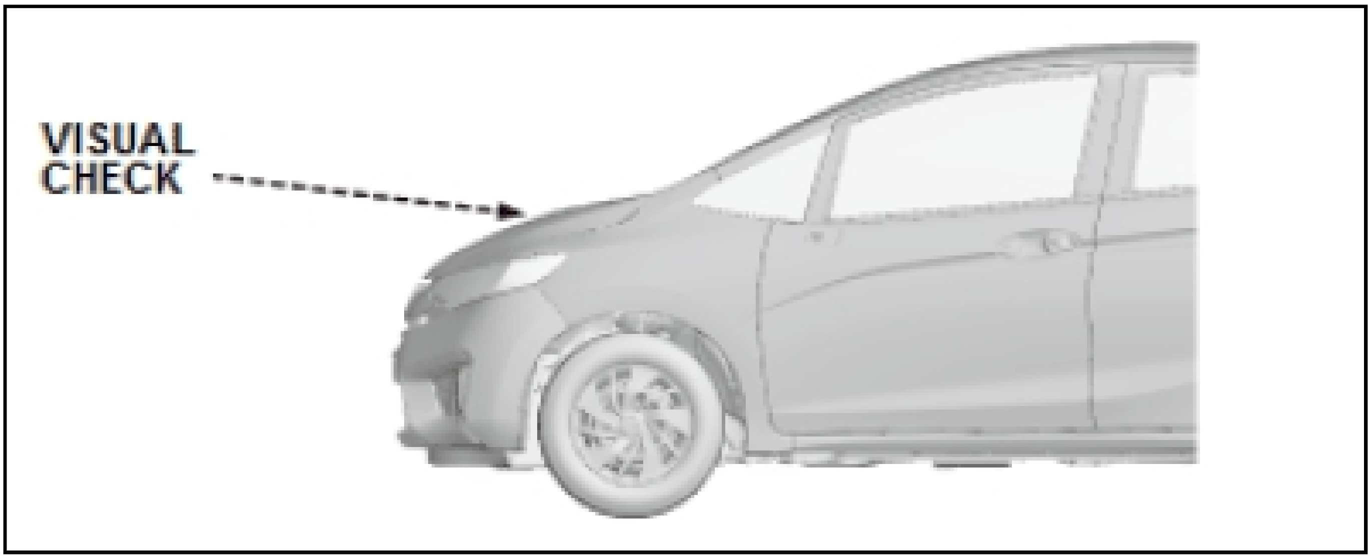
BEFORE STARTING PAINT REPAIR

Determining Paint Finish And Compatible Repair Materials

In paint repair, it is important to identify the old paint layer type and its state of deterioration. To correctly evaluate the old paint layer and decide on the type of paints to be used, follow these methods.

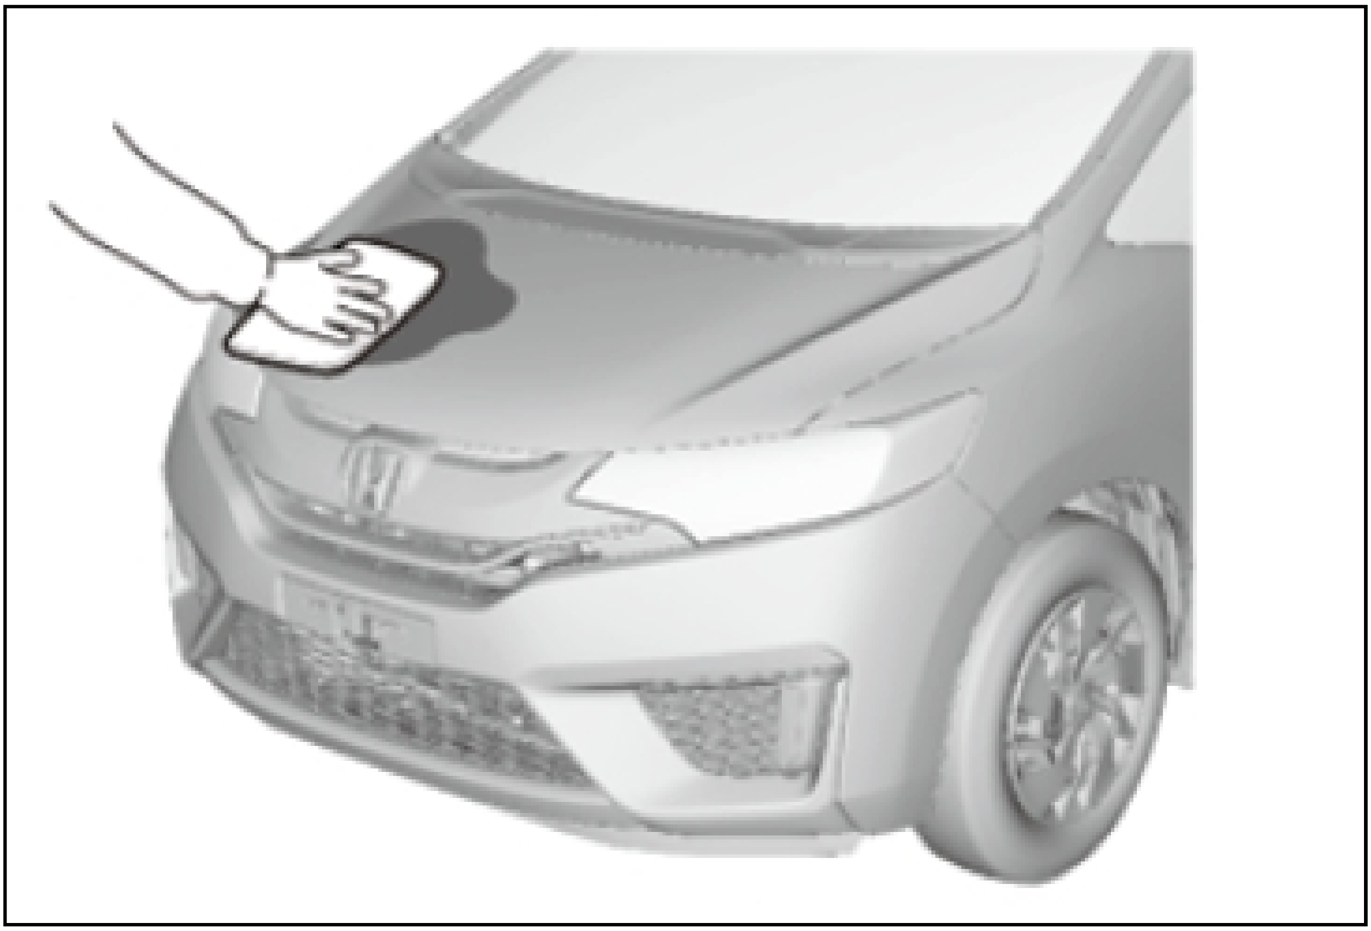
Visual Check

Check the surface appearance and level of polish.



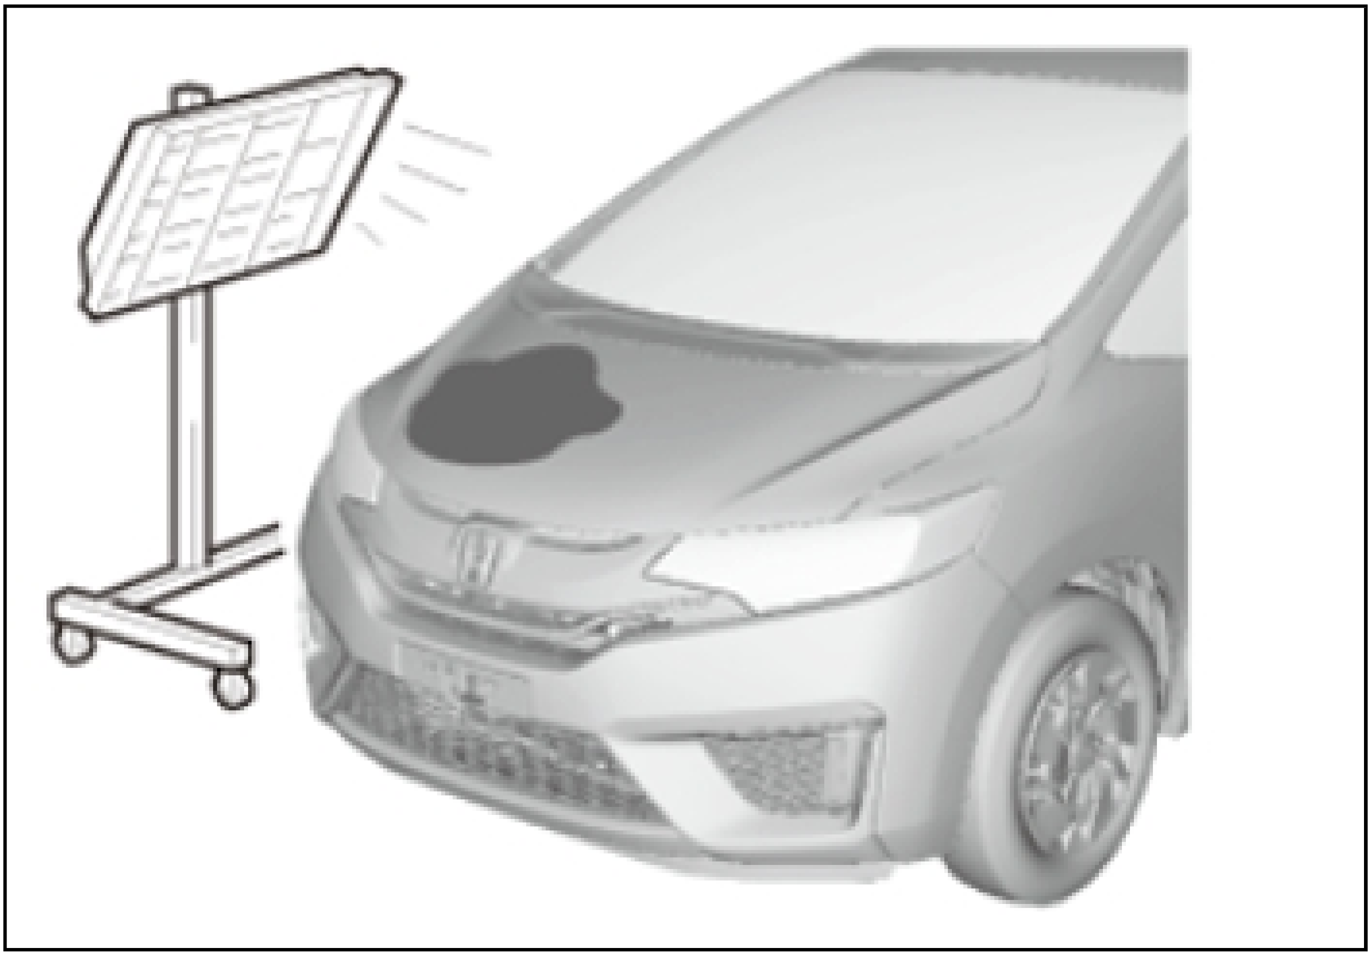
Solvent Method

Wipe the paint film using a cloth wetted with lacquer thinner.

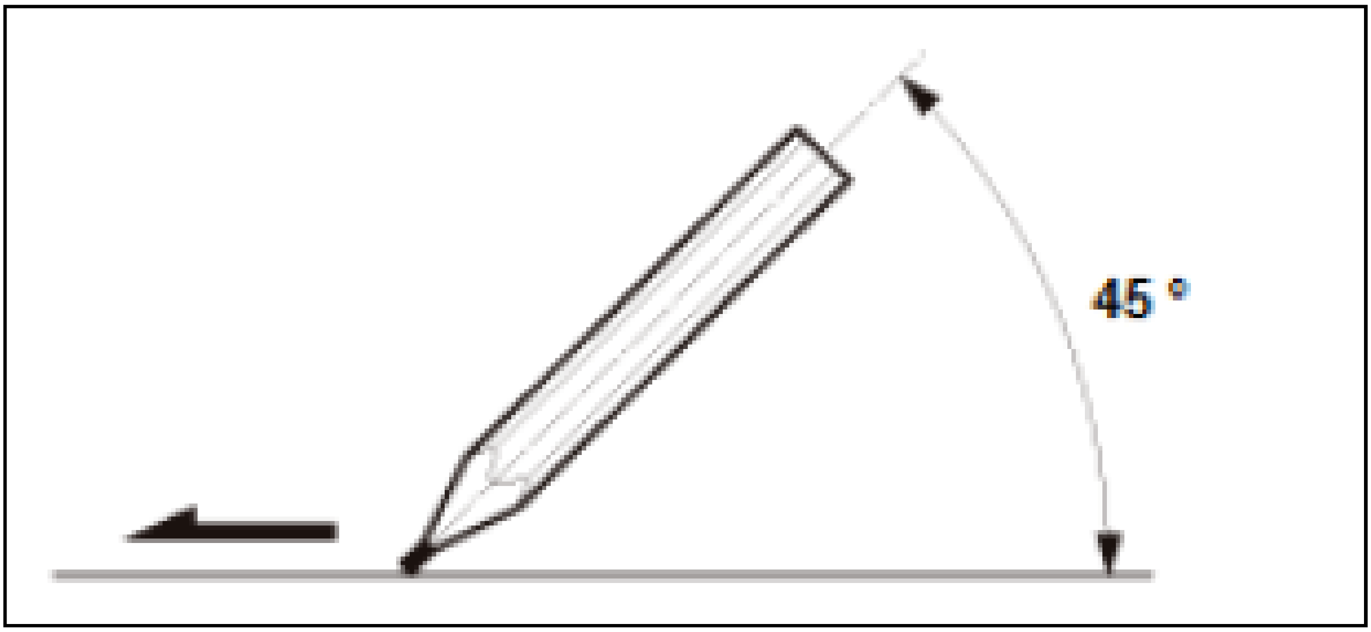


Thermal Method

Polish with P800 to P1000 sandpaper, and heat the sanded area with an infrared lamp to 176Â°F (80Â°C) or higher.



Quick Check Pencil Method



Press a flattened drawing pencil tip on the paint layer as shown. The hardness of the pencil which does not mar the paint layer identifies the paint layer hardness in the chart on the next page.

Old Paint Film Status By Judgment Method

Type of Paint Film	Judgment Method			
	Visual Check	Solvent Method	Thermal Method	Pencil Check
Melamine baked type	Granulated	Insoluble	No change	2H
Acrylic baked type	Finely granulated	Insoluble	No change	2H
Baked primer type	-	Insoluble	No change	HB-H
NC lacquer type	Polished	Soluble	No change	F-H
NC denatured acrylic lacquer type	Polished	Soluble	Slightly softened	B-HB
CAB straight acrylic lacquer type	Polished	Soluble	Softened	B-HB
Acrylic Urethane Type	Mirrored	Insoluble	No change	H-2H
Quick drying acrylic urethane type	Mirrored	Hard to be solved	No change	H-2H

- Not all paint types can be used for paint repairs, depending on the condition of the old paint layers.
- When the old paint layers are a baked or an acrylic urethane type that is not dissolved by lacquer thinner. Or if the old paint layers are totally removed, including the basecoat, lifting rarely occurs.
- If the old paint layer is a lacquer type that is dissolved by lacquer thinner, lifting often occurs during paint repair.
- For this reason, repair paint types are limited.
- Types of top coat paint corresponding to old paint layers.

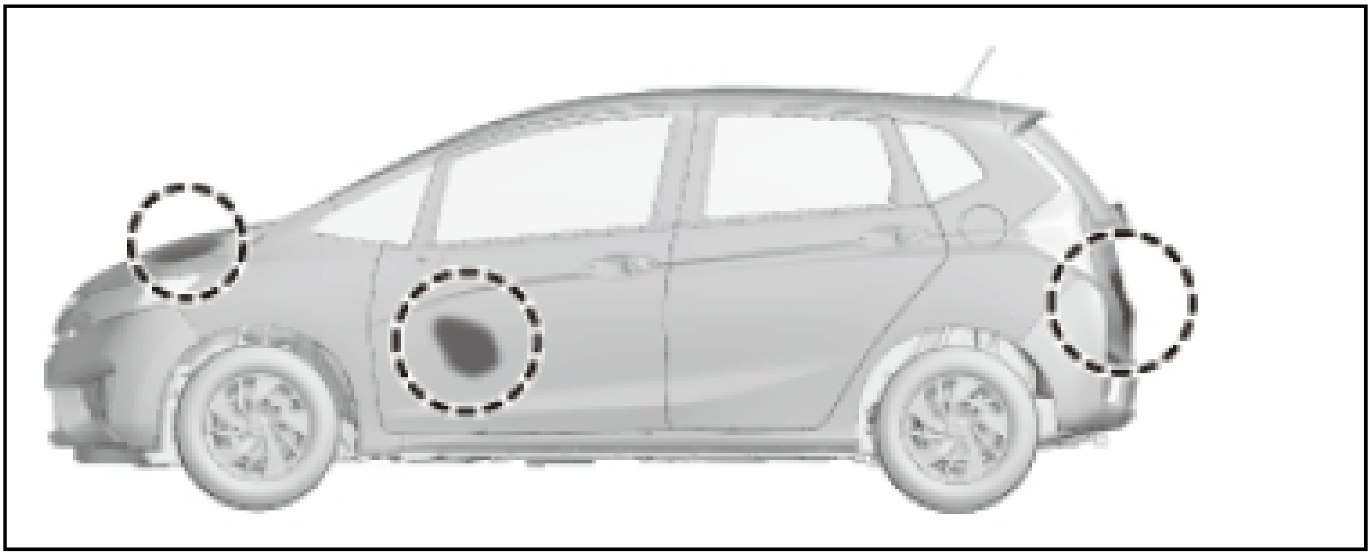
Paint Repair Methods

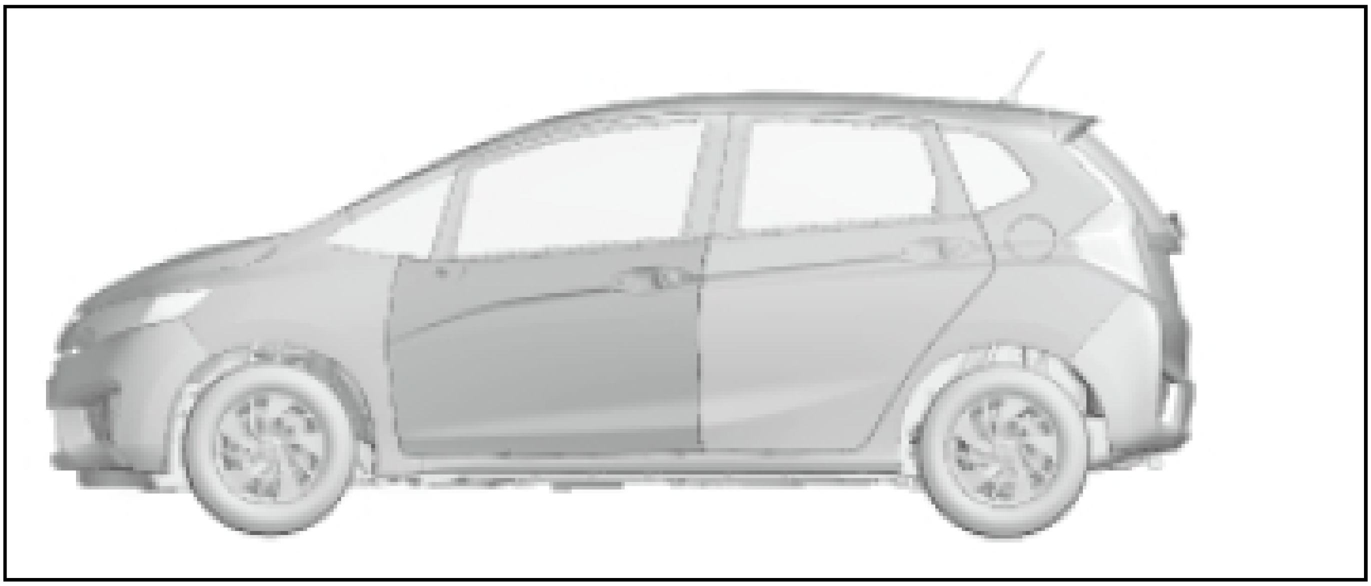
Spot Gradation Painting

A repair method to be used for a narrow range of the damage for doors, hood etc. In order to minimize the differences in colors and surface appearances between the repainted area and the surrounding panel, gradation paint is applied.



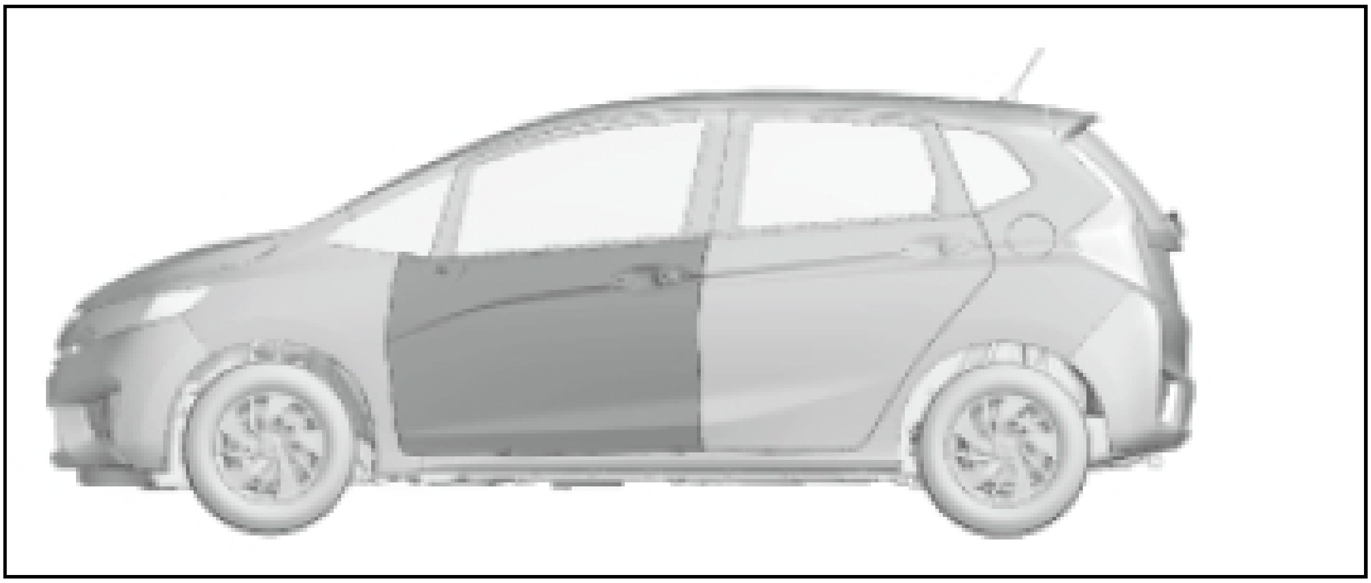
Block Gradation Painting

A repair method for enamel base with metallic colors by applying the gradation painting partially Clear is painted to a section of block (the whole panel). It also is used for solid colors in some cases.



Block Painting

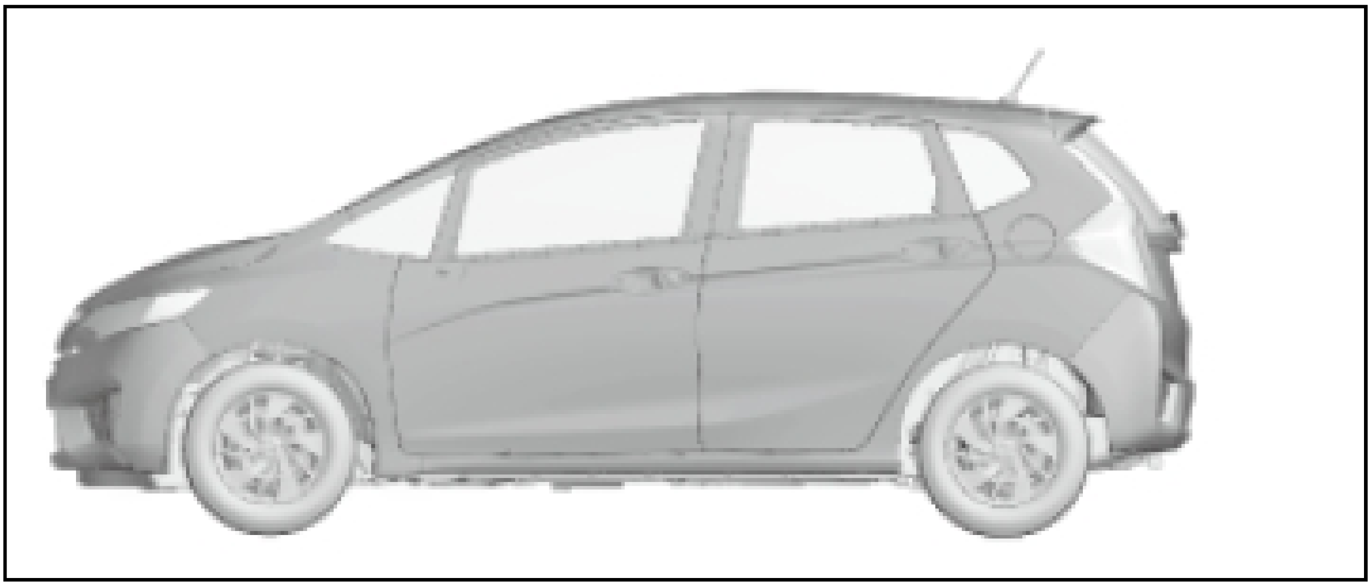
A repair method to apply paint for each panel, as the body panels are divided into individual blocks such as a door, hood etc. The entire panel is painted. No gradation painting usually is applied except for the part between roof panel and rear pillar depending on the situation.



Whole Painting

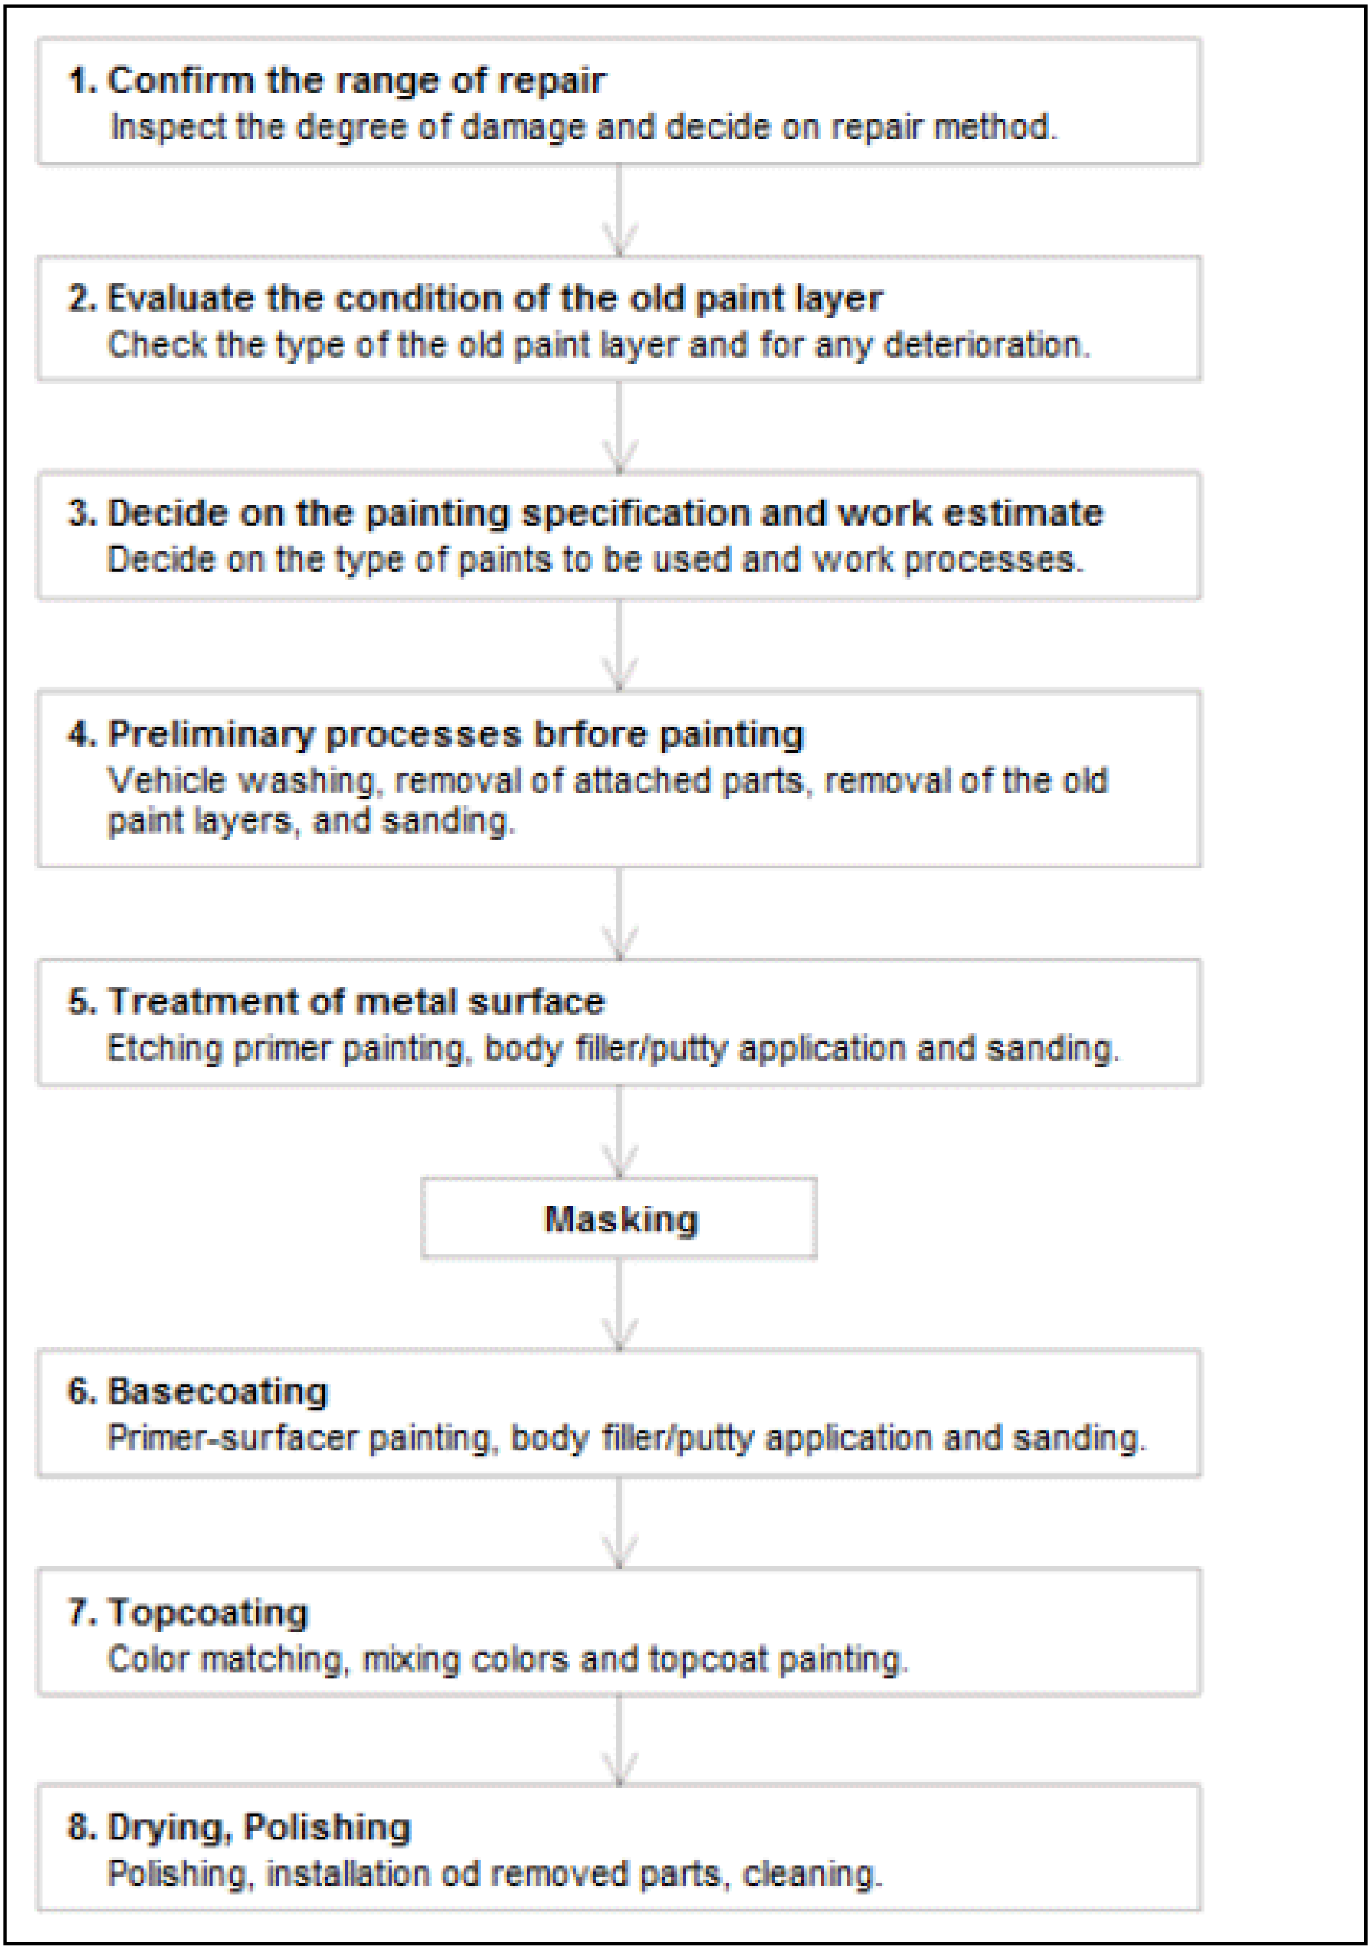
A repair method to apply the same color or new color to the entire vehicle body.

In a case of numerous damaged spots spread over the vehicle body the whole painting is much better than the partial color repairing.



Work Processes And Descriptions

Generally, paint repair on a vehicle body is carried out using these steps.



1. Confirm the range of repair
Inspect the degree of damage and decide on repair method.

2. Evaluate the condition of the old paint layer
Check the type of the old paint layer and for any deterioration.

3. Decide on the painting specification and work estimate
Decide on the type of paints to be used and work processes.

4. Preliminary processes brfore painting
Vehicle washing, removal of attached parts, removal of the old paint layers, and sanding.

5. Treatment of metal surface
Etching primer painting, body filler/putty application and sanding.

Masking

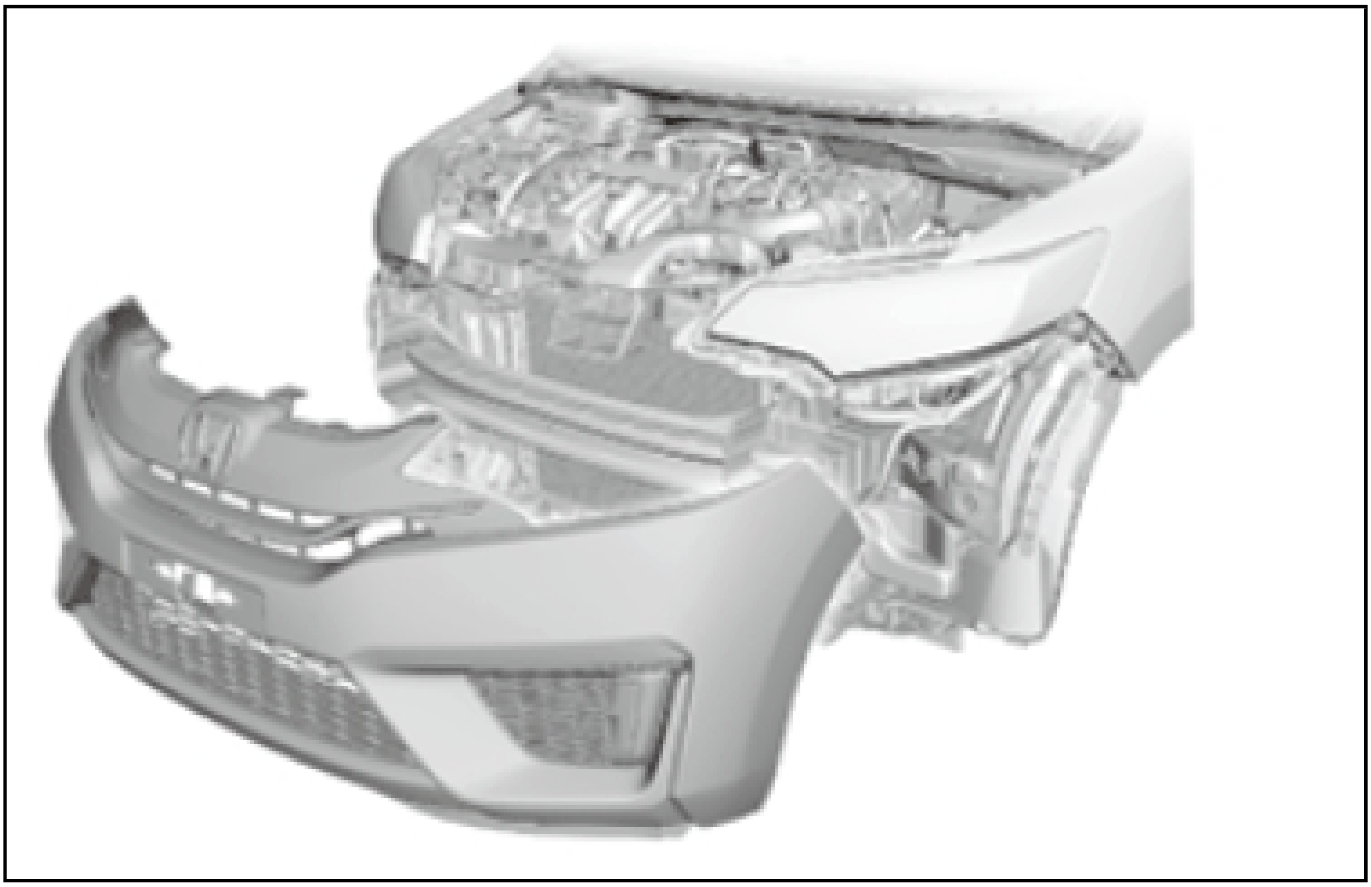
6. Basecoating
Primer-surfacer painting, body filler/putty application and sanding.

7. Topcoating
Color matching, mixing colors and topcoat painting.

8. Drying, Polishing
Polishing, installation od removed parts, cleaning.

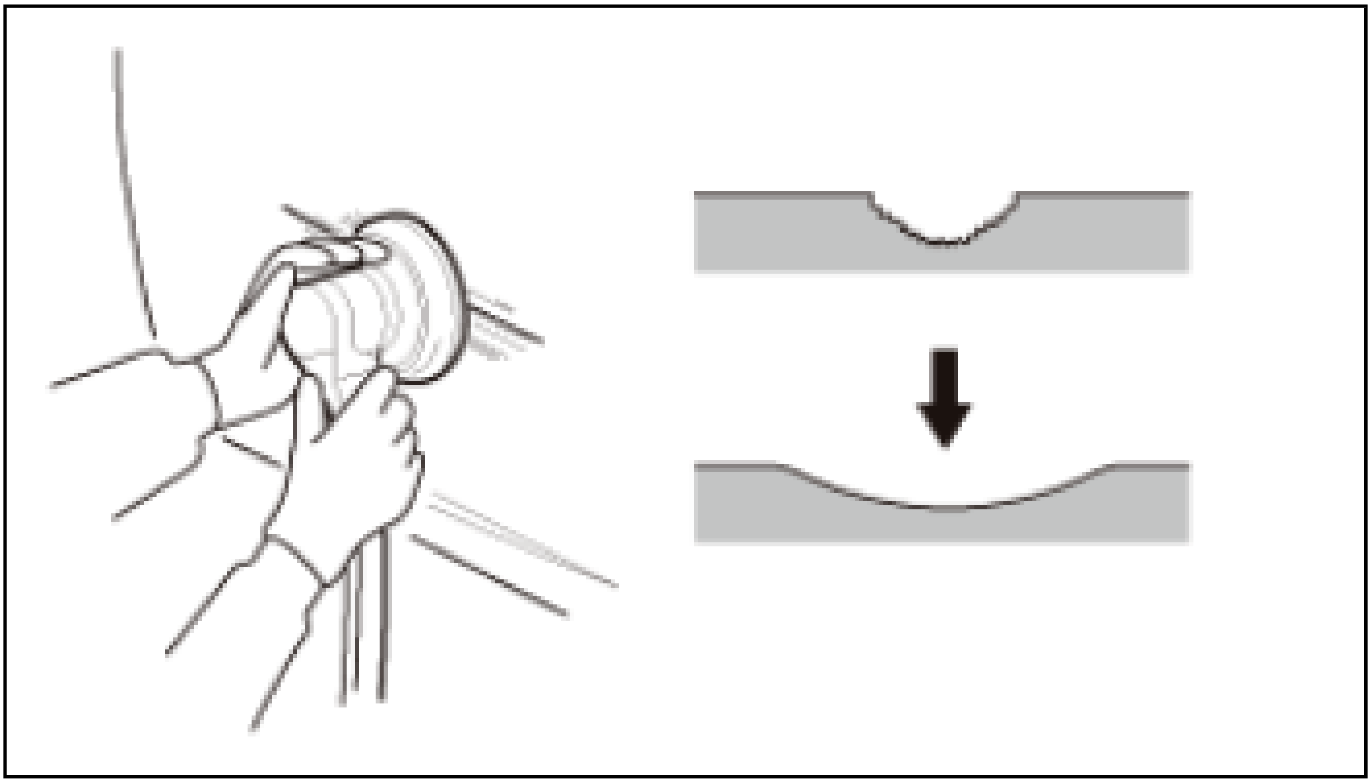
PAINT REPAIR

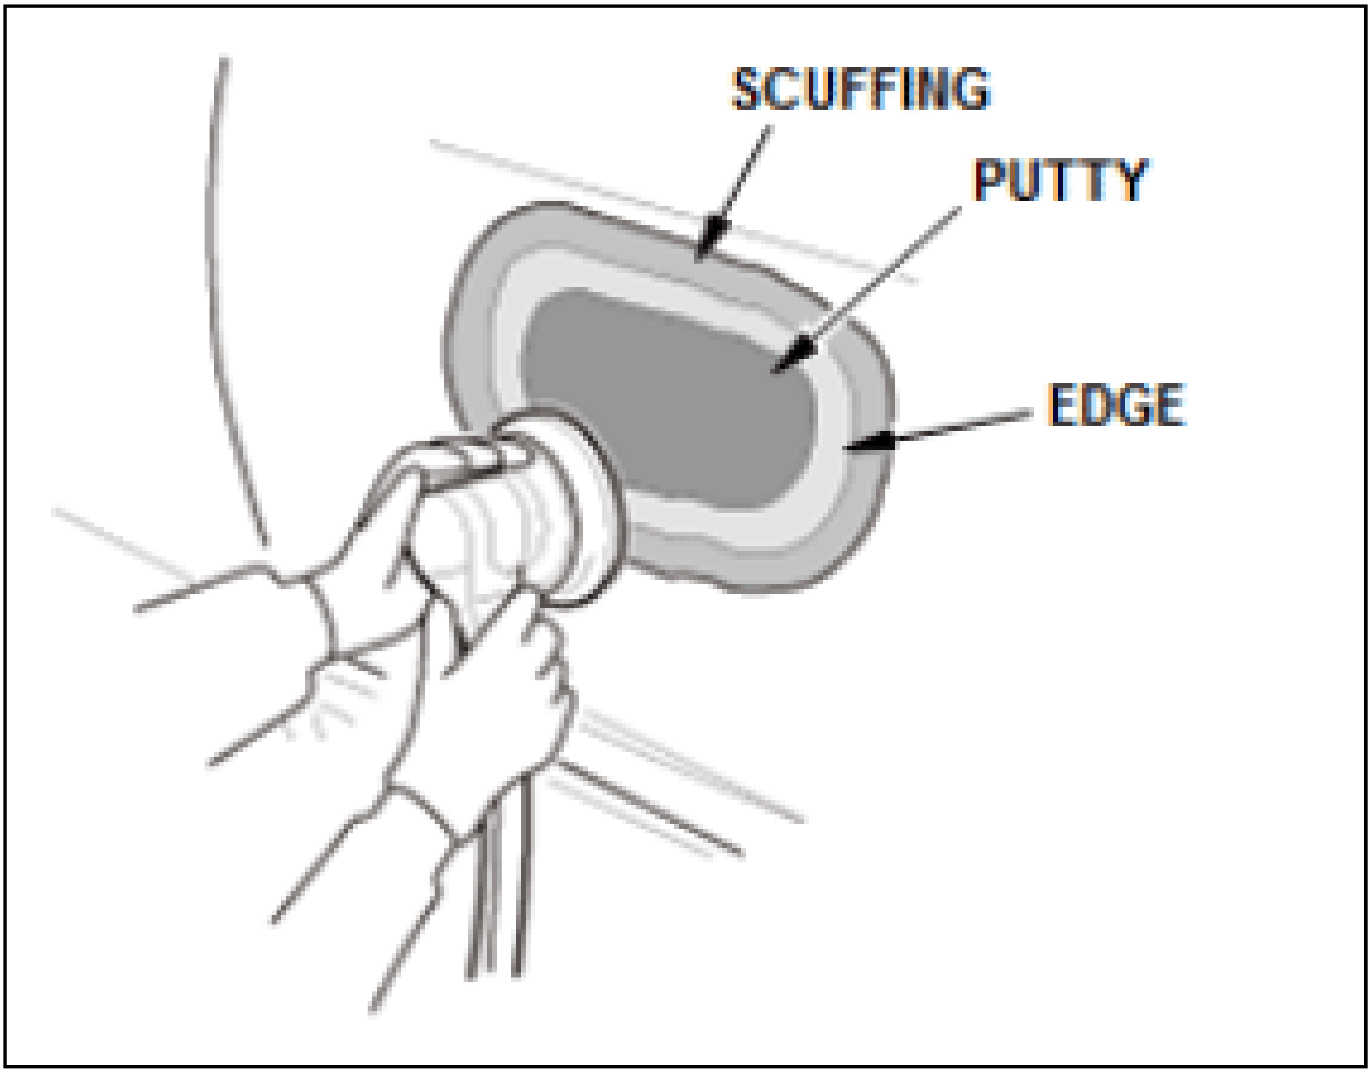
Attached Parts Removal



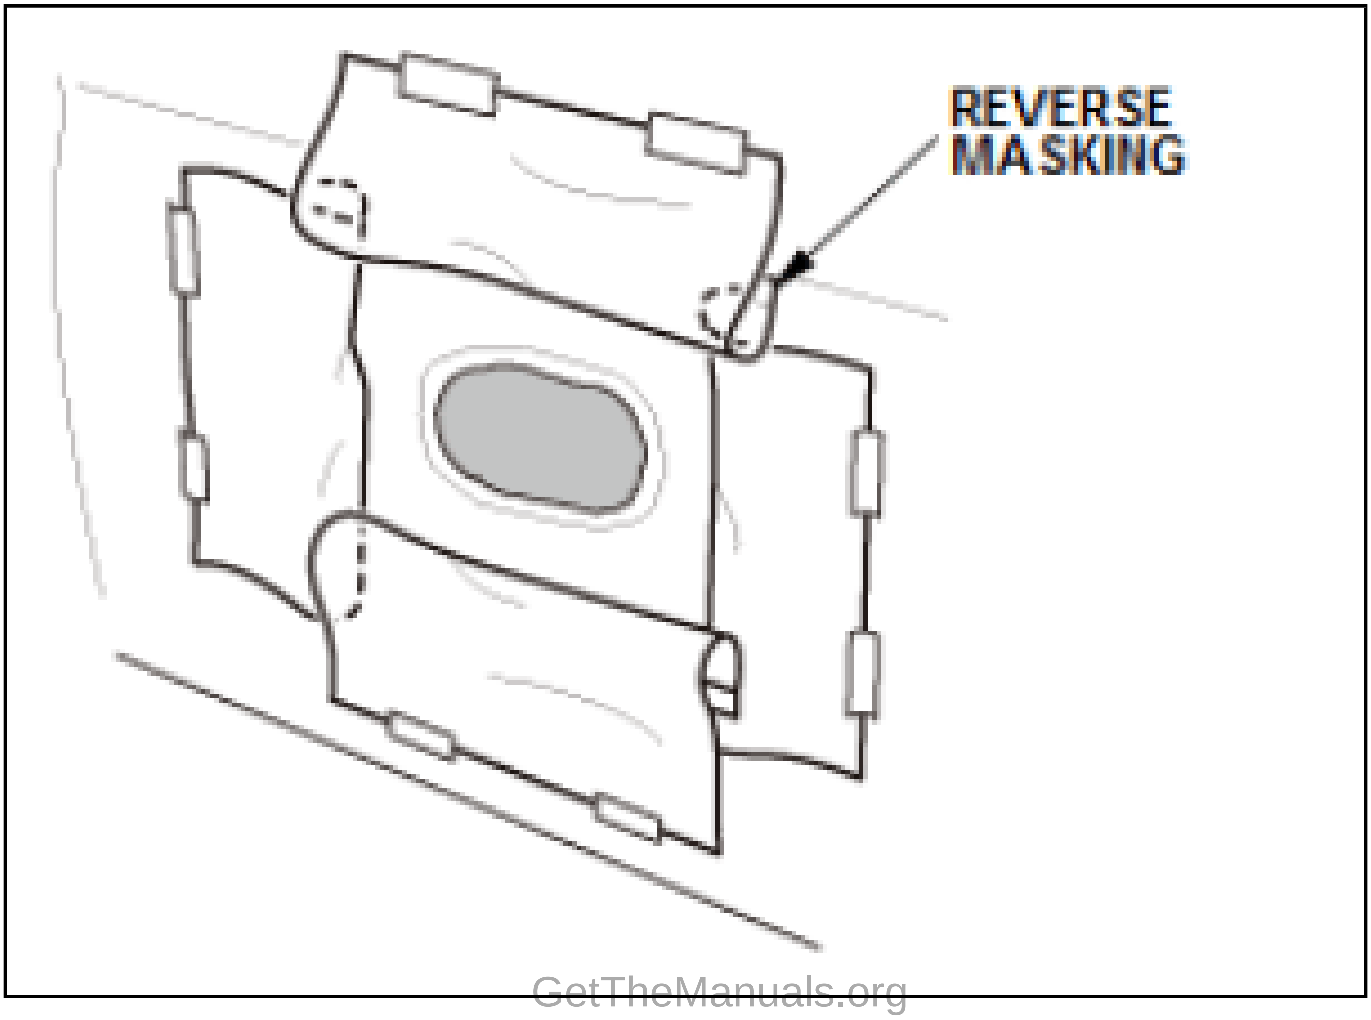
1. Wash Vehicle:
    - Water wash from the roof downward. Move to the hood, trunk lid and side panels.
    - Remove wax with neutral detergent to help prevent contaminants from entering the paint shop area.
2. Removal of Attached Parts:
    - Refer to the appropriate service information for chassis maintenance.
    - Where necessary remove attached parts and use an air blow gun remove dust and dirt. Remove any water from the paint surface.
    - When a heater is used for drying, be sure to remove heat-sensitive plastic parts from the area being repaired.

Basecoat (Primer-Surfacer) Application





SCUFFING
PUTTY
EDGE

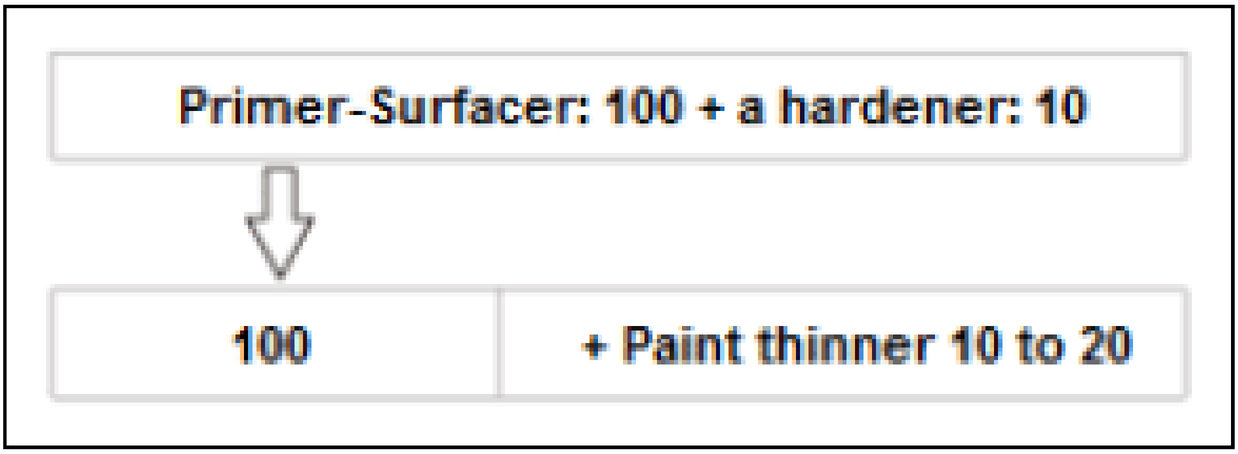


REVERSE MASKING

Quick Dry Urethane Primer-Surfacer Use Example

1. Before Coating:
    1. Checking the coating surface:
        - Before applying the primer-surfacer, be sure to inspect the coating surface. Deep surface damage will remain even after the primer- surfacer is applied. Then it would become necessary to repair the damage after the primer surfacer is applied.
        - When it is necessary to sand deep surface damage, use a double action sander with P240 to P400 sandpaper.
        - Use a hand file together with P400 to P600 sandpaper to remove damage where a sander cannot be used.
    2. Scuffing (for primer-surfacer coating):
        - Use a double action sander with P320 sandpaper to sand the hairline sanding scratches on the filled/putted surface.
        - Use a hand file, for the areas a sander cannot access, along with P600 sandpaper to remove sanding scratches.
        - Apply scuffing up to approximately 10 cm (4 in) away from the edge of filled/puttied area.
    3. Air blow all dust, dirt and body filler/putty residue from the area.
    4. Apply reverse masking slightly outside the primer-surfacer coating area with a margin.
    5. Degrease and clean up the primer-surfacer application area.
2. Preparation of Primer-Surfacer:

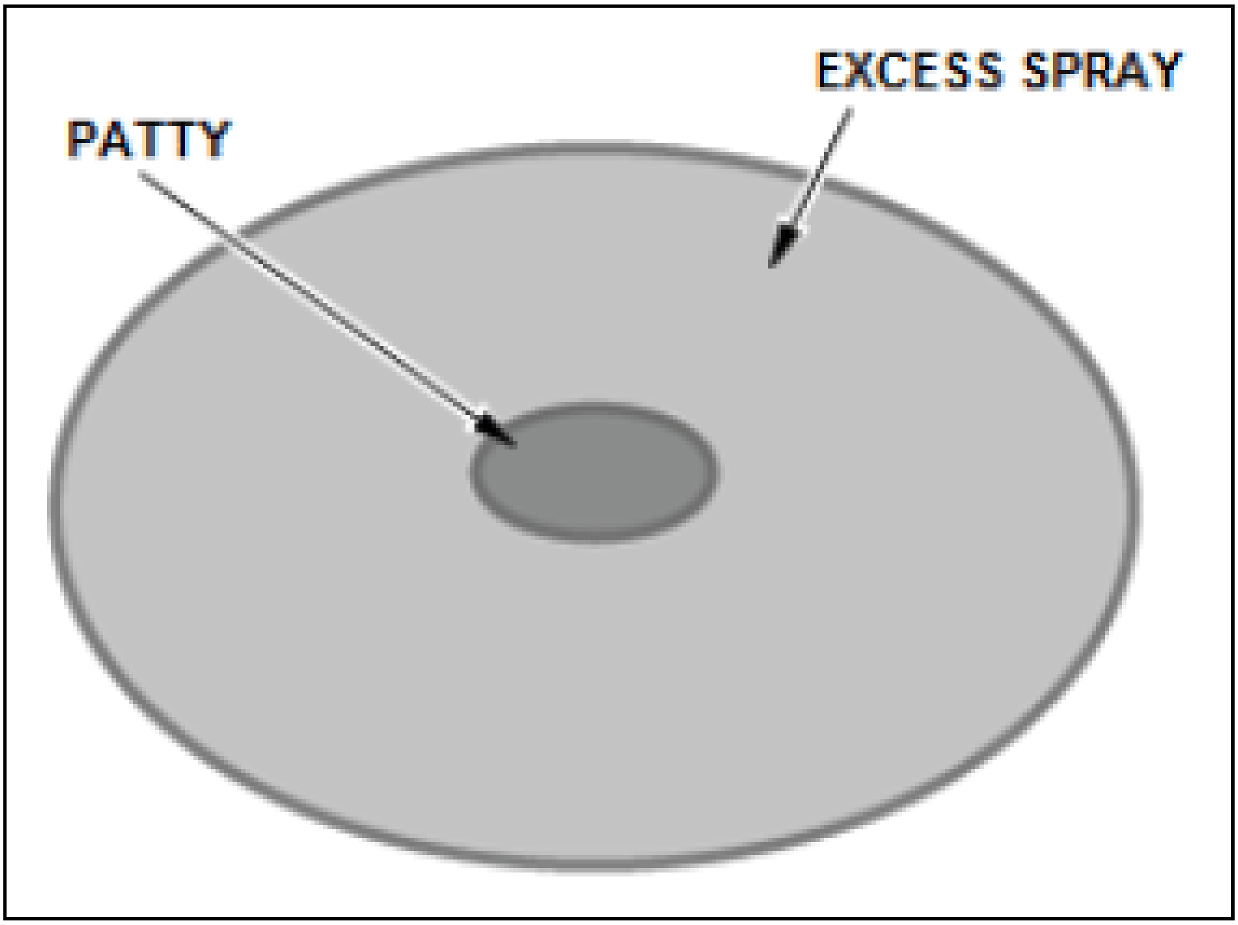
    Spec of Primer-Surfacer (reference)



Primer-Surfacer: 100 + a hardener: 10

100 + Paint thinner 10 to 20

3. Applying and Drying Primer-Surfacer:



The nozzle diameter of spray guns used for primer-surfacer should be 1.5 to 1.8 mm (0.050 to 0.070 in), depending upon the size of the repair area.

1. Retouching.

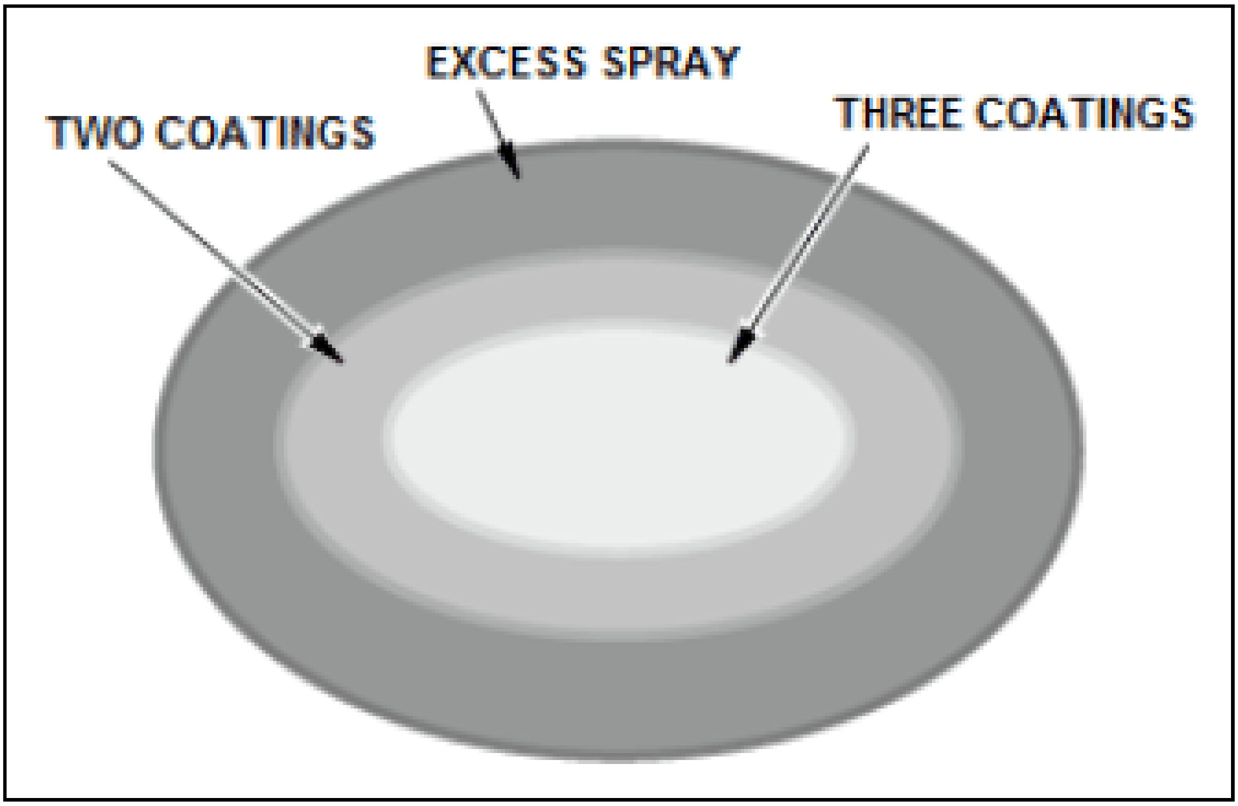
   Spray primer-surfacer to the entire repair area.

2. Within the retouch area, spray while making the surface flat.

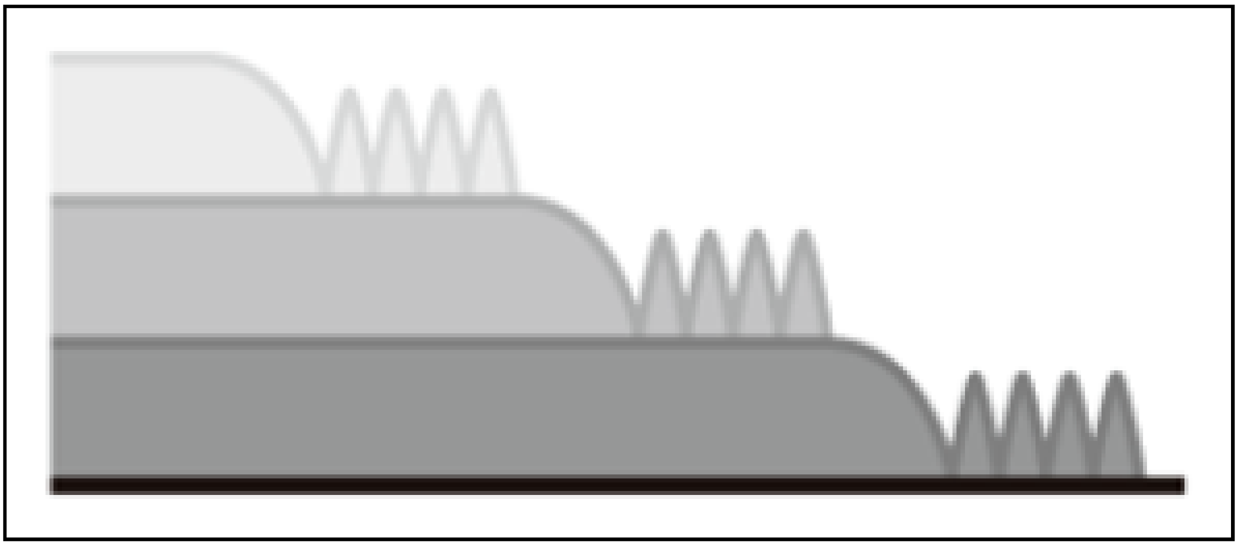
   Repeat two to three times based on the basecoat condition.

3. Allow sufficient flash time.
4. Continue to apply, narrowing the application surface to avoid overspray.
5. Dry the primer-surfacer.

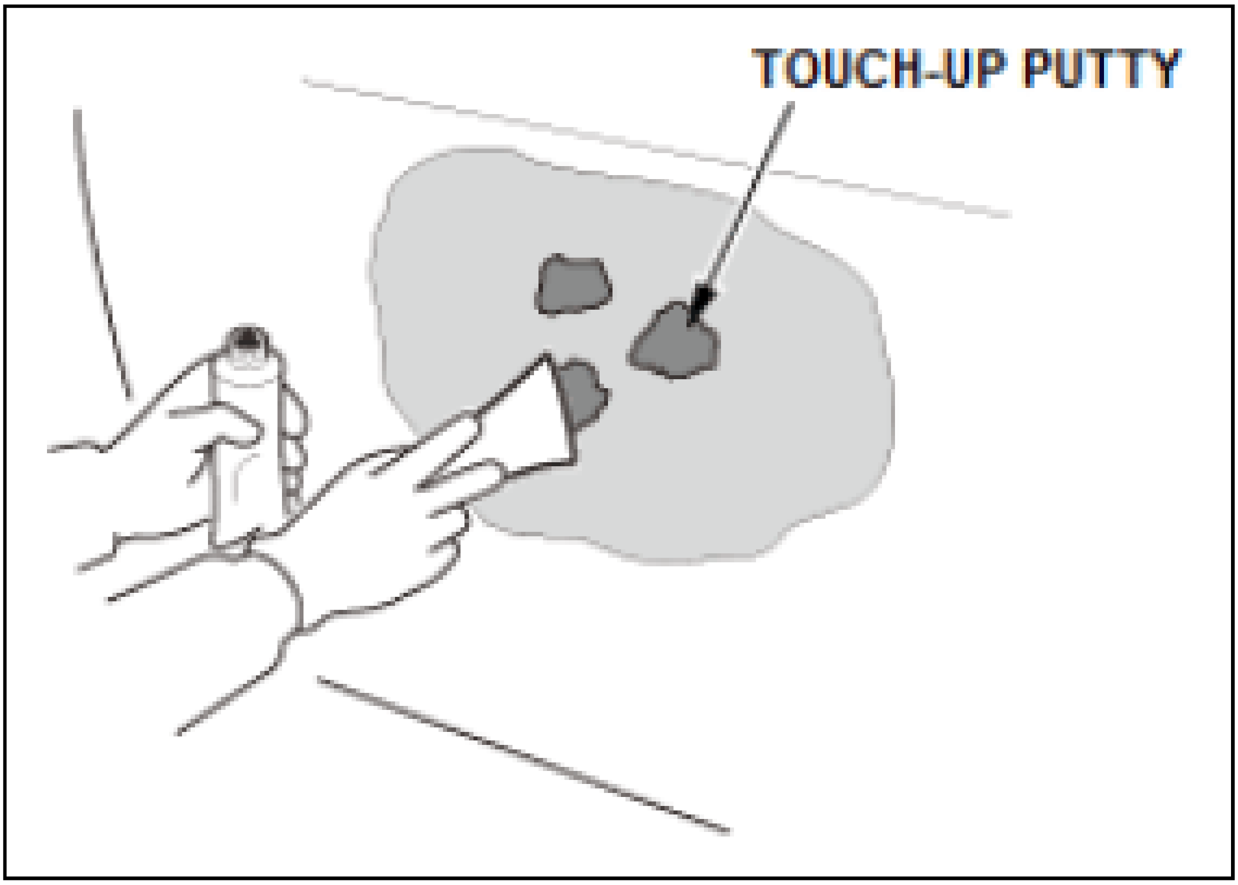
   Force-dry after allowing sufficient set-up time.



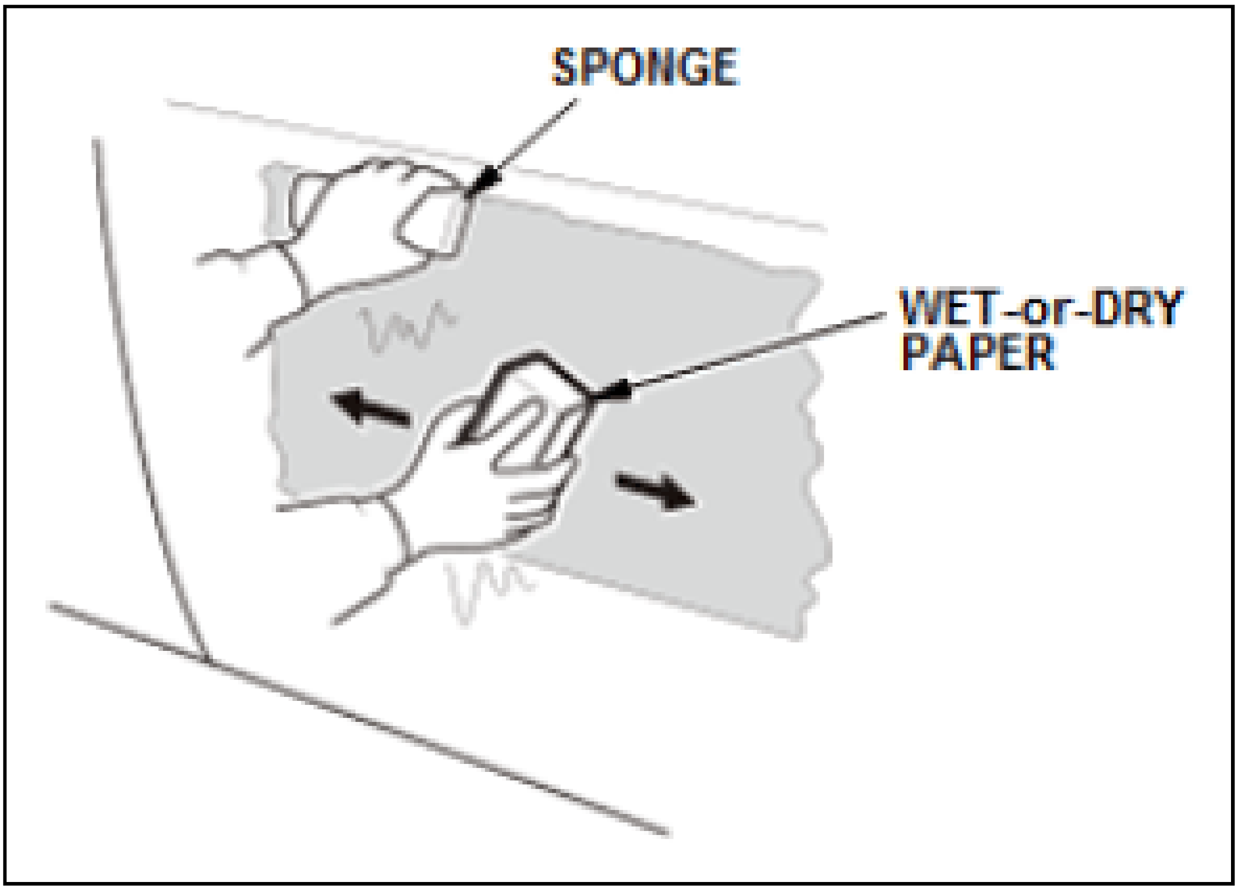
EXCESS SPRAY
TWO COATINGS
THREE COATINGS



4. Confirmation of Primer-Surfacer Coating Surface and Spot Putty:
   - Thoroughly inspect the primer-surfacer coated surface for hairline sanding scratches and cavities.
   - When scratches or cavities are found, fill them with spot putty (touch- up putty).



5. Sanding Primer-Surfacer Coating (including spot putty):



1. Sand the spot putty and primer surfacer coated surface by dry or wet sanding to finish the surface.

NOTE: **Do not over sand as it will result in exposure of bare metal or body filler.**

Dry Sanding:

- For hand sanding, use P600 to P800 sandpaper together with a rubber sanding block. Continuously remove any sanding dust to avoid clogging the sandpaper.

    - When using a double action sander, use P400 sandpaper.

    Wet Sanding:

    - Manually sand using P400 to P800 wet-or-dry sandpaper.
    - While wet sanding, use a sponge soaked with water to keep the sanding surface sufficiently moistened.

  2. Completely dry the surface with a compressed air blow gun and infrared lights after wet water sanding.

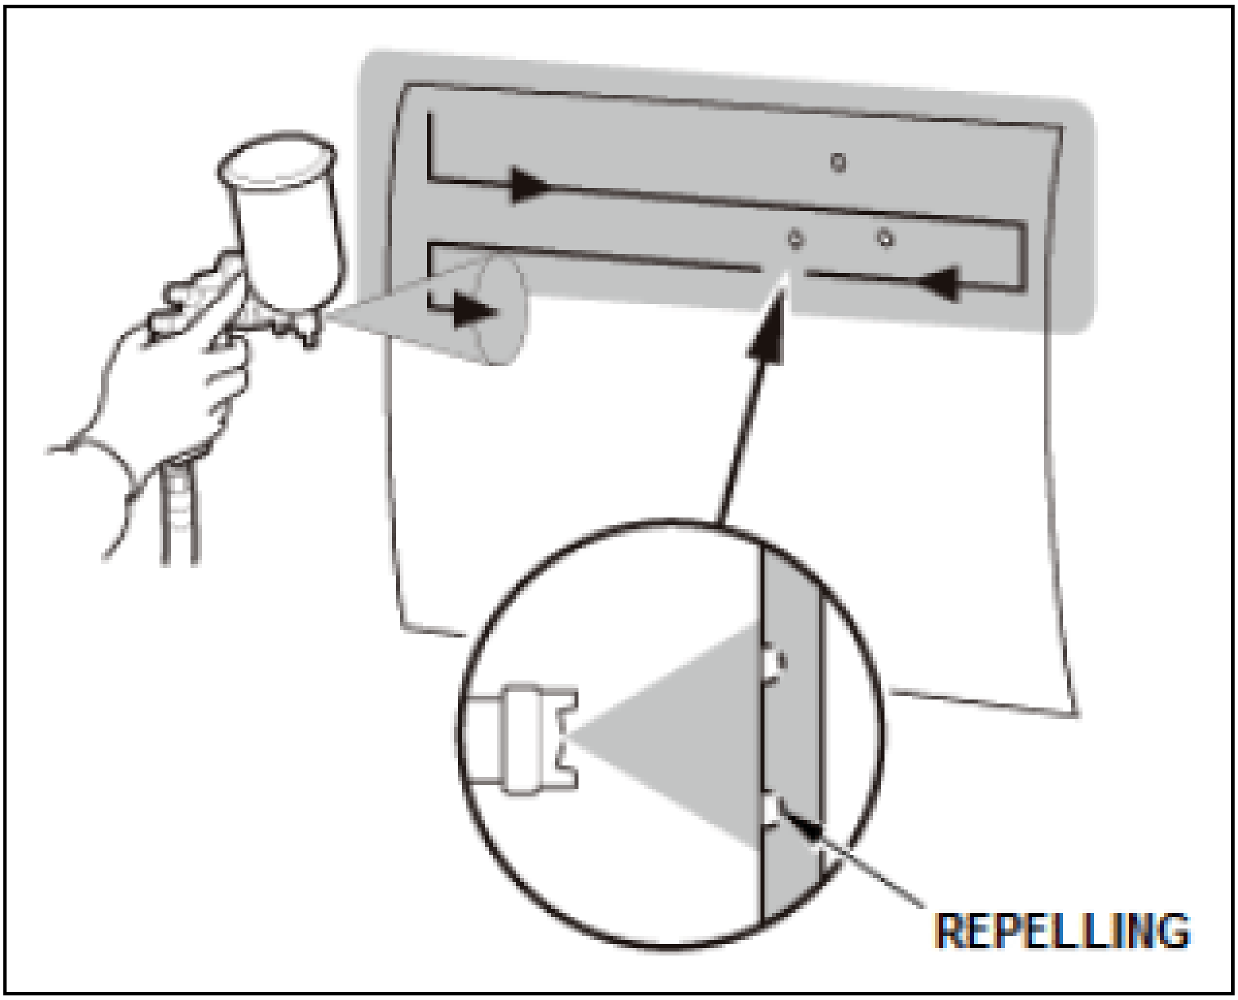
  NOTE: **Use a dry sprayed guide coat to visually check surface flatness.**

6. Inspection and Repair after Sanding:
   - Inspect the state of the finished primer-surfacer coated surface.
   - If the surface is OK without any thin or uncoated spots, move on to the topcoating process.
   - If any defect is found on the surface including thin or unpainted spots, exposed filler/putty, or bare steel panel, repeat the primer-surfacer coating and sanding processes.

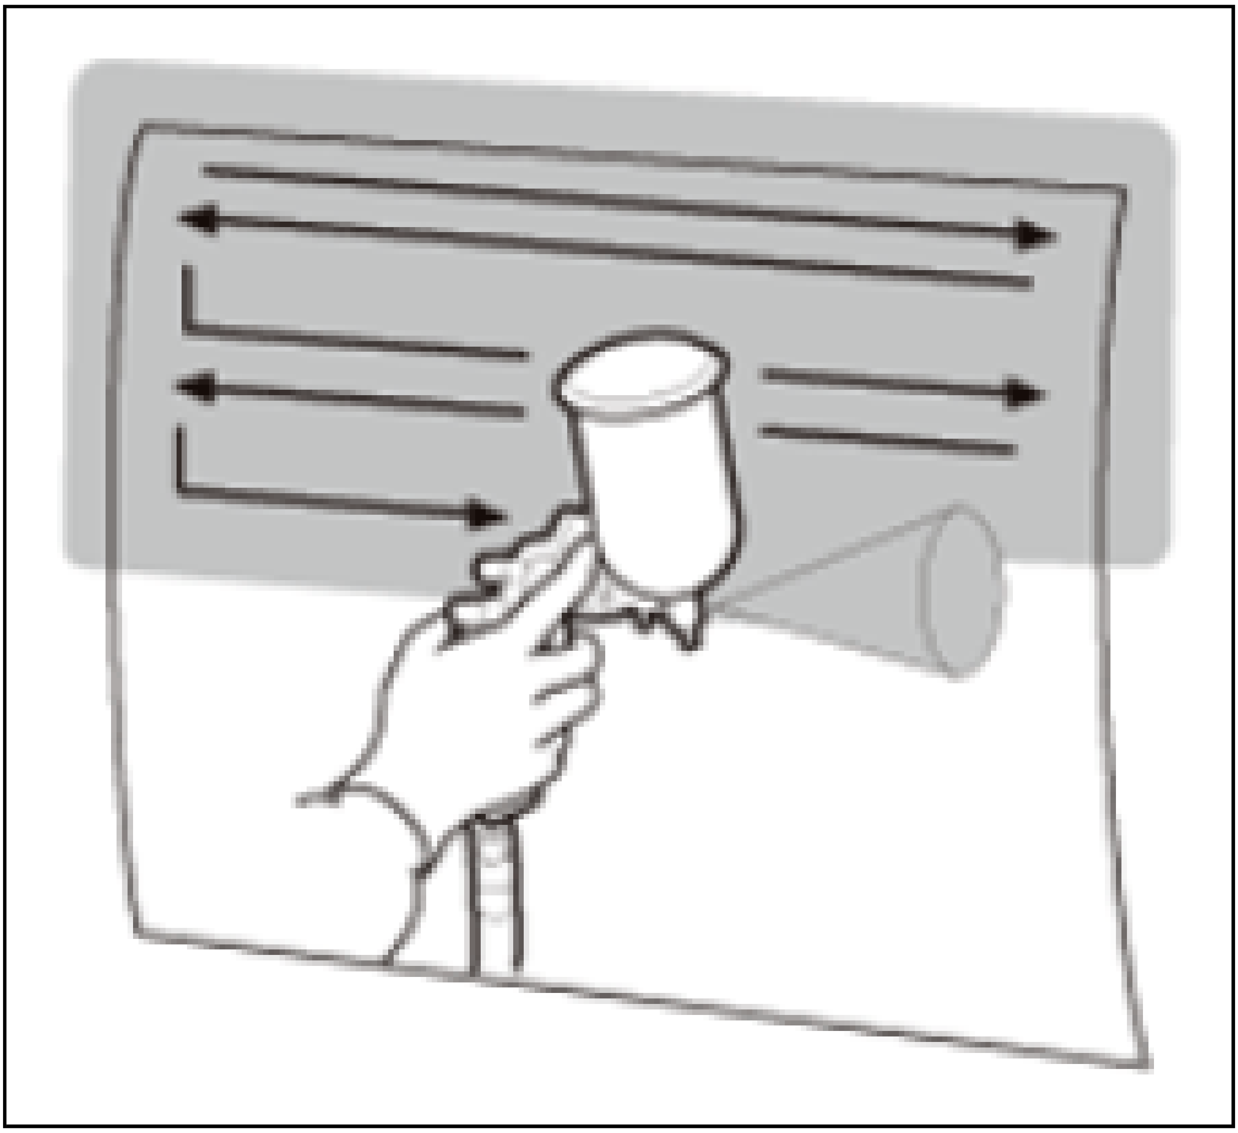
Basic Topcoat Application Process

Use Of 2K Paint (Example)

1. Light Coating:
   - Spray a light coat to check for any issues with the paint.
   - When lifting is found on the surface of coating, fill with dry coating.

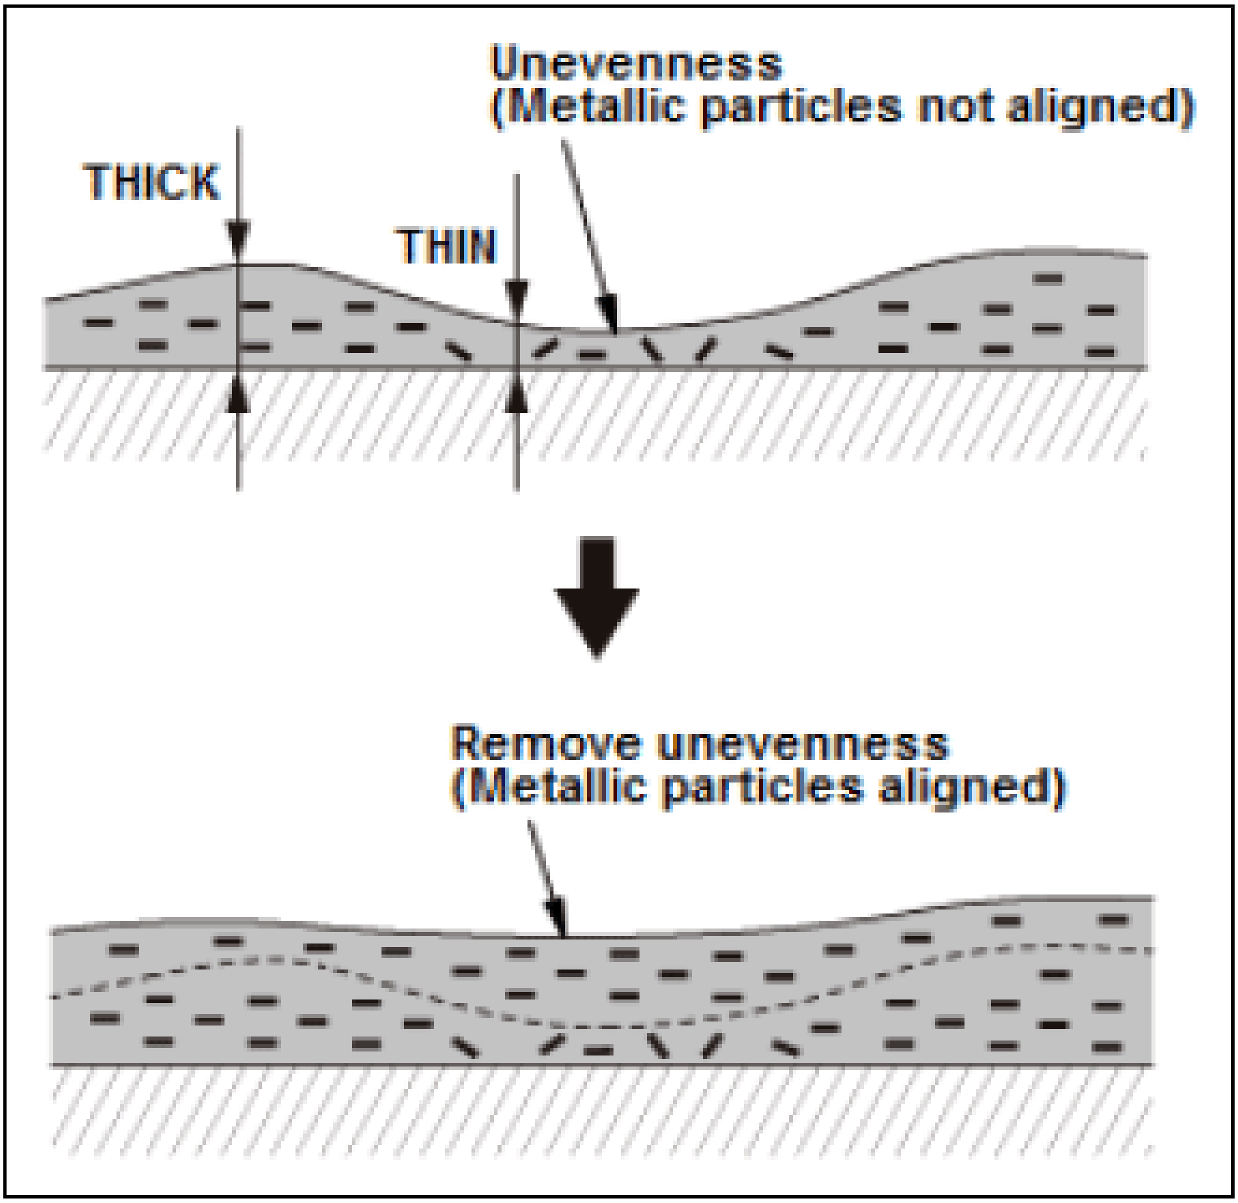


2. Fixing Color:
   - Spray a medium coat.
   - Continue spraying until the basecoat is completely covered.
   - Do not attempt to spray one thick coat. Apply several thin coats with sufficient flash time in between.



- For metallic colors, spray carefully not to create color unevenness. Pay attention to overlap pattern.

3. Removing Unevenness (Metallic Color, Pearl Color):
    - Maintain the same spray size as the color fixing process and hold the gun slightly further away from the coating surface. Move the gun more slowly to leave the surface a little wetter.
    - By keeping the surface a little wet with paint, it is possible to let metallic and pearl base arrange regularity, which reduce any uneven surface appearance.
    - Overlap spray gun passes repeatedly until the paint film surface evens out.



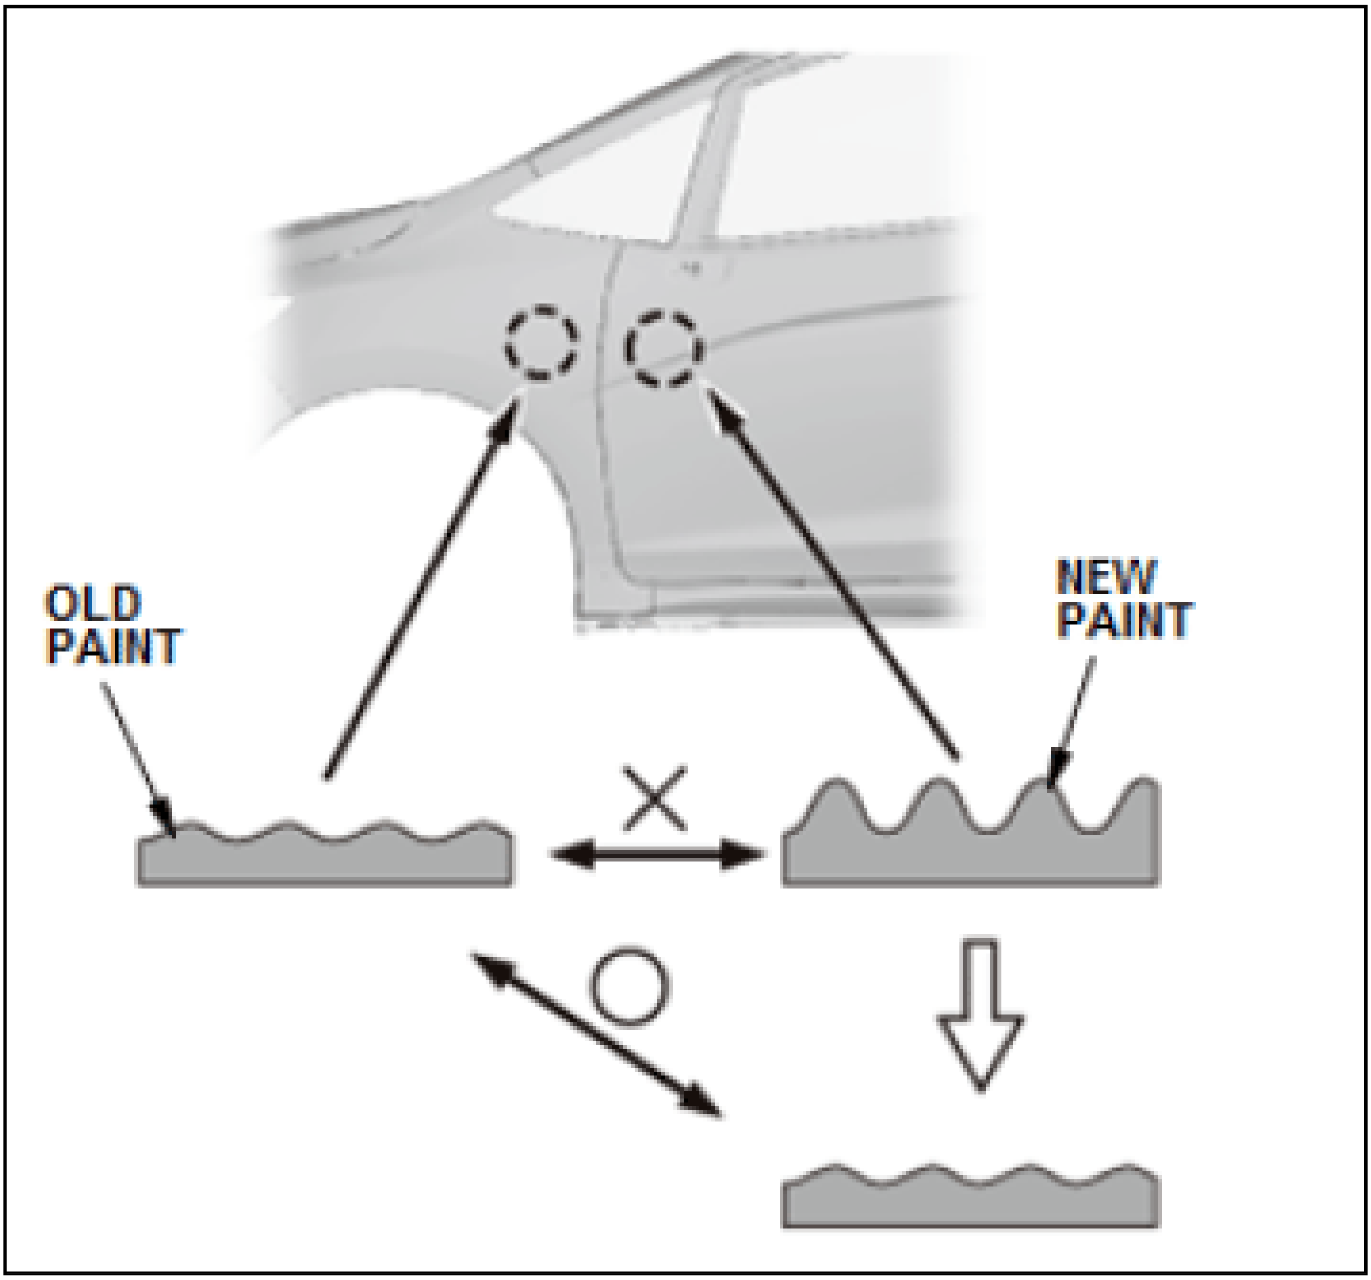
Unevenness
(Metallic particles not aligned)
THICK
THIN
Remove unevenness
(Metallic particles aligned)

4. Finishing:
    - **1-Coat Solid**

      Finish the coated surface smoothly and match the adjoining panels surface quality.

    - **Metallic, Pearl and 2-Coat Solid**

      Spray clearcoat to smoothly finish the coated surface



Surface coating method	Type of Surface		Roughness of Surface	
	Fine surface	**Rough surface**	**High**	**Low**
Spray Gun Nozzle Diameter	Small	Large	Large	Small
Paint Viscosity	Low	High	High	Low
Spray Pressure	High	Low	Low	High
Distance of Spray Gun	-	-	Far	Near
Speed of Spray Gun	Fast	Low	Low	Fast
Thinner Evaporation Speed	Fast	Low	Fast	Low
Flash Time	-	-	Required	Not Required

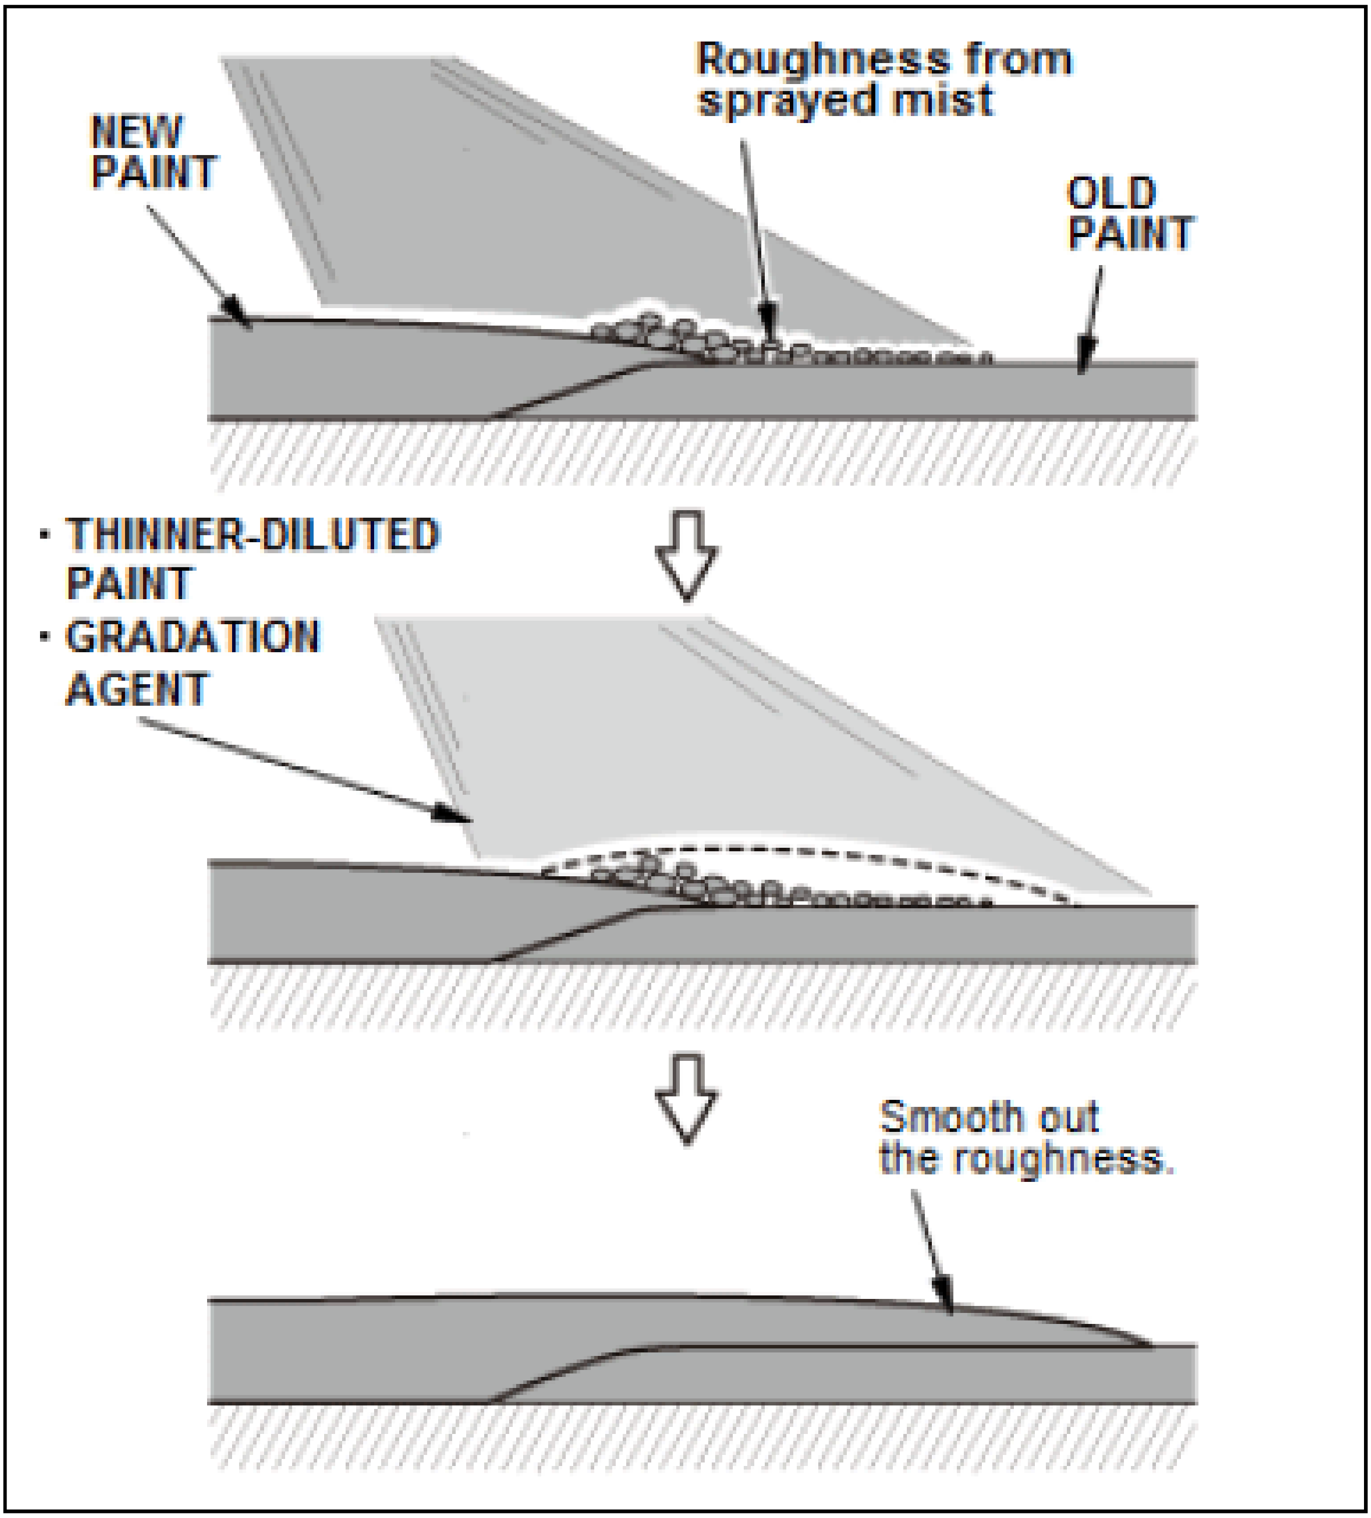
Flash Time And Set-Up Time

Flash Time (Interval between paint coats)

When layering several coatings, allow paint solvent to evaporate somewhat before applying another coat. This waiting time between the paint coats is called flash time.

Set-Up Time

The time between completion of painting and starting of the force-drying process. If the painted surface is heated immediately after application where the solvent is still very actively evaporating, paint defects such as pinholes will occur.



Roughness from sprayed mist
NEW PAINT
OLD PAINT
· THINNER-DILUTED PAINT
· GRADATION AGENT
Smooth out the roughness.

Steps Of Gradation Paint - Solid And Clear

NOTE: **Gradation paint is a clear paint diluted by the paint reducer/thinner. Its viscosity is very low and it applies in very thin layers.**

1. Spray so that the luster will be even with the old painted surfaces.
2. Dilute the finishing paint following the paint manufacturer's instructions.
3. Spray the gradation paint so that the new and old surfaces blend with each other.

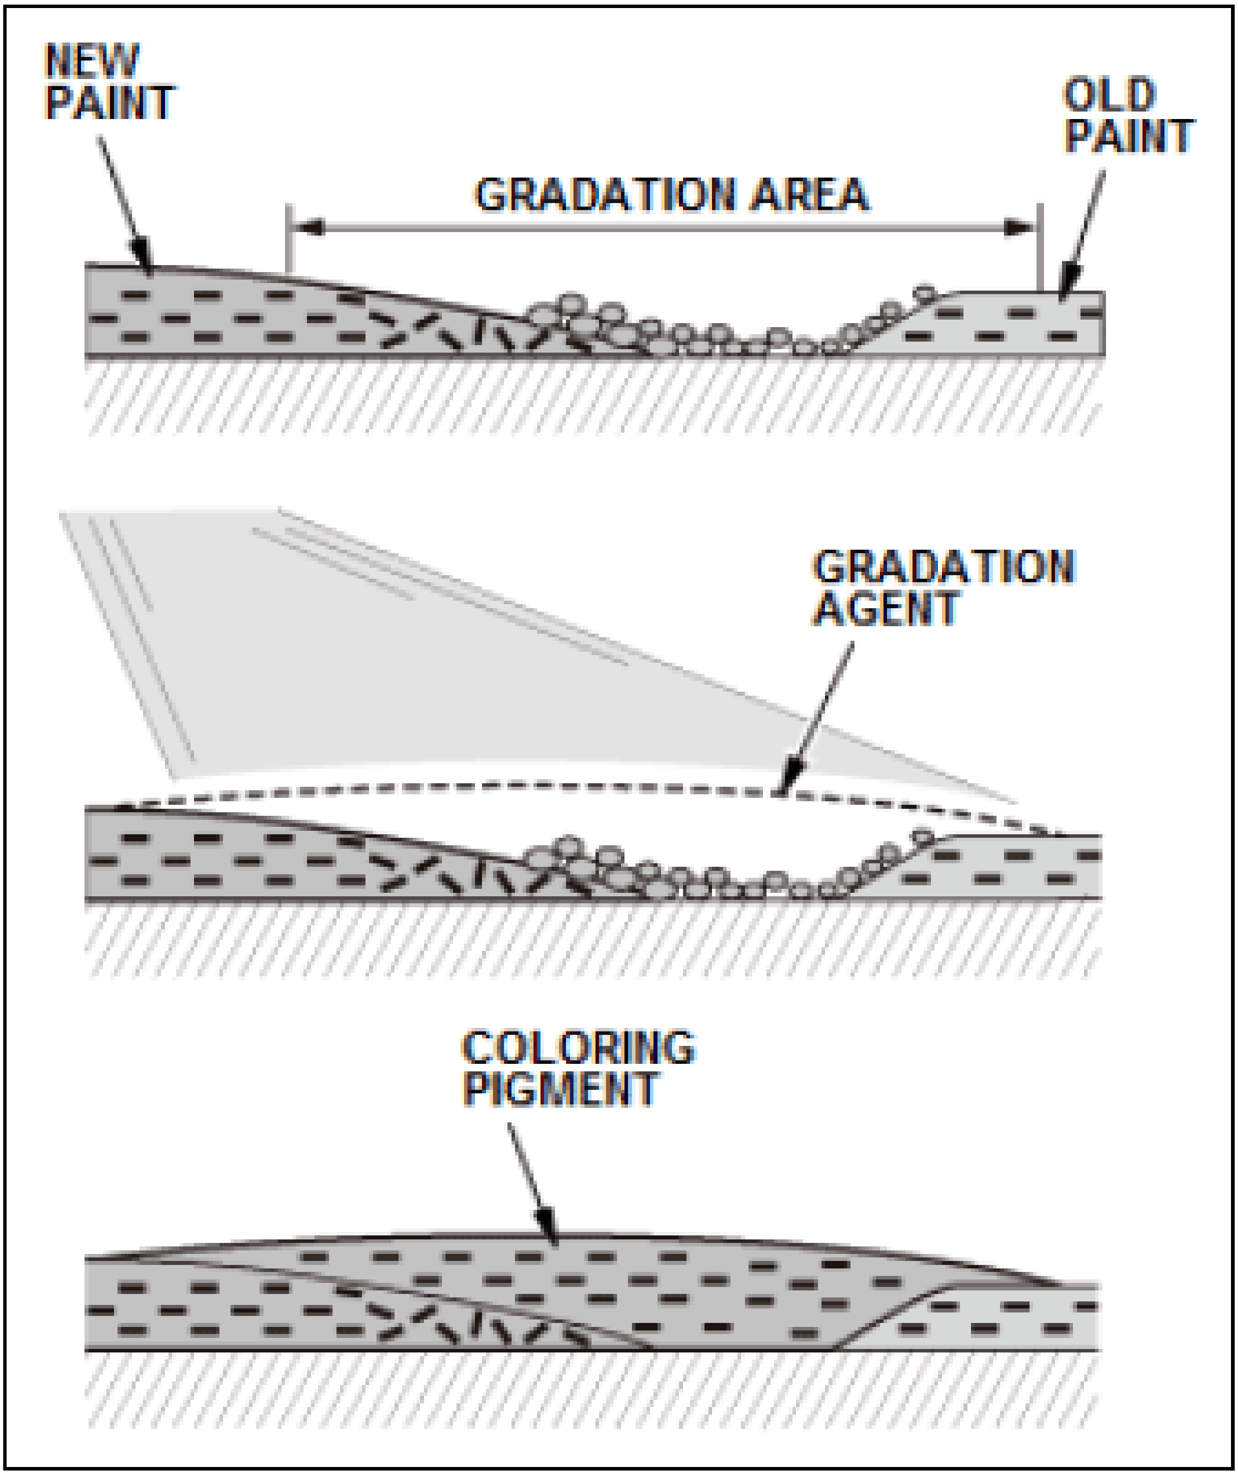
Steps Of Gradation Paint - Metallic And Pearl

NOTE: **Gradation paint is a clear paint diluted by the paint reducer/thinner. Its viscosity is very low and it applies in very thin layers.**

When using under clear coating:

1. Spray under clearcoating roughly around the repair area.

2. Spray a base color on the under cleared area.
3. Repeat these steps until no differences between the old and new paint layer in color while keeping the under clear wet.



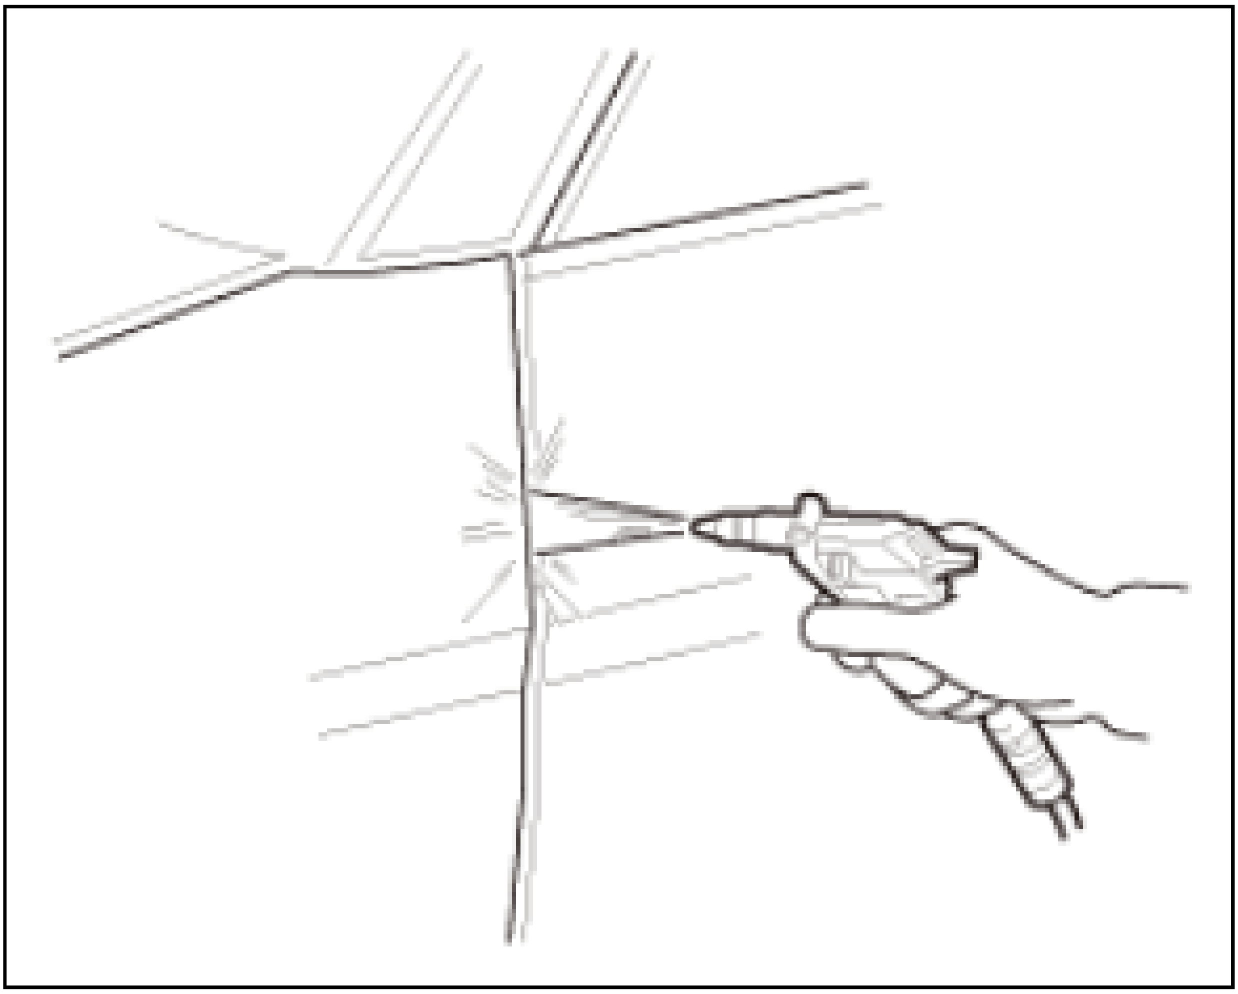
NEW PAINT
OLD PAINT
GRADATION AREA
GRADATION AGENT
COLORING PIGMENT

Cleaning And Degreasing

1. Compressed Air Blow Gun:

   If the material or paint layer surface is not completely cleaned of dust, contaminants, oil, etc., adhesion defects may occur after painting.

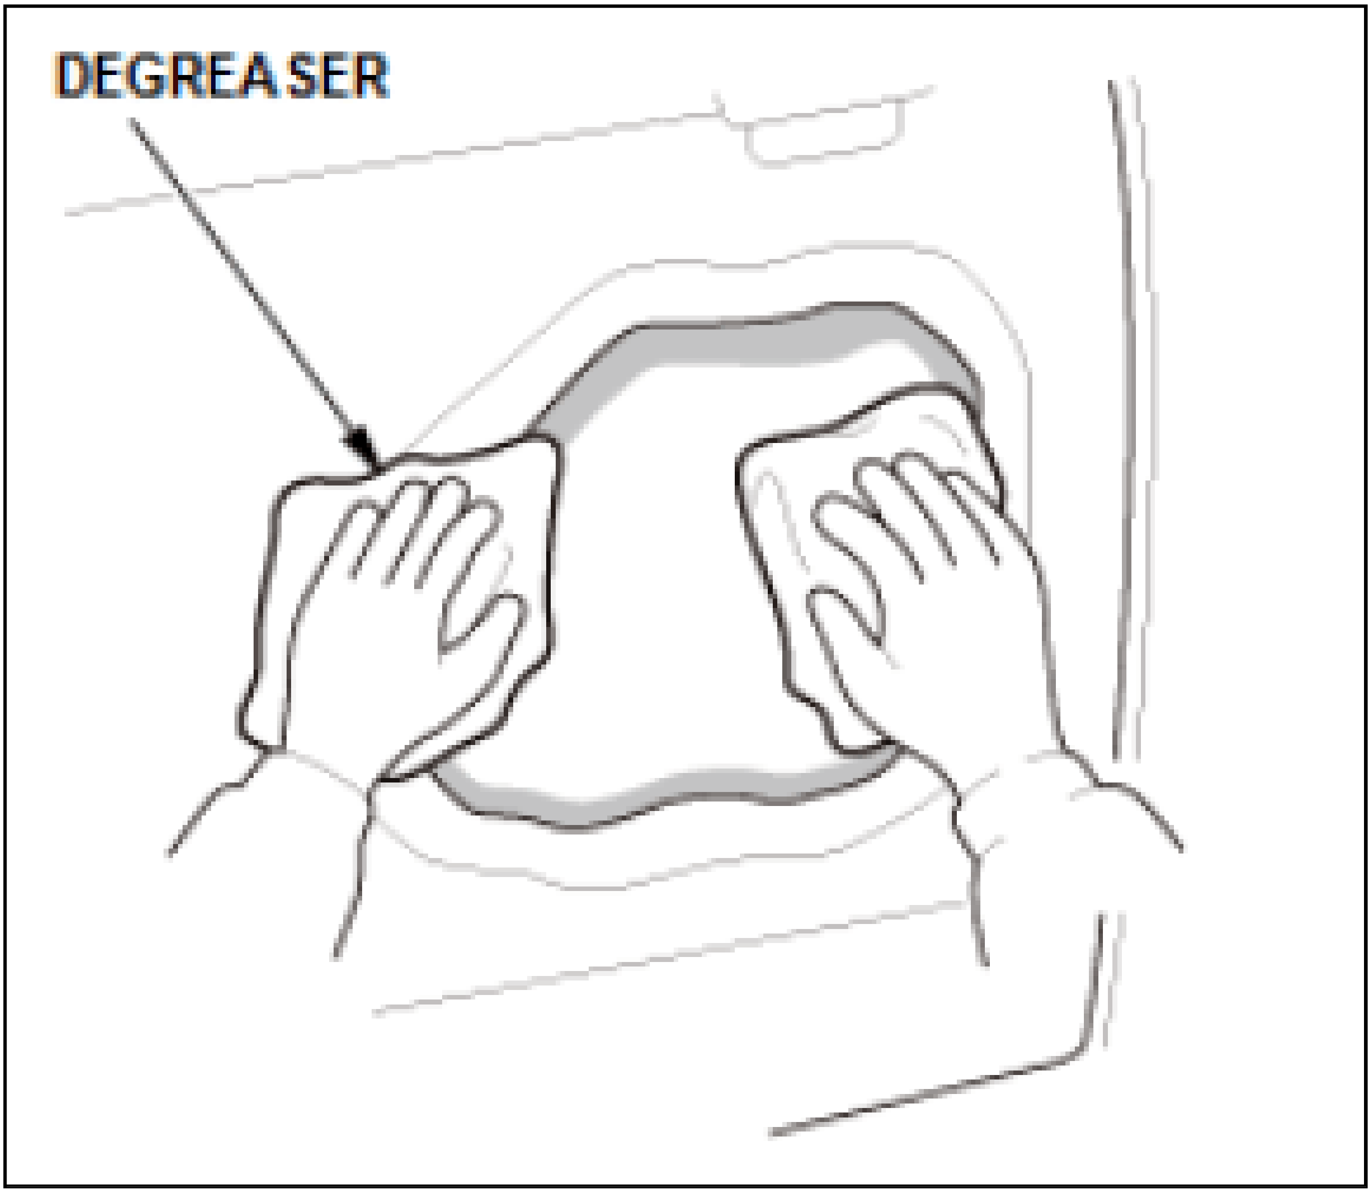
NOTE: **Thoroughly remove all dust and dirt from inside jambs and between panels with a compressed air blow gun.**



2. Degreasing:

   Wet a clean cloth with degreaser and apply to the panel surface being painted. Make sure the surface is fully moistened then wipe the area with a second clean dry cloth.

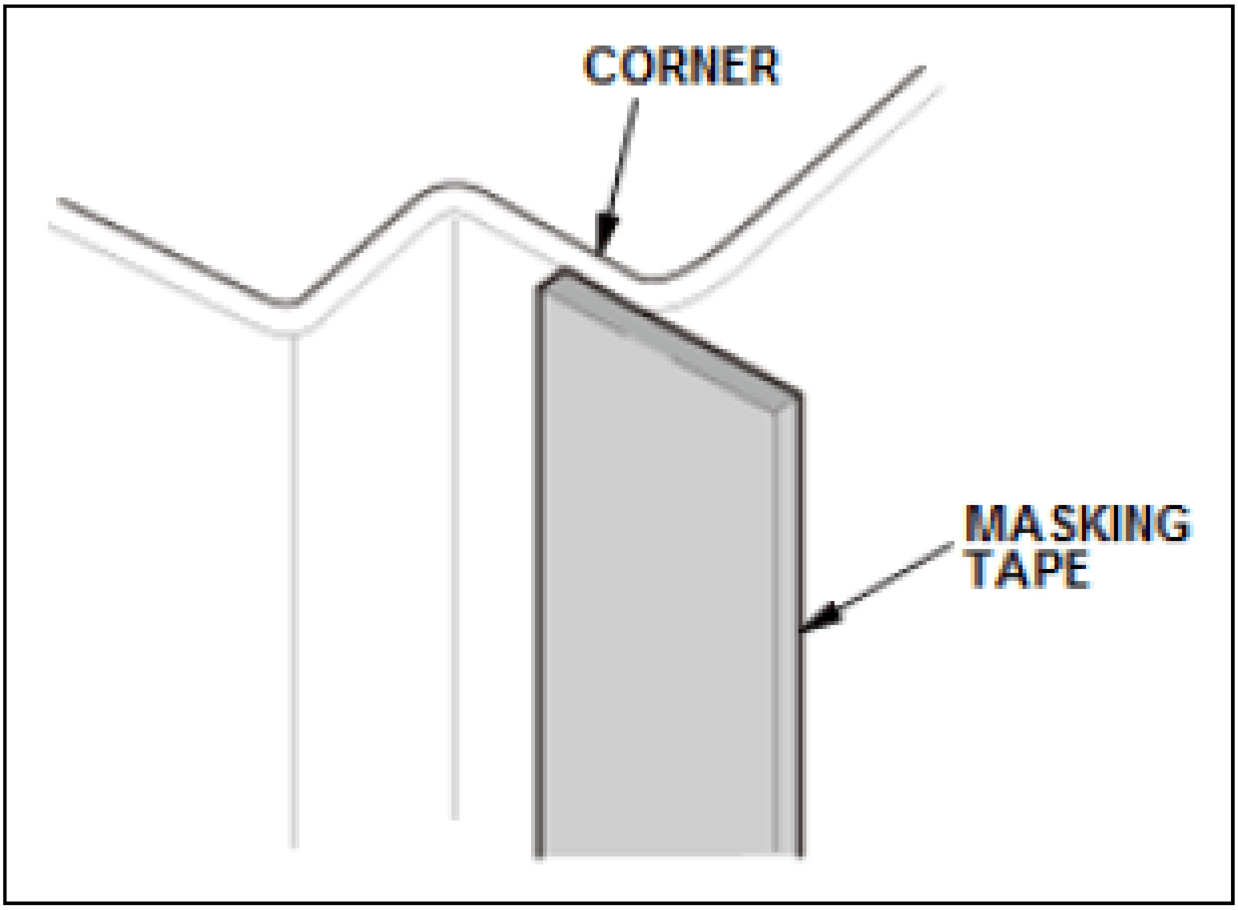
NOTE: **Always do this step before painting.**



Masking Methods

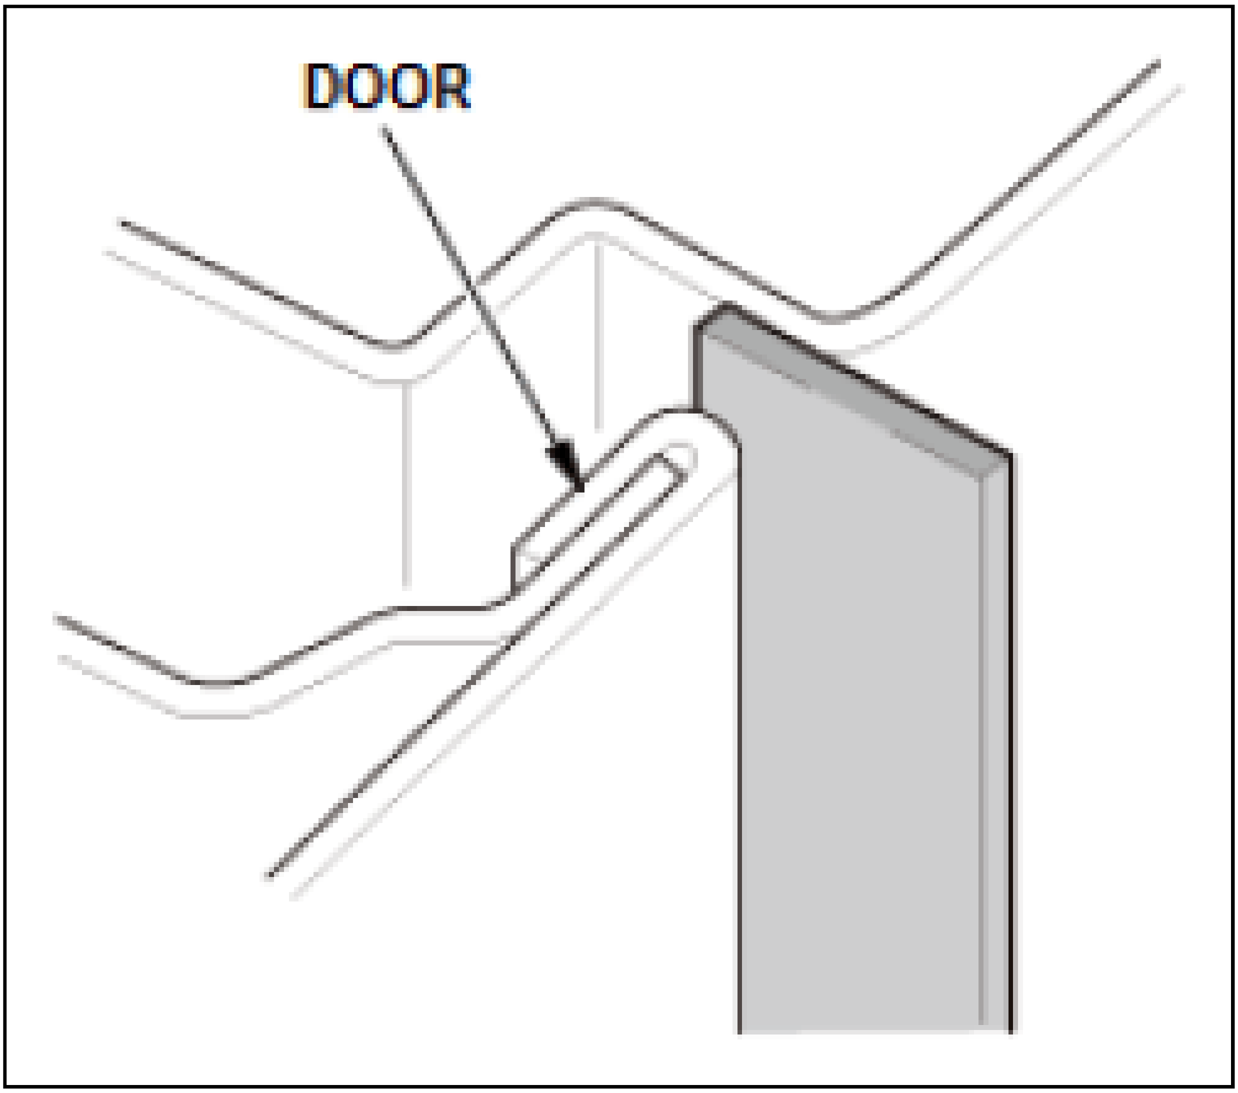
Example Of Outer Panel And Door Edge

1. Place the masking tape with the glued surface toward the painted surface at the outer panel corner area.

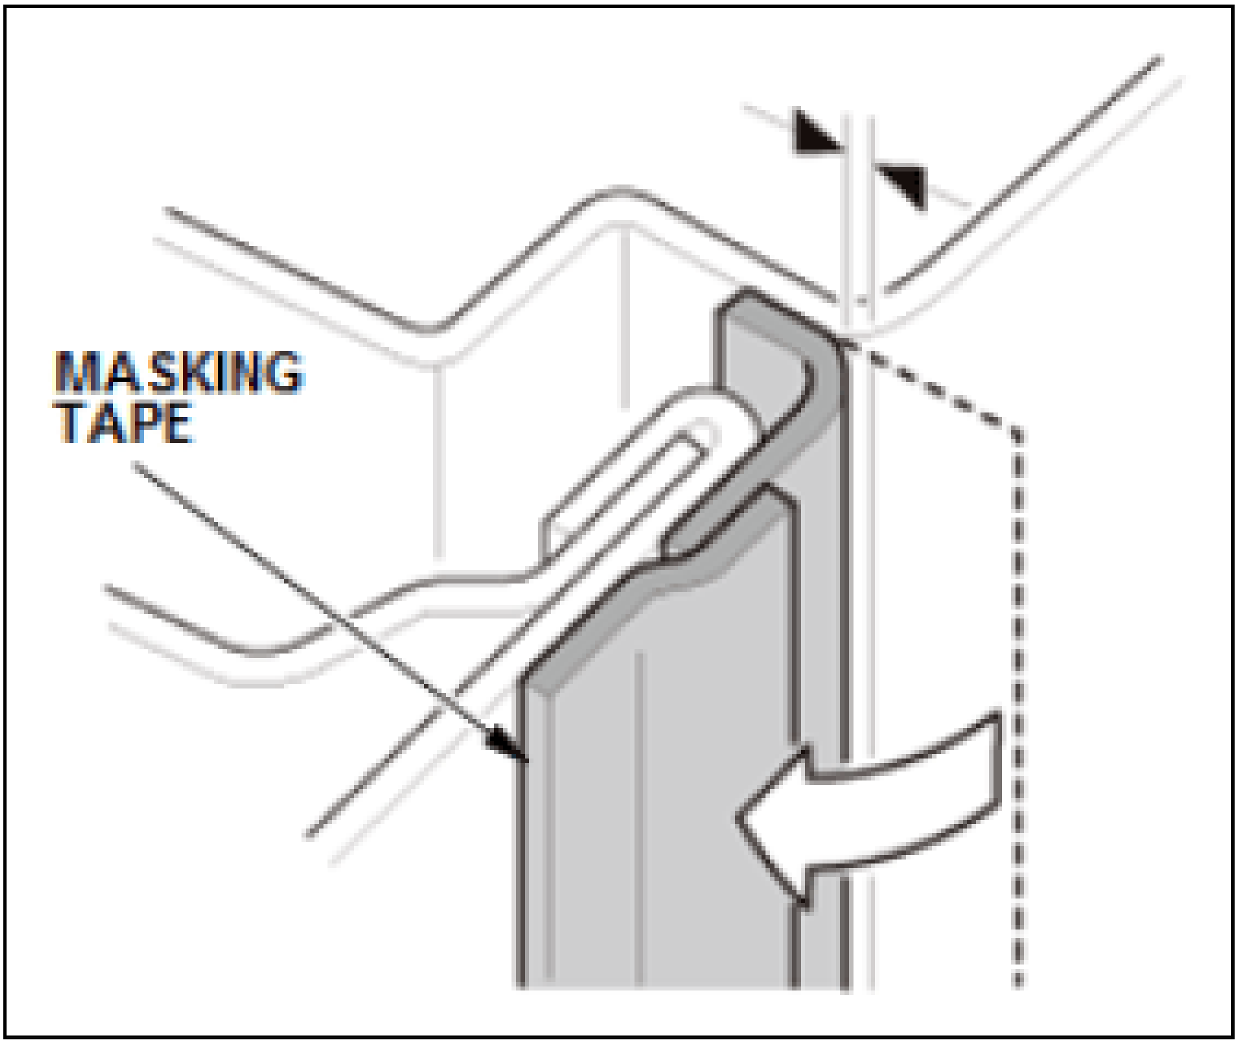


CORNER
MASKING TAPE

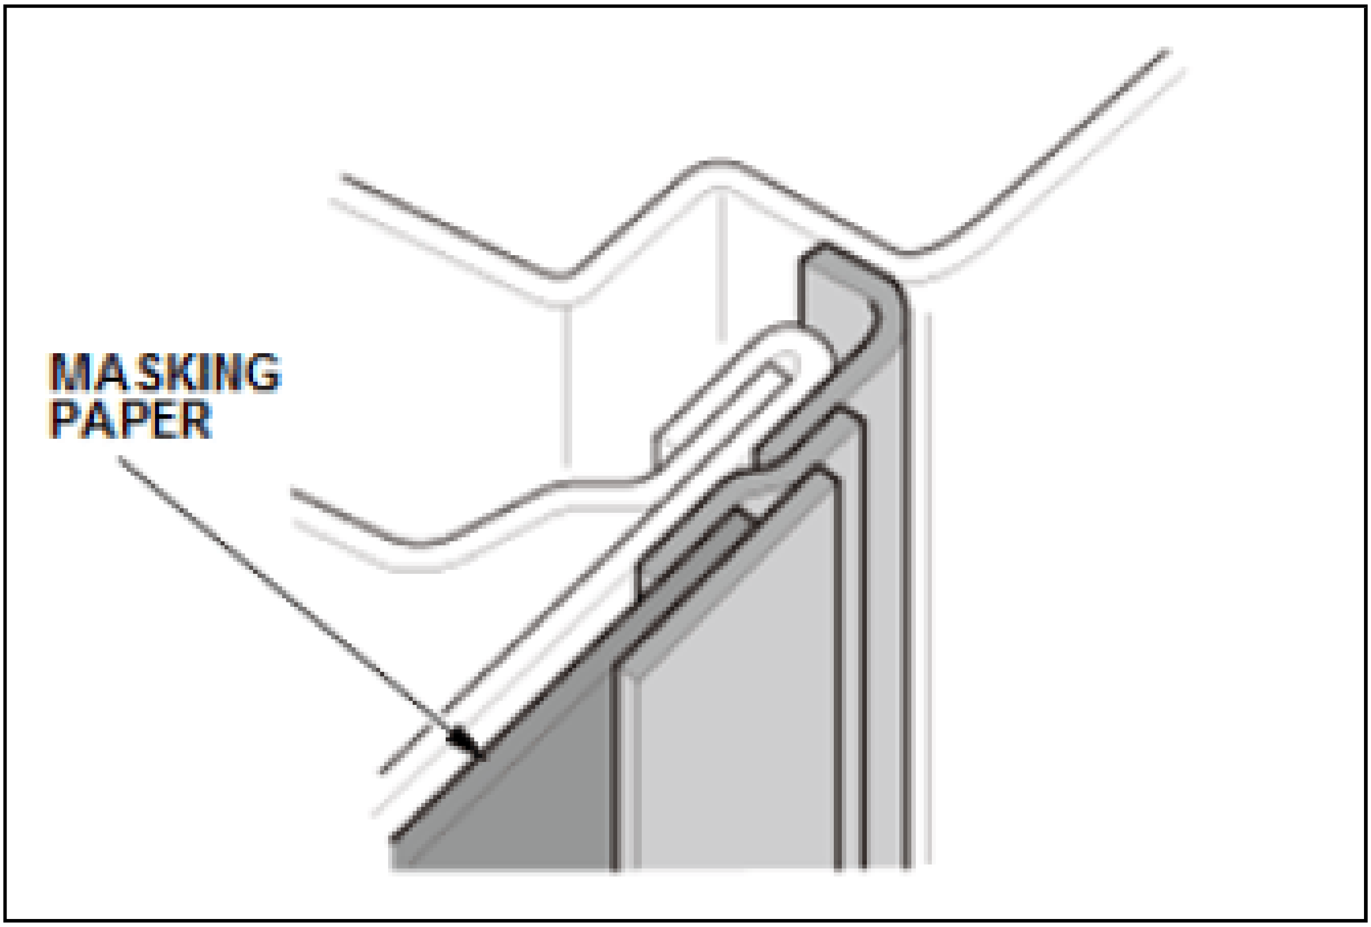
2. Close the door.



3. Bend the masking tape along the outer panel surface towards the door making sure the tape extends further inside the panel corner. And then place another masking tape to fix the position.



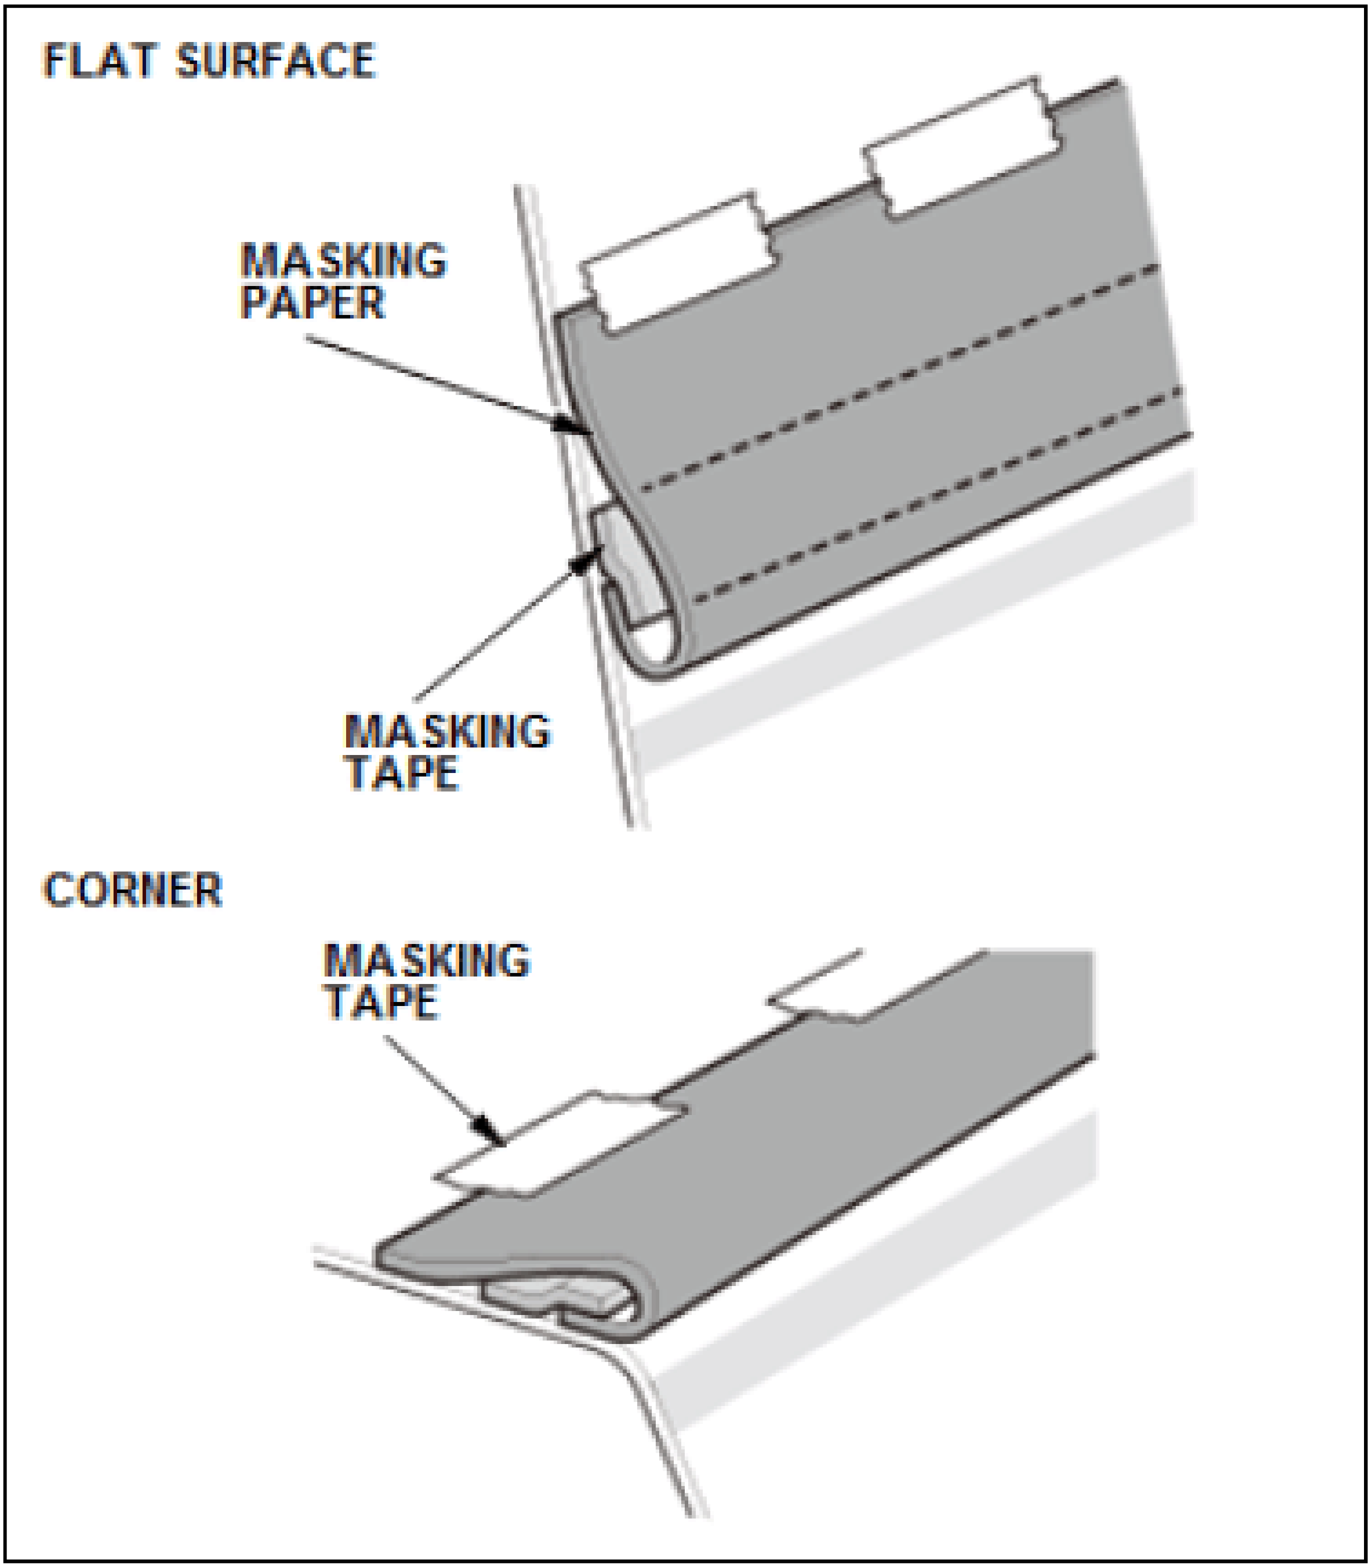
4. Mask the whole door.



Reverse Masking

- Round up the masking paper to create a soft edge corner so that paint mist is applied thinly towards the end of line.
- Use masking paper for the flat surface, and masking tape for the corners.
- There are two reverse masking methods. One is to use a masking tape and another is to use a masking paper.

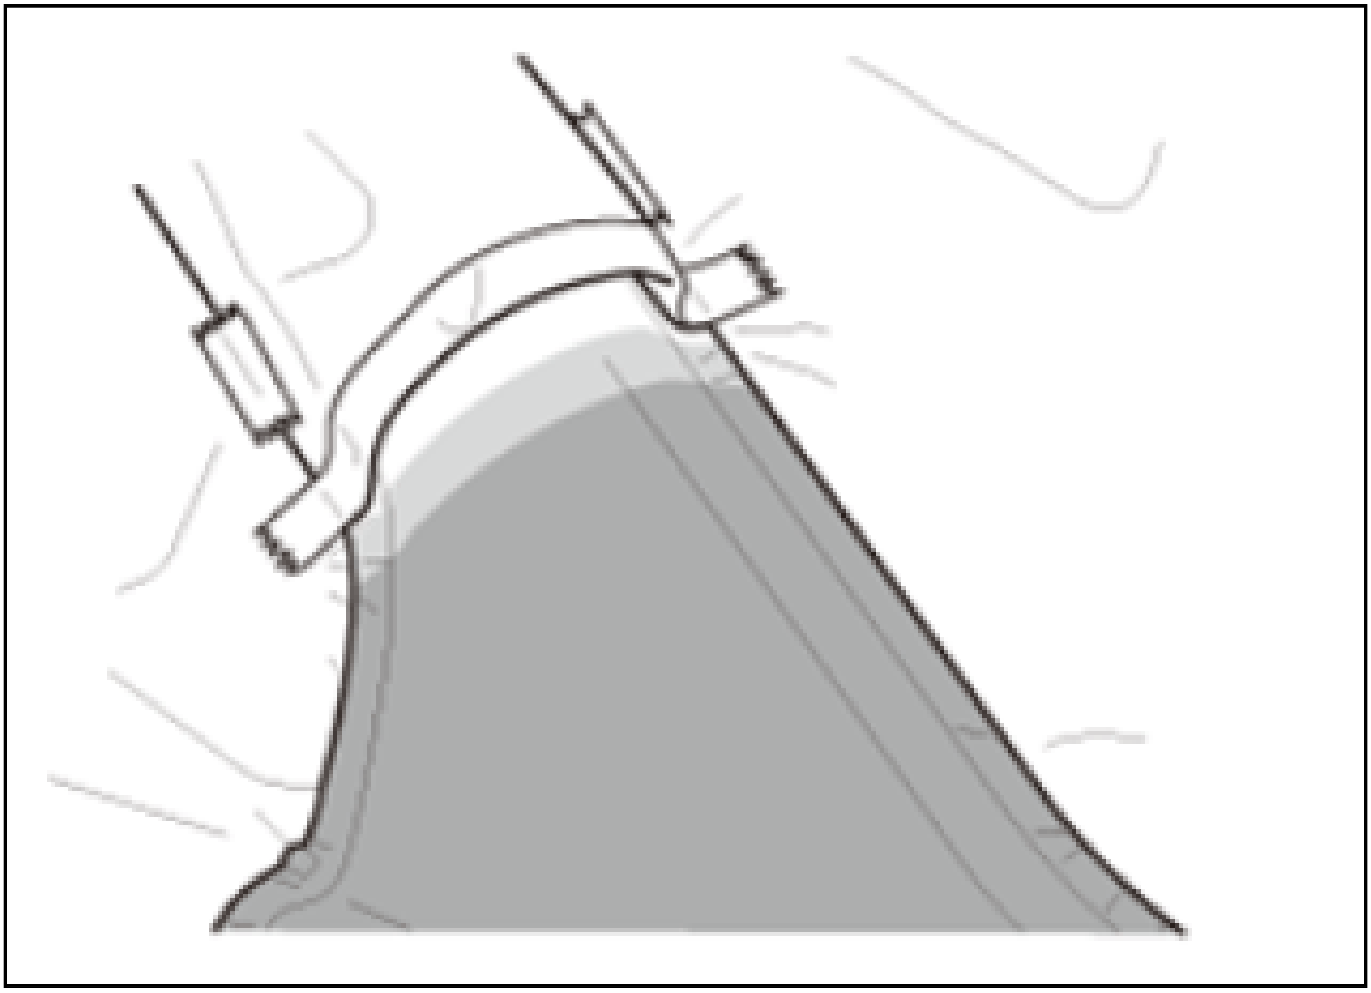
NOTE: **Painting the way to the separation line defeats the purpose of reverse masking. Consider the size of repair area and apply masking with an ample margin.**



FLAT SURFACE
MASKING PAPER
MASKING TAPE
CORNER
MASKING TAPE

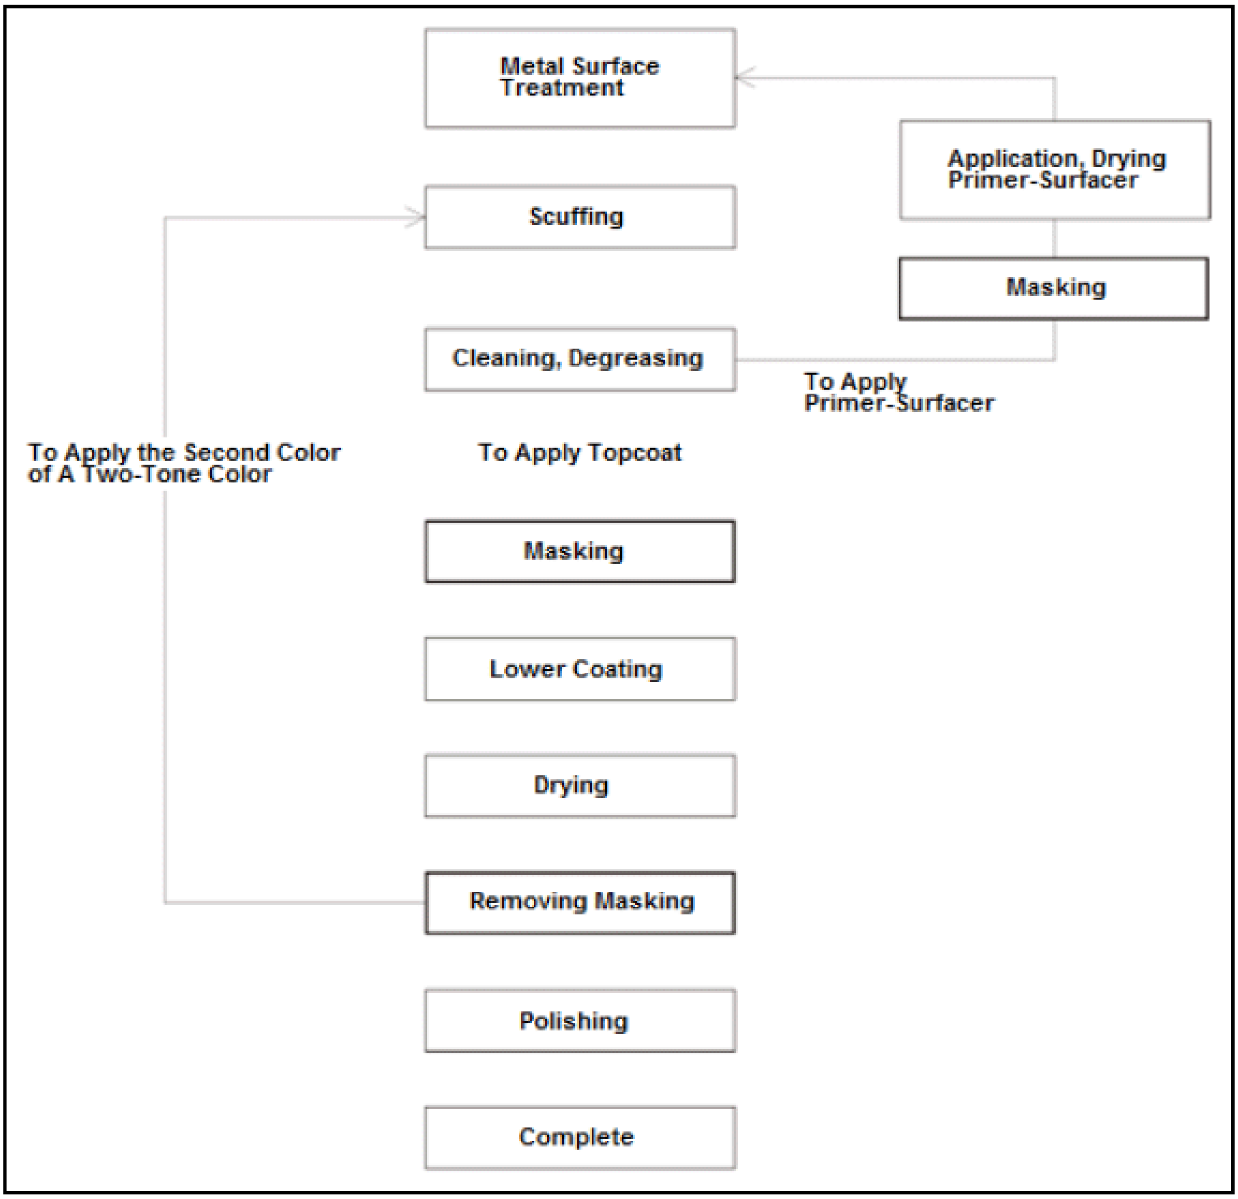
Tunnel Masking

When giving a gradation paint to a pillar or similar parts, lift the masking paper from the repair part to create a tunnel-like space so that ending line of the paint becomes fuzzy resulting in smooth color gradation of the repair part to the original colored part. In some cases, the masking is lifted at two or three stages based on the cycles of the gradation paint



Masking Process

- Masking is conducted when lower coat (primer-surfacer) and topcoat are applied.
- The purpose of masking is to prevent the paint from adhering to areas other than the repair area. It also prevents paint overspray dust, and dirt into the vehicle.
- The work processes or methods may differ depending on the repaired area and painting method, but the general steps of masking are as follows:



Metal Surface Treatment
Application, Drying Primer-Surfacer
Scuffing
Masking
Cleaning, Degreasing
To Apply Primer-Surfacer
To Apply the Second Color of A Two-Tone Color
To Apply Topcoat
Masking
Lower Coating
Drying
Removing Masking
Polishing
Complete

Masking Tools And Materials

Masking Paper

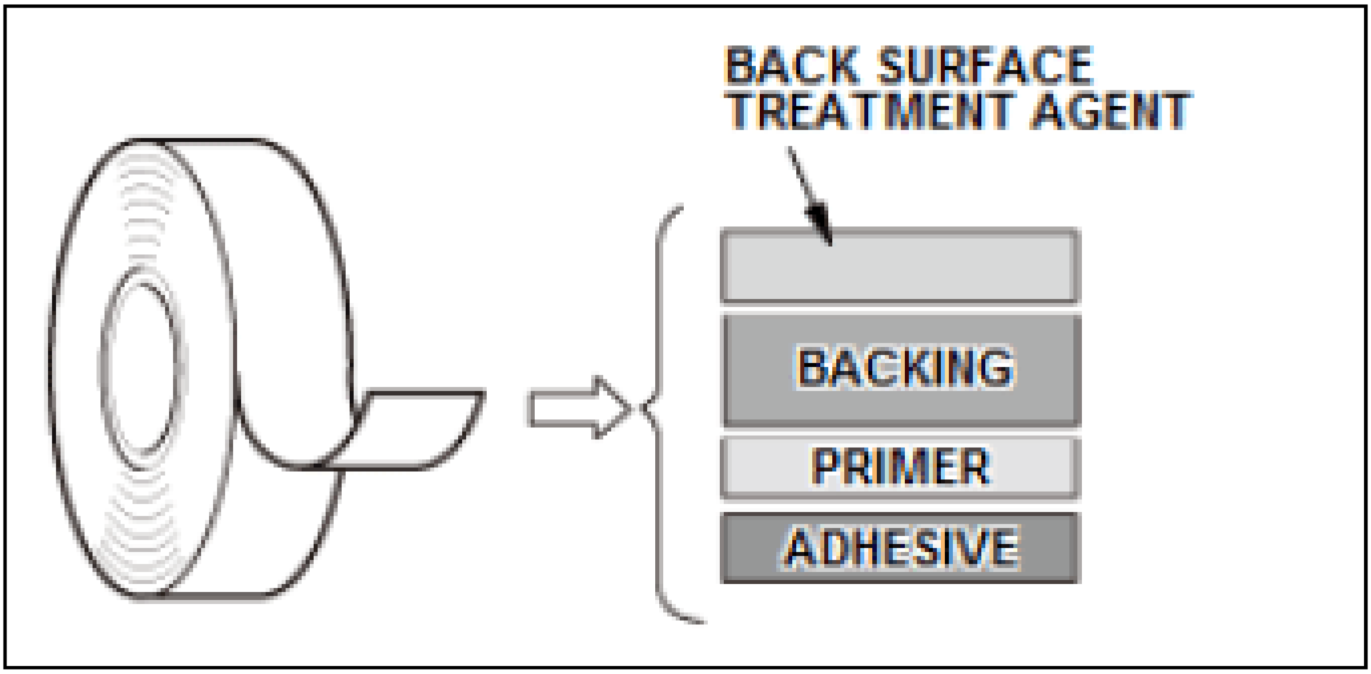
- Masking paper is a cover or paper applied in order to prevent unwanted adhesion of paint and overspray outside of the work area.
- There are several different kinds of masking paper available. Some resist solvent penetration or high temperatures. A liquid type-masking agent is also available that can be applied with a spray gun.

Masking Tape

- Masking tape for paint repair may be used with a masking paper or by itself.
- Paper-based masking tape is most common, but there are also metallic tapes which are heat resistant, and plastic tapes which create sharp masking lines depending upon the purposes.

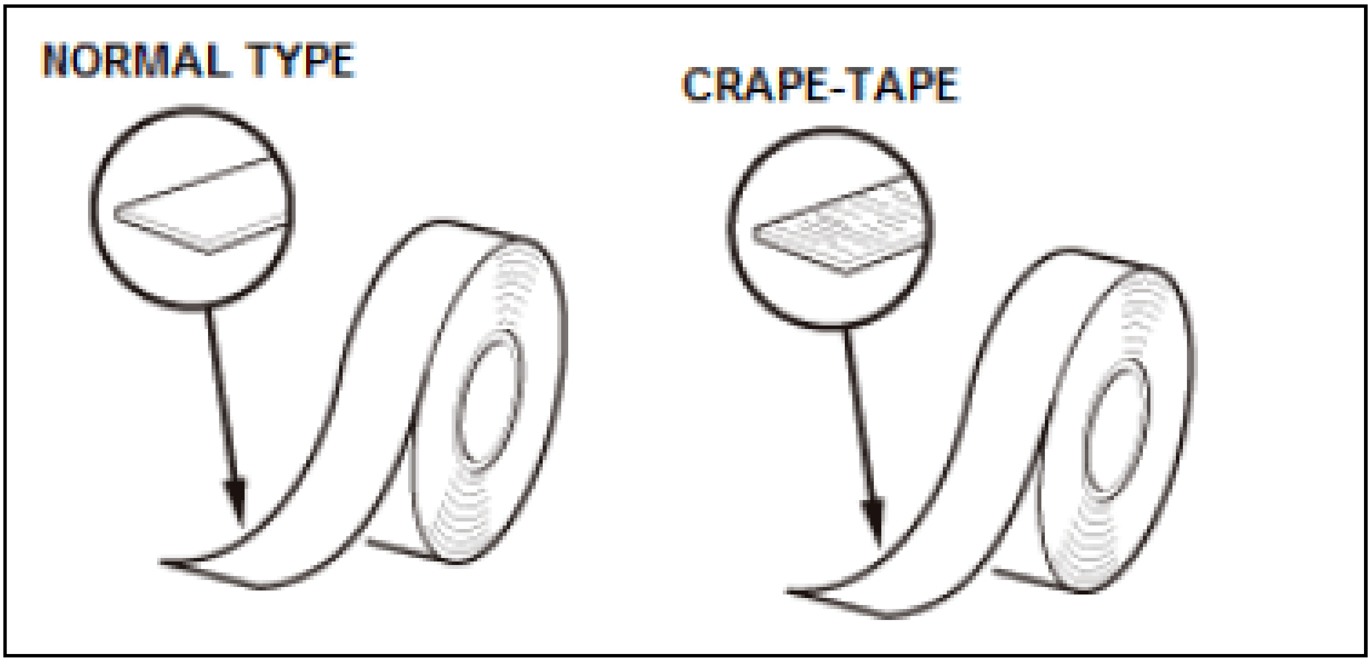
Composition of Masking Tape

- Back Surface Treatment Agent: Prevent tape from sticking to another tape.
- Backing: Tape base made of paper, cloth, plastic etc.
- Primer: Enhances adhesion of glue to the base material and prevents glue residue on the applied surfaces.
- Adhesive: Material with gluing capability.



Usage Based on Backing Material

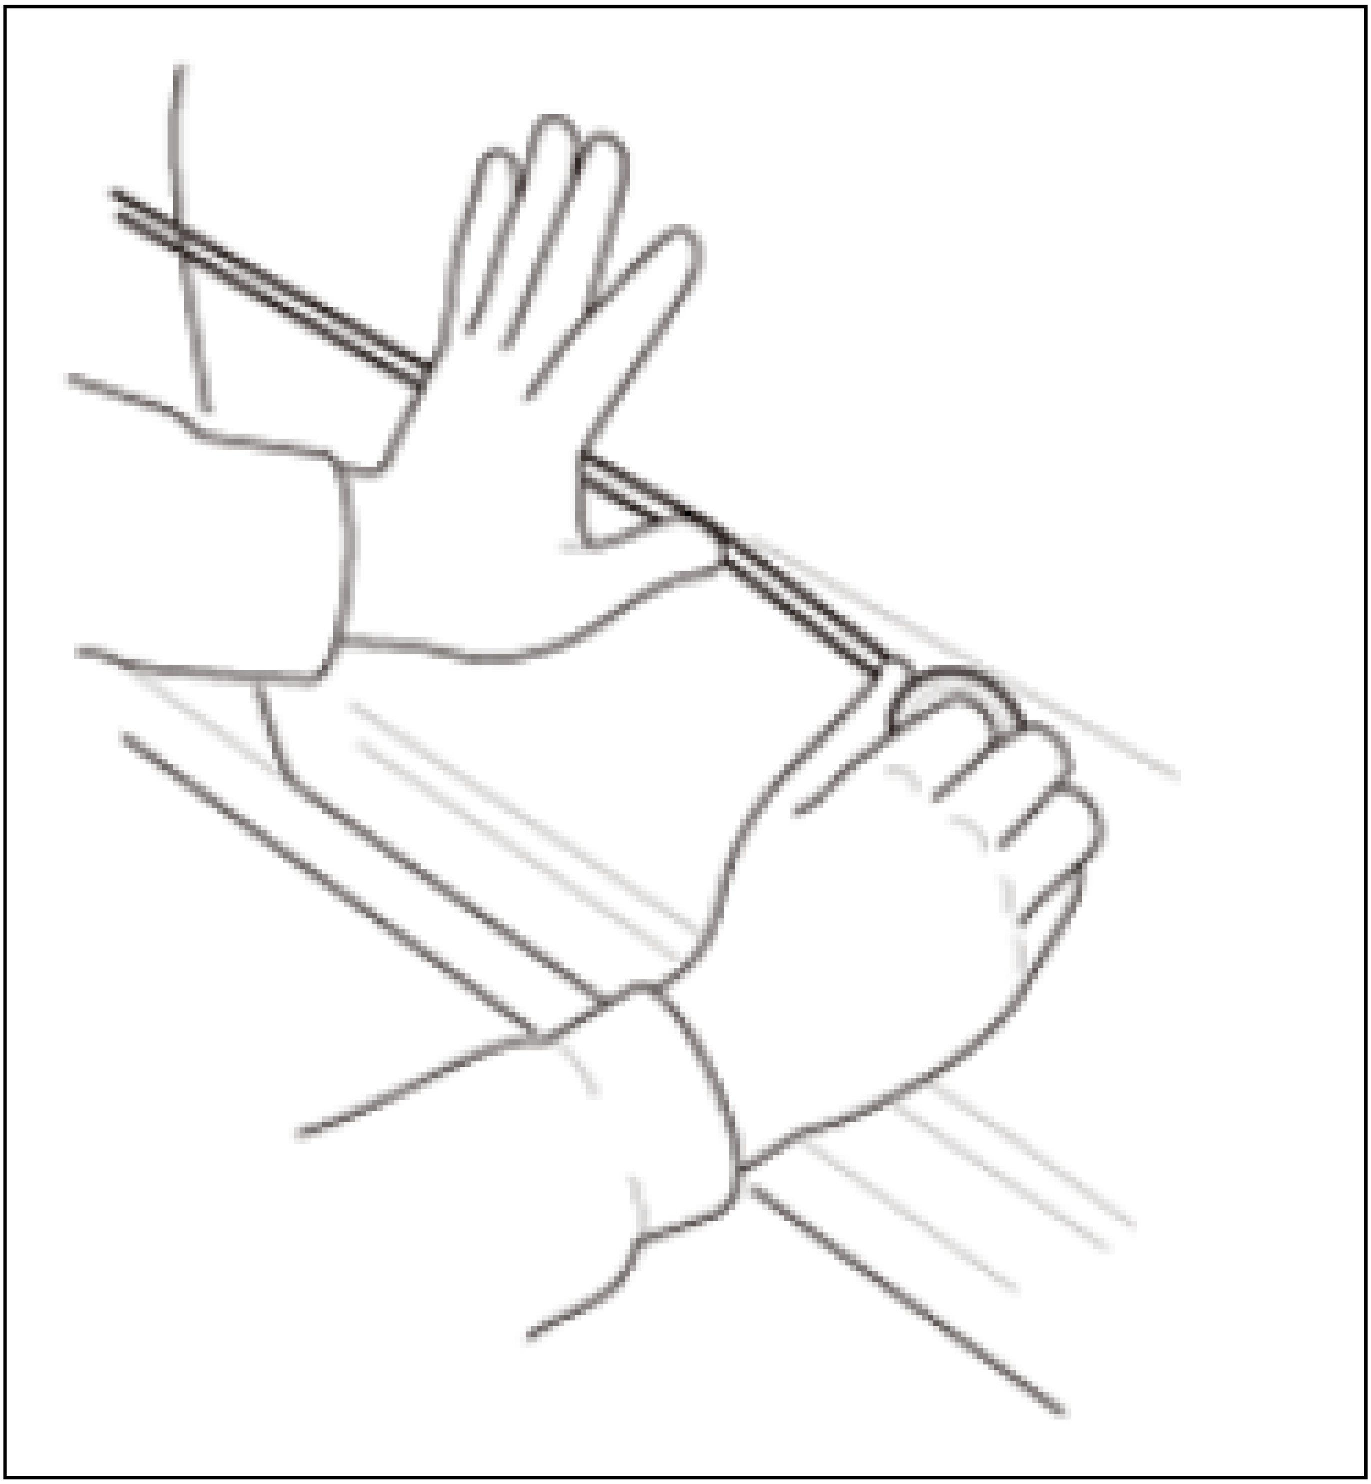
- Masking tape often used for automotive repair is made of Japanese paper, and has high heat and solvent resistance. It also is designed not to leave adhesive residue on body surfaces after tape removal.
- Plastic tape is ideal for edging, trimming, and separation of curved surfaces or and two-tone painting, etc.
- There are two types of backing surface texture; one normal type with a flat surface and another called crape-tape with fine wrinkles. The crape-tape stretches and shrinks slightly so it is suitable for masking curved surfaces.



Other Types Of Masking Tape

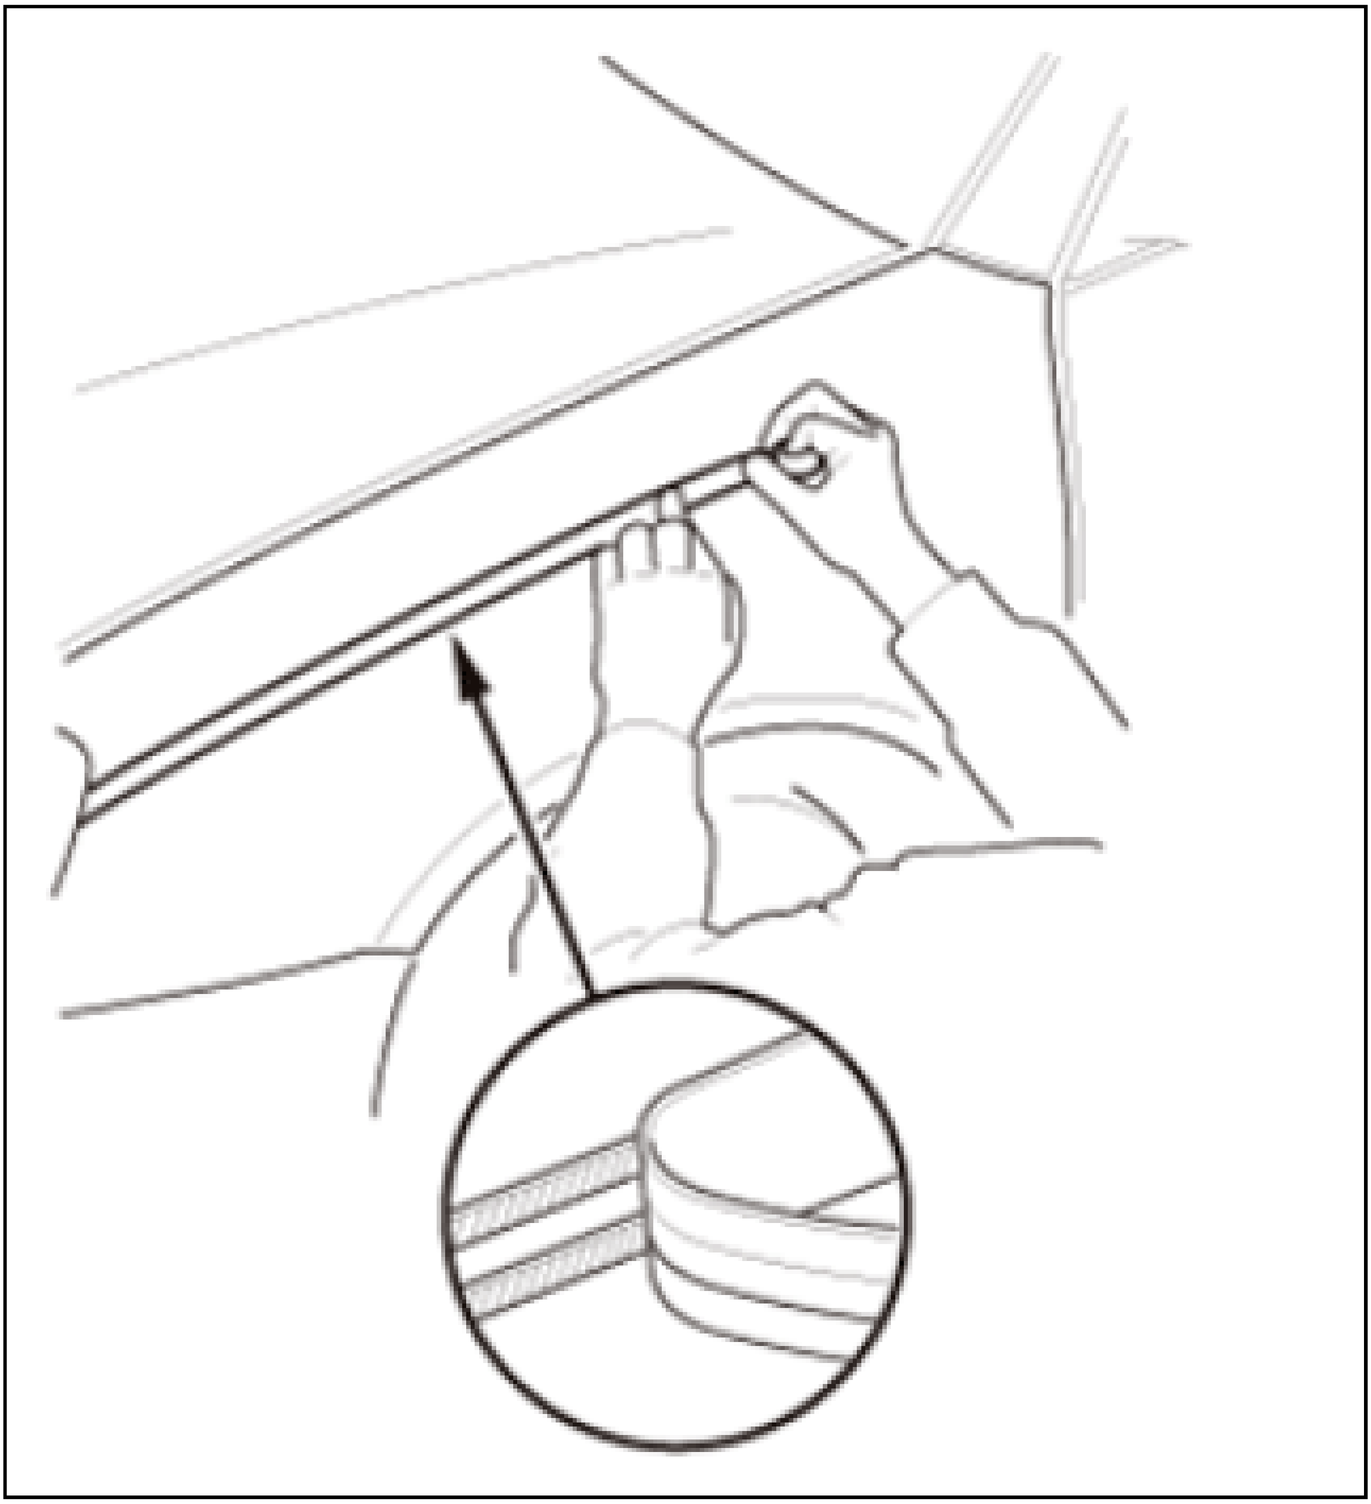
Masking Tape for Two-Tone Paint

This type of tape is called vinyl tape, trimming tape, or fine line tape. It is ideal for separating curved lines of surfaces, or separating color tones. It can create a clean masking line without fuzziness.



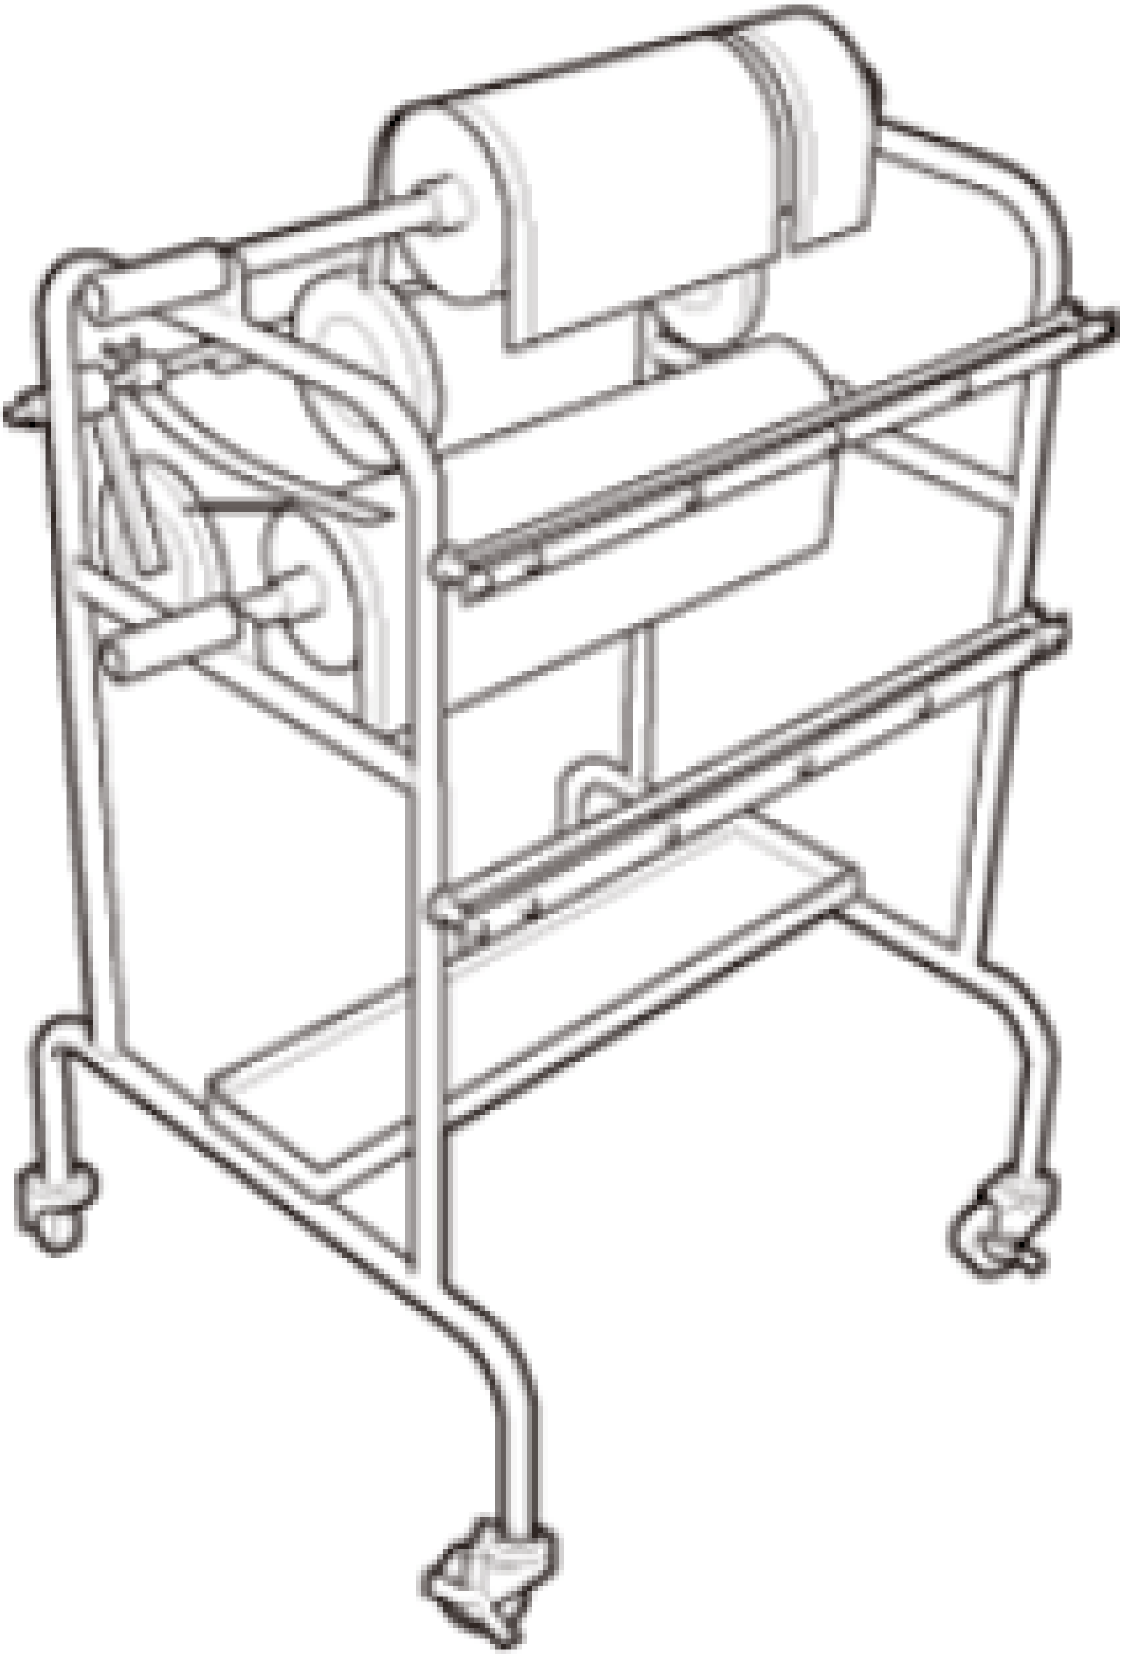
Tape for Painting Lines

This tape has scored lines of various width, so it can be used for paining multi-width lines.



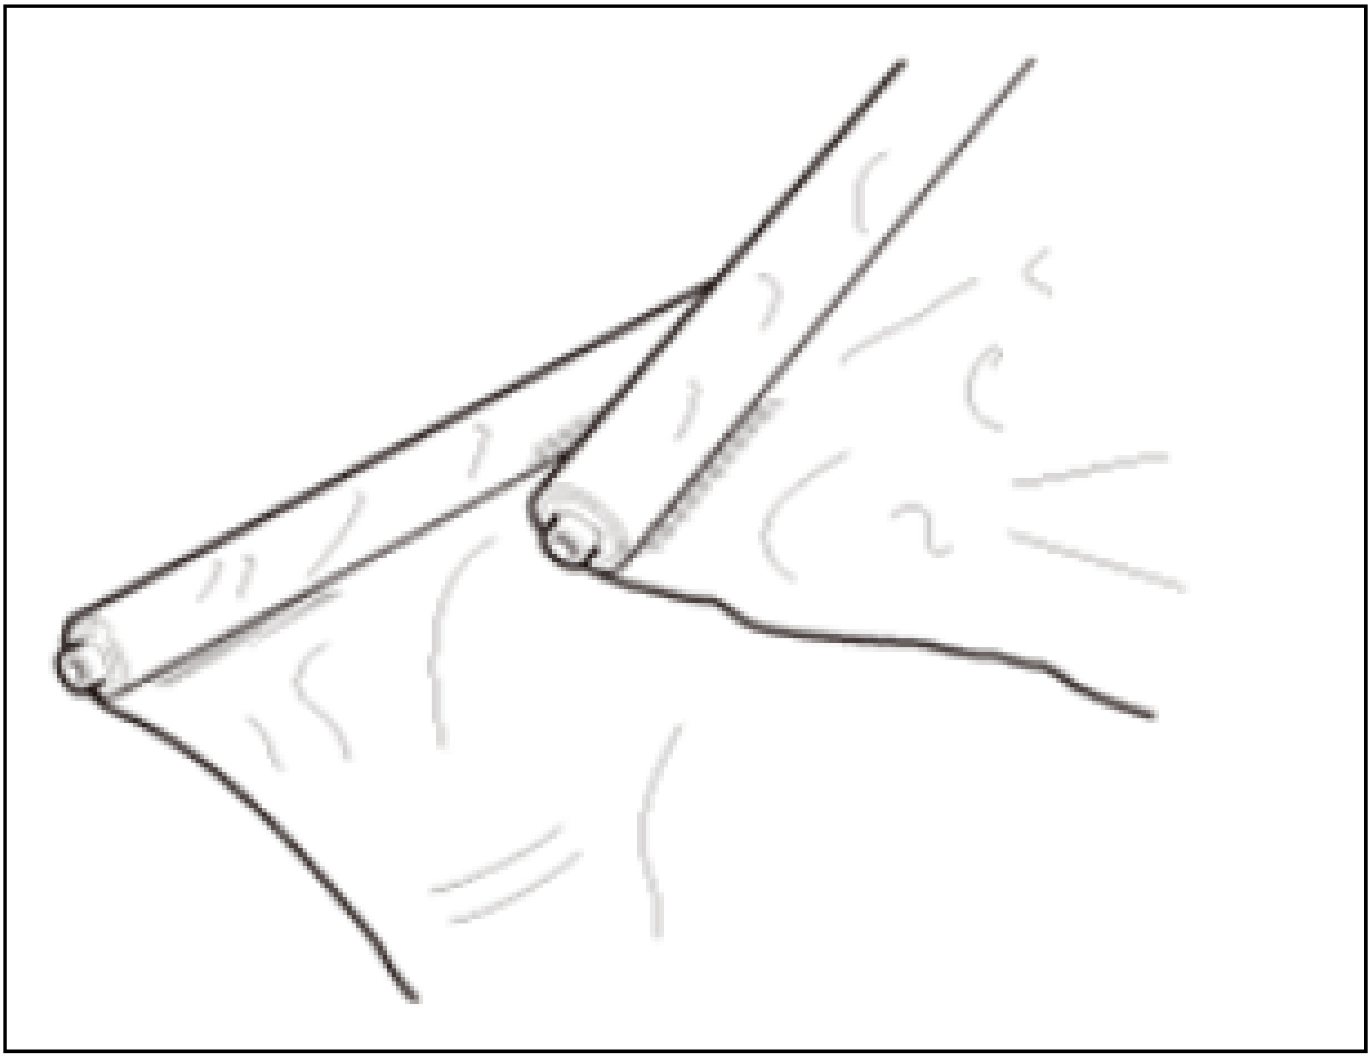
Paper Dispenser

In the device, rolled masking paper and masking tape are matched. This allows you to remove the required masking paper size with tape already applied. This device also makes it possible to set different sized masking paper simultaneously.



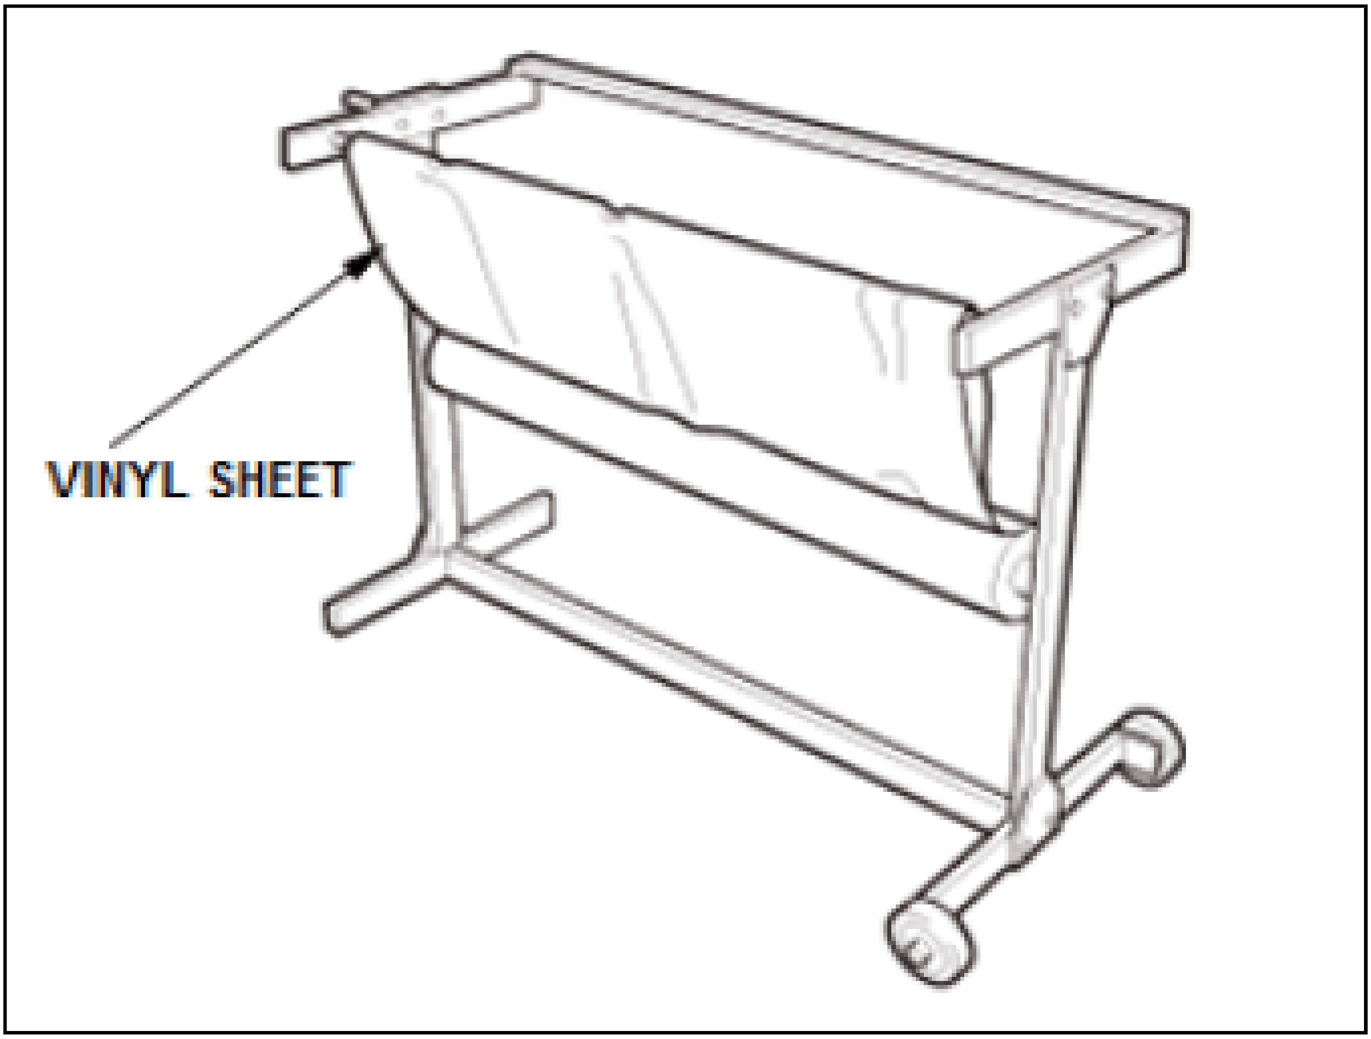
Polyvinyl Sheet

This sheet is composed of three combined layers, polyethylene, polypropylene, and polymer for use as an automotive masking sheet. It absorbs and retains paint overspray mist and powder.



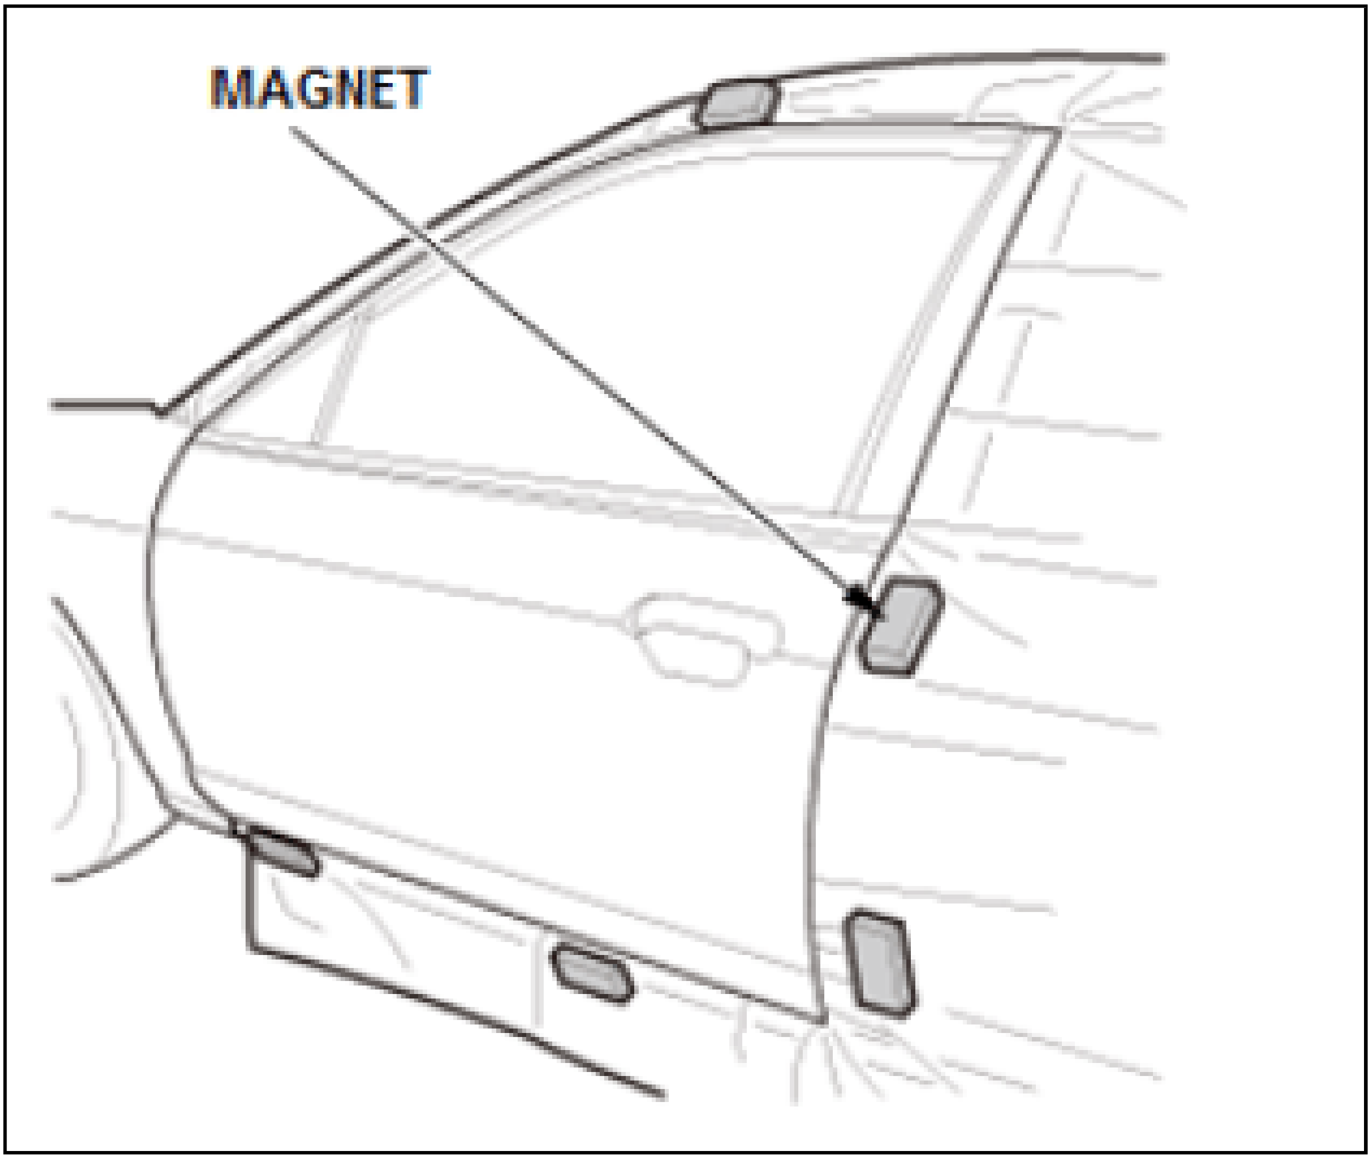
Sheet Dispenser

Using this stand it is easier to dispense polyvinyl sheet.



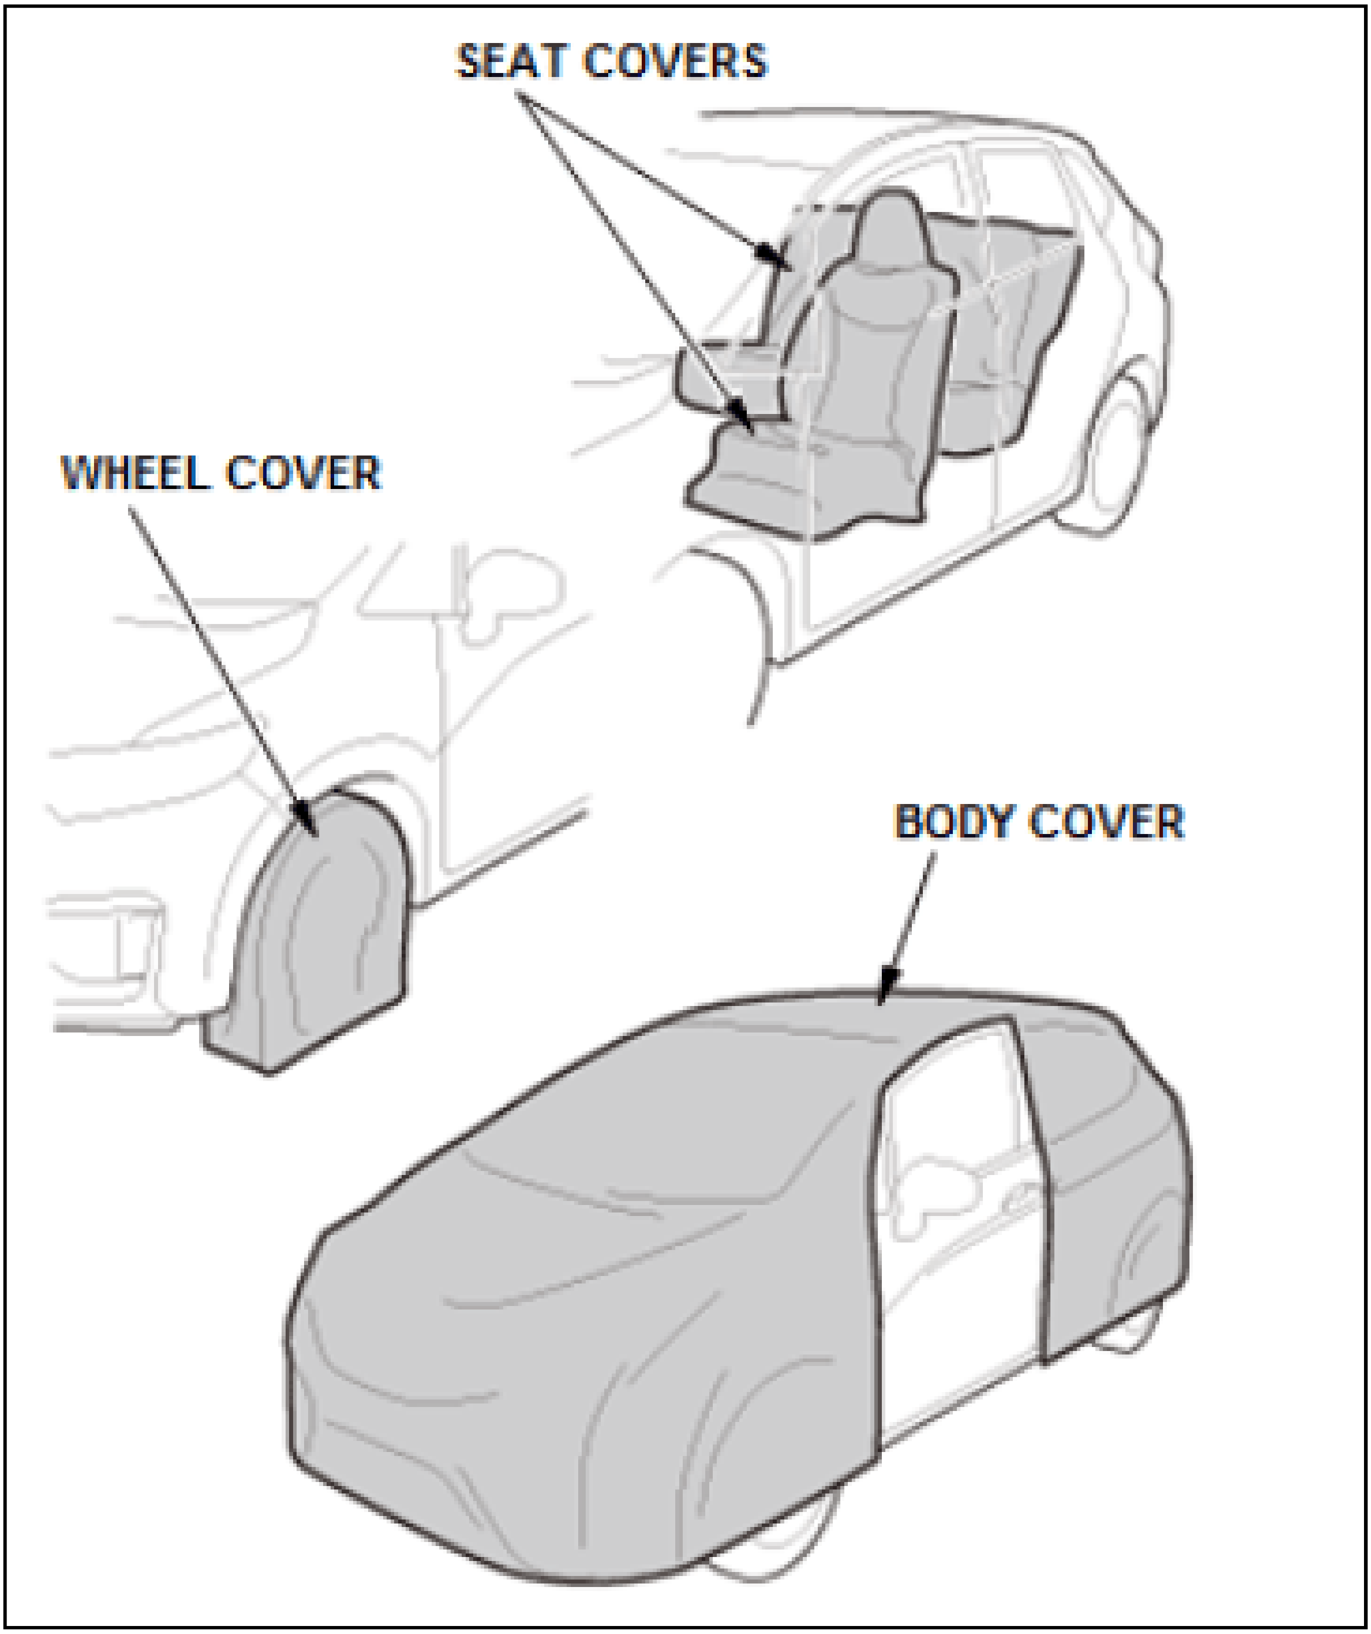
Magnet

It is used to attach vinyl sheet on the vehicle or press tight a wrinkled vinyl sheet in a pulled state. Magnets make it possible to shift the vinyl sheet's position as required.



Special Covers

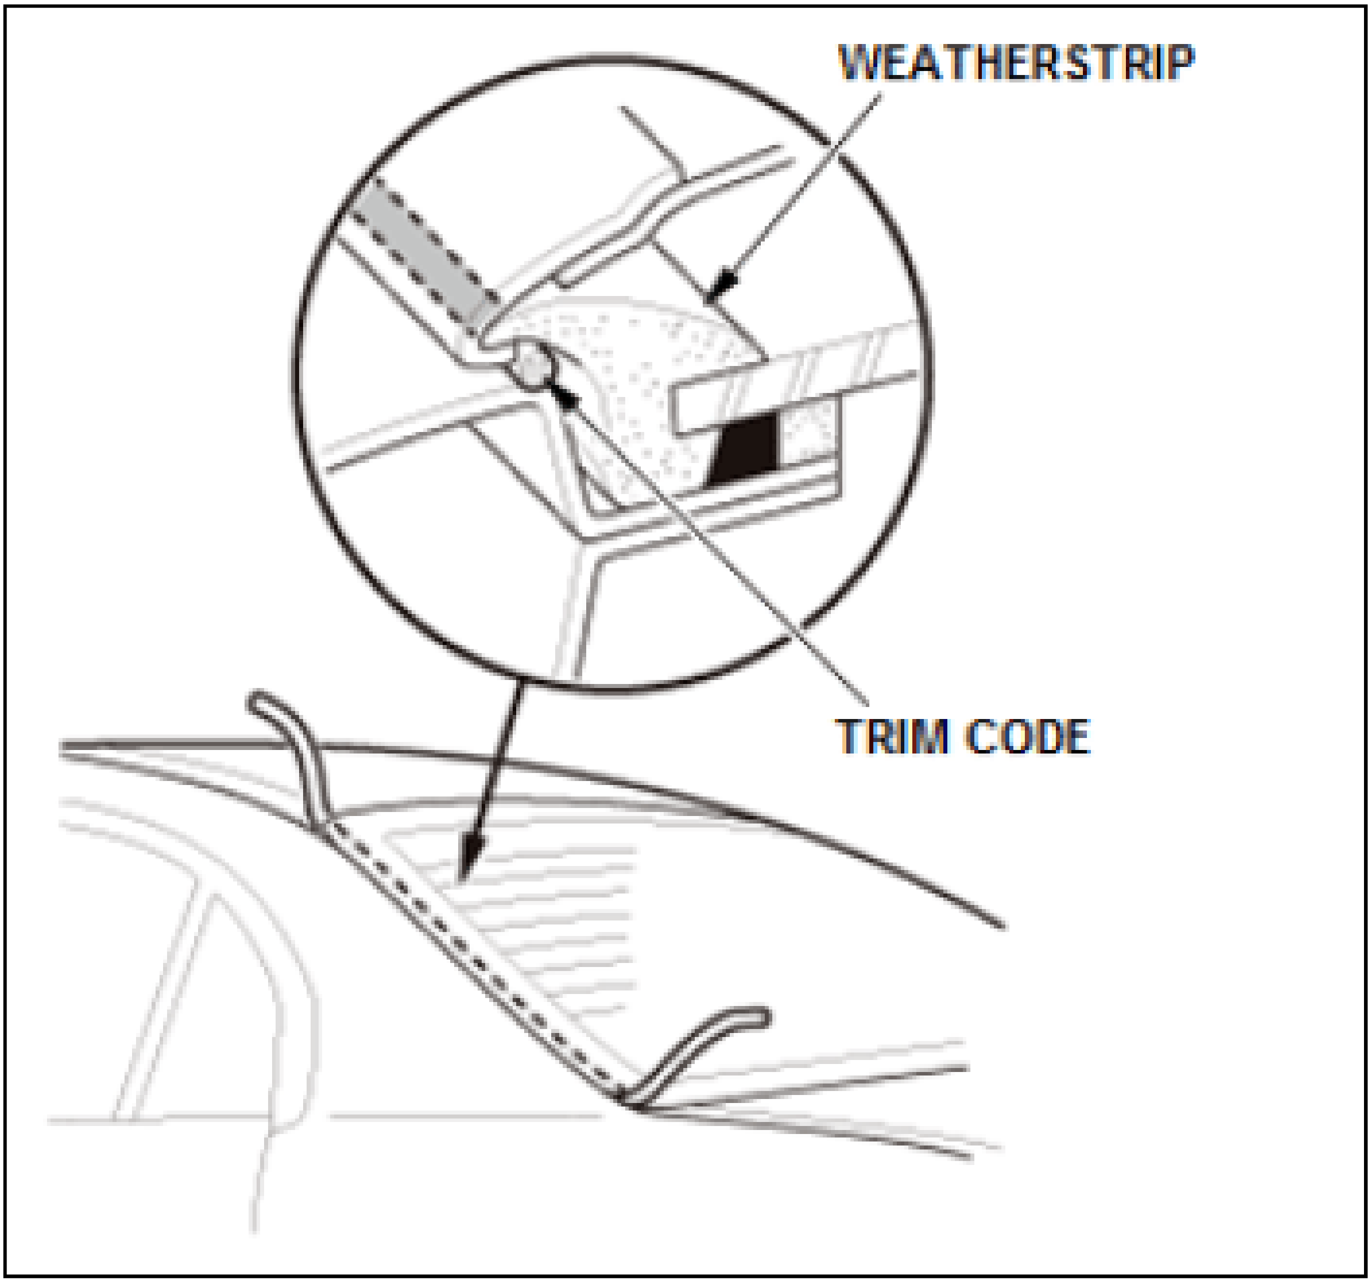
There are body covers available for a variety of uses made of special synthetic paper or treated fabric. Some cover the whole body others cover just part of it. In addition, there are wheel covers and interior covers that protect the passenger compartment.



SEAT COVERS
WHEEL COVER
BODY COVER

Trim Lifting and Masking Tape

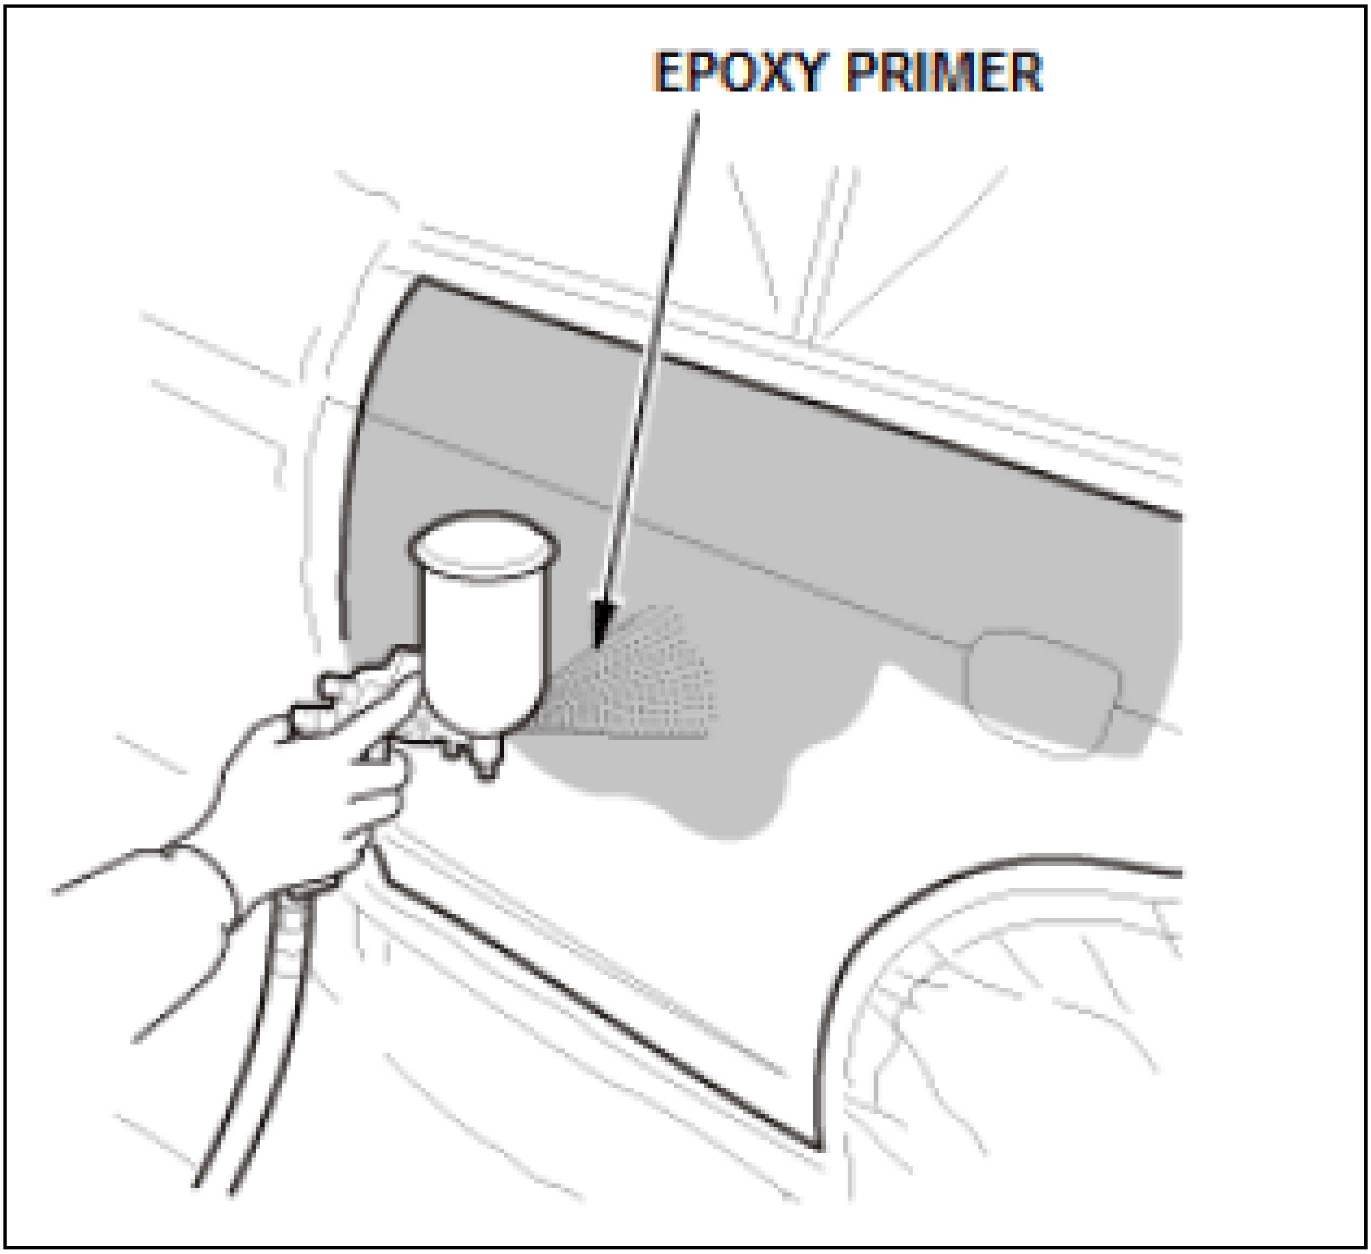
This tape is used to prevent the rubber weatherstrips around glass from being paint-stained. By inserting it between the rubber weatherstrip and body, the strip can be held away from the body.



WEATHERSTRIP
TRIM CODE

Metal Surface Treatment

Metal Surface Treatment (Epoxy Primer Coating)



When bare metal surfaces are exposed to air after sanding, corrosion will form quickly. Apply epoxy primer to the surface in order to prevent corrosion and to improve topcoat adhesion:

1. Mix the main agent with its additives and dilute it with the correct reducer/thinner.
2. Apply one or two layers using a spray gun or brush.
3. Allow the epoxy primer to dry.

Drying time should be around about 60 minutes at 68Â°F (20Â°C). Force-drying will improve the paint quality. Check for the epoxy primer manufacturer's product spec for the actual required drying time.

Selection Of Body Filler/Putty

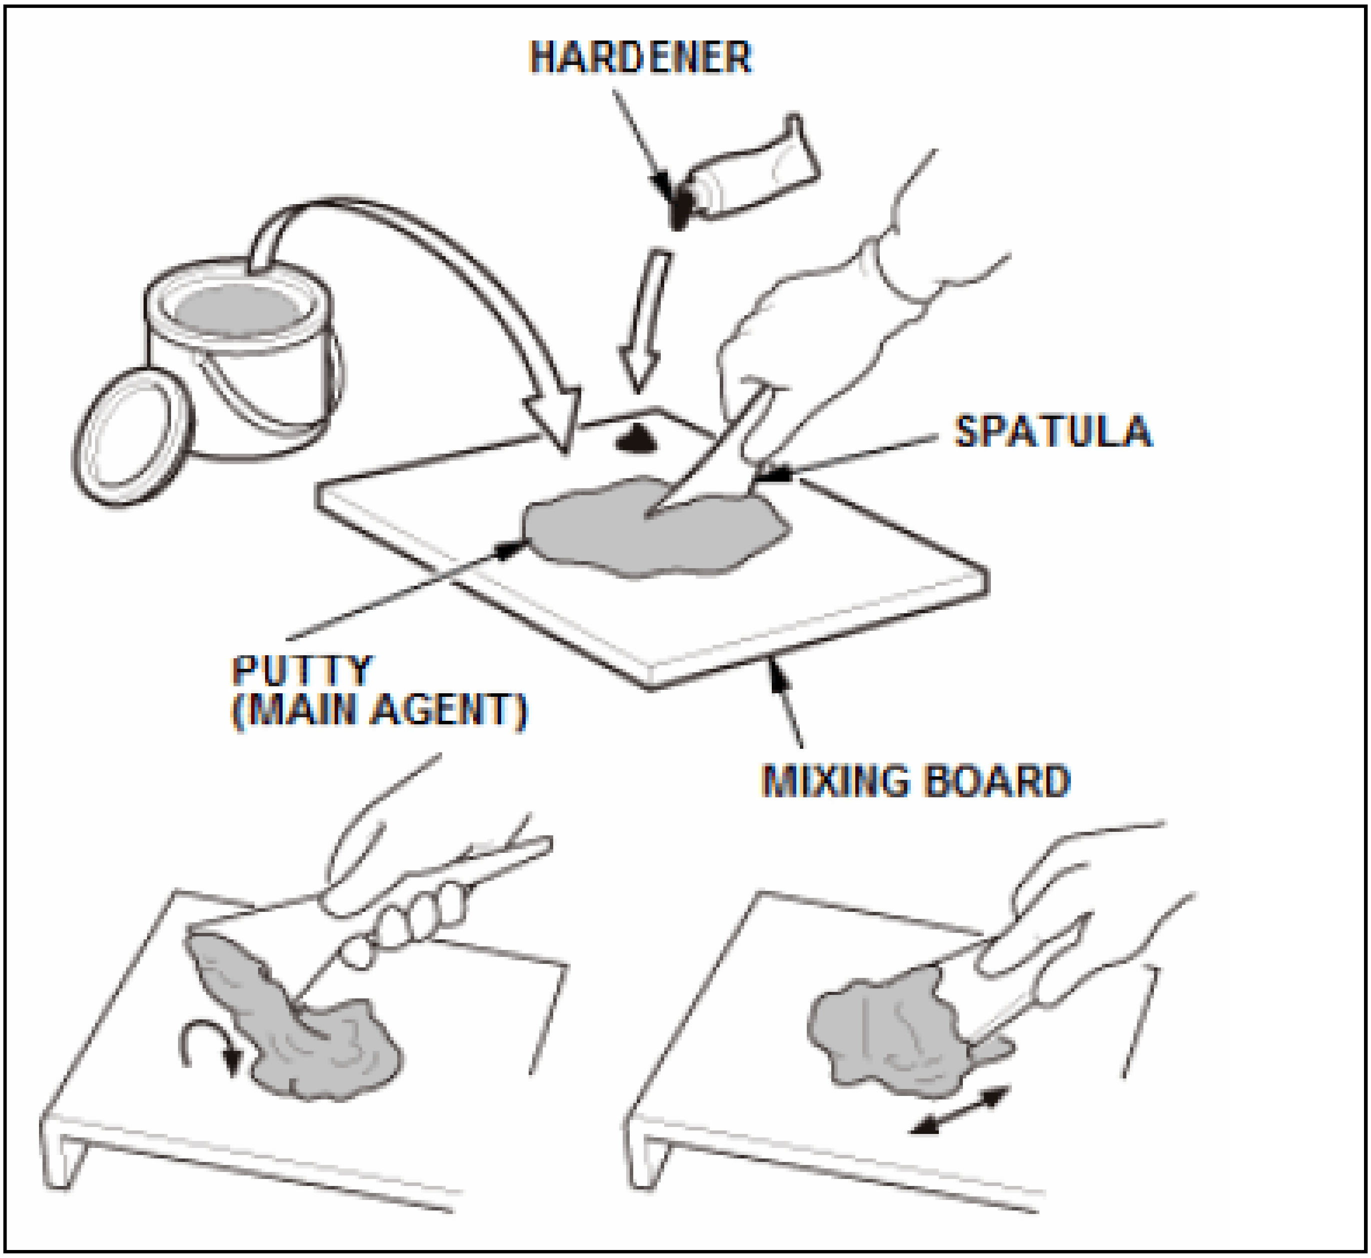
There are different kinds of body filler or putty.

- Metal filler is good for rough filling when thickness is needed.
- Light-weight panel filler sands very smooth.
- Polyester putty which dries fast and sands very smooth, etc.

Each has its own characteristics, so choose a body filler or putty most suitable for the work being done. In the following work process example, we will use intermediate body filler/putty. This type has characteristics of both panel and polyester fillers.

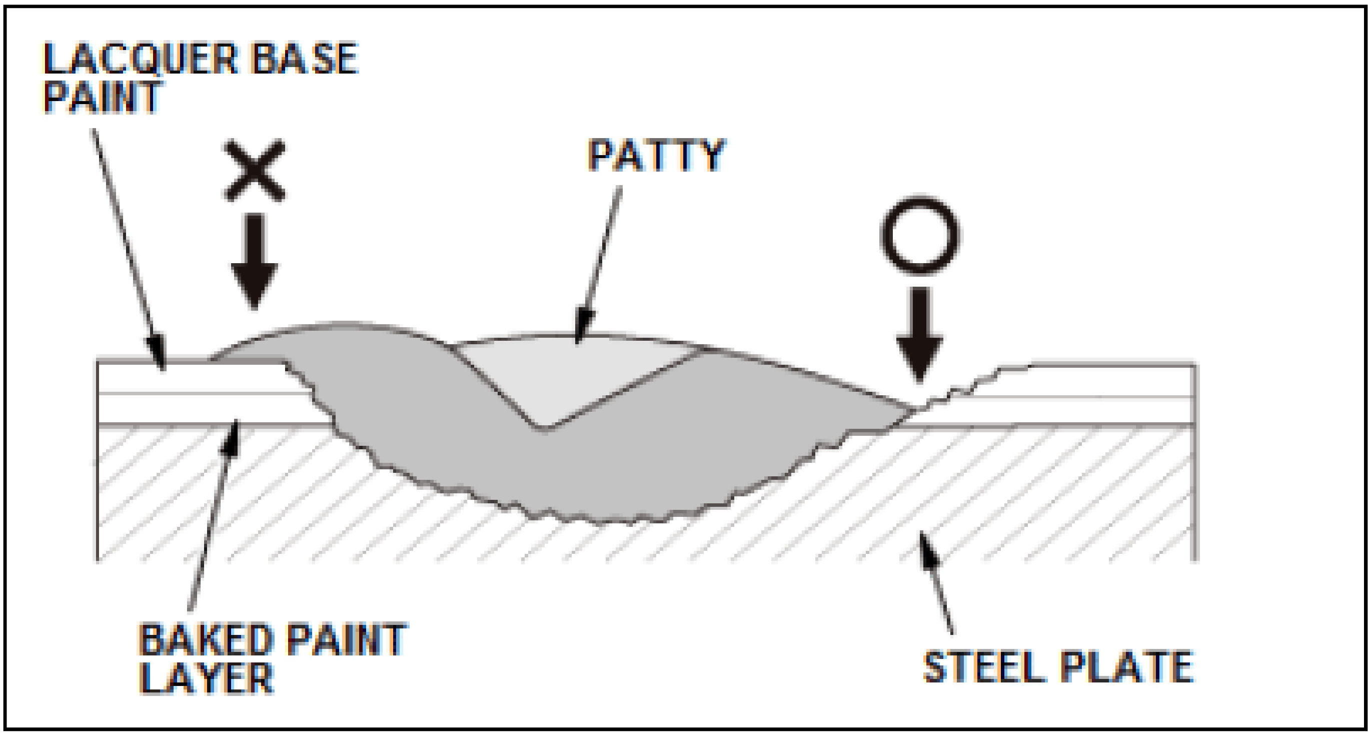
Preparing Intermediate Filler/Putty

1. Stir the putty until it is a smooth consistency
2. Remove the required amount of filler/putty and place it on a mixing board. Then mix with the correct amount of hardener.
3. Knead and mix the filler and hardener with a spatula until the color becomes even. Be careful not to entrap air in the filler.



HARDENER
SPATULA
PUTTY
(MAIN AGENT)
MIXING BOARD

Application Of Intermediate Filler/Putty



LACQUER BASE
PAINT
✕
PATTY
○
BAKED PAINT
LAYER
STEEL PLATE

Apply intermediate filler/putty with a spreader into the recess of the damaged area.

NOTE: **When the old paint layer is a lacquer type, be careful not to put the filler/putty directly on the old paint surface. If it happens, the filled area mark show through the new topcoat paint.**

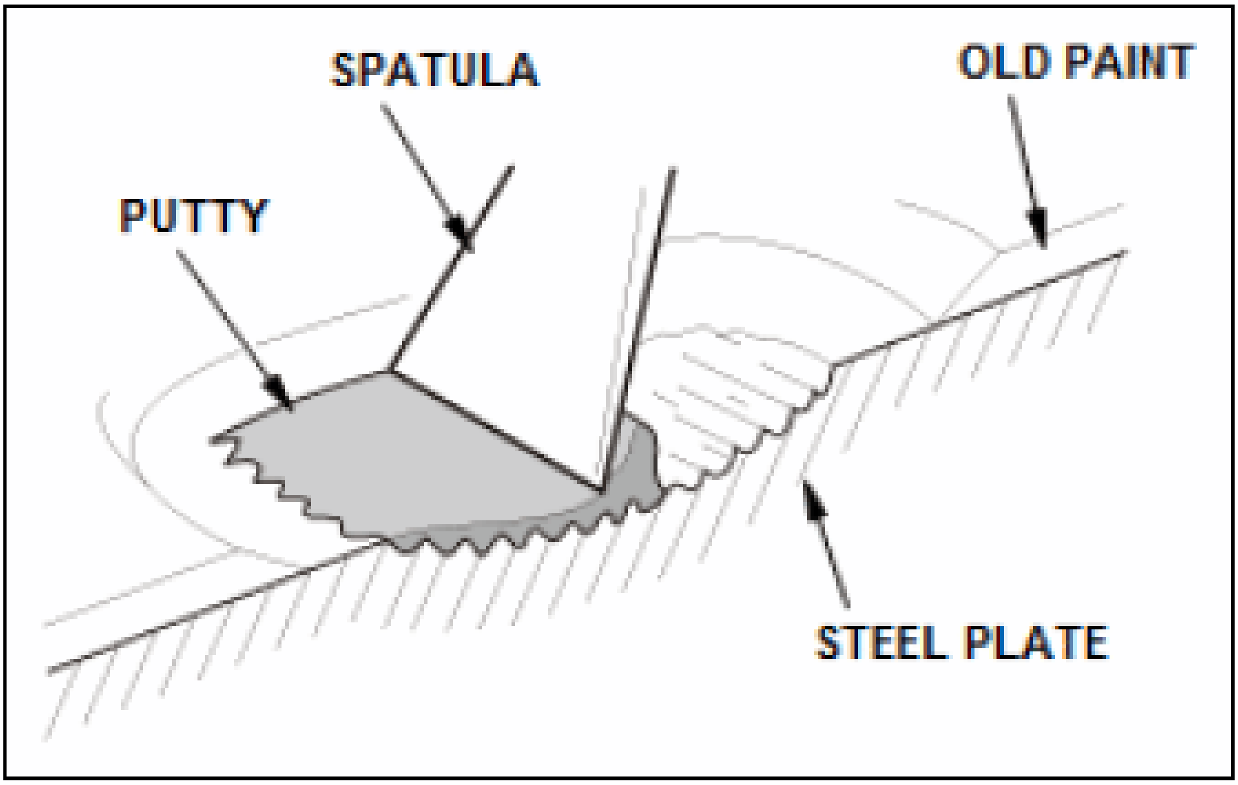
Basics Of Body Filler/Putty Application

Do not apply filler/putty in a single thick layer. Instead, apply it in several thinner layer with sufficient drying time allowed between each.

NOTE: **Be careful not to trap air in the filler/putty.**

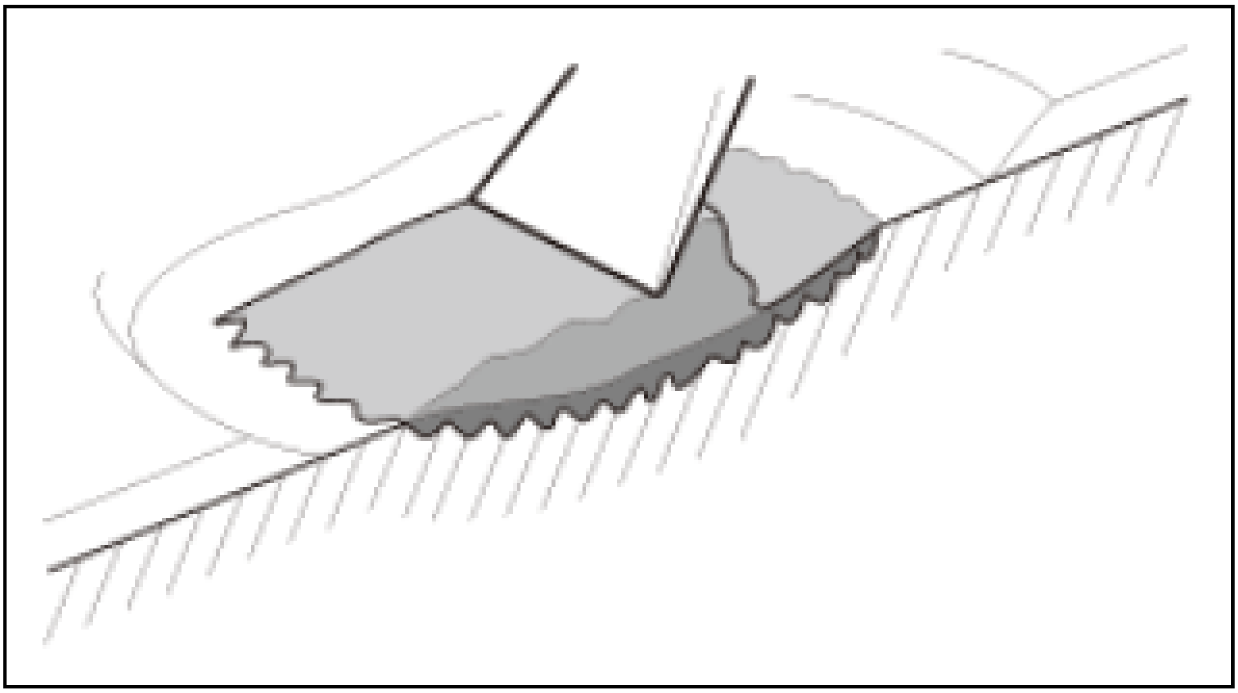
1. Covering:

   At the first application of the filler/putty, stand the spatula nearly straight up apply the filler/putty very thinly so that it penetrates into the hairline sanding scratches.

2. Thickening:

   Build up the filler/putty using a spreader held at a small angle.

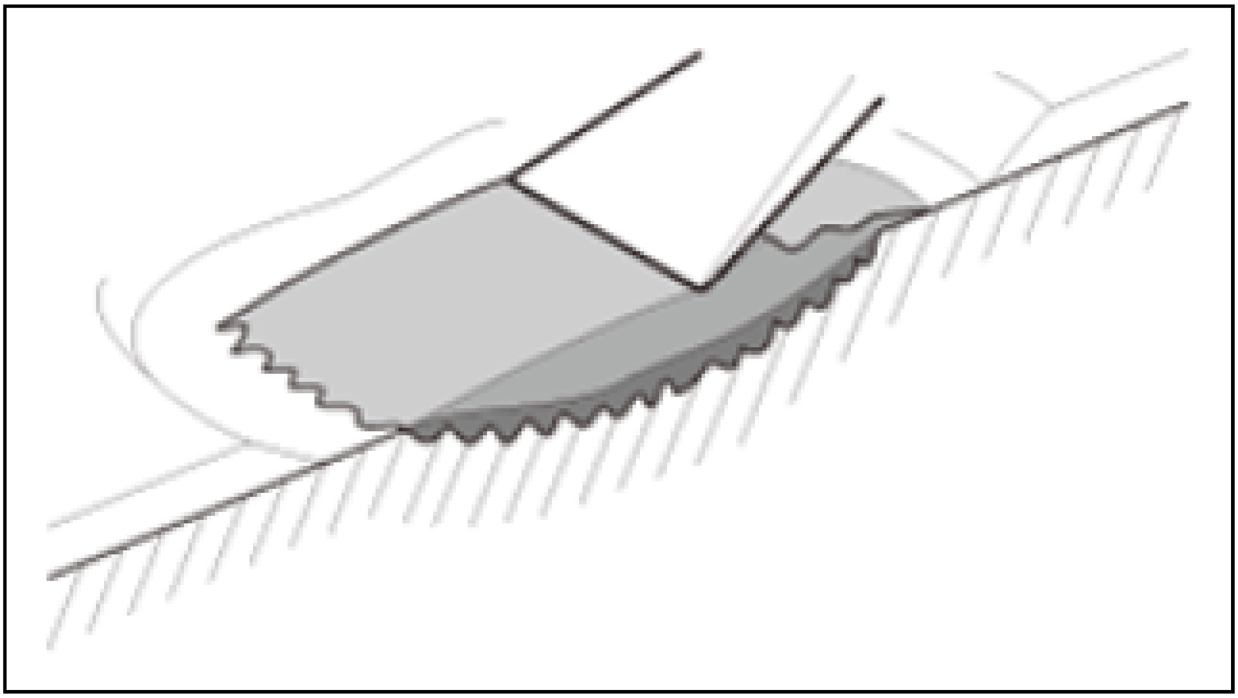


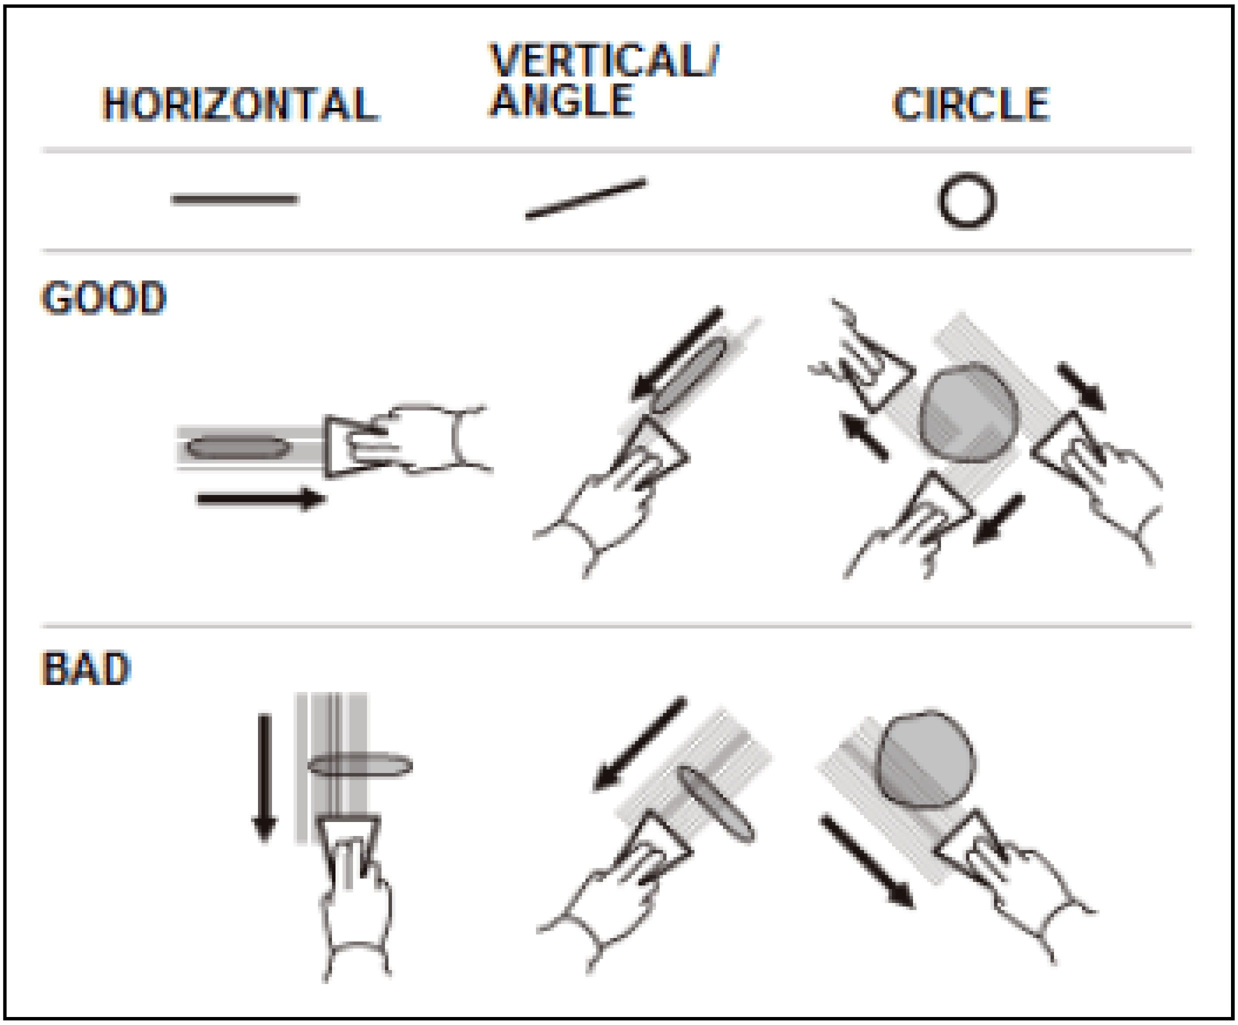
3. Flattening:
   - If the spreader leaves unevenness filler/putty surface, remove them by flattening the spreader's angle.

     NOTE: **Surface unevenness is cause by the step-shape at end of spreader. Don't push the spatula too hard, and completely smooth the filler/putty before it starts to dry up.**

     NOTE: **If a large amount of putty is applied at one time, air may be entrapped in the putty causing air pockets.**

   - Use the proper spreader direction and angle depending on the filler/putty surface desired for paint repair.

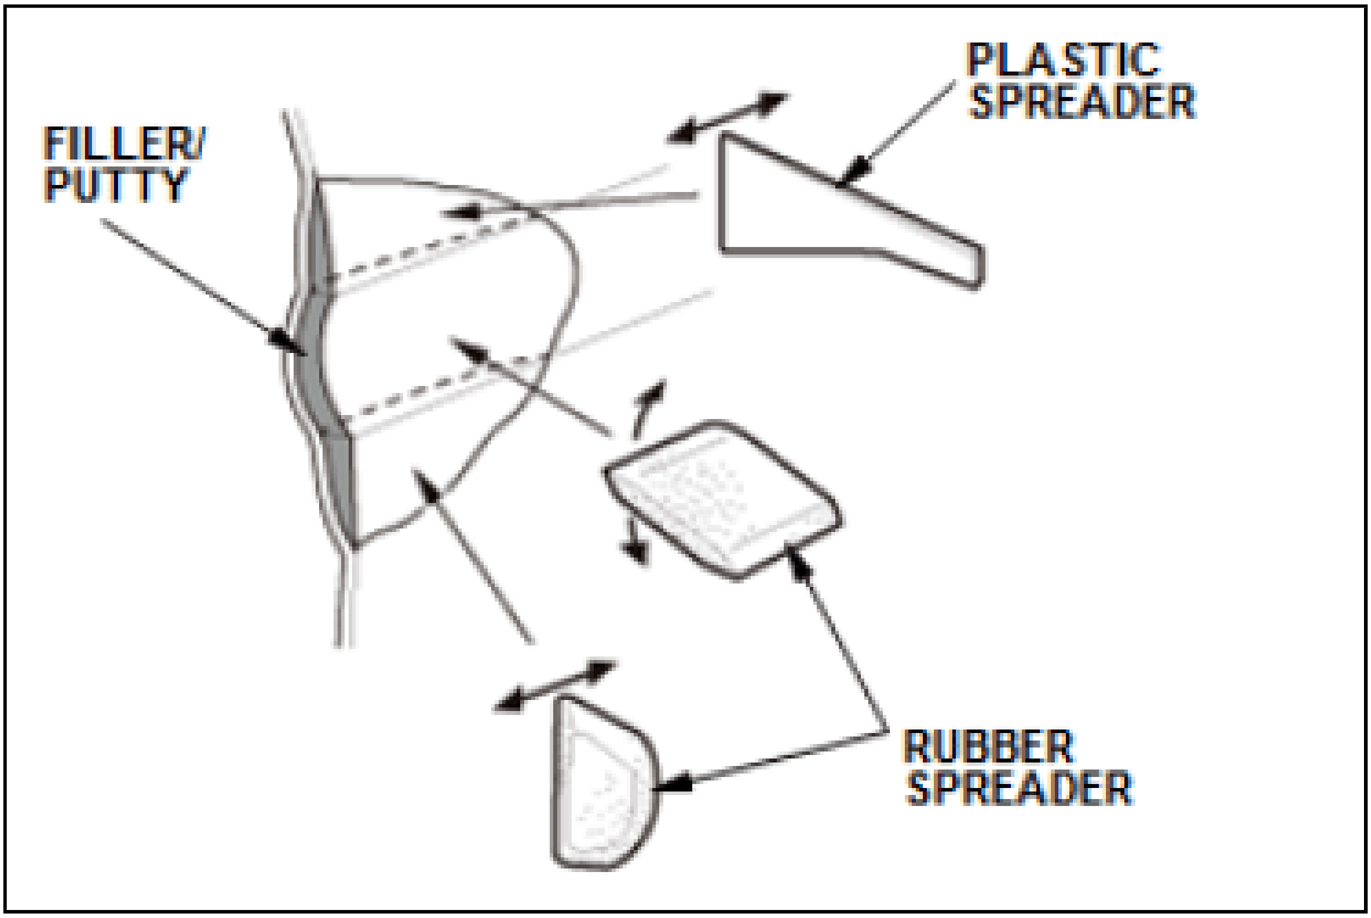




HORIZONTAL
VERTICAL/ ANGLE
CIRCLE
GOOD
BAD

Filler/Putty Application On Curved Surface

1. Apply filler/putty to the damaged area (a) with a plastic spreader.
2. Apply filler/putty to the damaged area (c) with a rubber spreader.
3. Apply filler/putty along the line on the reverse curved surface of the damaged area (b) using a rubber spreader.

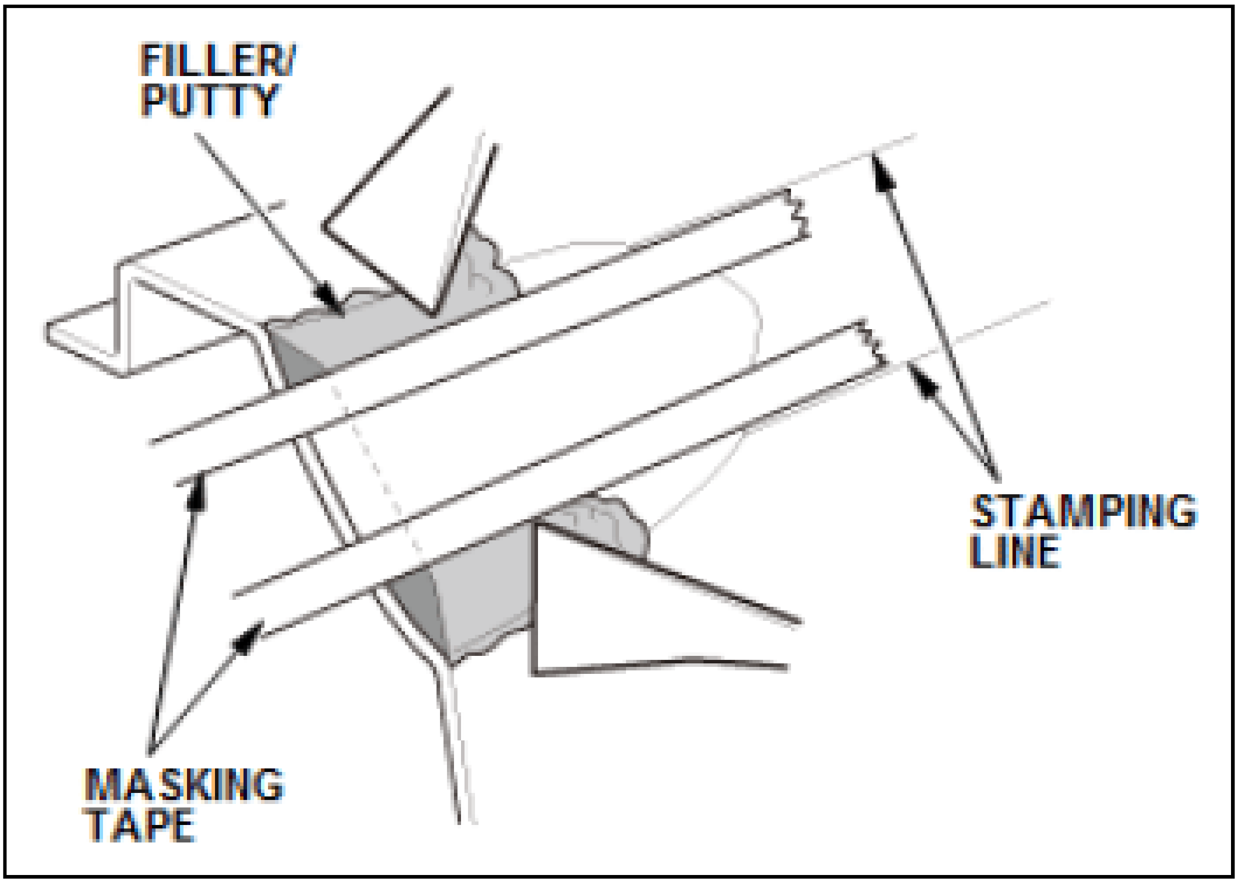


PLASTIC SPREADER
FILLER/ PUTTY
RUBBER SPREADER

Putty On Stamping Line

Use masking tape for applying filler/putty on a straight-line area like the stamping line.

1. Place the masking tape along the upper and lower stamping lines of the dam aged area (b).
2. Apply filler/putty to the damaged area (a) and surface (c).



FILLER/ PUTTY
STAMPING LINE
MASKING TAPE

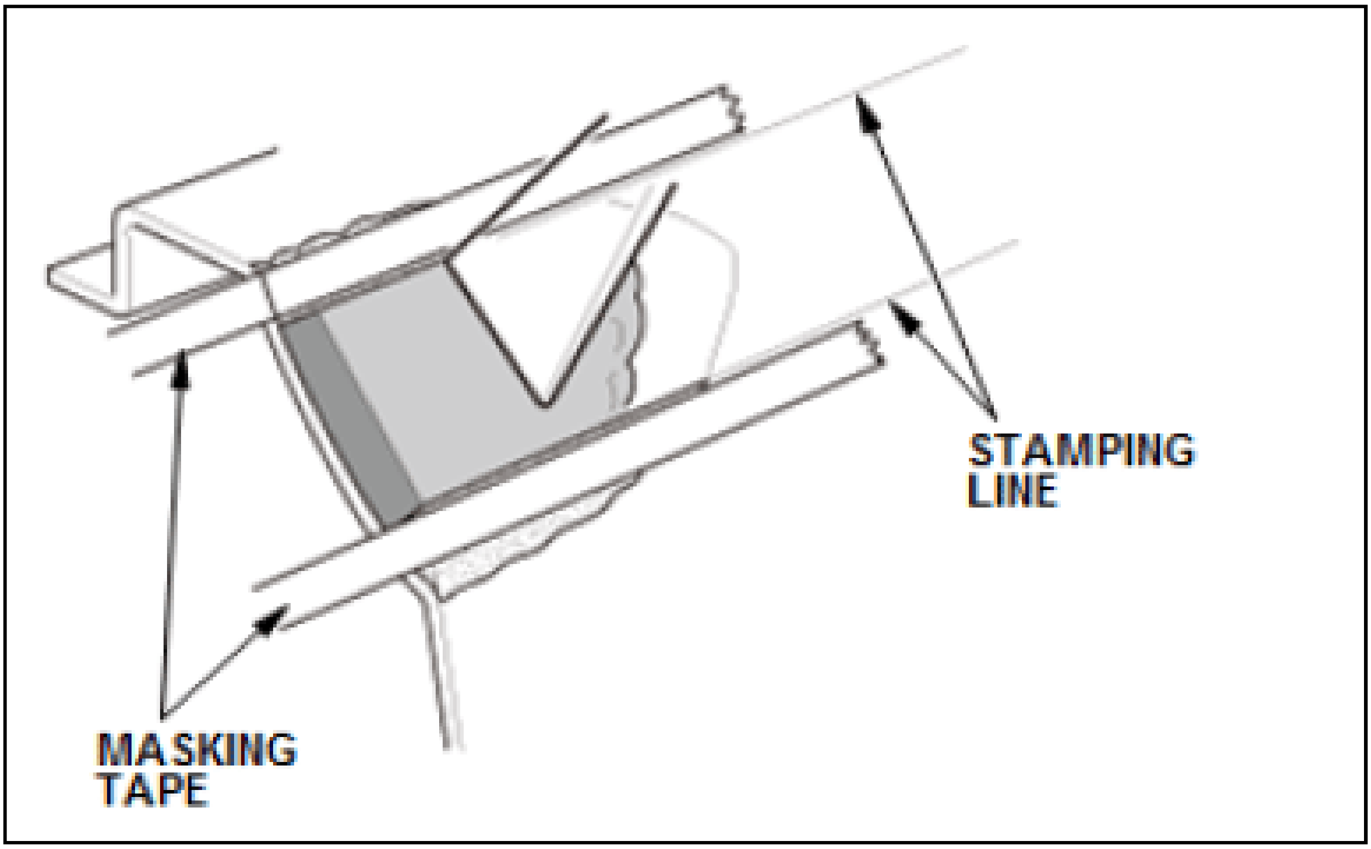
3. Remove the masking tape after putty dries.

4. Place the masking tape along the stamping lines of damaged area (a) and (c) and apply putty on the damaged area (b).

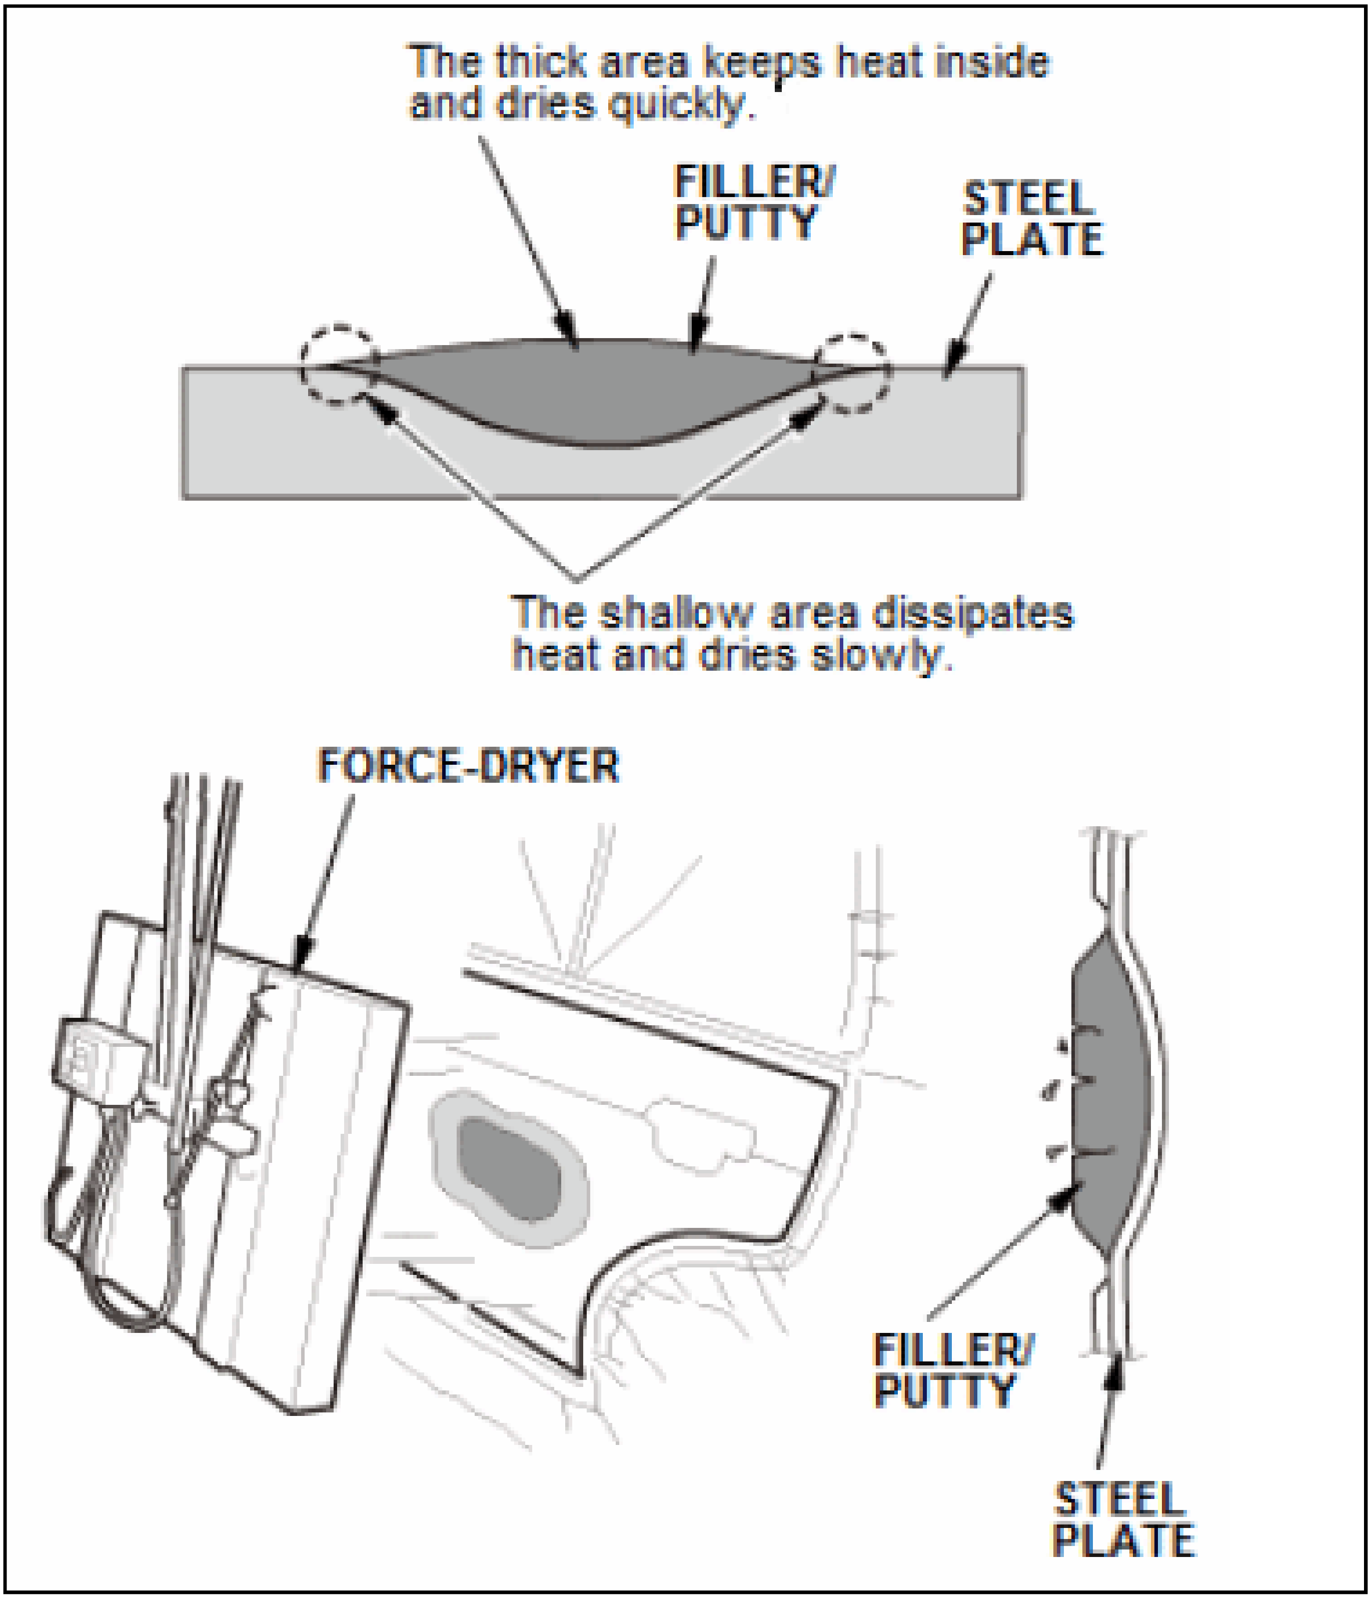
NOTE: **Disposing Filler/Putty**

- **Body filler or putty generates heat via thermal reaction while hardening.**

  Place leftover filler/putty into a fireproof disposal can.
- **Wait until the filler/putty cools down before disposing in a regular trash can.**
- **Do not dispose of filler/putty with flammable materials due to the risk of fire.**



Drying Intermediate Filler/Putty



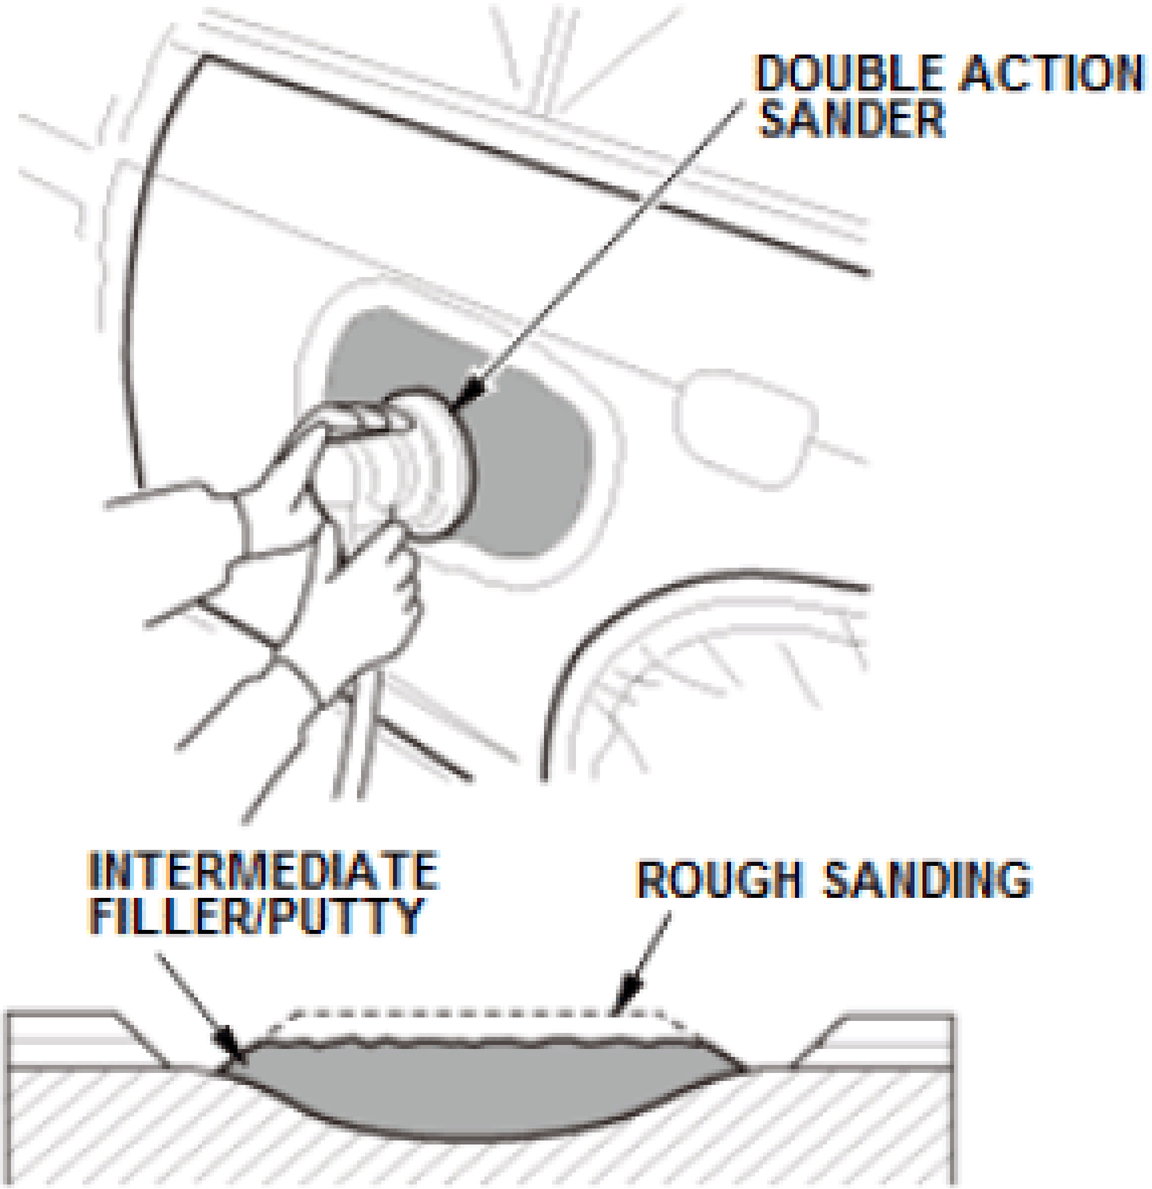
The thick area keeps heat inside and dries quickly.
FILLER/ PUTTY
STEEL PLATE
The shallow area dissipates heat and dries slowly.
FORCE-DRYER
FILLER/ PUTTY
STEEL PLATE

The drying time depends greatly upon ambient temperature. Filler/putty thickness also affects the drying time because a thermal reaction takes place while it is drying. Thicker filler/putty layers trap heat, increasing the internal temperature and accelerating the drying time.

NOTE:

- **Check the filler/putty manufacturer's instructions for drying time.**
- **Before starting forced drying, allow sufficient set-up time. Force dry at a temperature of approximately 122-140Â°F (50-60Â°C). Higher temperatures may degrade the hardener.**
- **Avoid rapid heating or cooling as it may cause distortion of the steel body panel and cracking or peeling of the filler/putty.**

Sanding Of Intermediate Filler/Putty



1. Sanding with Sander (Rough Sanding):

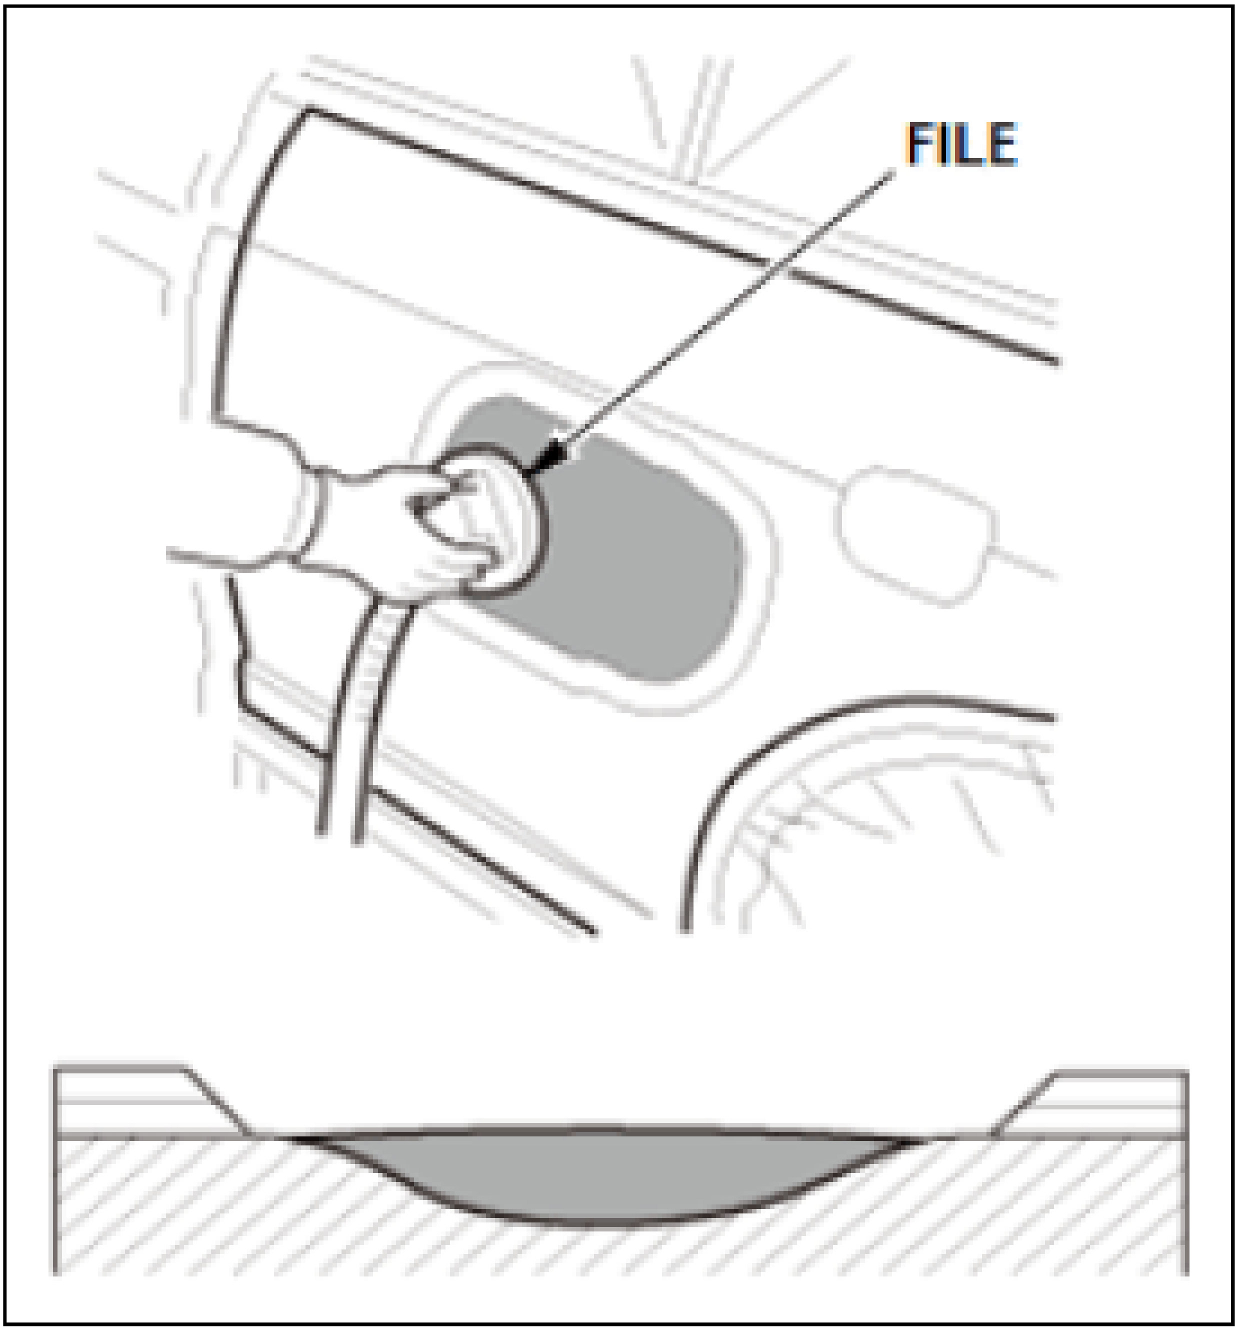
   Use a double action sander or orbital sander with P80 to P120 sandpaper depending on the filler/putty condition and sanding surface area. Sand the filler/putty surface to a rough surface shape. Filler/putty must be dry-sanded.

   NOTE: **Use a dry sprayed guide coat to visually check the flatness of the filled surface.**

2. Manual Sanding (Rough Surfacing):

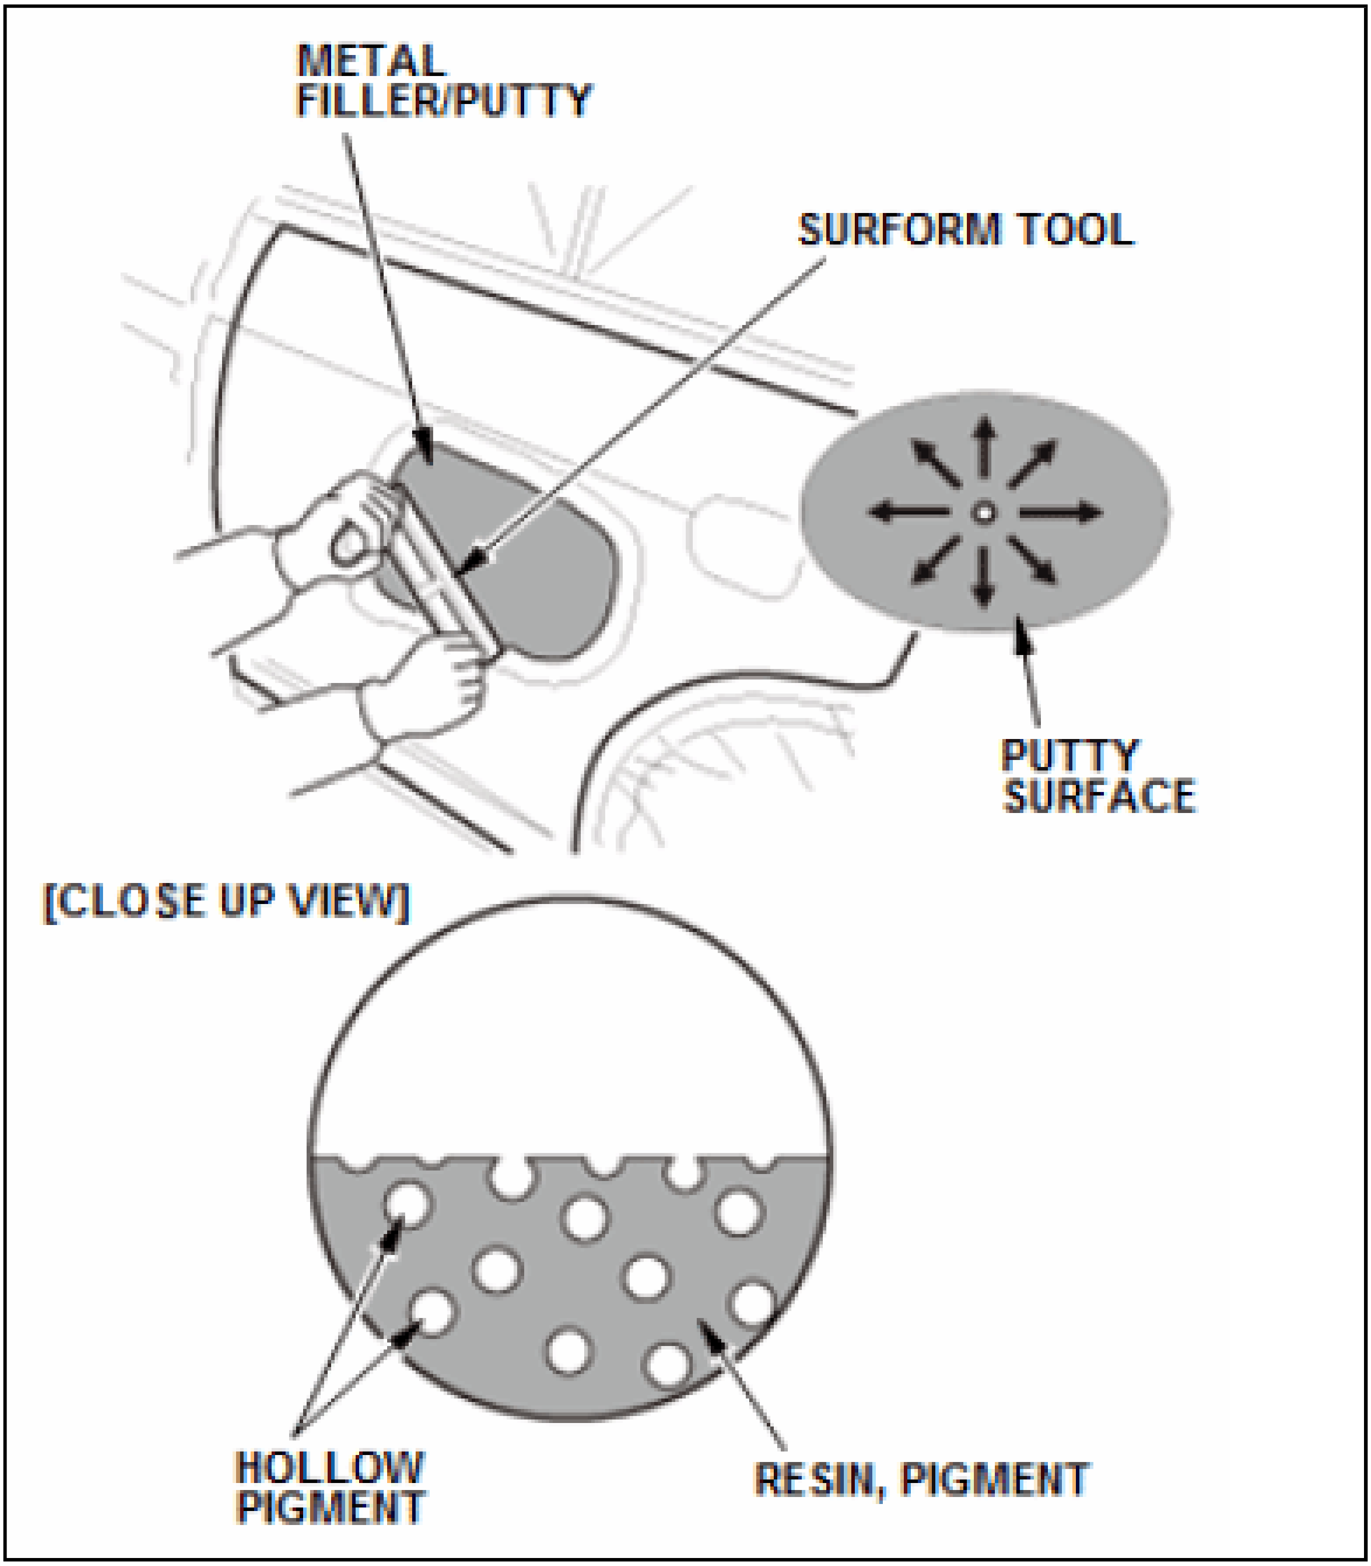
   While feeling the rough sanded surface with your fingertips, bring the surface to the final finish using P120 to P180 sandpaper together with a file and a rubber block.

   NOTE: **Be careful not to sand the area excessively.**



3. Confirmation after Intermediate Filler/Putty Surfacing:
    - Check the surface for cavities or hairline scratches by feeling it with your fingertips. Then move on to the primer-surfacer process.
    - If a dent could not be filled with body filler or putty the first time, or there are low spots apply additional filler/putty again to correct them. Use polyester filler/putty in this case.
    - Use a surform tool when rough sanding wax type metal filler because it is difficult to sand.
    - Sanding becomes more difficult after the filler/putty hardens too much. It is the best to sand approximately 2 to 10 minutes from the start of hardening. Note that the edges of body filler/putty adhere slower than the center, so start sanding from the center in a radial direction.

NOTE: **After a metal puttied surface is sanded, a number of hollow cavities remain on its surface. Because it is difficult to fill tiny air cavities with a primer-surfacer, use polyester filler/putty instead.**



METAL FILLER/PUTTY
SURFORM TOOL
PUTTY SURFACE
[CLOSE UP VIEW]
HOLLOW PIGMENT
RESIN, PIGMENT

Cleaning And Degreasing

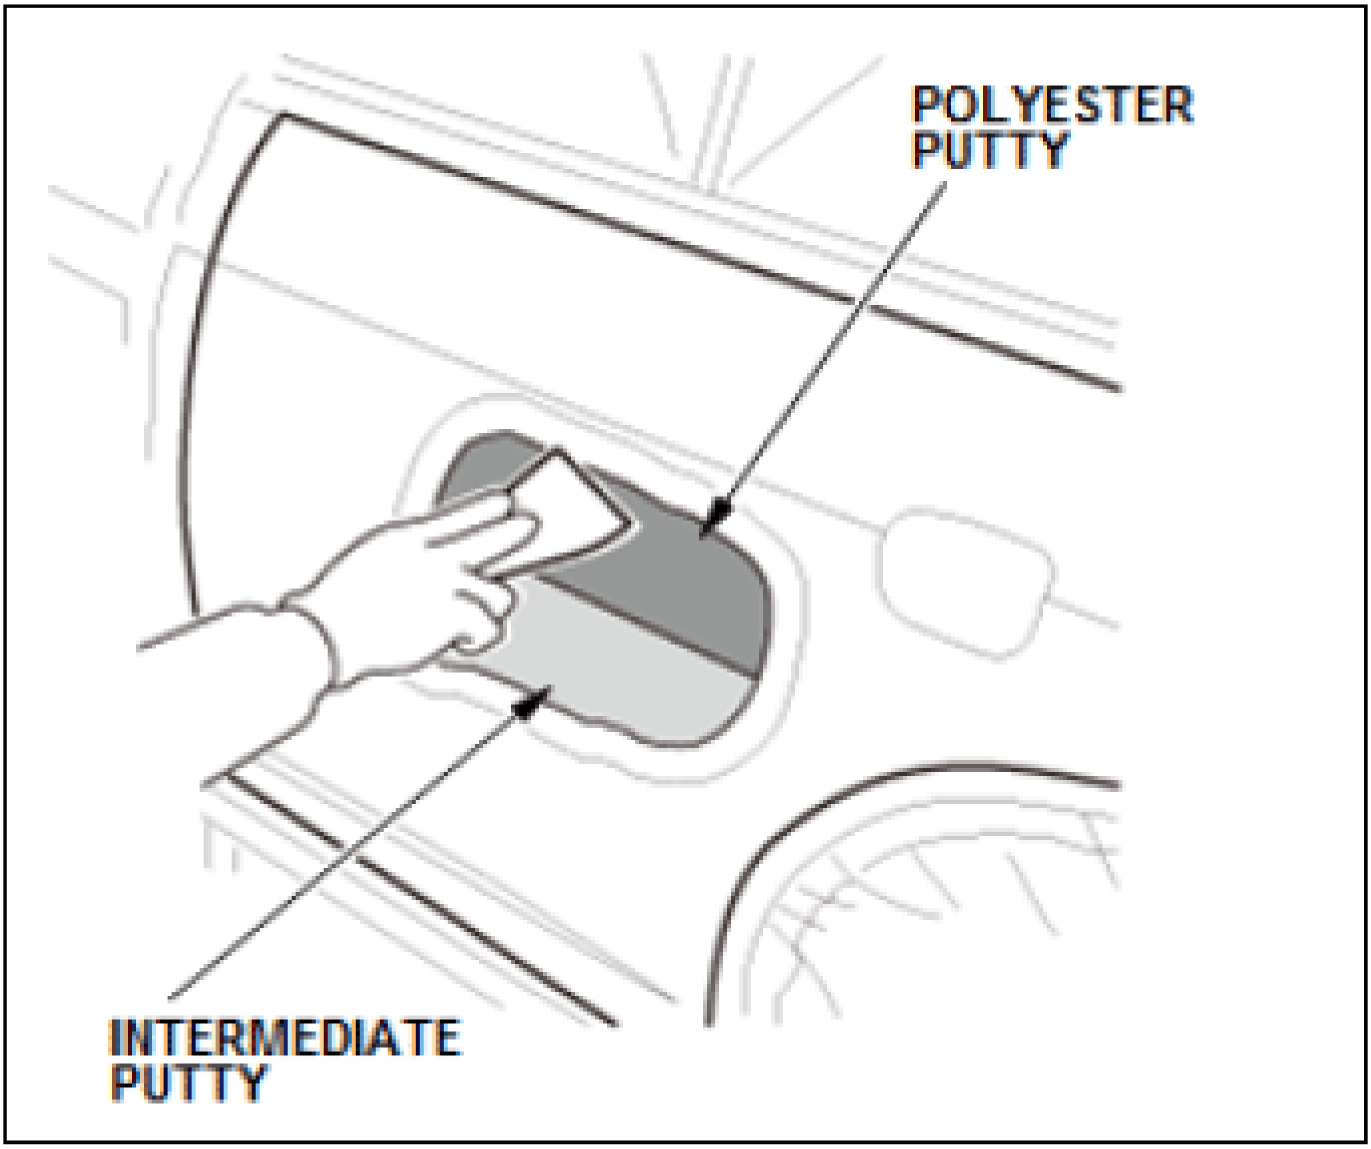
Blow air on the filled surface and remove any oily residue with solvent.

NOTE: **Remove sanding residues from cavity holes.**

Preparation Of Polyester Filler/Putty

Mix the filler/putty with the required amount of hardener and knead it until its color becomes even.

Application Of Polyester Filler/Putty



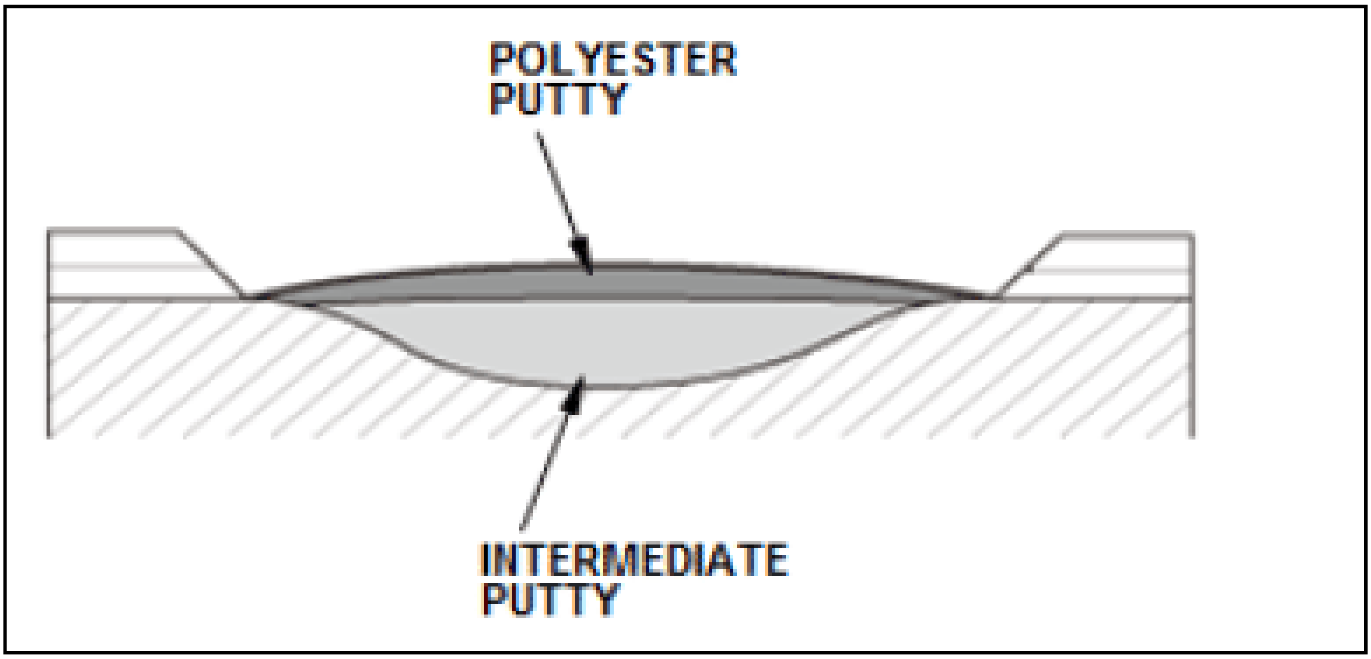
POLYESTER PUTTY
INTERMEDIATE PUTTY

Apply polyester filler/putty.

Drying Polyester Filler/Putty

Dry polyester filler/putty.

Sanding And Finishing Polyester Filler/Putty



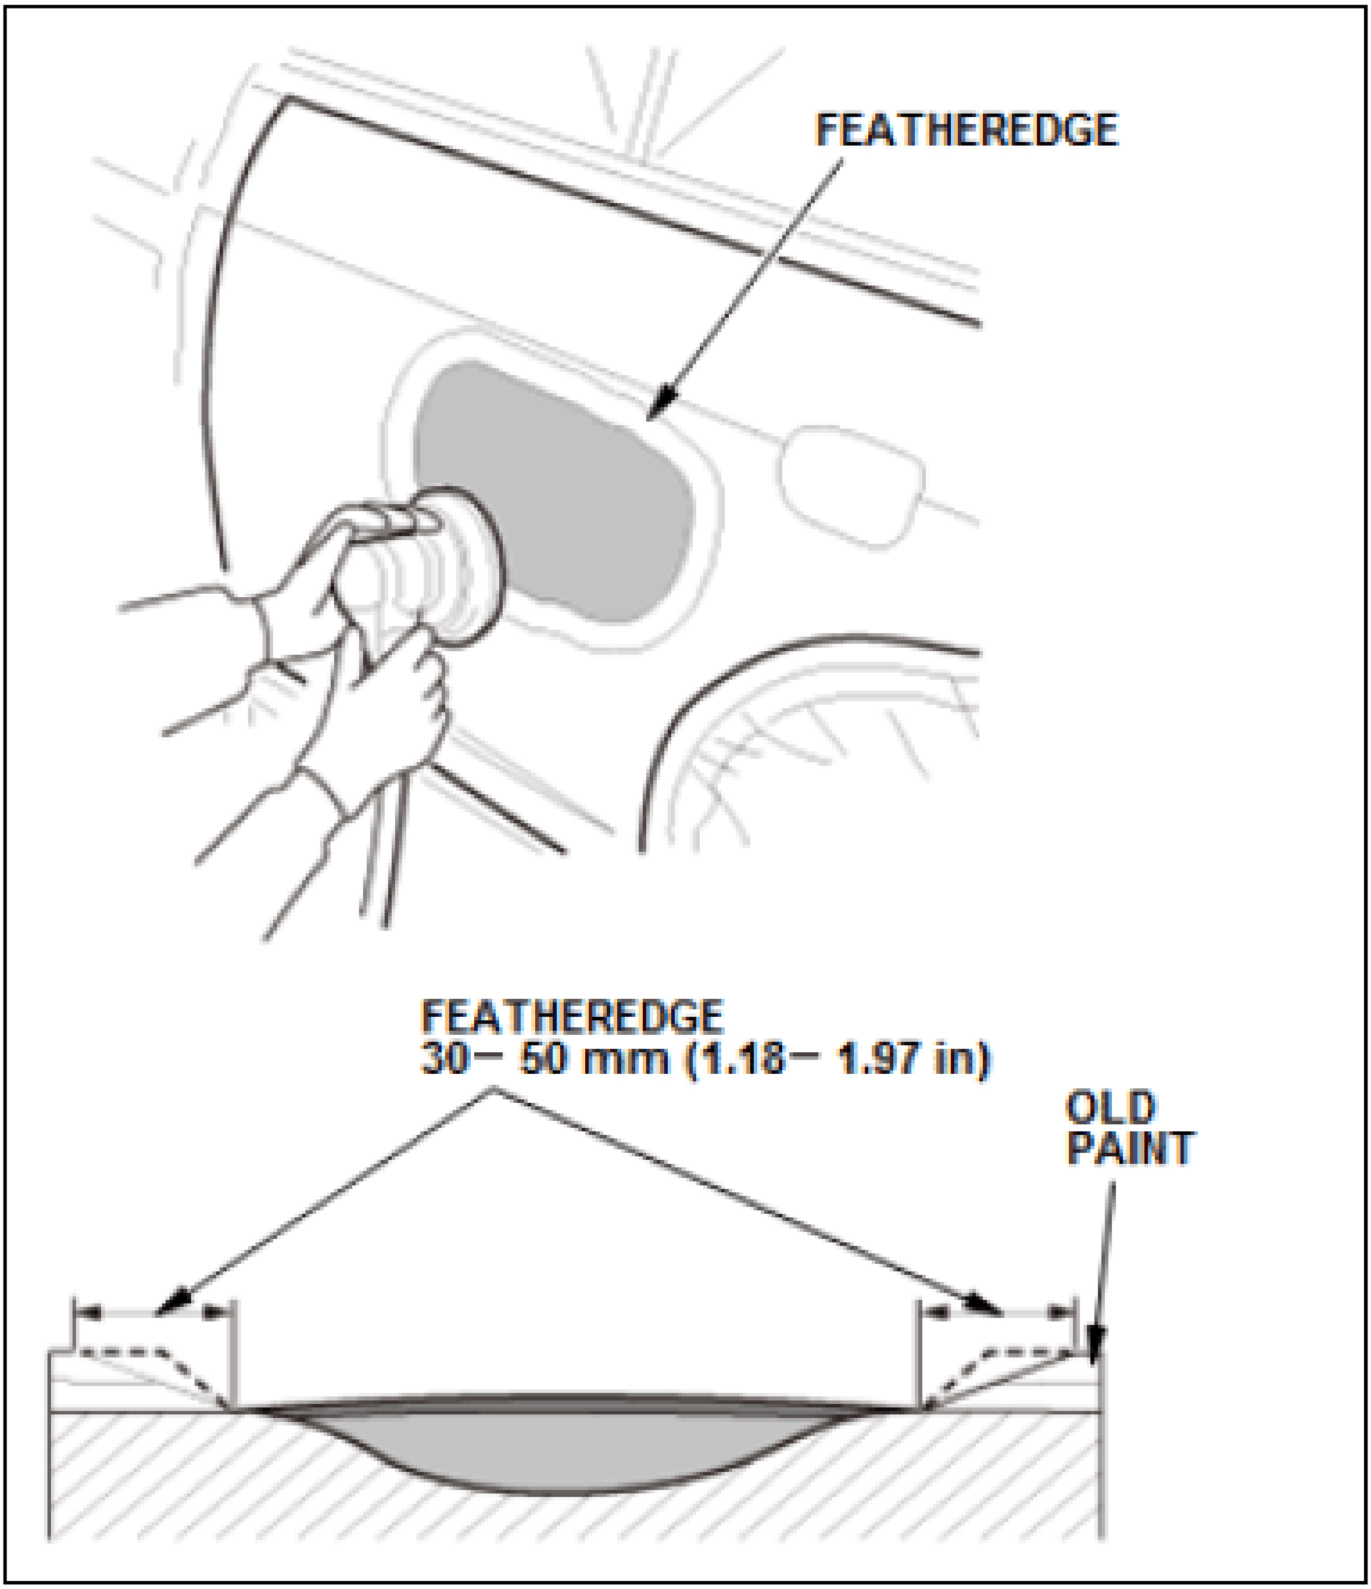
POLYESTER PUTTY
INTERMEDIATE PUTTY

- Use P180 to P240 sandpaper when manually sanding.
- Use P120 to P180 sandpaper when using a disc sander.

NOTE: **Be careful not to sand excessively.**

Featheredge (Scuffing For Basecoat)

- Depending upon the situation, make the sanded old paint layer an even slope without steps.
- For the old paint layer where primer-surfacer will be applied, scuff it with sandpaper for better adhesion to the new paint



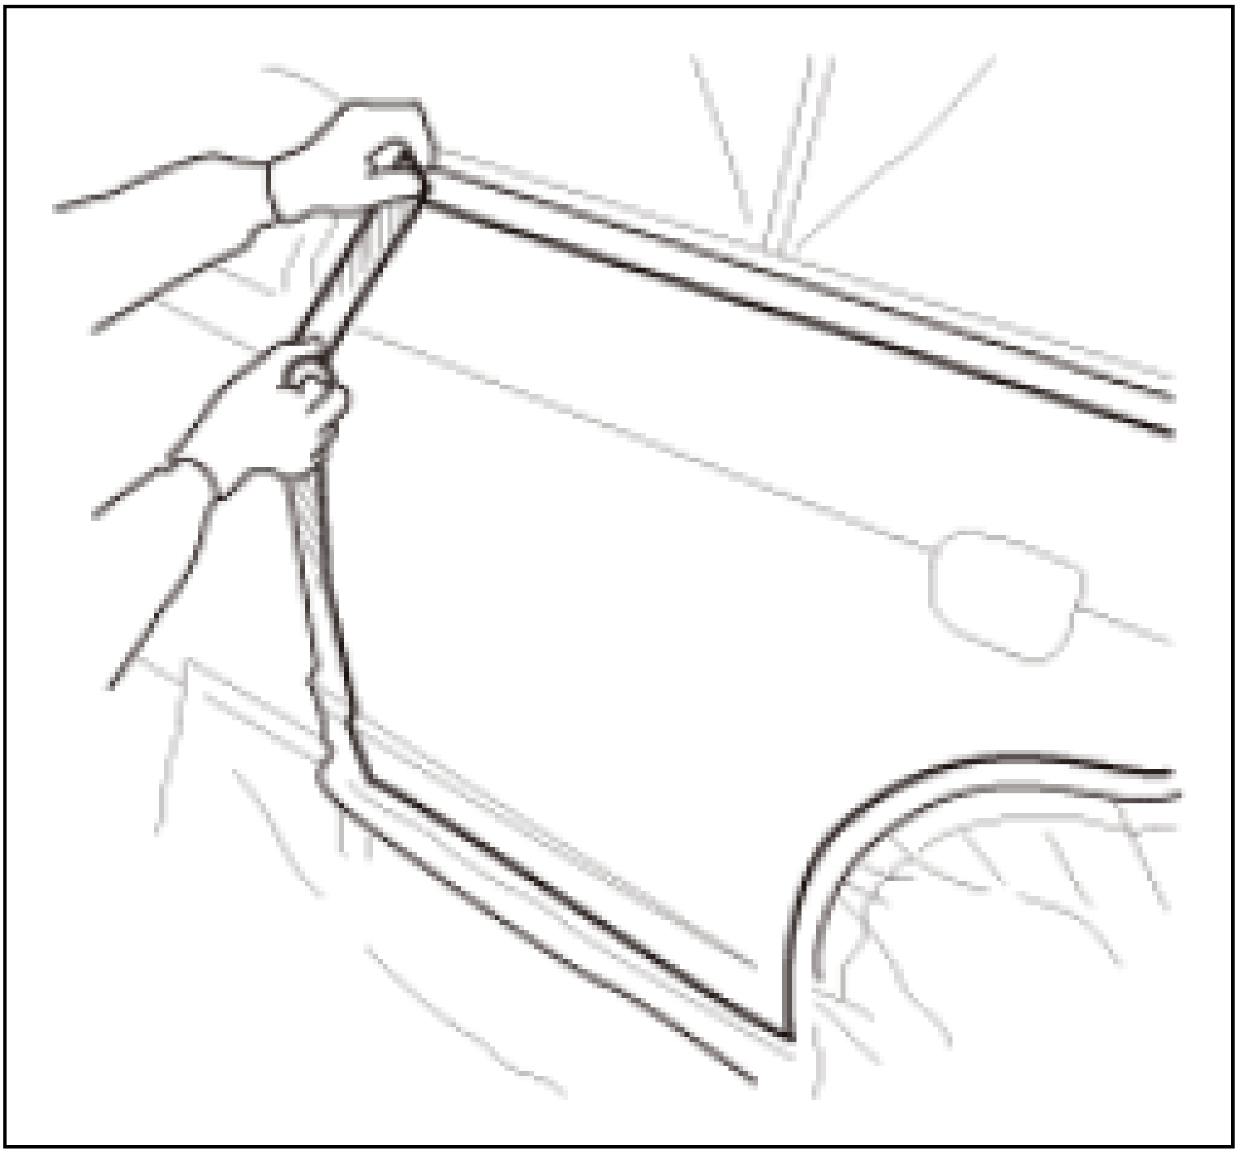
Paint Stripping

If Using Paint Stripper

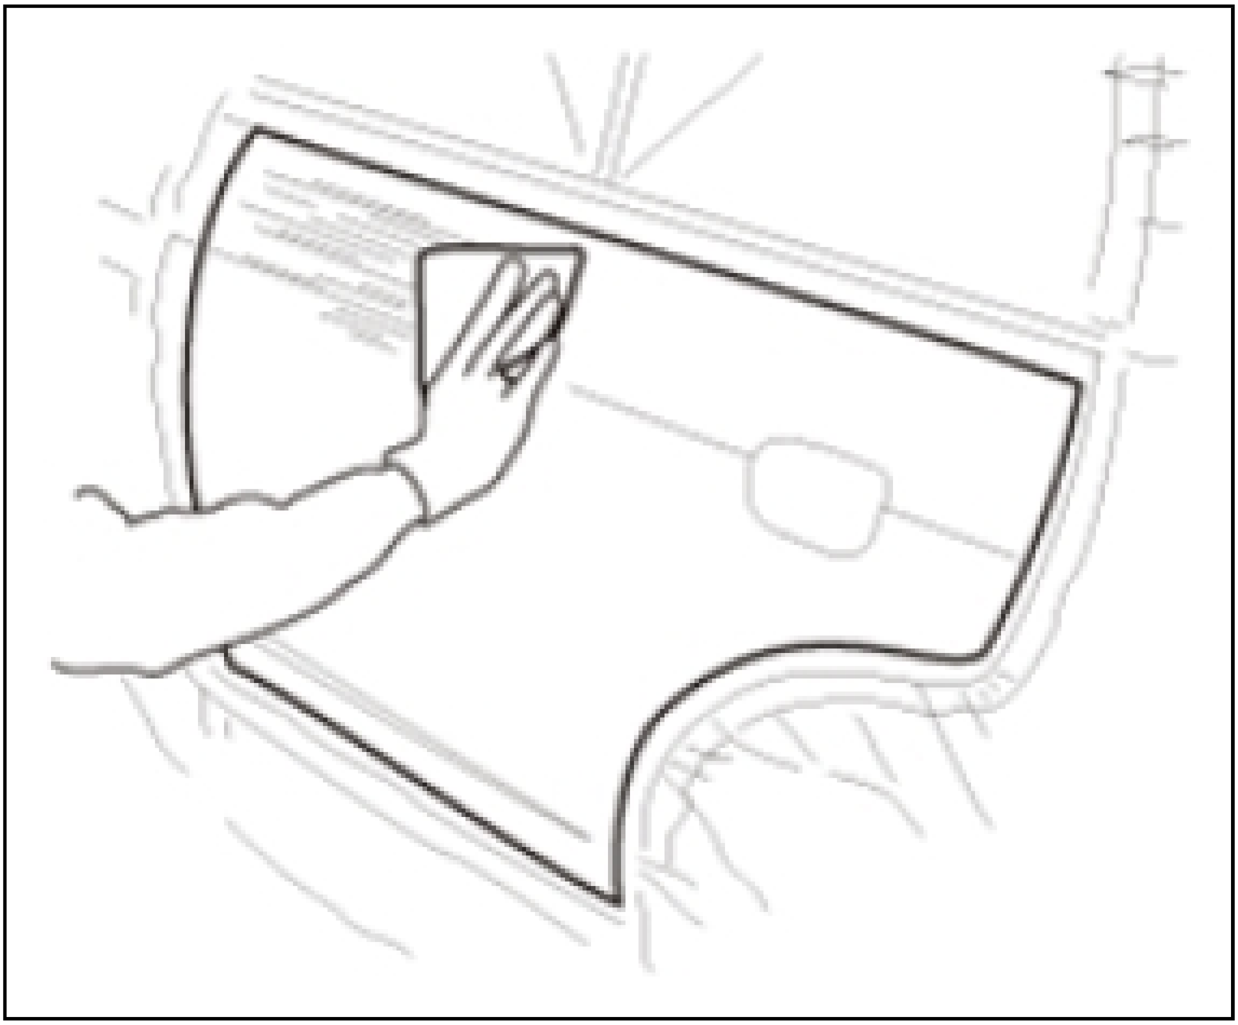
- Use a chemical paint stripper to remove the old paint layers if the damage is too deep or its deterioration is extensive.

- Paint stripper can also be used on large repair areas.

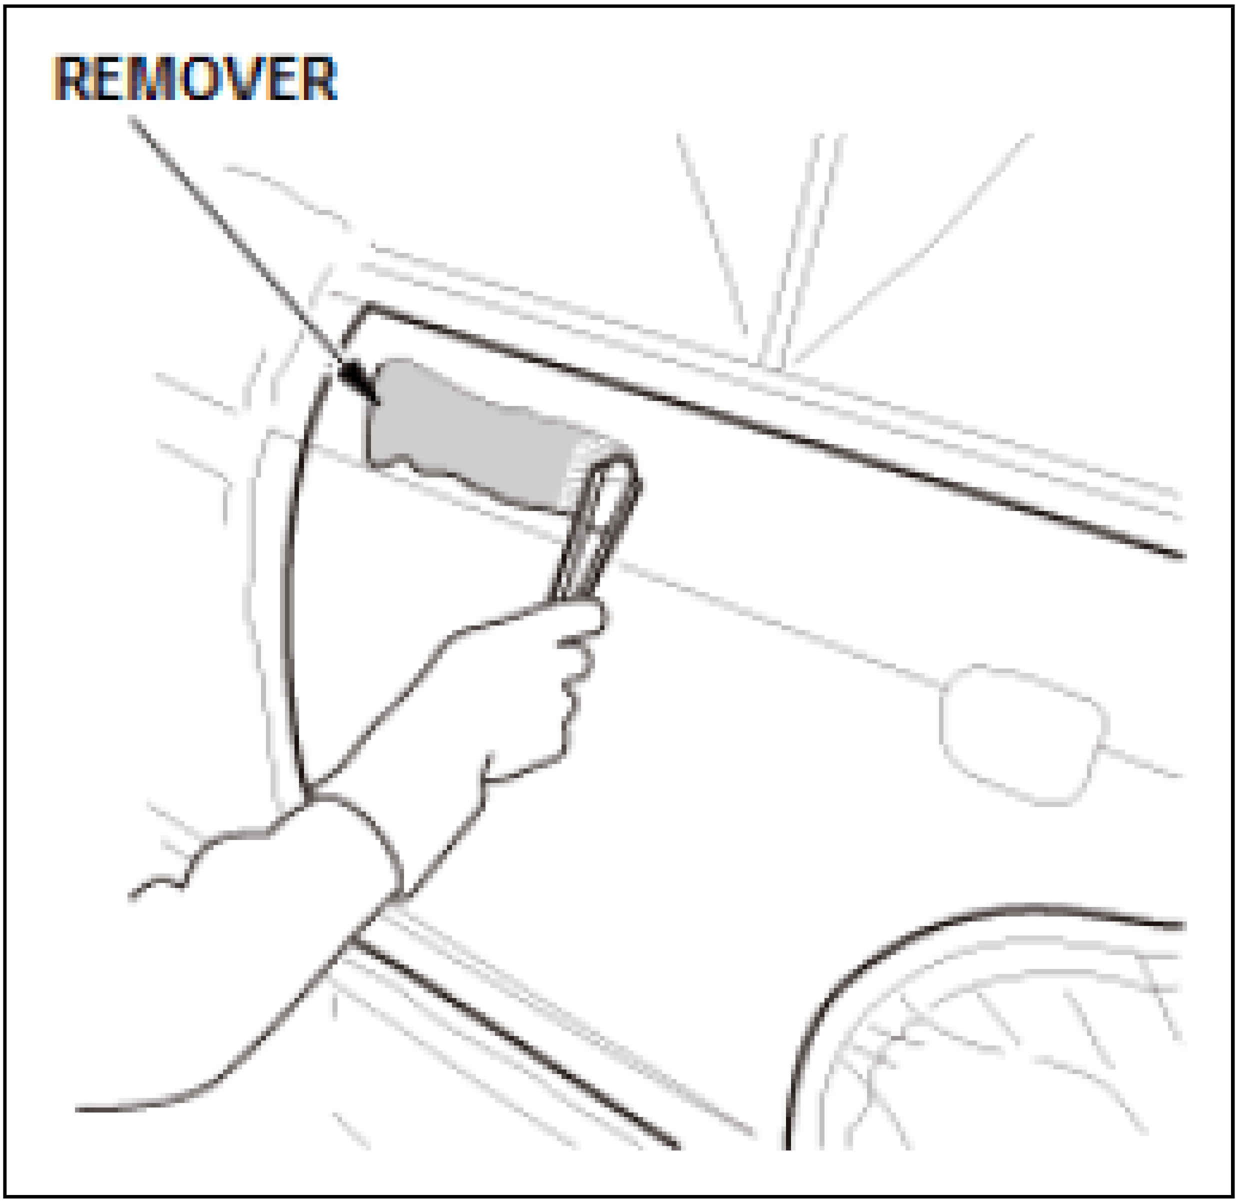
1. Place the masking tape about 1-2 cm (0.4 - 0.8 in) inside from the edge of the area being stripped to protect the surrounding surfaces.



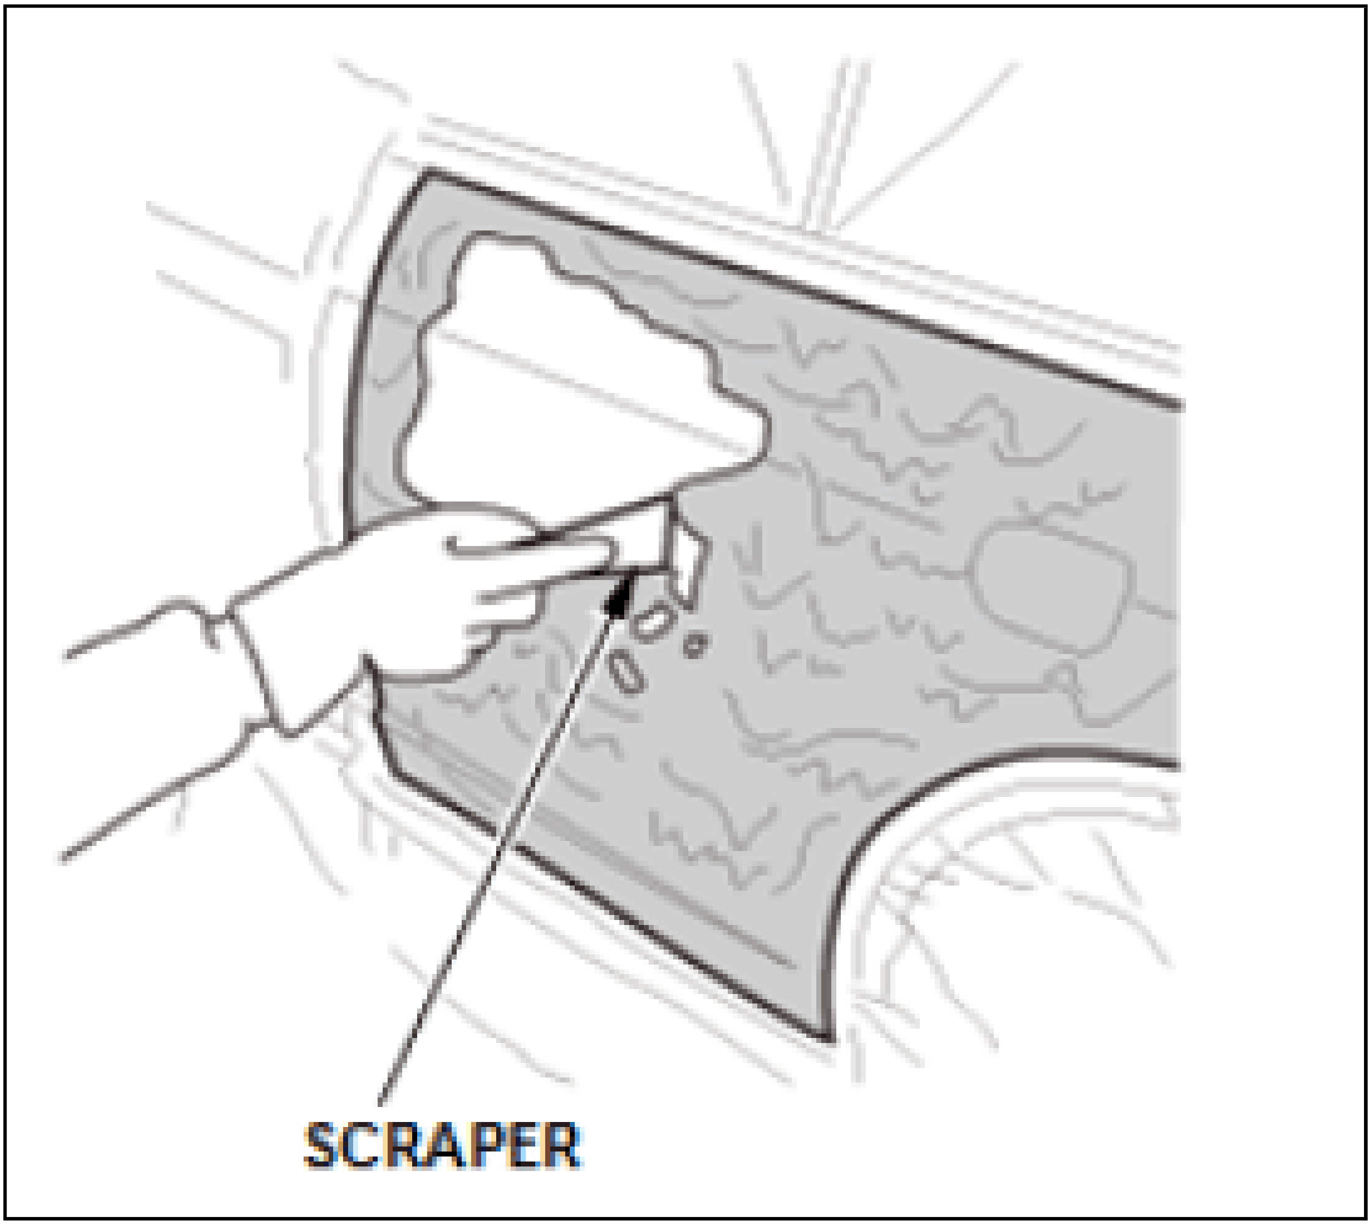
2. Sand the surface to be stripped with P60 to P80 sandpaper to improve penetration of the paint stripper.



3. Liberally apply the paint stripper on the surface with a brush in one direction only.



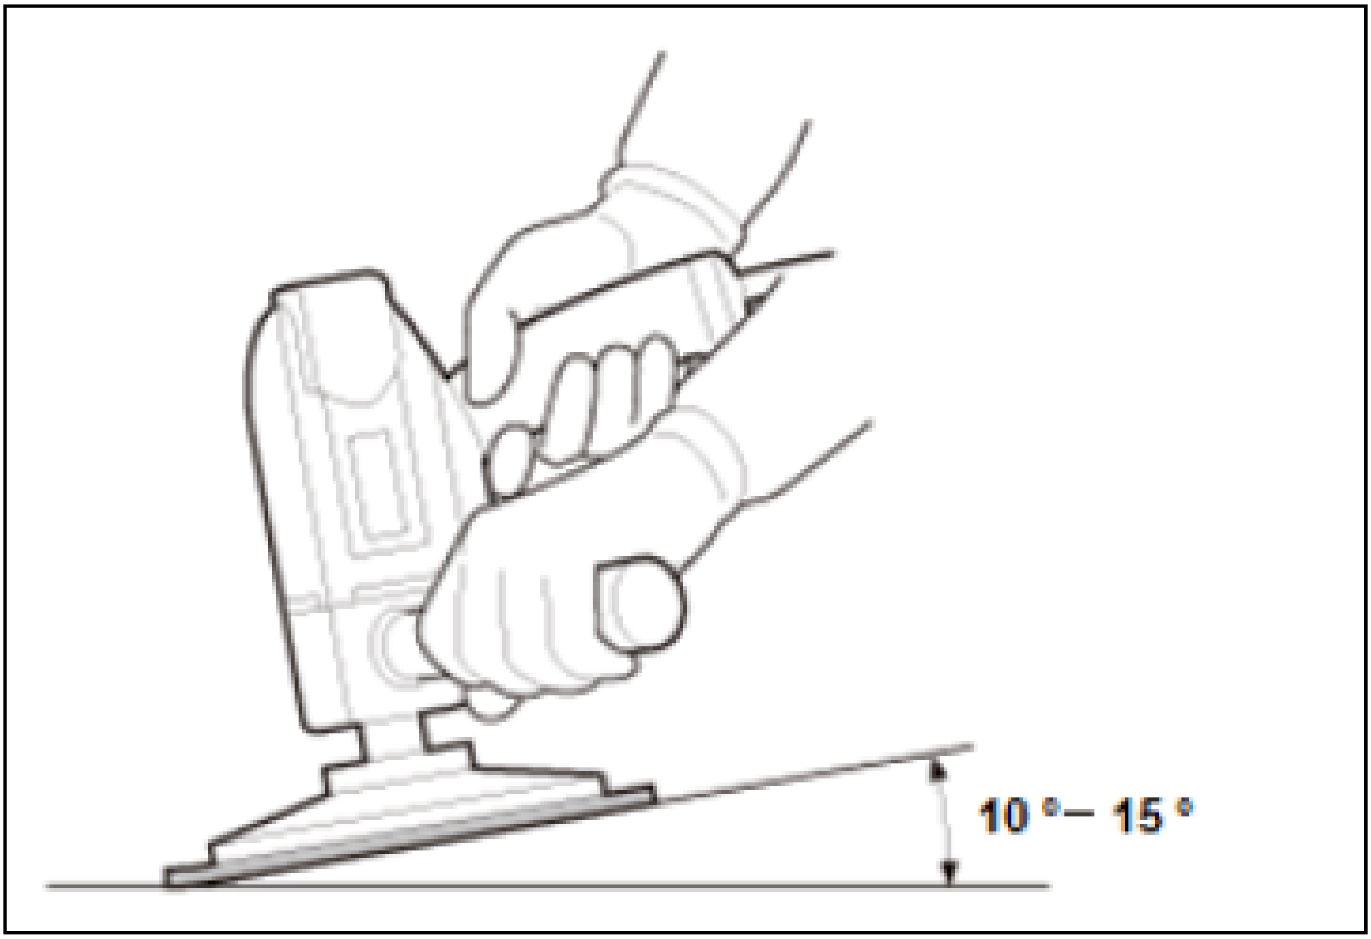
4. When the paint layer becomes softened, remove it with a scraper or spatula.
5. Remove any remaining paint stripper and other residue by rinsing thoroughly with water.
6. If any paint or masking tape marks remain on the surface, sand them off with P60 to P80 sandpaper. Clean the area using degreaser after sanding.



Removal With Disc Sander

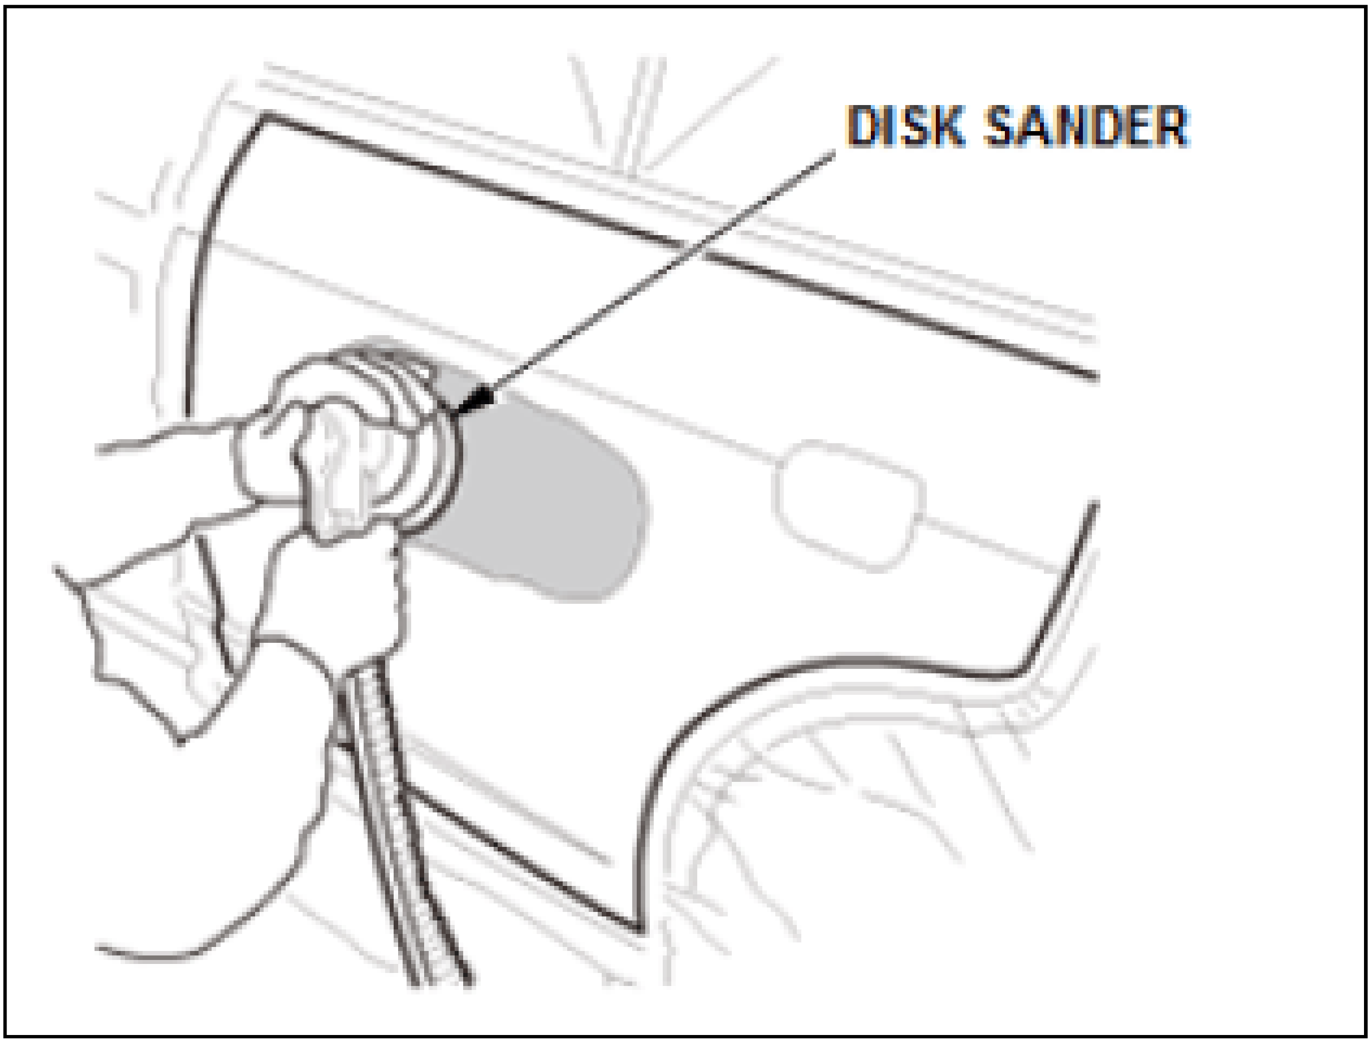
If the repair area is small, use a disc sander to remove the old paint layer.

NOTE: **There is no need to apply excessive pressure to the sander. Press down lightly on the sanding disc at an angle of 10Â° - 15Â° against the paint layer.**



Attach P60 to P80 sandpaper to the disk to sand the damaged or deteriorated area smooth.

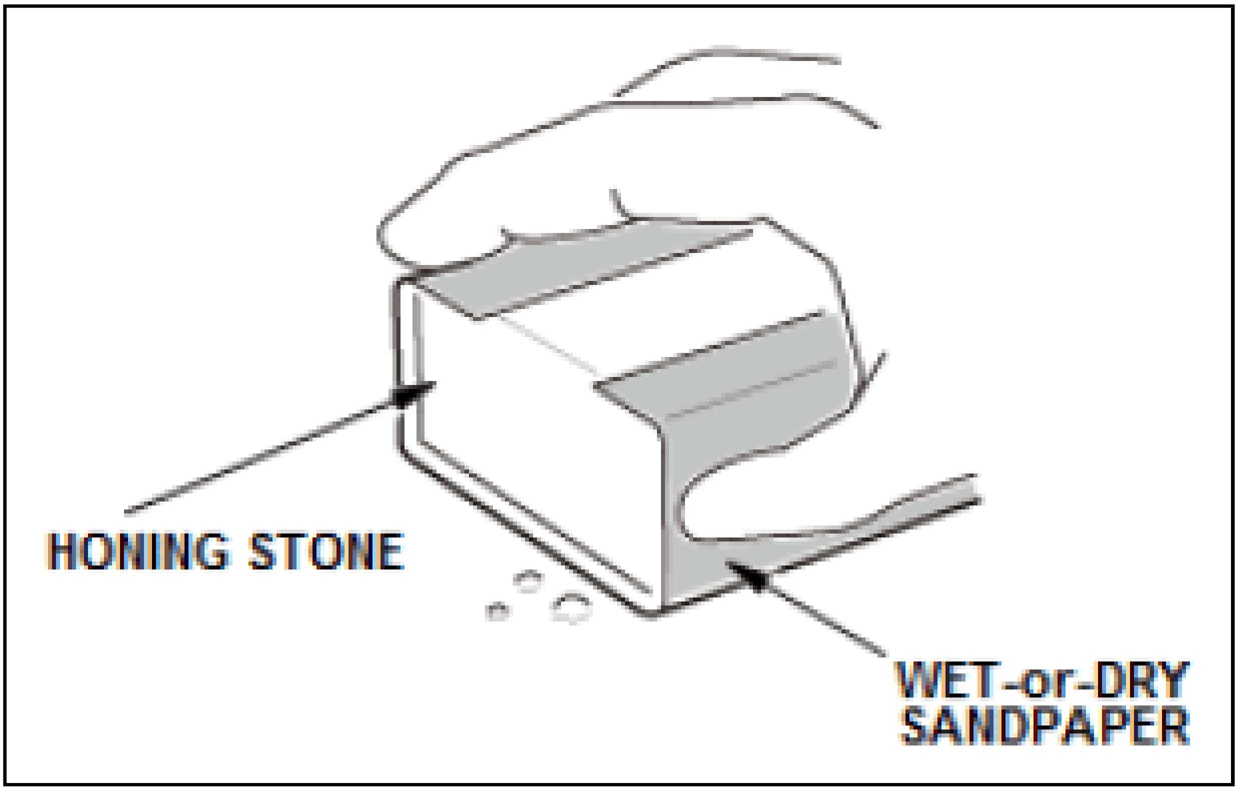
NOTE: **Remove any decals or trim attachment tape using a razor spatula or scraper. Use a degreaser to completely remove any glue residue.**



DISK SANDER

Polishing

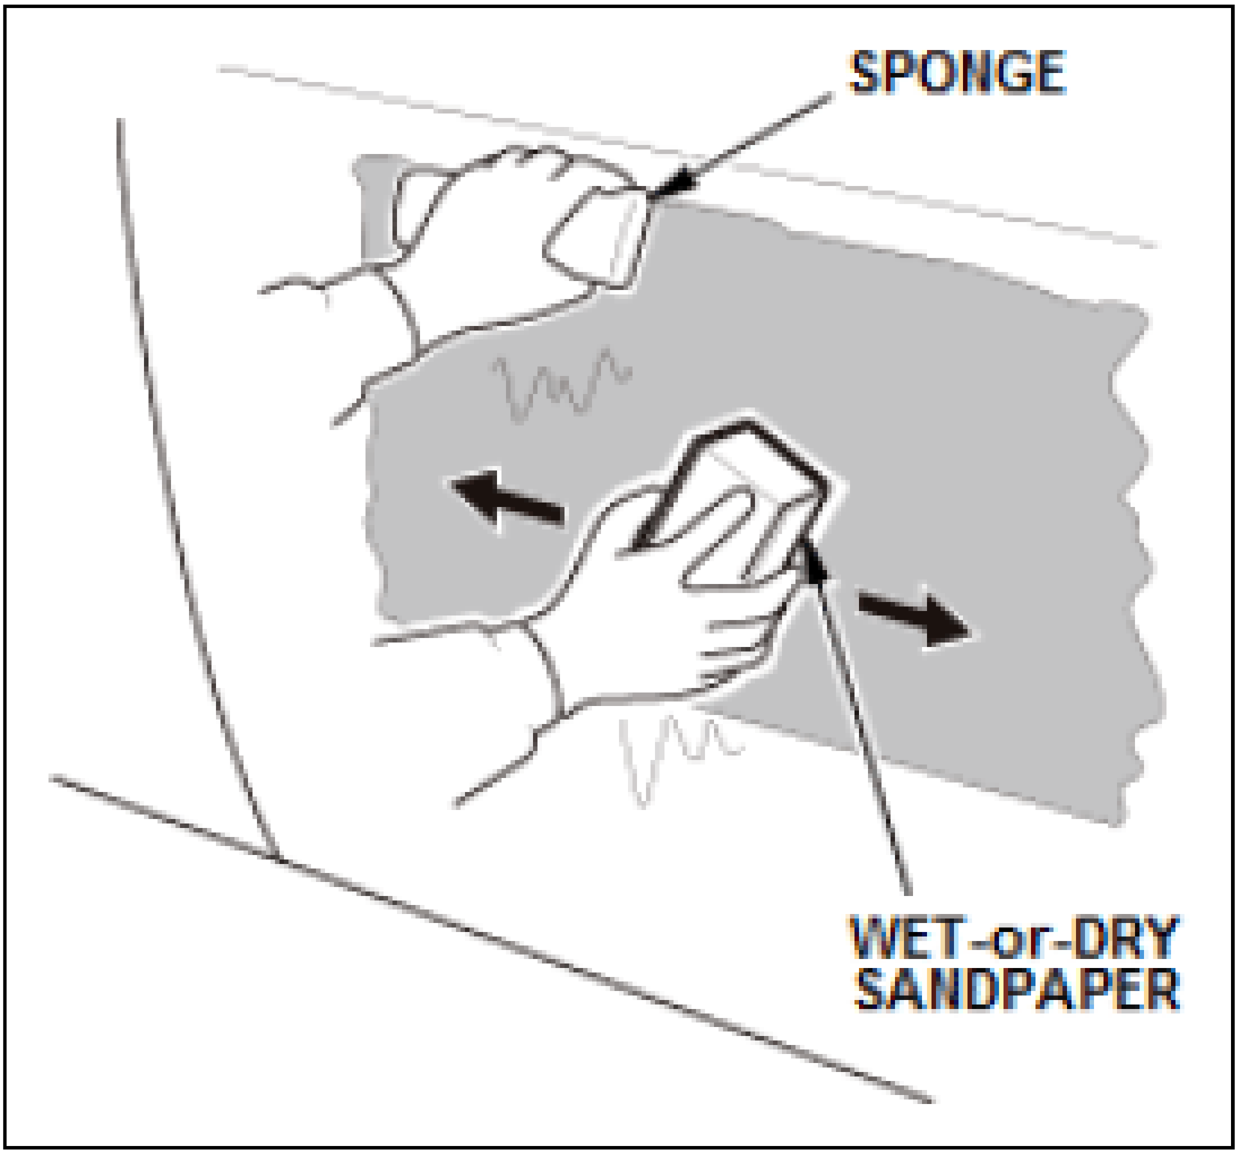
1. Removing Small Cavities or Paint Grains:
    - Remove small cavities and paint grains with a honing stone or wet-or-dry sandpaper.
    - Start with a rough wet-or-dry sandpaper and finish up with a fine P2000 to P3000 paper.



HONING STONE
WET-or-DRY SANDPAPER

2. Finishing of Painted Surface:

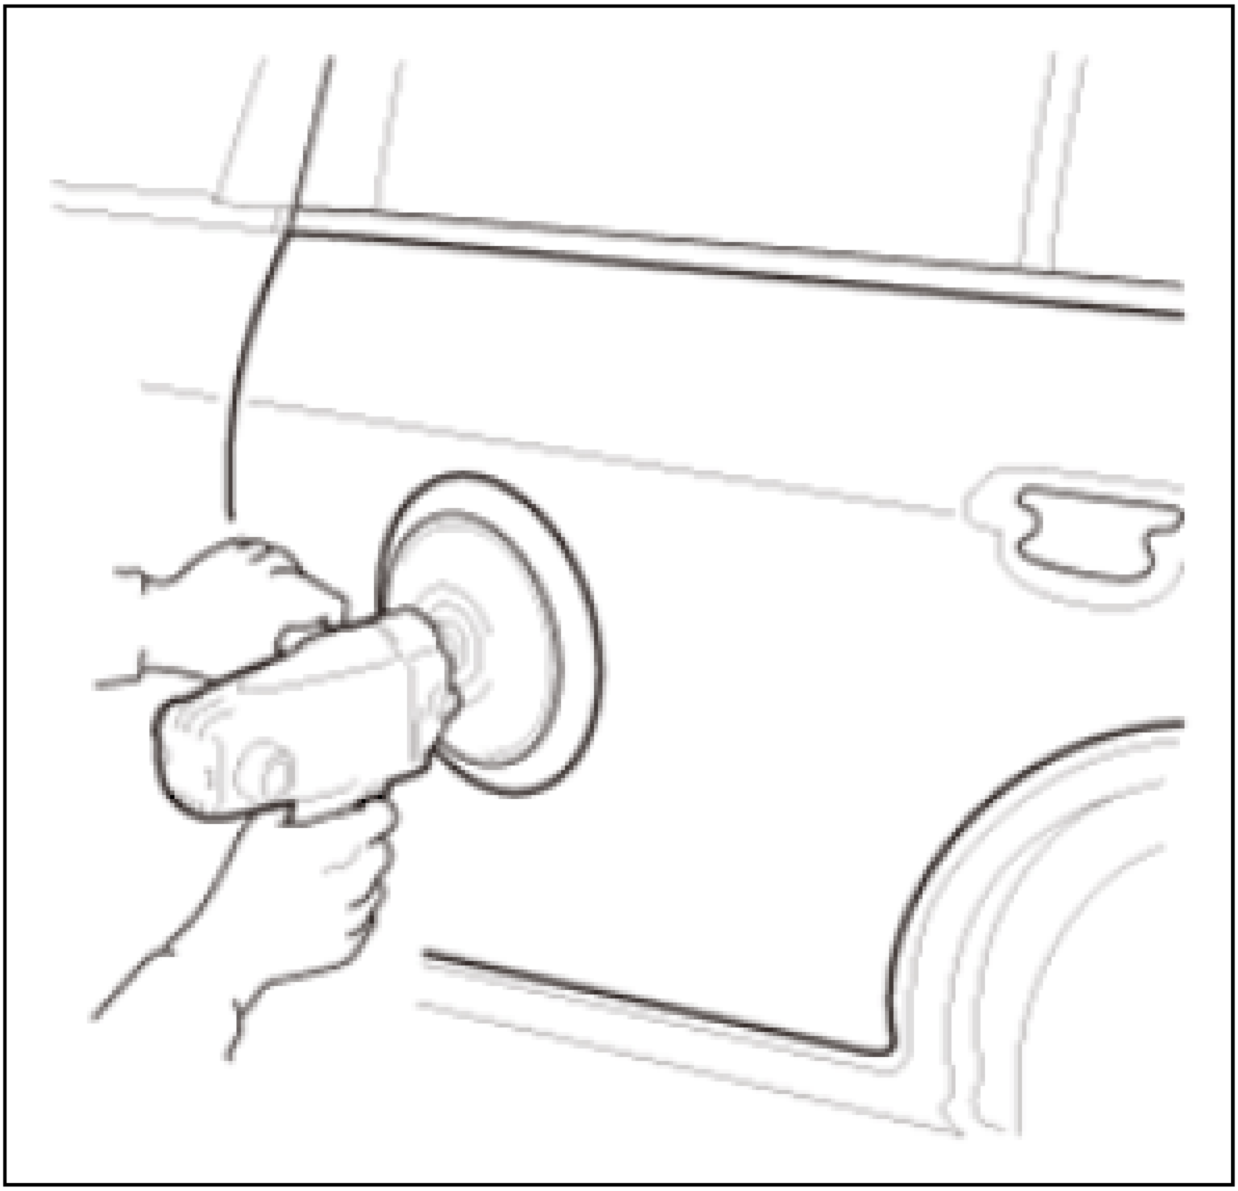
Sand the painted surface in one direction with water or soapy water using P1200 to P3000 wet-or-dry sandpaper to flatten the surface. Wipe off any remaining sanding particles using a cloth.



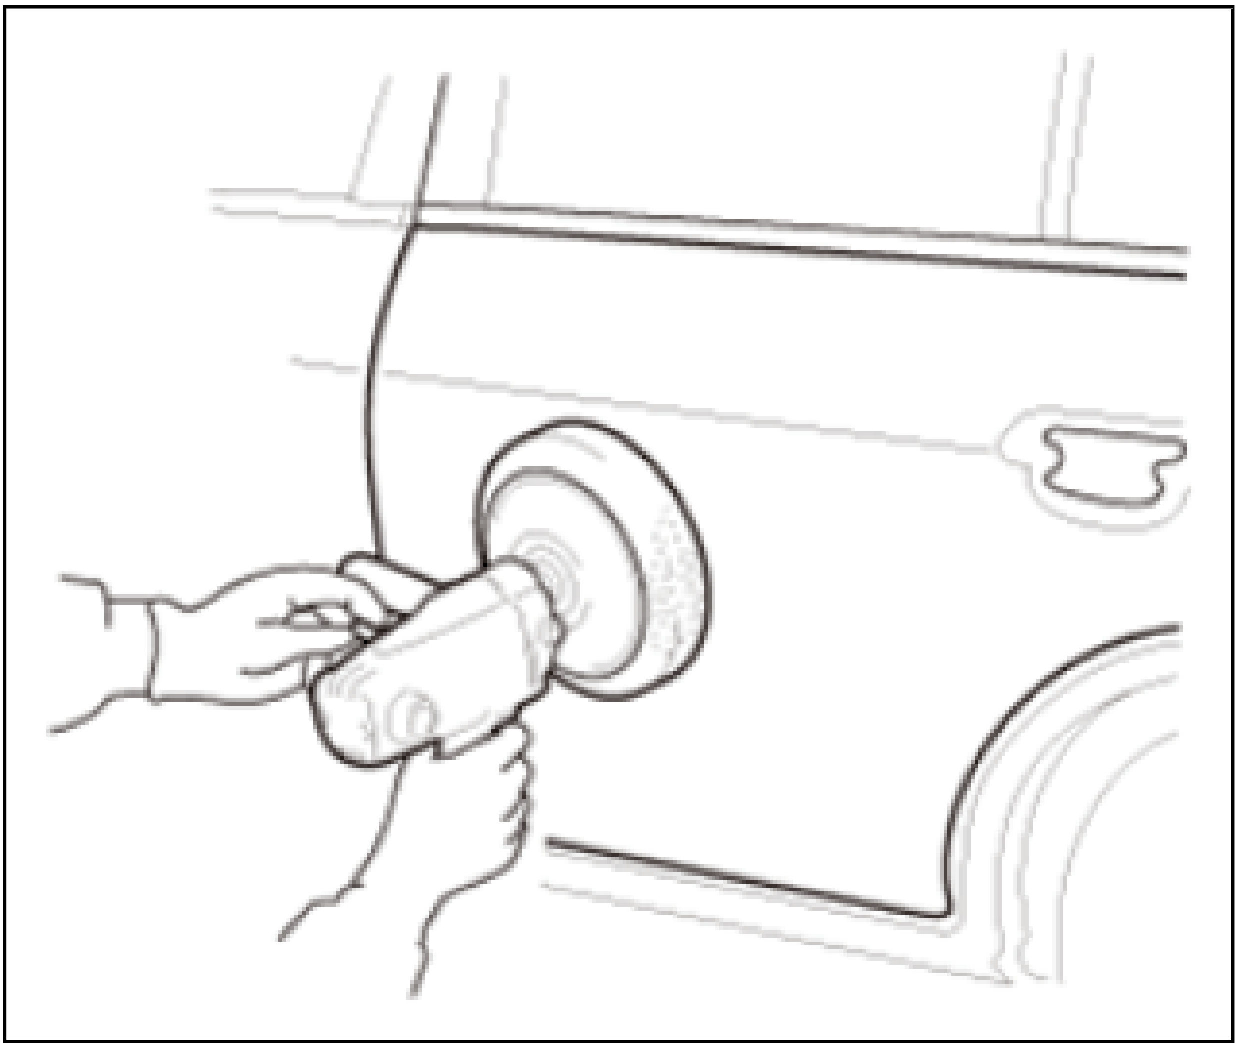
3. Matching Surface Quality and Polishing:
    - With fine compound, polish the surface with a polisher set with a towel buff or intermediate sponge buff to remove hairline sanding scratches. Finally, polish it out with finer compound.
    - Remove compound residue frequently to avoid damaging the paint surface.

NOTE: **Turn on the polisher power switch after it is touching the painted surface.**

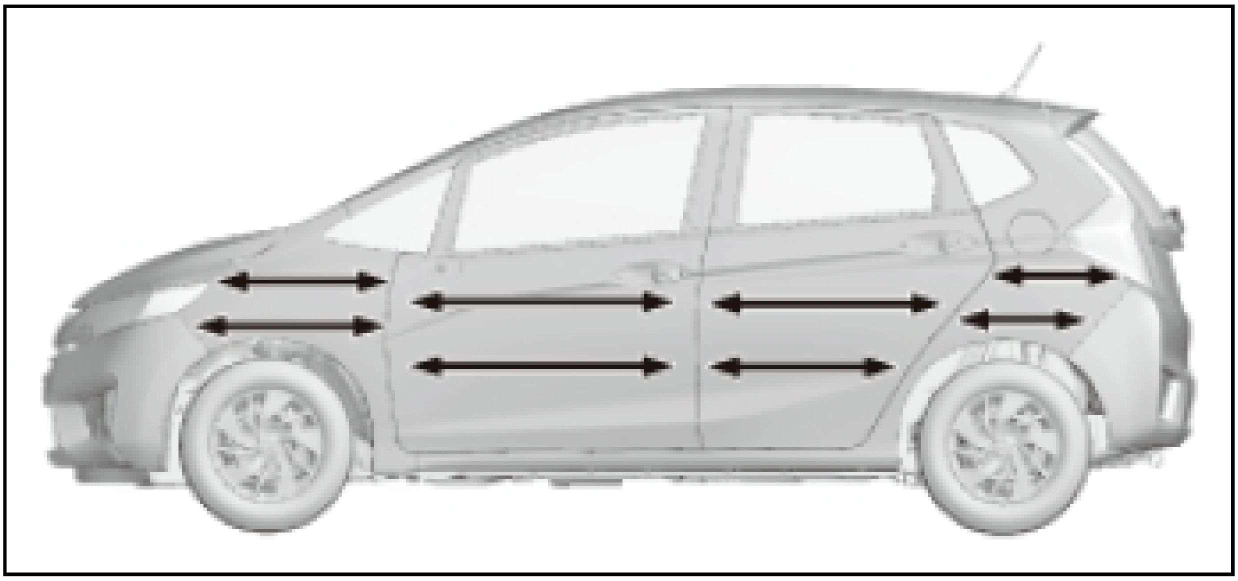
Polishing



Finessing

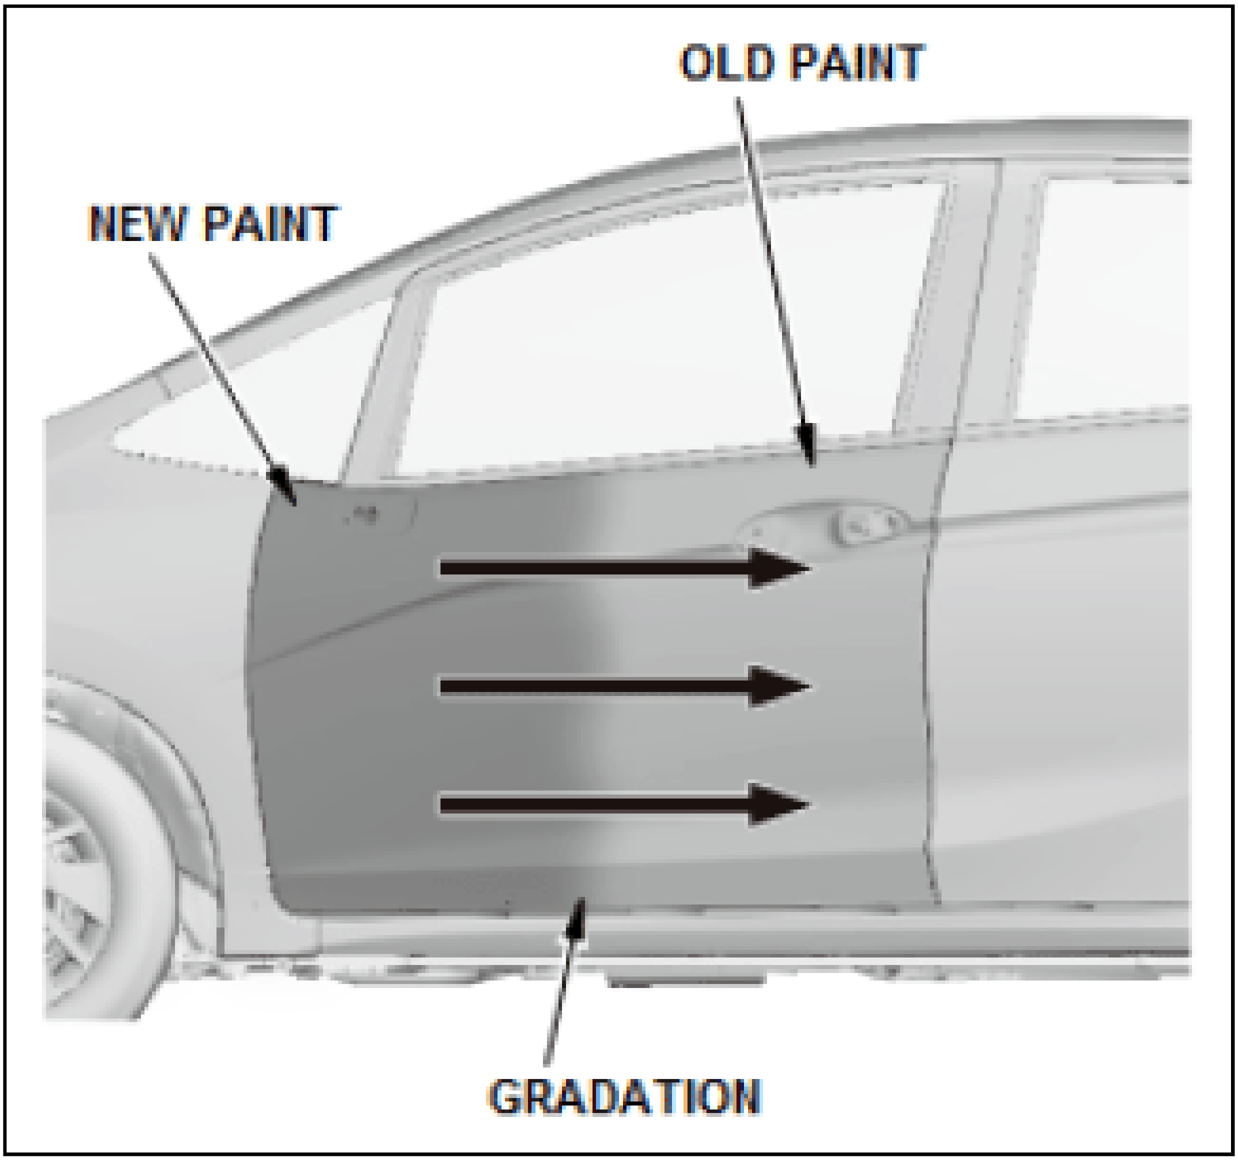


4. Move the polisher along the panel surface parallel to the ground (horizontal direction).



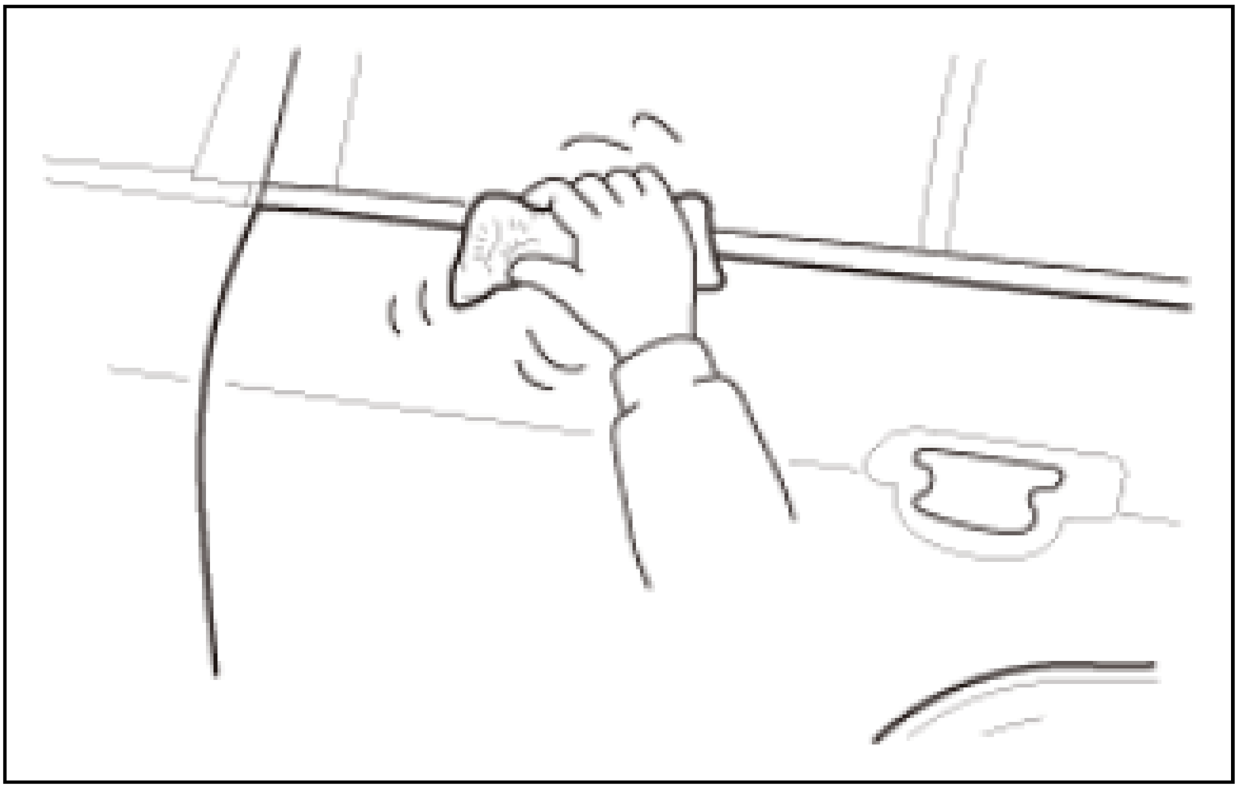
5. Where the paint is repaired in gradation, move the polisher from the newly painted area to the old painted area.

NOTE: **Moving the polisher in a wrong direction may expose the paint border.**



OLD PAINT
NEW PAINT
GRADATION

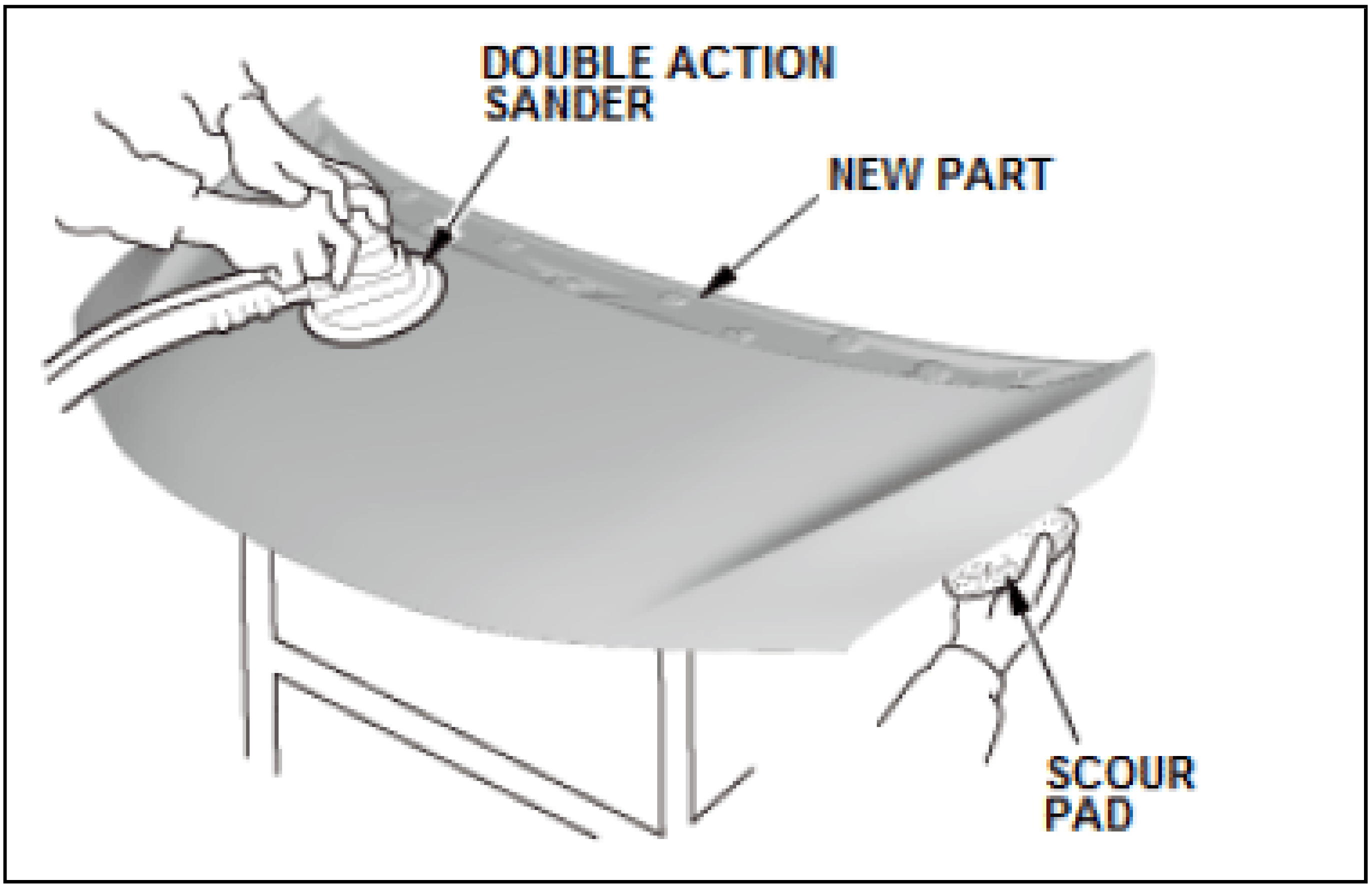
6. Hand-polish the stamping lines or near weatherstrips.



NOTE: **Machine polishing may remove too much paint from stamping lines, so hand polish these areas.**

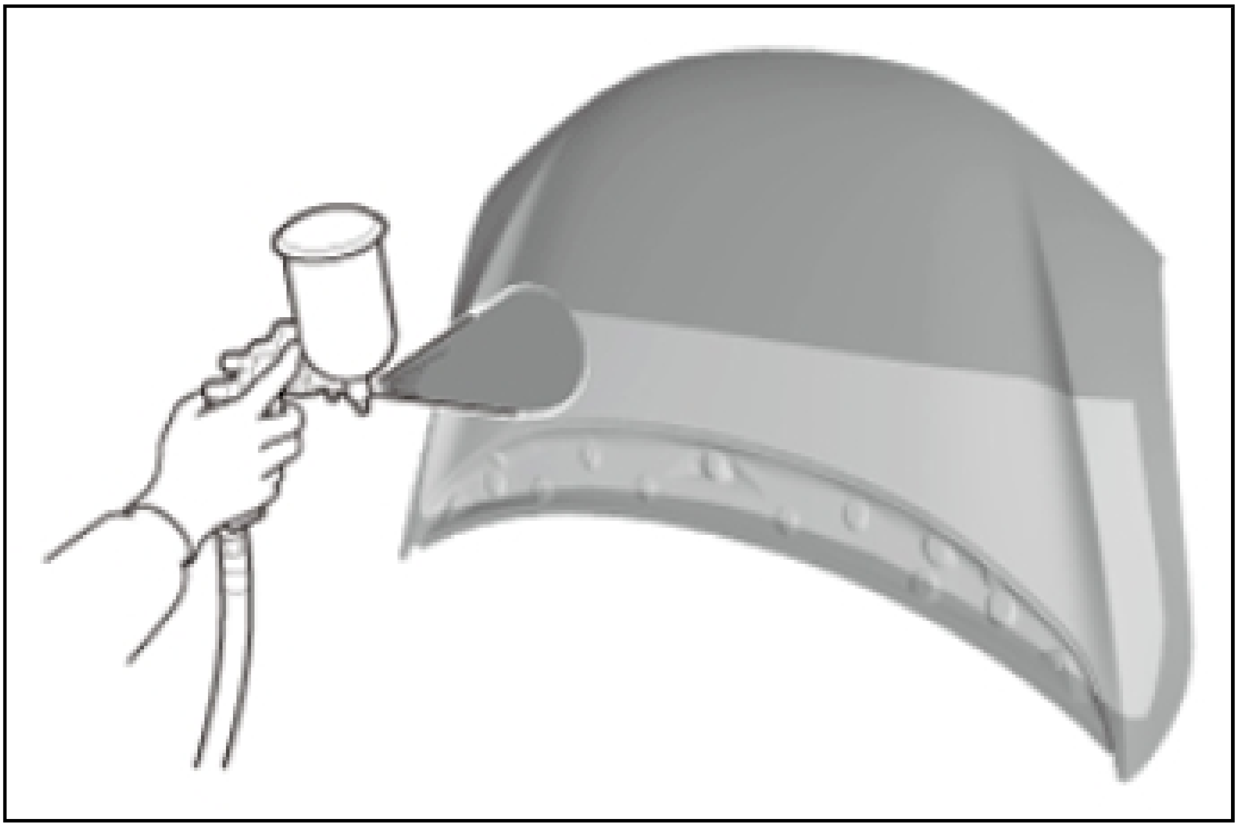
7. Apply more compound for finessing. Move it in a horizontal direction for the final polishing.

Primer-Surfacer Application On New Parts



If you are replacing hood and door panels with brand new parts

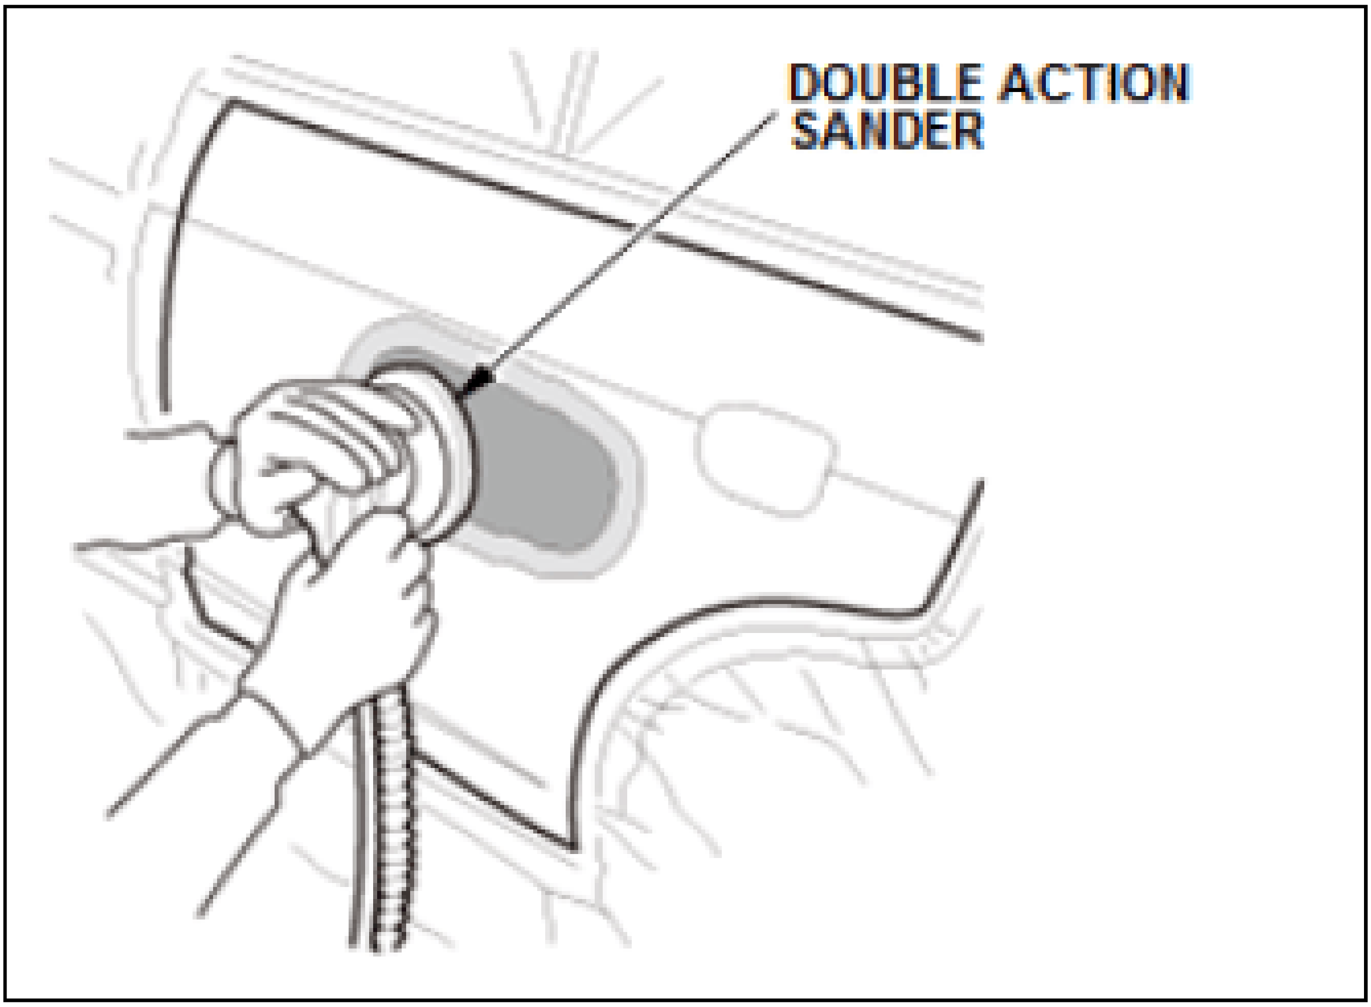
1. Dry sand the panel with a double action sander and P320 sandpaper. Manually sand using a sandpaper or a scuffing pad where the sander cannot access.
2. Degrease and clean after air blowing away any debris.



3. Spray the primer-surfacer (mist coat to form a thin layer) over the whole panel and inspect for any lifting or other defects.

4. Allow sufficient flash time.
5. Applying primer-surfacer to the entire surface, making sure the texture and appearance are even.
6. **Sand off the primer-surfacer coating** .

Surface Preparation (Featheredge)



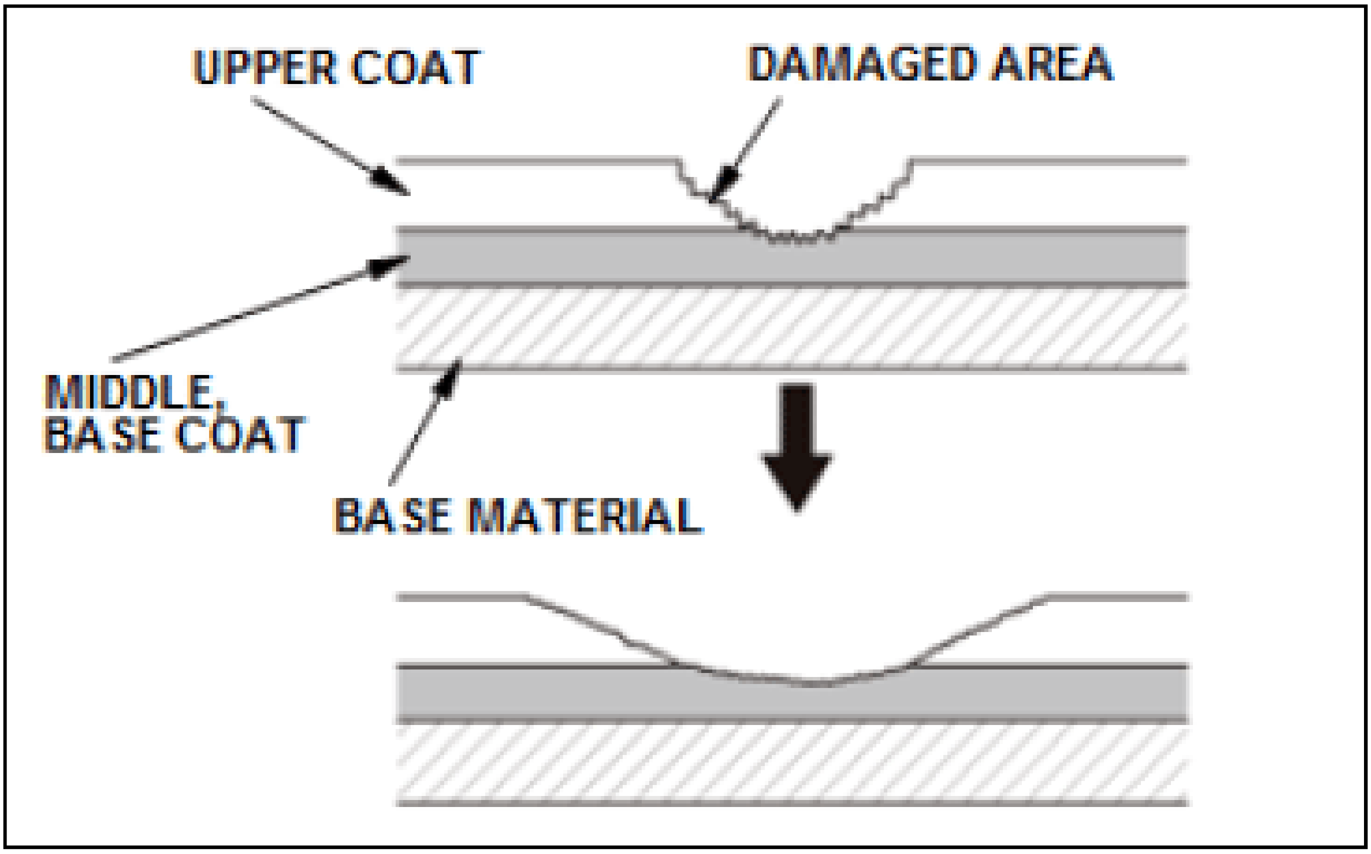
- Create a reference featheredge surface on the old paint layer.

NOTE: **The featheredge quality greatly affects the final repair results.**

- Using a double action sander, featheredge the area to match the paint thickness of the damaged and surrounding areas.

For Shallow Paint Damage

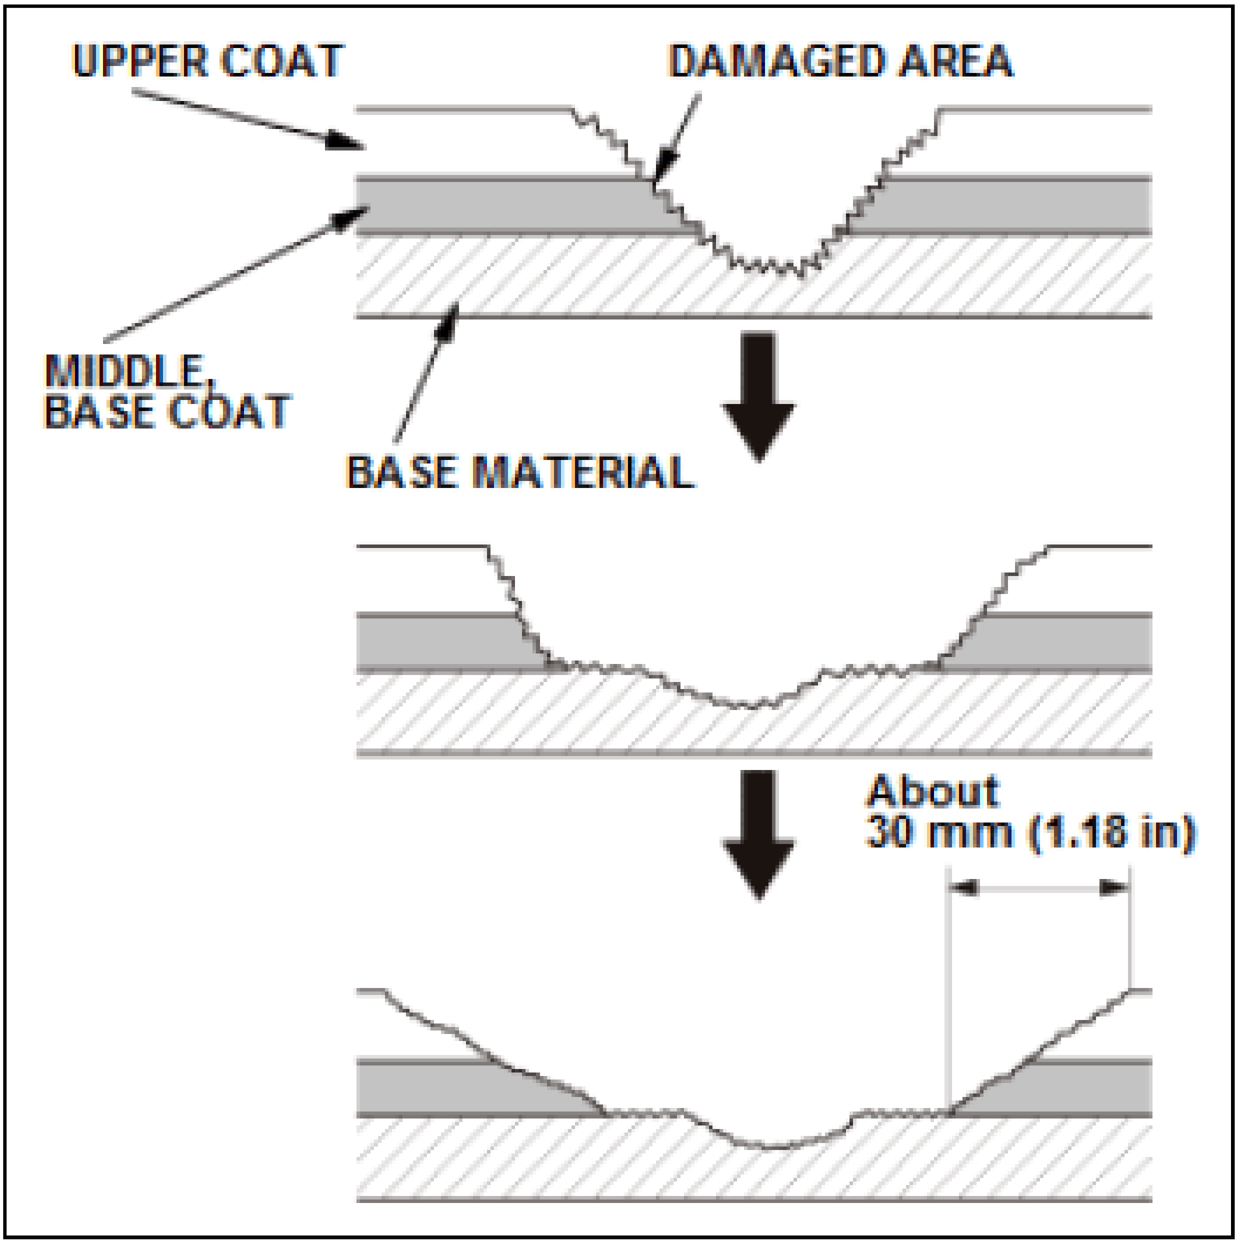
Featheredge with a double action sander and P240 sand paper.



UPPER COAT
DAMAGED AREA
MIDDLE, BASE COAT
BASE MATERIAL

For Extensive Paint Damage

1. Remove the paint layers using a single action sander with P60 to P80 sandpaper.
2. Form a reference surface using double action sander with P80 sandpaper.
3. Featheredge using double action sander with P80 to P120 sandpaper.



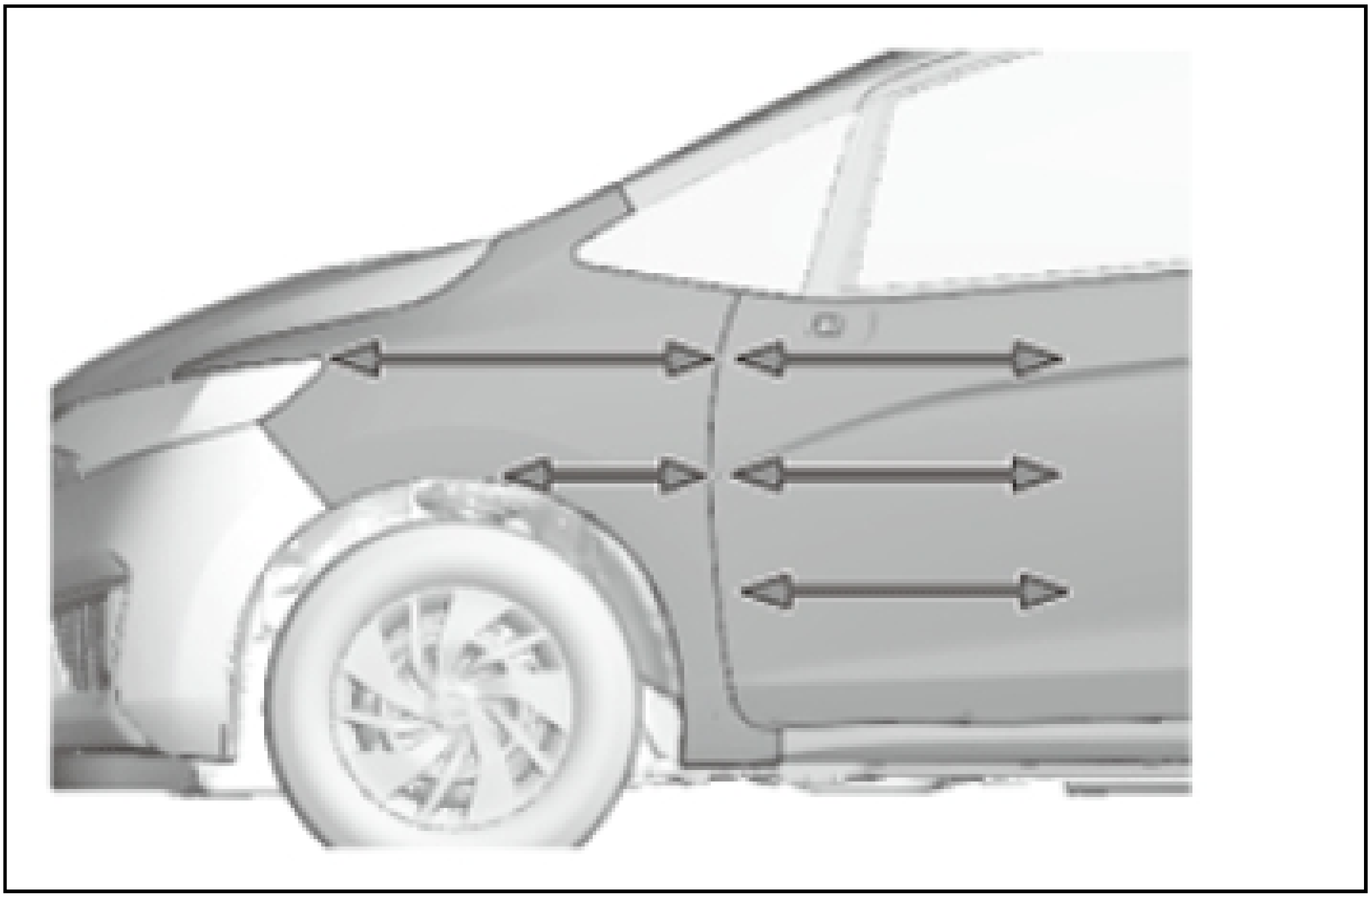
UPPER COAT
DAMAGED AREA
MIDDLE, BASE COAT
BASE MATERIAL
About 30 mm (1.18 in)

Topcoating Preparation

Scuffing is done to increase adhesion of the old paint layer to the new topcoat.

When Block Painting or Overall Painting (Overall Recoloring)

- Sand the topcoated area using a double action sander with P400 sandpaper.
- Manually sand with P600 to P800 sandpaper where the sander cannot access. Be careful not to miss any spots.
- Sand only in one direction so that sanding scratches are not as noticeable.



When Gradation Painting

- Scuff off the old paint layer of the primer-surfacer coating area with some extra margin so that scuffed area is a little wider than the gradation border.
- For a light solid colored surface, sand with an intermediate compound, or with P1500 wet-or-dry sandpaper.
- For a metallic, pearl, or deep solid colored surface, sand with a fine compound or with P1500 wet-or-dry sandpaper.
- After scuffing the old paint layer, **mask it for topcoating** .

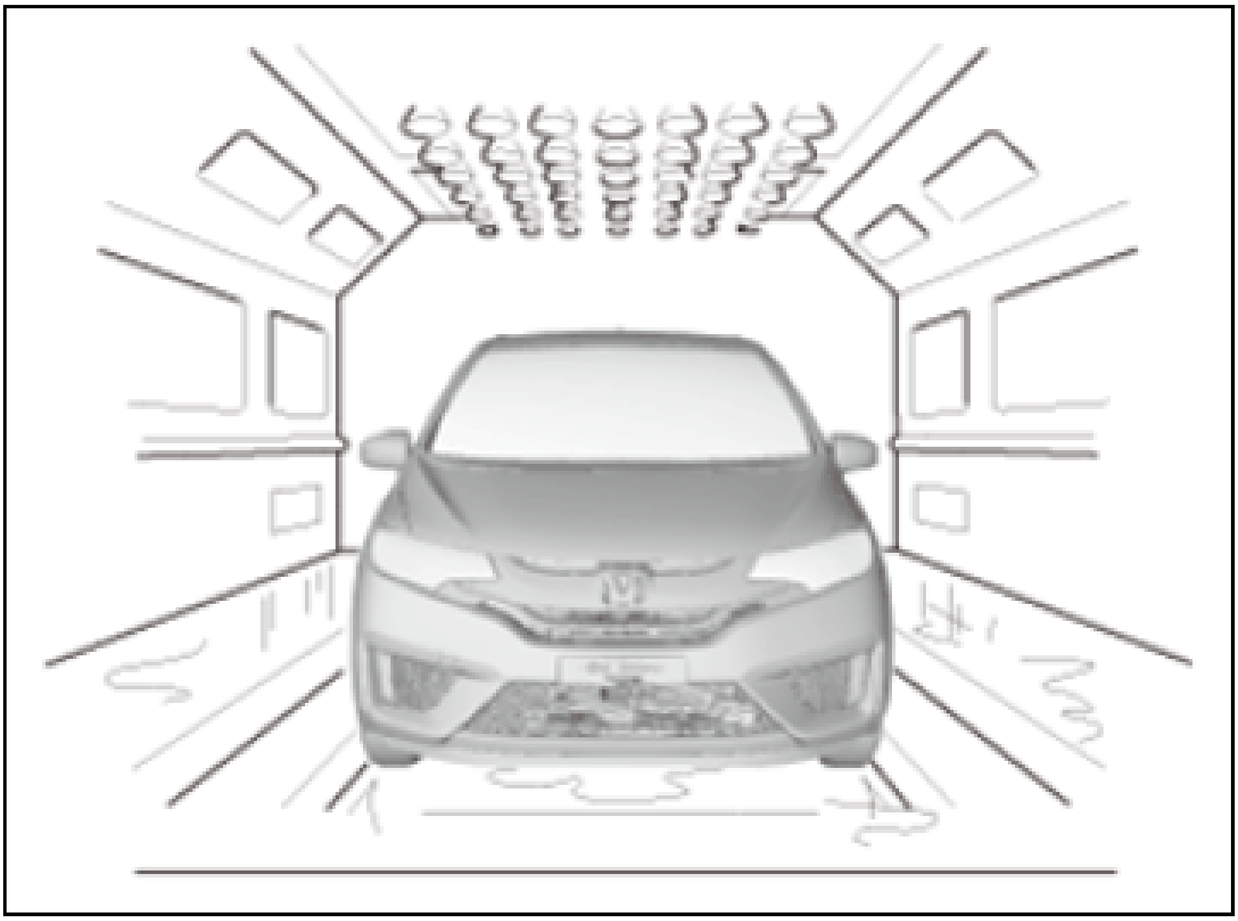
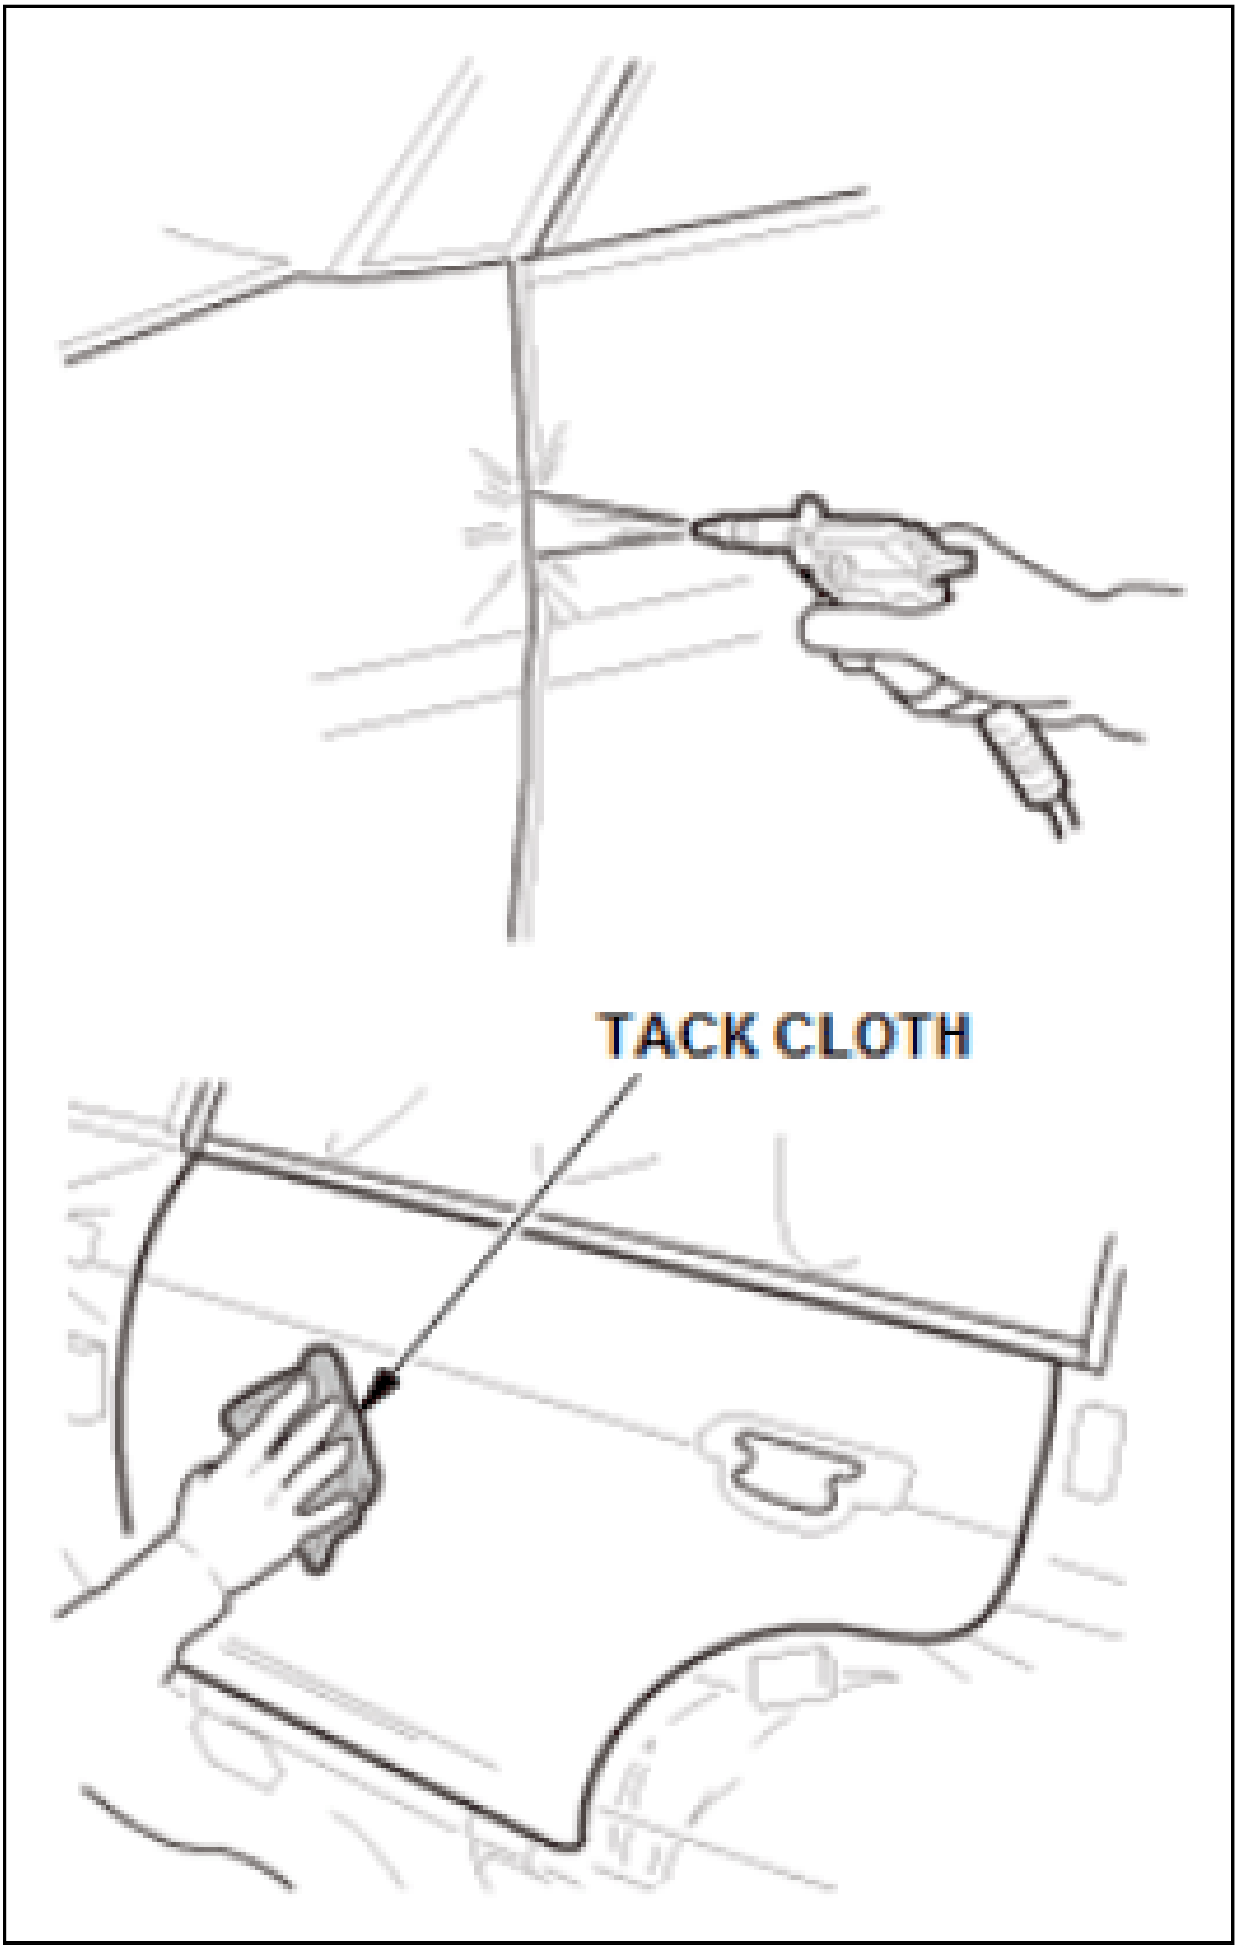
1. Transfer and Cleaning of Vehicle:

   Clean any dust and dirt in the paint both first and wet the floor with water. Then transfer the vehicle into the paint booth.



2. Air Blow Cleaning and Degreasing of Coating Surface:
    - Degrease and clean the surface, check the masking paper and coating surface for any lifting or peeling. Use a compressed air blow gun to thoroughly remove all dust and dirt from the gaps between parts and panels.
    - Just before topcoating, wipe the entire coating surface with a tack cloth. Be careful not to apply too much pressure against the surface or the cloth may leave varnish residue on the surface.

NOTE: **Do not touch the degreased surface with your bare hands.**



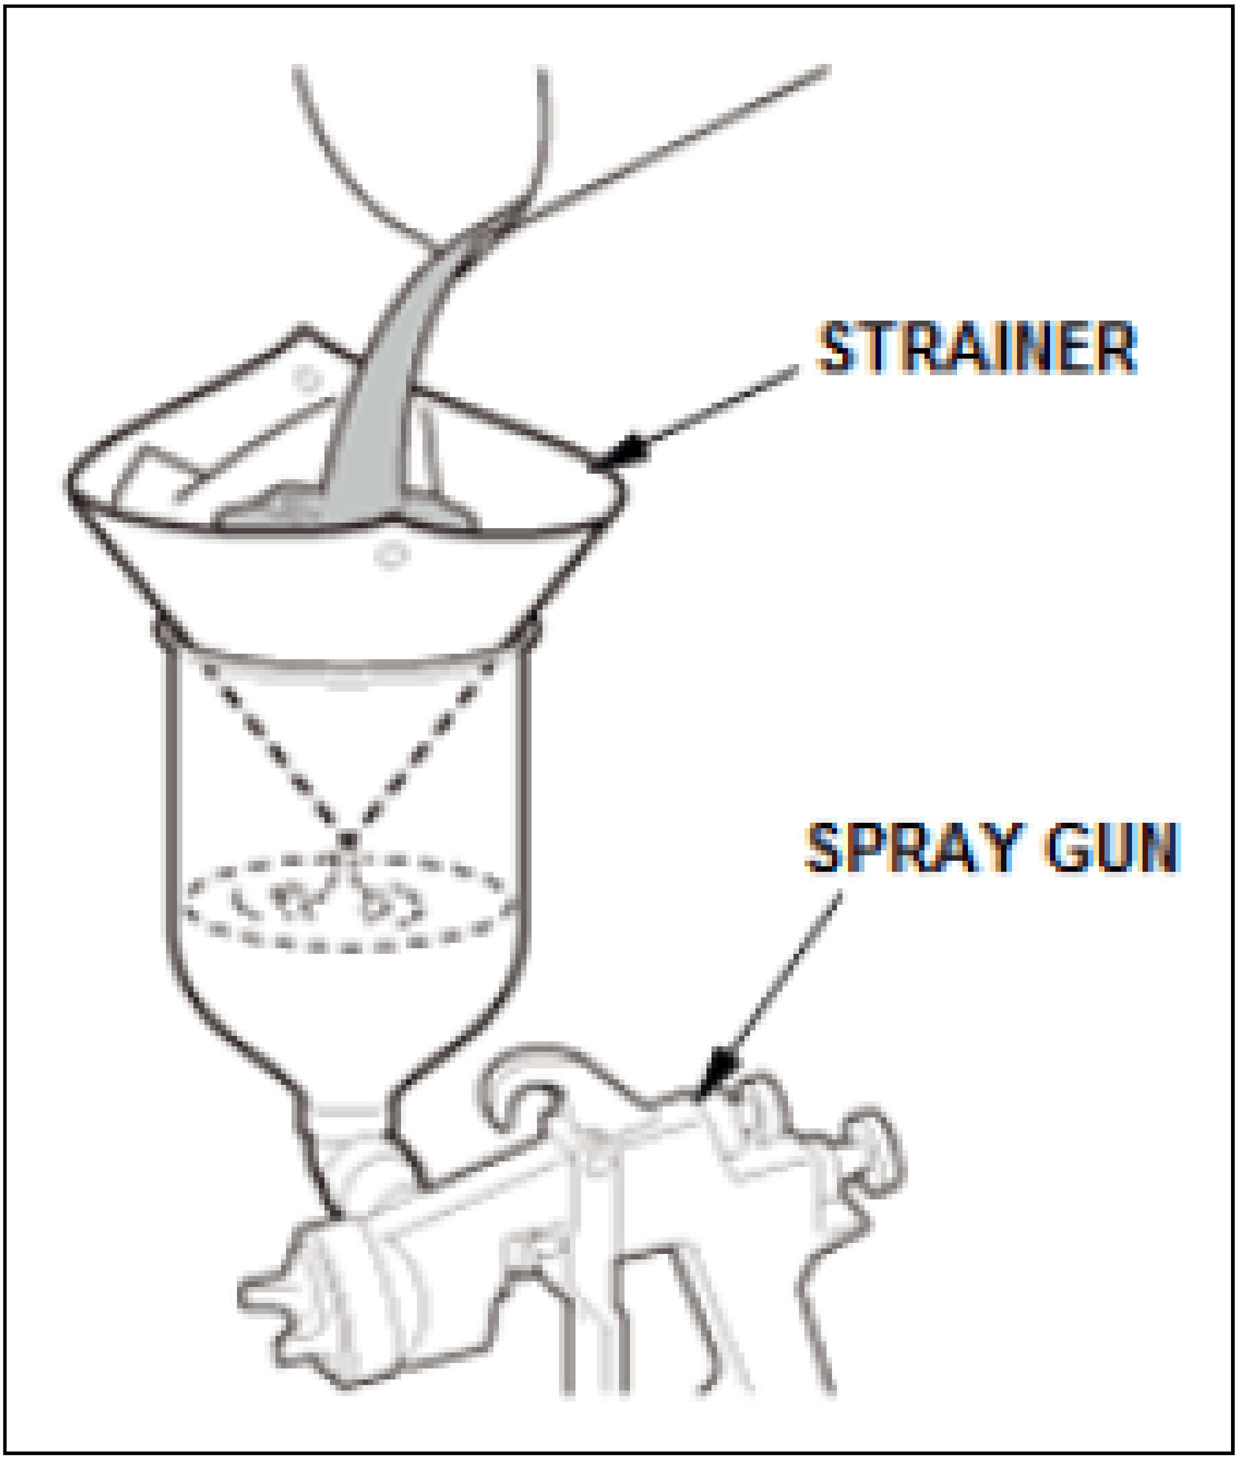
3. Wear safety protection and clean work wear to avoid dust and dirt adhering to the surfaces being painted.
4. Paint Mixing:
   - Mixing Hardener and Additive.

NOTE: **Follow the manufacturer's instructions for correctly mixing paint.**

- Mixing Paint:
  - Mix the paint, hardener, and paint reducer/thinner to the correct ratio according to the paint manufacturer's instructions using a microcomputer scale. The amount of hardener must absolutely be correct or it will cause defects after topcoating. The use of a digital measuring instrument is widely used for color mixing.

  - It is important to select the appropriate paint reducer/thinner depending upon the ambient conditions.

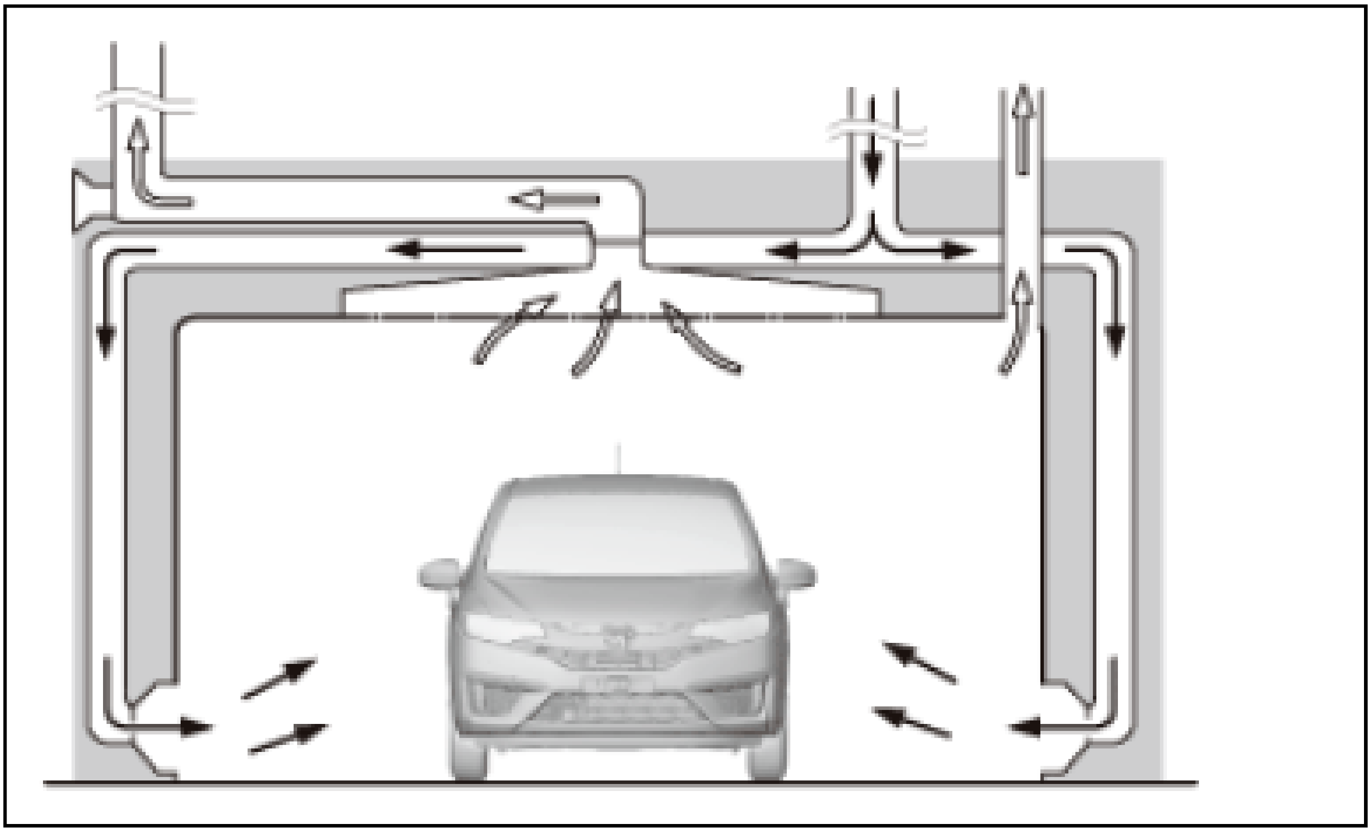
Type of Paint Thinner	Temperature (reference)
Ultra quick drying type (very cold season)	50Â°F (10Â°C) or lower
Quick drying type (cold season)	50-59Â°F (10-15Â°C)
Normal type (warm/cool season)	About 68Â°F (20Â°C)
Slow drying type (hot season)	77-95Â°F (25-35Â°C)
Ultra slow drying type (very hot season)	95Â°F or higher (35Â°C) or higher



STRAINER
SPRAY GUN

5. Mix the hardener and paint reducer/thinner thoroughly with the paint, filter it with a strainer, and pour it into the spray gun.

Topcoat Drying

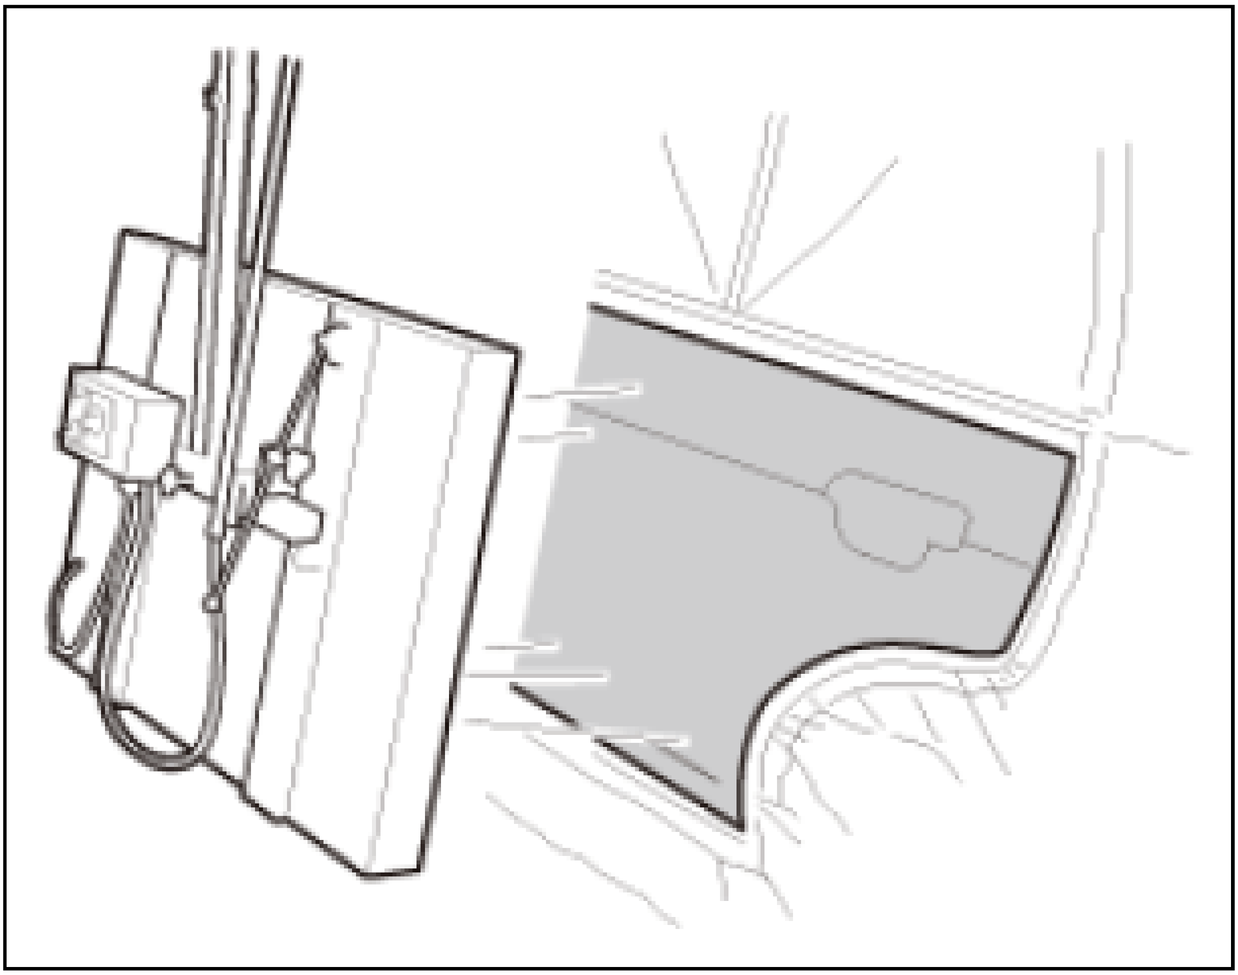


1. Allow sufficient set-up time:

   After painting, leave the surface as is for about 10 to 20 minutes, in order to let the solvent evaporate and prevent defects during forced drying.

   NOTE: **Check the paint manufacturer's instructions because set-up time changes according to ambient temperature and paint layer thickness.**

2. Force Drying Topcoat:
   - Force dry the surface for approximately 30 to 40 minutes at a temperature of 140Â°F (60Â°C).
   - Always refer to the paint manufacturer's instructions for the appropriate drying time.



Topcoating Information

Partial Repair

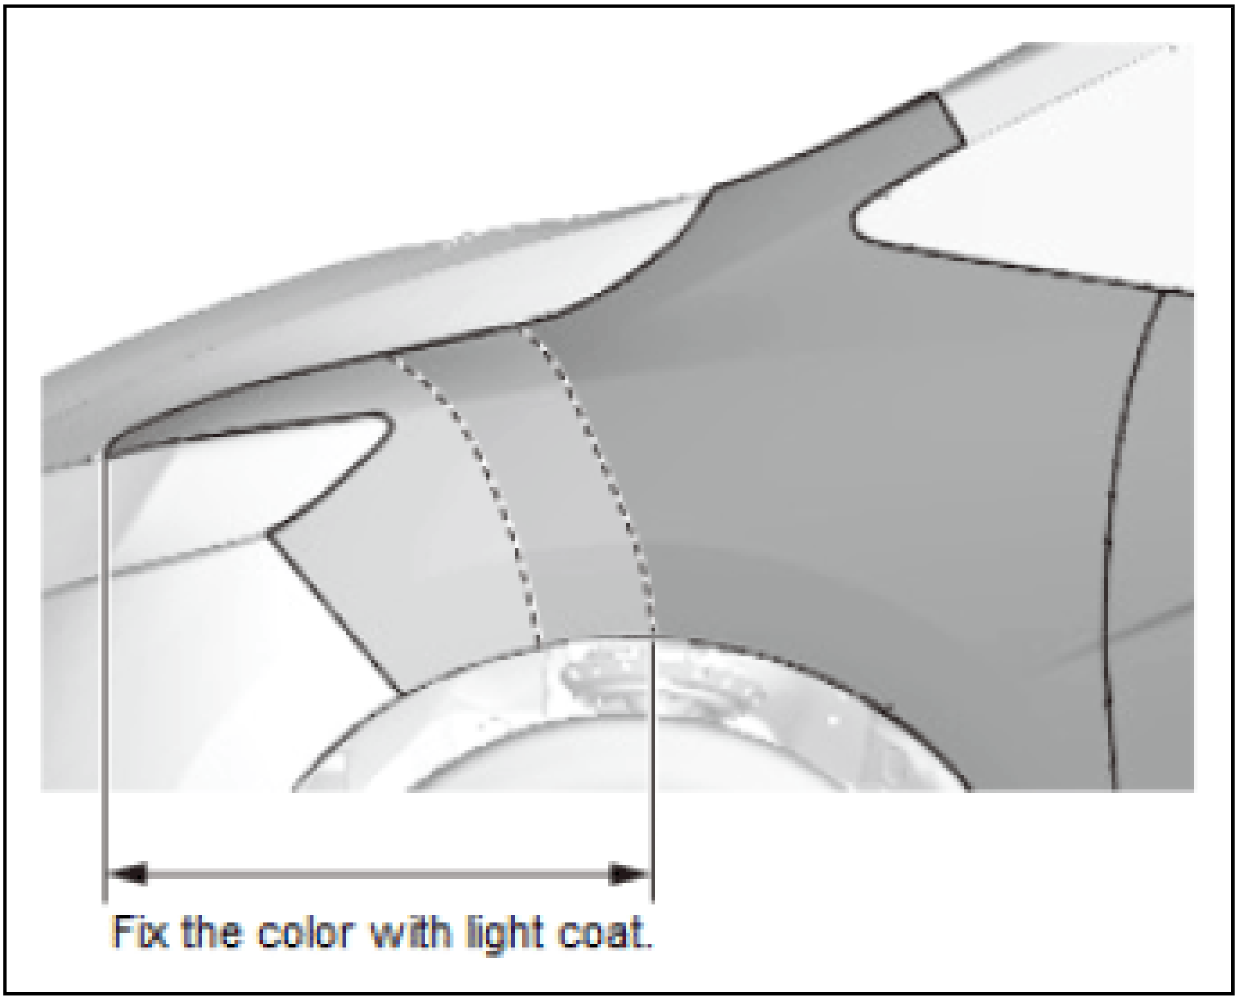
For each process, refer to the corresponding basic process.

Spot Gradation Coating

Using a technique of gradation, match the color and luster with those of the surrounding paint surface.

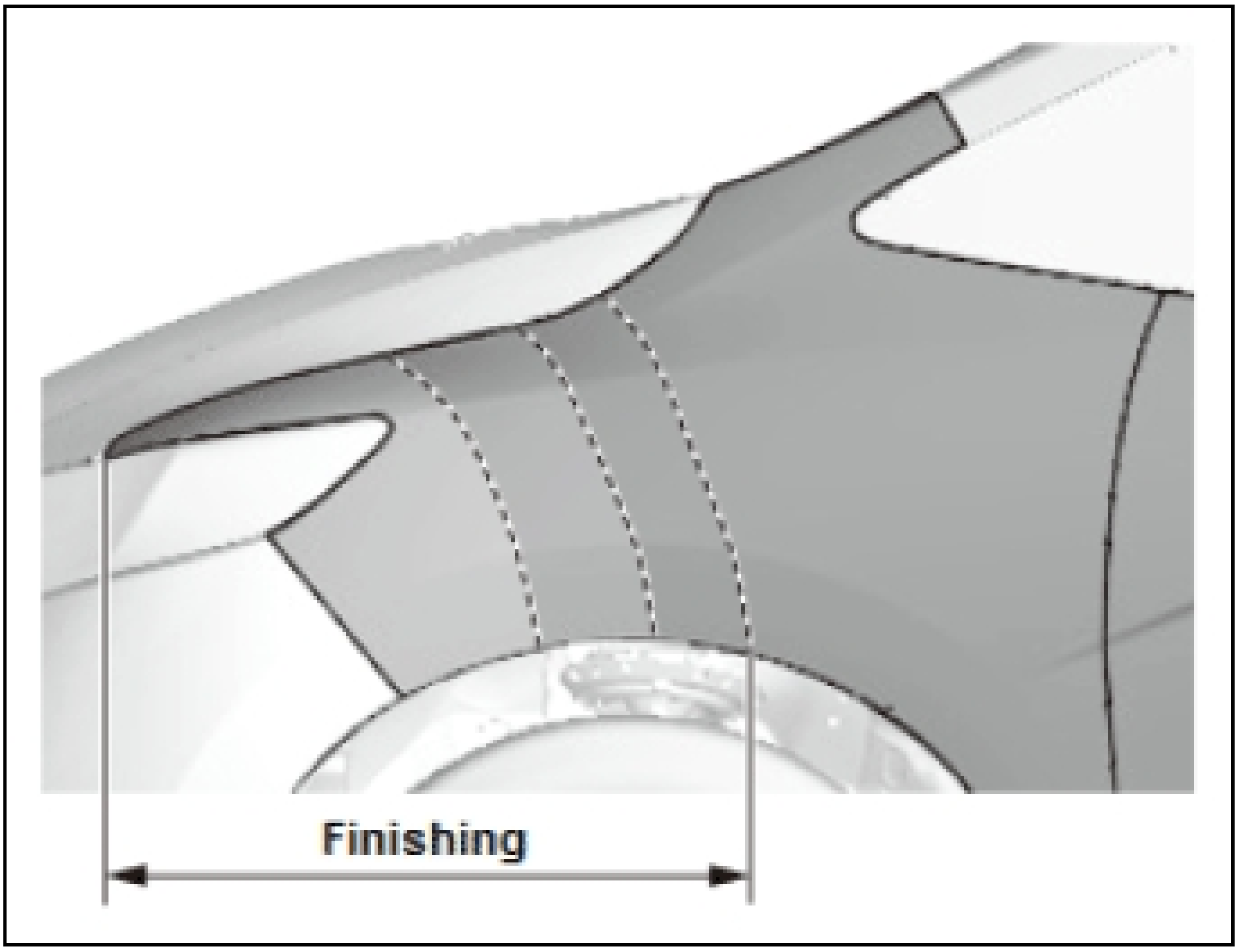
In Case of Solid Color

1. Light coat and fix the color.



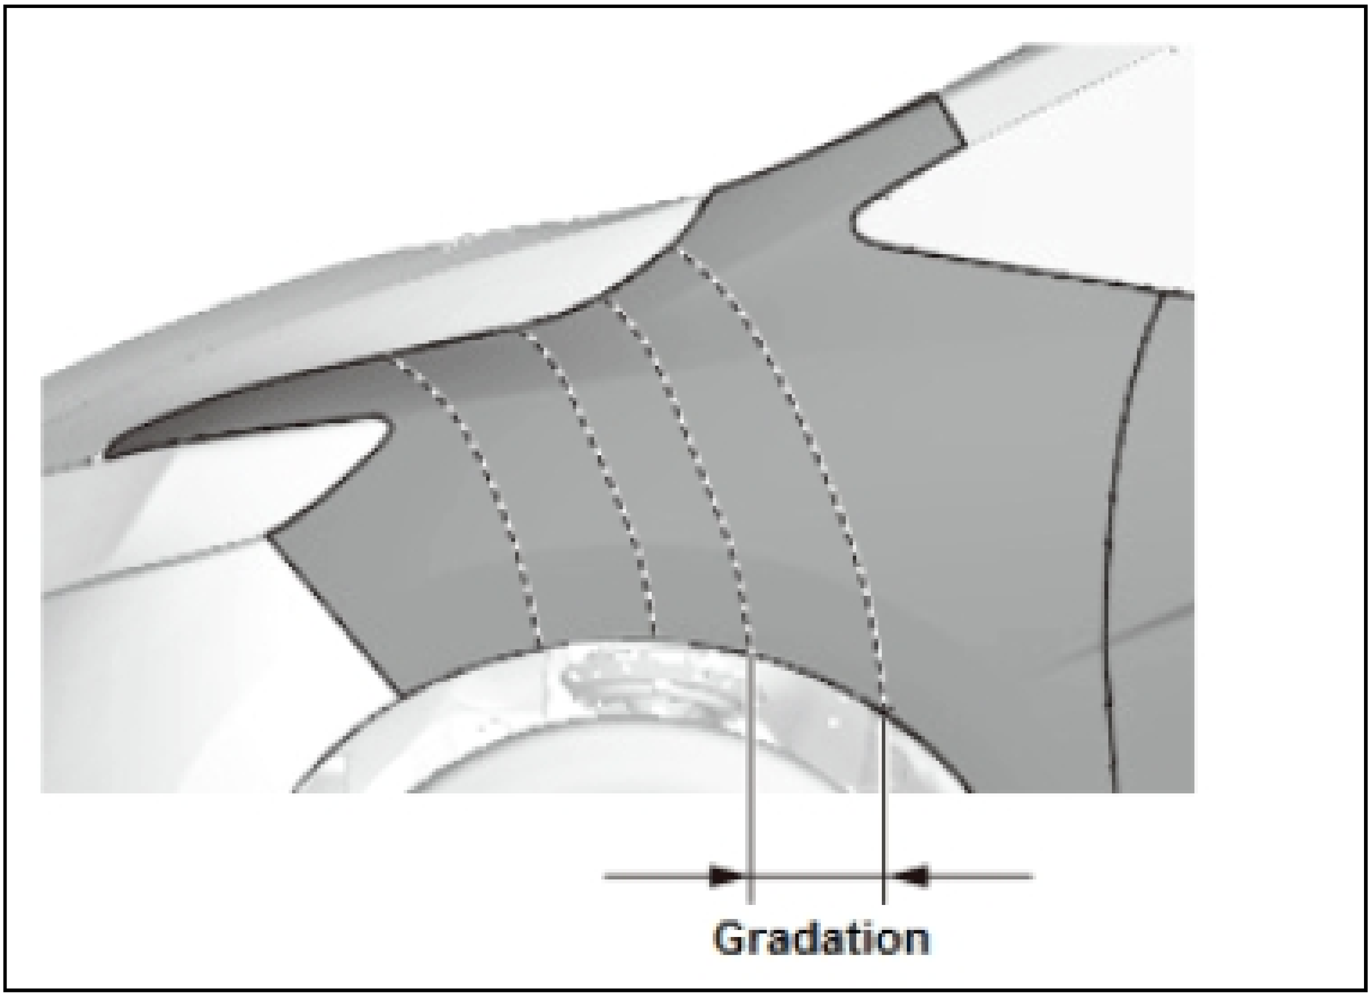
Fix the color with light coat.

2. Finish coat.



3. Gradation.

4. Dry.

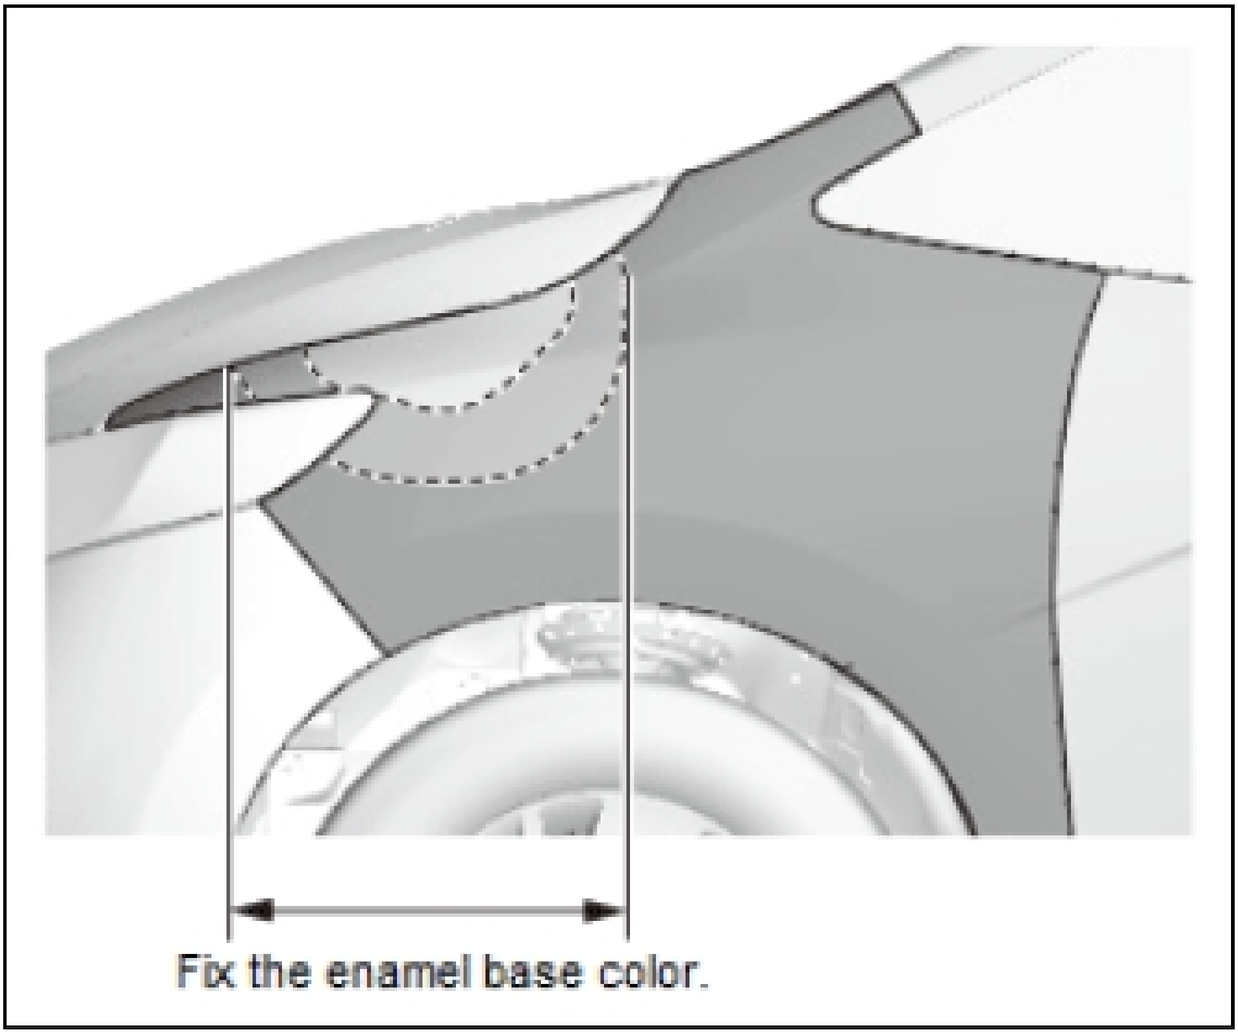


Block Gradation Coating

Provides a gradation effect to the enamel base area before applying clearcoat to each panel (block). It is effective for dark solid colors to help prevent color fading.

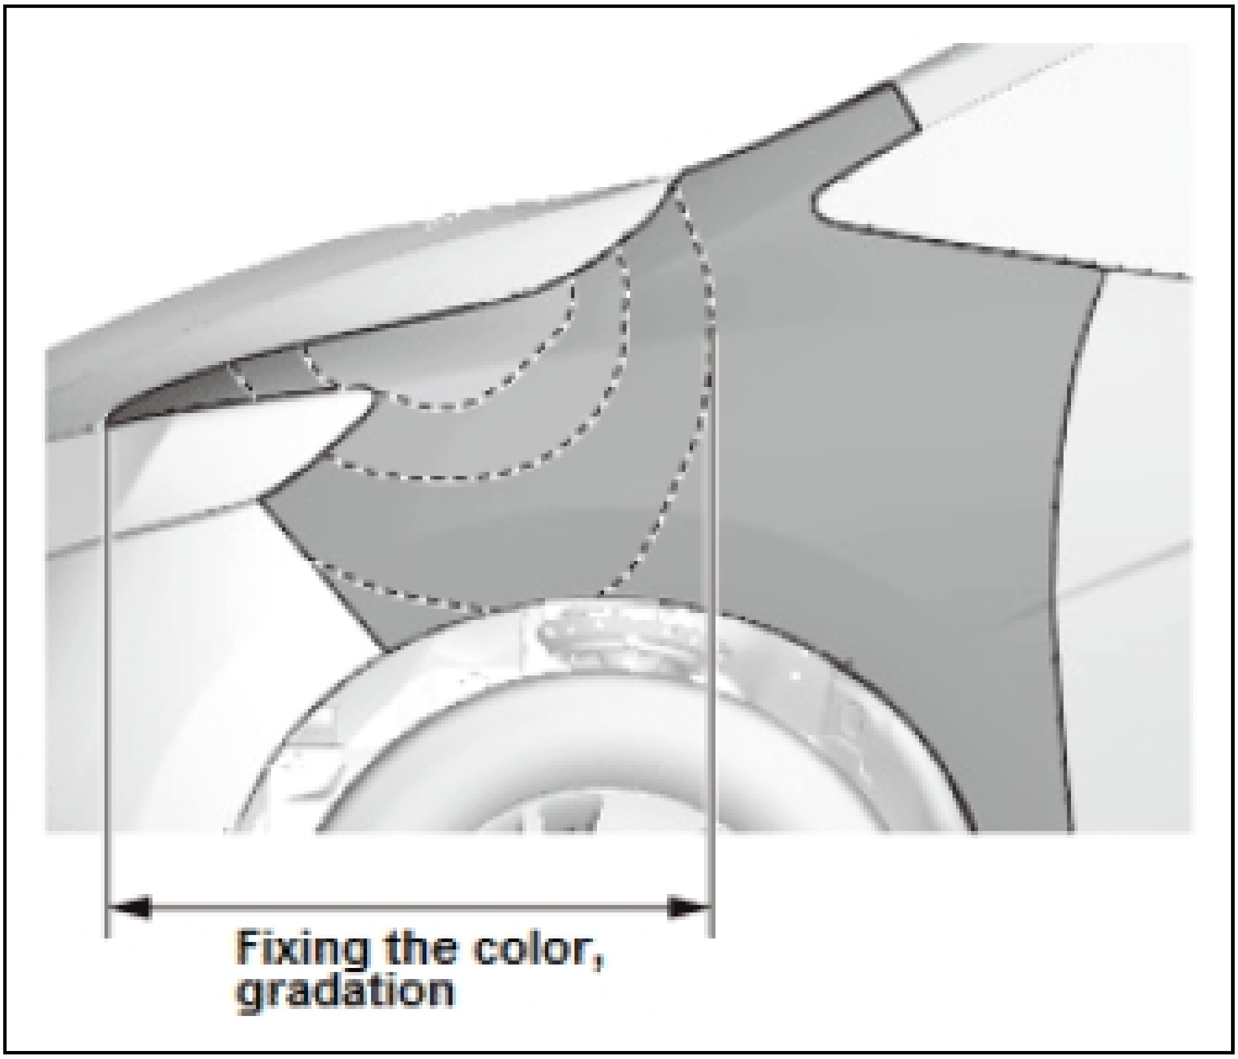
In Case of Solid Color

1. Fixing the enamel base color.



Fix the enamel base color.

2. Remove unevenness and give gradation to the enamel base.

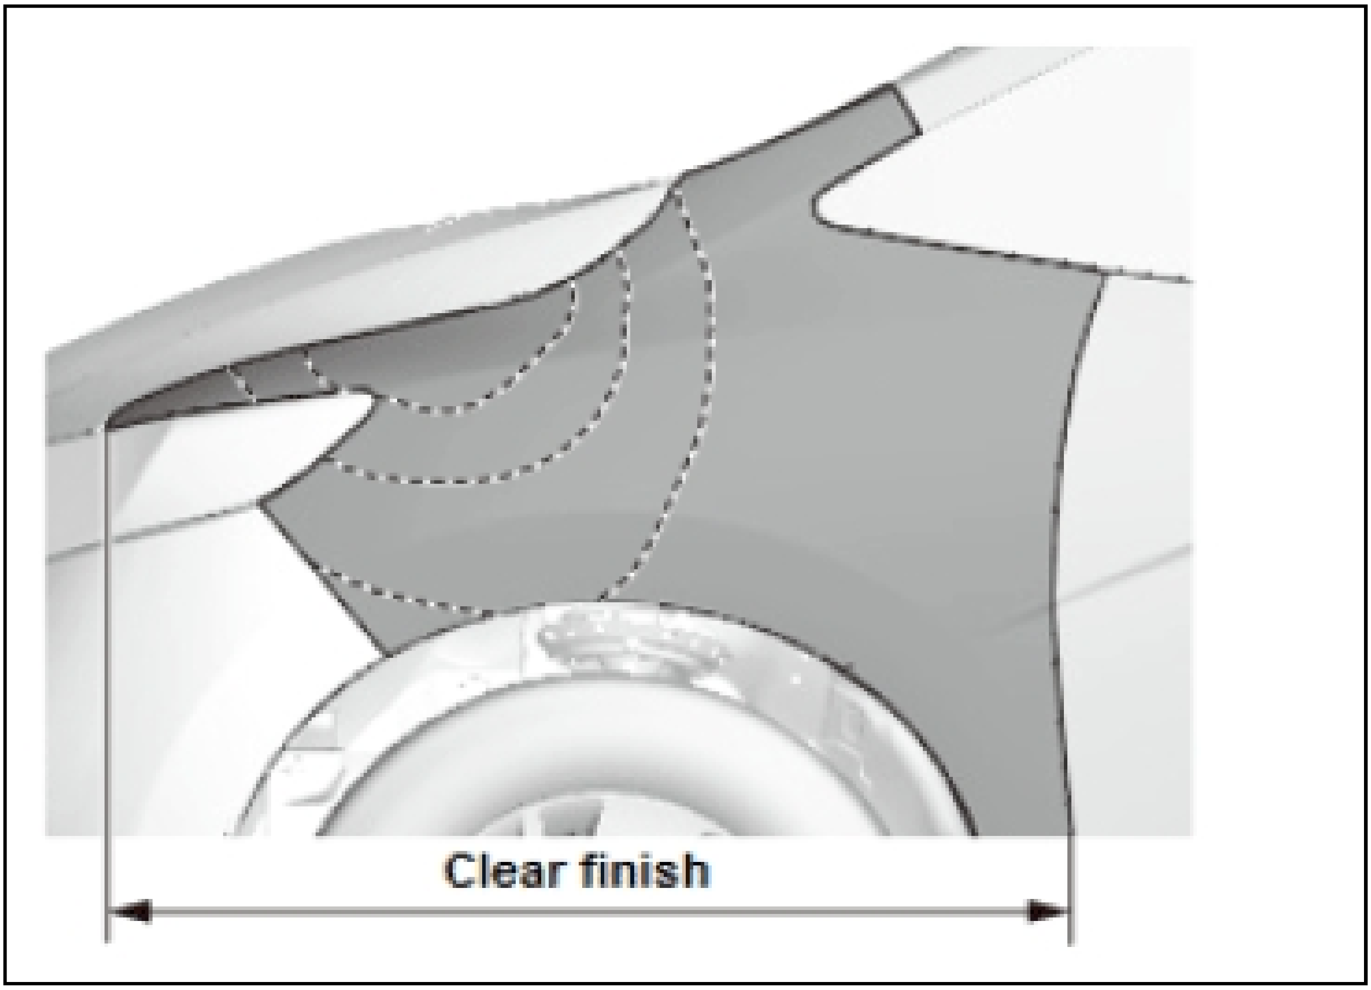


Fixing the color, gradation

3. Light coat with clear.
4. Finish with clear.

   The same area as the light coat.

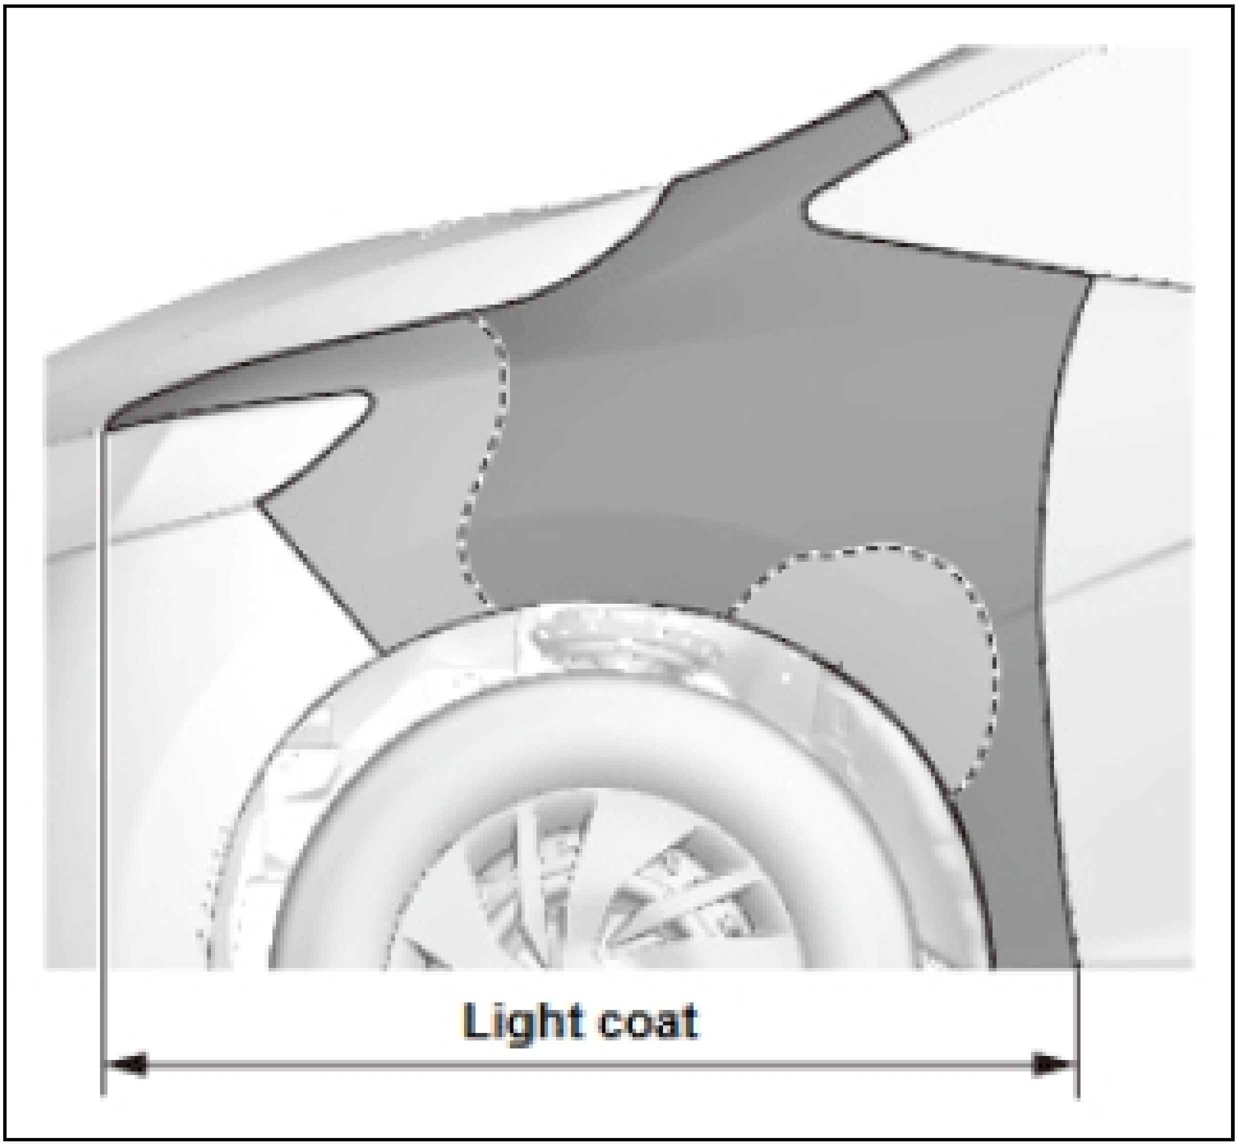
5. Dry.



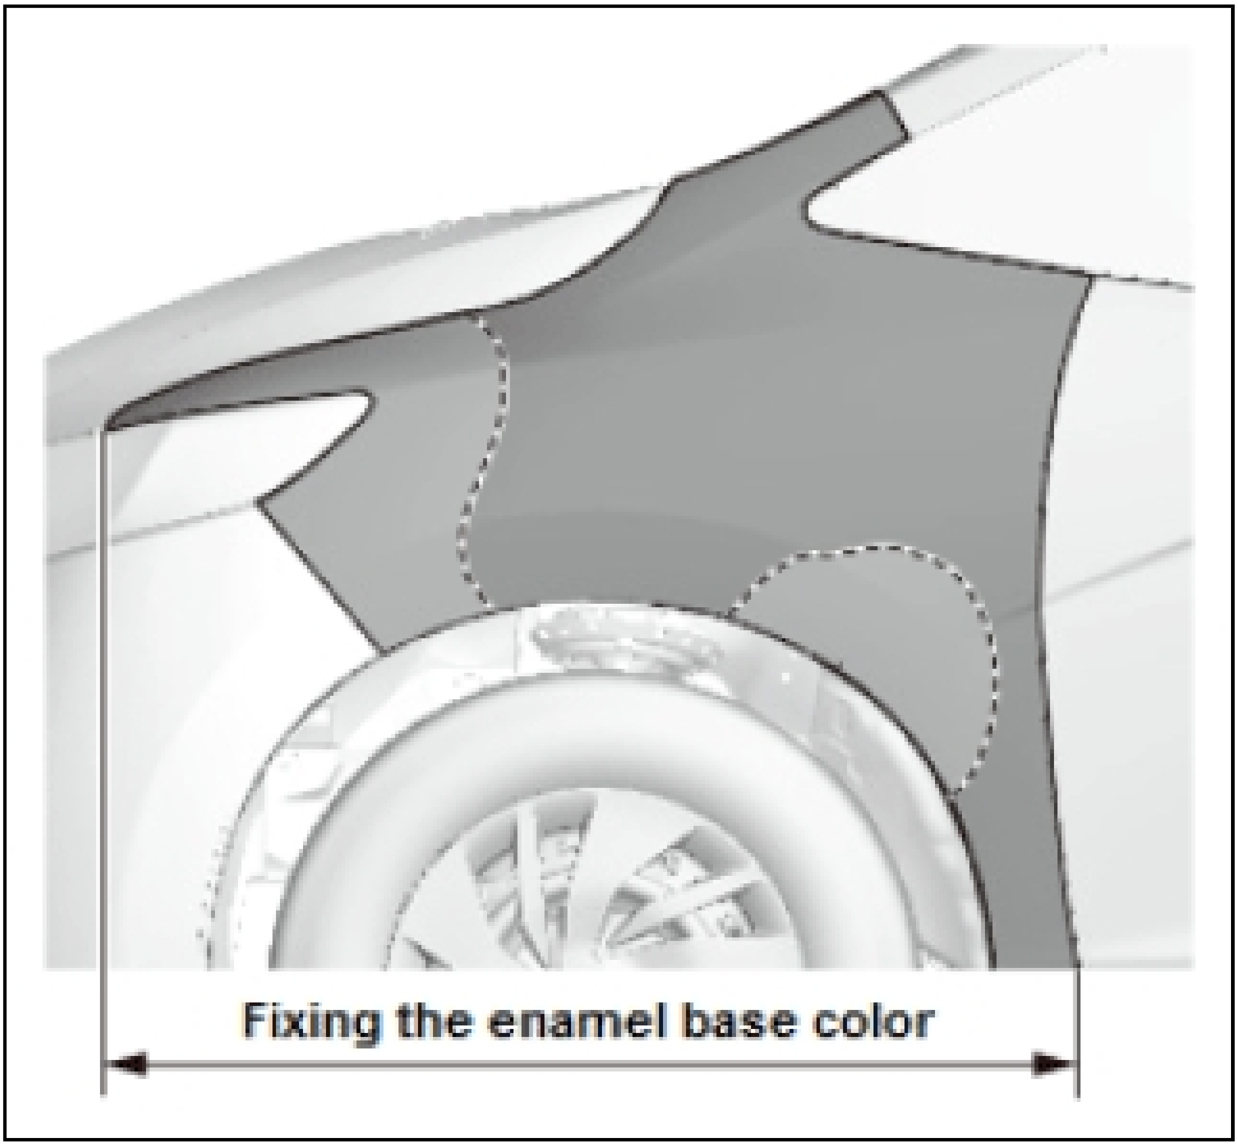
Clear finish

In Case of Metallic Color

1. Apply a light coat of enamel base color.

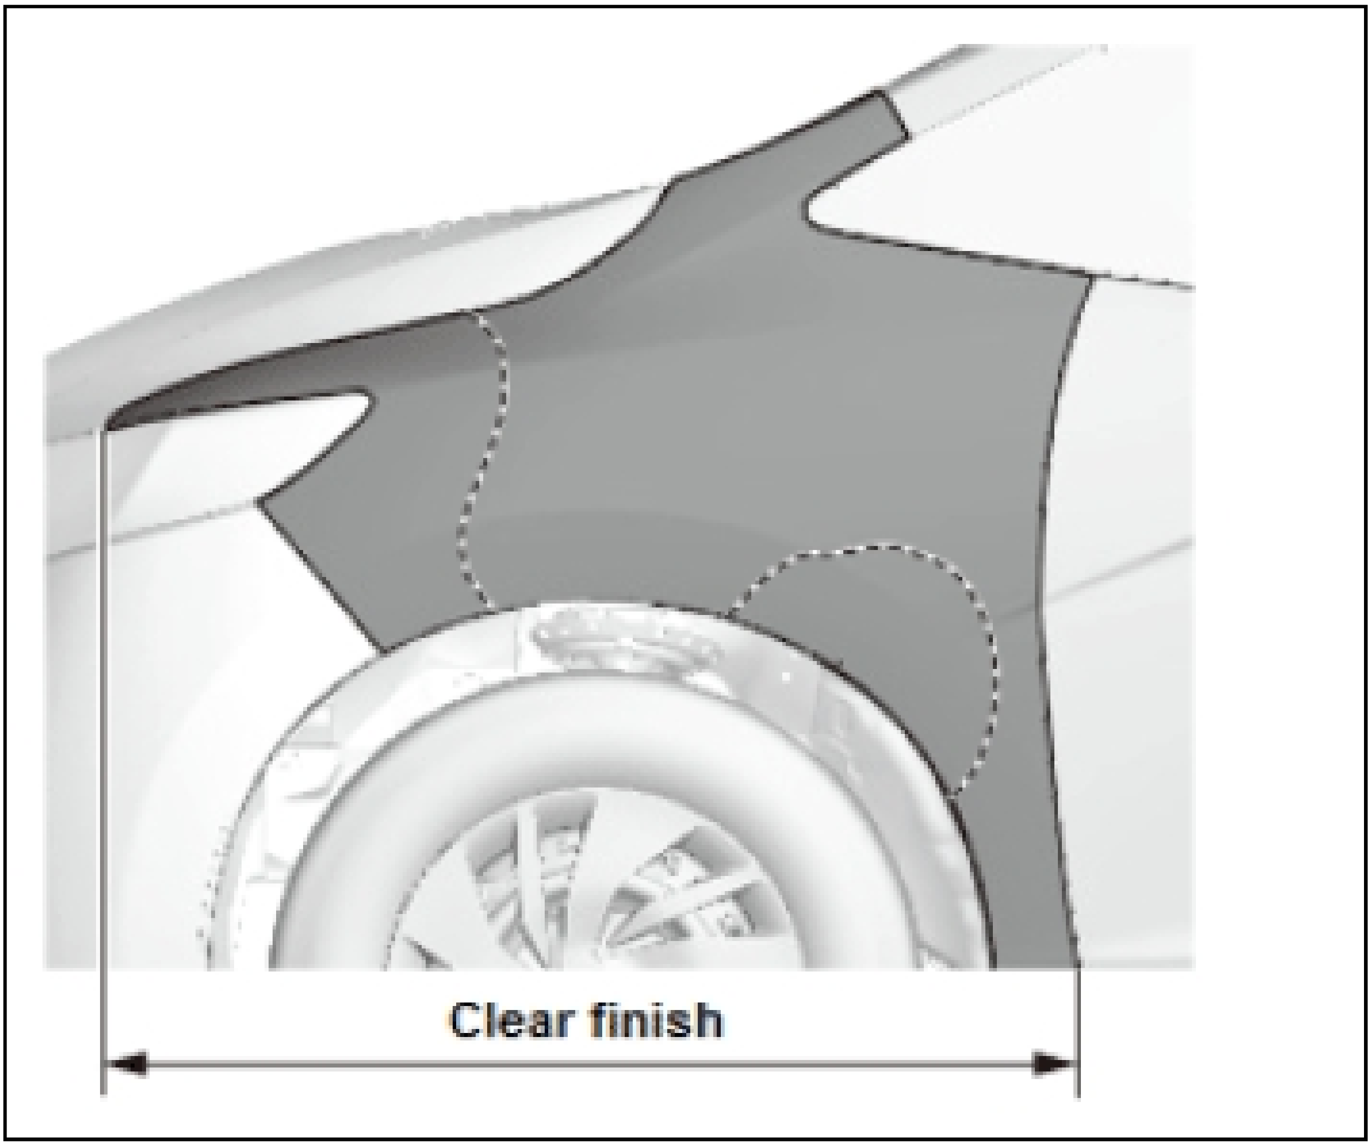


2. Finish applying the enamel base color.



Fixing the enamel base color

3. Remove any unevenness in the enamel base.
4. Light coat with clear.
5. Finish with clear.
6. Dry.



Water-Based Topcoat Application

1. Preparation of Water-Based Topcoats:

   Mixing Paint and Paint Reducer/Thinner:

   - Stir the paint thoroughly before mixing colors.
   - Combine the primary colors and adjust with a paint reducer/thinner.

   NOTE:

   - **The viscosity of water-based paint is adjusted by adding reducer or paint thinner exclusively for the water-based paint.**
   - **There are several types of reducer; such as standard type and slow-dry type. Select the most appropriate type depending upon the ambient conditions and accurately measure the required amount.**
   - **When too much reducer/thinner is added, coverage capability is reduced. Selecting the wrong type of reducer/thinner, greatly increases drying time, slowing your work efficiency Confirm the product spec information issued by the paint manufacturer.**

   Coating Condition

   NOTE: **The setting of your spray gun has significant impact on the finish quality Make sure to apply the correct settings after confirming the production spec information issued by the paint manufacturer.**

   Settings for Low Pressure Spray Gun (Example):

   - Air Pressure

     Block Paint: 130-200 kPa (1.3-2.0 bar, 20-30 psi)

Gradation Paint: 150-180 kPa (1.5-1.8 bar, 22-26 psi)

Removal of Unevenness: 130-150 kPa (1.3-1.5 bar, 18-22 psi)

- Discharge Rate: Open 3 to 3.5 turns from full close
- Pattern: Open 3/4 turn from full close
- Spray Distance: 15-20 cm (6-8 in)

The setting value will change depending on the size or shape of the coating surfaces.

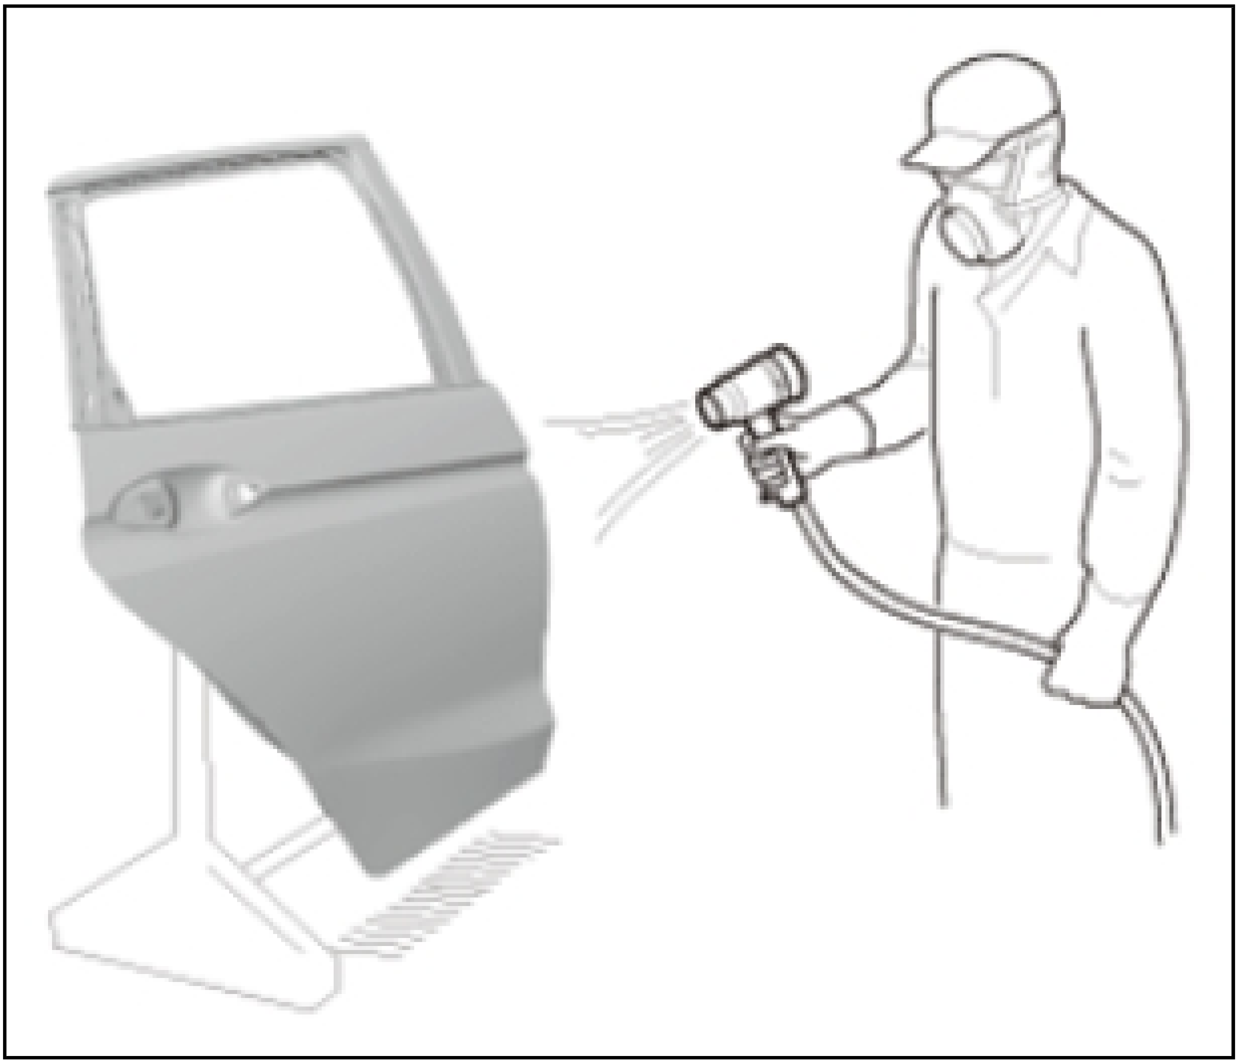
2. Sanding and Degreasing before Topcoating:
   - Scuff with P600 to P800 sandpaper.
   - Degreasing should be done in two steps; one with solvent type degreaser and another with water-based type degreaser.
3. Water-Based Color Basecoating:
   1. Apply medium coat so that the entire surface will be lustered.

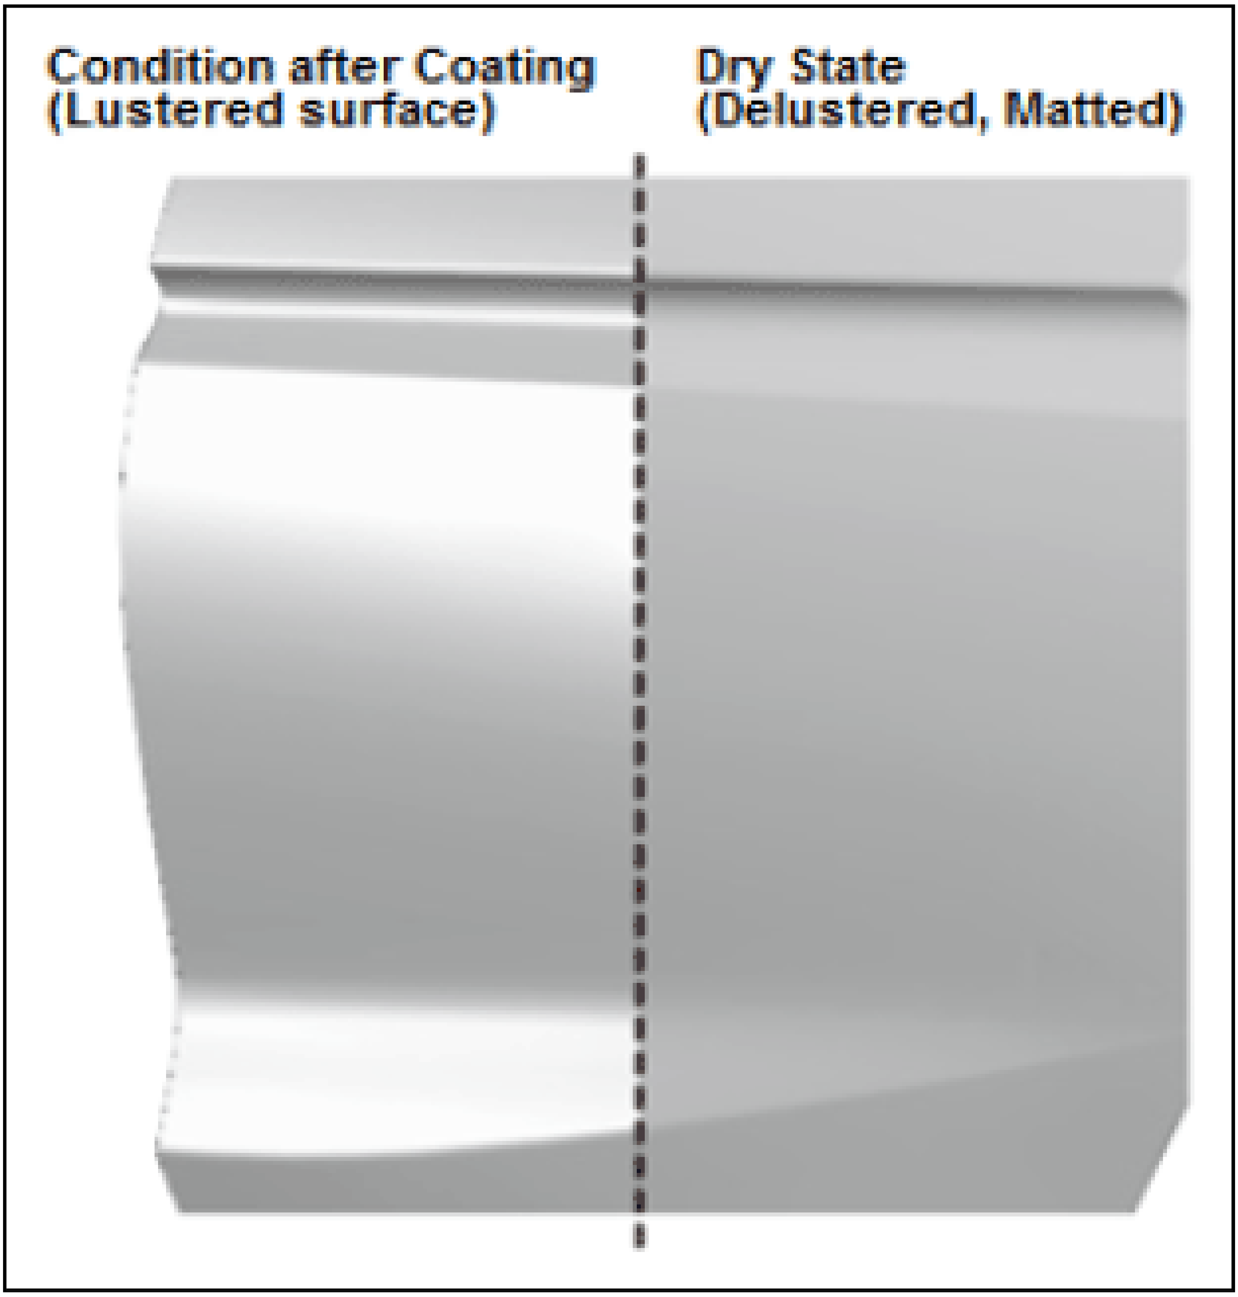
NOTE: **Apply in thin coats or the water won't be able to escape from the paint film, reducing your work efficiency In addition, thickly applied paint layers may become whitish.**

   2. Dry the color basecoat.

After allowing sufficient flash time, use a portable air blower/heat gun to completely remove water content from the paint layer until it has a flat appearance.

NOTE: **Refer to the paint manufacturer's instruction for the appropriate flash time and drying temperature.**





NOTE: **Flash time can be greatly impacted by the ambient humidity.**

Comparison of Flash Time (Example):

Conditions (in paint booth for water-based paint)

- Coating Surface: Door Panel
- Color: Silver Metallic
- Dilution Rate: 20%
- Coating Condition: Block Coating
- Ambient Conditions: Temperature 70Â°F (21Â°C)/Humidity 60% RH

No.	Drying Location	Flash Time
1	Below the booth fan	8 min 41 sec
2	Away from the booth fan	10 min 15 sec
3	Below the booth fan with air blower	3 min 35 sec
	Same as above conditions 30% RH humidity	2 min 10 sec

3. Repeat the processes of (1) and (2) (coating and drying) and layer the color base to cover the surface completely

NOTE:

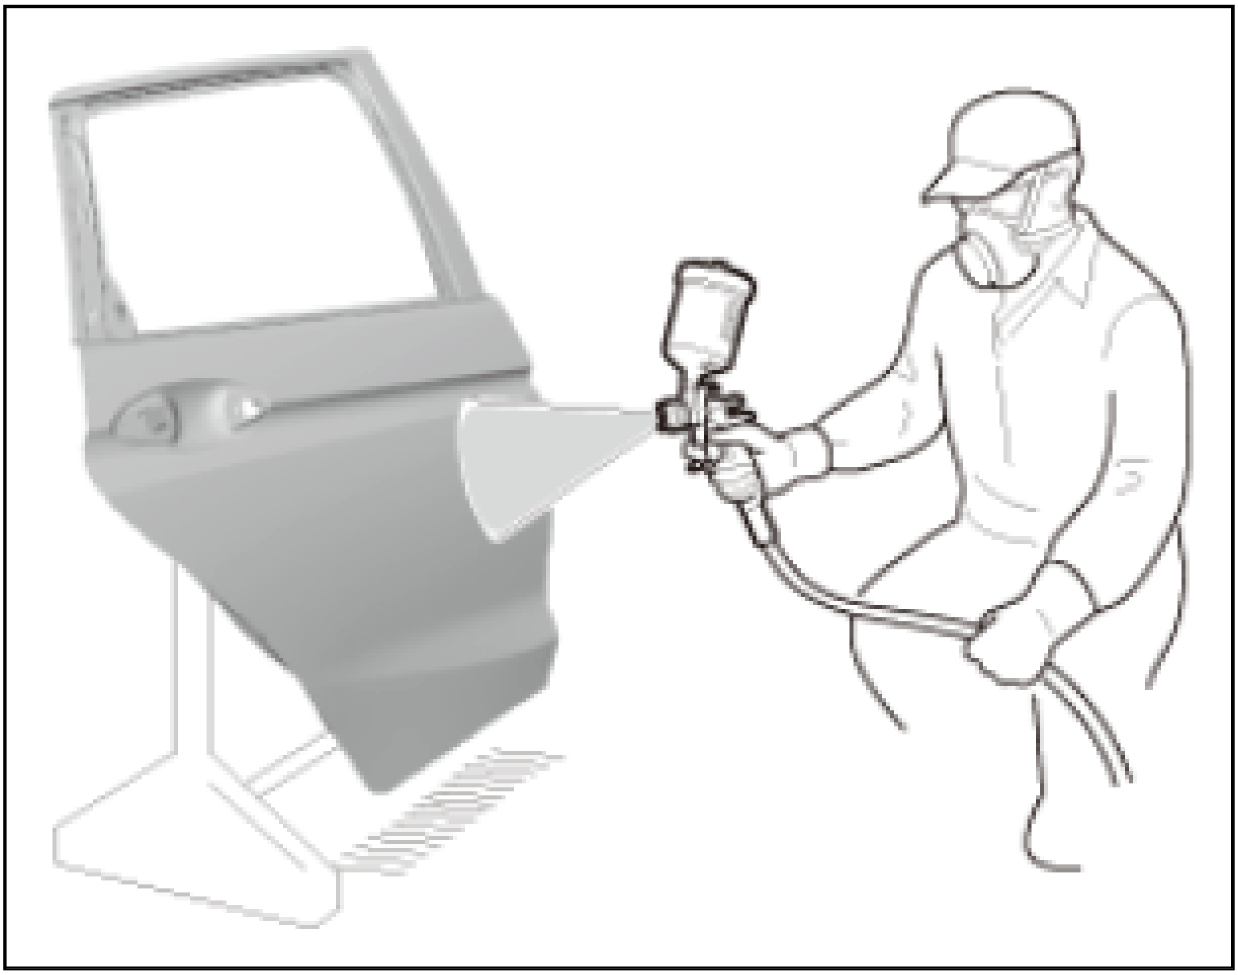
- **Normally spray 1 to 2 times to cover the surface.**
- **Gradually widen the coating area at each layer when applying gradation coating.**

- **When foreign substances adhere to the surface, dry sand with a sandpaper of P1000 or higher after complete dry Do not wet sand.**

4. Remove unevenness.

   Color unevenness rarely occurs, so apply as needed.

   NOTE:
   - **When removing unevenness, place the spray gun a little further away from the surface being painted and spray with a lightly lower pressure.**
   - **Apply light coat for gradation coating.**
   - **Confirm the paint manufacturer's instructions. Some paint may require use of exclusive paint reducer/thinner for the gradation paint.**



4. Drying Topcoated Layer:

   Allow sufficient set-up time and let the color base completely dry.

5. Clearcoating:

   Generally apply two coats, allowing it to match the adjoining panel's surface quality.

   NOTE: **After the first light coat, allow flash time and wet coat (finishing).**

6. Drying Clear:

   Allow sufficient set-up time before force-drying.

   NOTE: **Confirm the paint manufacturer's instructions for the appropriate setting time and drying temperature.**

7. Polishing.

PLASTIC PARTS PAINT REPAIR

External Plastic Parts Examples

- Because plastic parts are extensively used for exterior parts on vehicles, they may also require paint repairs like other steel body parts.
- The paint repair method and used materials are different depending upon the construction material of the plastic parts.
- In order to confirm the plastic material type, refer to the code stamped on the rear surface of the part, or the appropriate service information.
- Understand the characteristics of the plastic materials before beginning paint repairs.

Plastic Part Types And Characteristics

- Before repairing plastic parts, confirm the temperature for forced (heated) drying and solvent resistance.
- Refer to the chart below to avoid heat or solvent damage to plastic parts.

Standard Plastic Parts Symbol	Name	Heat Resistance Temperature Â°F (Â°C)	Solvent Resistance	Note
AAS	Acrylonitrile acrylic styrene	176 (80)	Short time, a small amount of alcohol OK (to wipe off for degreasing etc.)	Organic solvent such as gasoline NG aromatic substance NG.
ABS	Acrylonitrile butadiene styrene	176 (80)	Short time, a small amount of alcohol OK (to wipe off for degreasing etc.)	Organic solvent such as gasoline NG aromatic substance NG.

Standard Plastic Parts Symbol	Name	Heat Resistance Temperature Â°F (Â°C)	Solvent Resistance	Note
AES	Acrylonitrile ethylene styrene	176 (80)	Short time, a small amount of alcohol OK (to wipe off for degreasing etc.)	Organic solvent such as gasoline NG aromatic substance NG.
AEPDS	Acrylonitrile/ethylene propylene diene styrene	176 (80)	Short time, a small amount of alcohol OK (to wipe off for degreasing etc.)	Organic solvent such as gasoline NG aromatic substance NG.
AS	Sthylene-acrylonitrile copolymer	176 (80)	Short time, a small amount of alcohol, gasoline OK	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG.
ASA	Acrylonitrile styrene acrylate	176 (80)	Short time, a small amount of alcohol OK (to wipe off for degreasing etc.)	Organic solvent such as gasoline NG aromatic substance NG.
CAB	Cellulose acetate butylate	176 (80)	Short time, a small amount of alcohol OK (to wipe off for degreasing etc.)	Organic solvent such as gasoline NG aromatic substance NG.
EPDM	Ethylene propylene diene terpolymer	176 (80)	Short time, a small amount of alcohol OK (to wipe off for degreasing etc.)	Organic solvent such as gasoline NG aromatic substance NG.
E/VAC	Ethylene-vinyl acetate	176 (80)	Short time, a small amount of alcohol, gasoline OK	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG.
PA	Polyamide	176 (80)	Alcohol, gasoline OK	Buttery fluid (sulfuric acid) NG.
PBT	Polybutylene terephthalate	320 (160)	Alcohol, gasoline OK	Almost all solvent OK.
PC	Polycarbonate plastics	248 (120)	Short time, a small amount of alcohol OK	Organic solvent such as brake fluid, wax, wax remover and gasoline NG.
PE	Polyethylene	176 (80)	Alcohol, gasoline OK	Almost all solvent OK.
PF	Phenol formaldehyde	176 (80)	Very short time, a s m all alcohol OK (to wipe off for degreasing etc.)	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG.
PMMA	Polymethyl methacrylate (acryl)	176 (80)	Short time, a small amount of alcohol OK (to wipe off for degreasing etc.)	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG. Thoroughly wash off remover.
POM	Polyoxymethylene polyacetal	212 (100)	Alcohol, gasoline OK	Almost all solvent OK.
PP	Polypropylene	176 (80)	Alcohol, gasoline OK	Almost all solvent OK.
PPE	Polypropylene oxide	212 (100)	Short time, a small amount of alcohol OK	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG.
PS	Polystyrene (styrol)	140 (60)	Short time, a small amount of alcohol OK	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG.
PUR	Thermosetting polyurethane	176 (80)	Very short time, a small amount of alcohol OK (to wipe off for degreasing etc.)	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG.
PVC	Polyvinyl chloride	176 (80)	Short time, a small amount of alcohol, gasoline OK (to wipe off for degreasing etc.)	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG.

Standard Plastic Parts Symbol	Name	Heat Resistance Temperature Â°F (Â°C)	Solvent Resistance	Note
SMC	Sheet molding compound	356 (180)	Alcohol, gasoline OK	Almost all solvent OK.
TPE	Thermoplastic polyester elastomer	176 (80)	Alcohol OK, gasoline for a short period of time OK (to wipe off for degreasing etc.)	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG. Thoroughly wash off remover.
TPO	Thermoplastic olefin/elastomer	176 (80)	Alcohol OK, gasoline for a short period of time OK (to wipe off for degreasing etc.)	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG. Thoroughly wash off remover.
TPS	Thermoplastic styrene elastomer	176 (80)	Short time, a small amount of alcohol, gasoline OK (to wipe off for degreasing etc.)	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG. Thoroughly wash off remover.
TPU	Thermoplastic/urethane/elastomer	176 (80)	Short time, a small amount of alcohol, gasoline OK (to wipe off for degreasing etc.)	Dipping in organic solvent such as gasoline and alcohol NG, contact with organic solvent NG. Thoroughly wash off remover.
UP	Polyester	230 (110)	Alcohol, gasoline OK (to wipe off for degreasing etc.)	Alkali NG.

NG= No Good - Do not use

- Heating plastic parts to temperatures at or above the "Heat resistance temperature" may deform them.
- For two plastic parts constructed of the same material, heat and solvent resistance may differ based on the polymerization.

Repair Processes

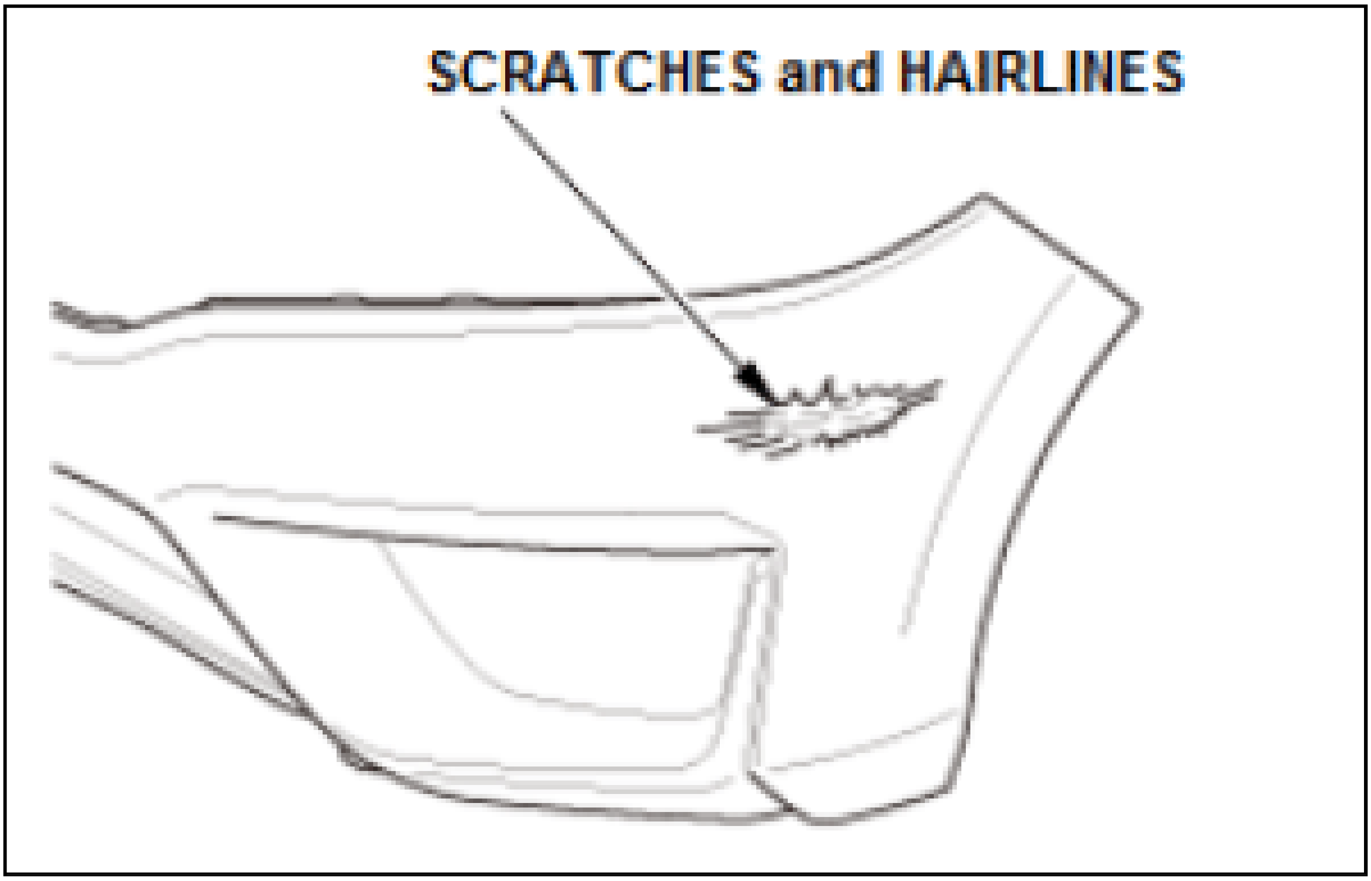
Many plastic parts are used for exterior parts of a vehicle. In addition to sheet metal repairs, it is sometimes necessary to repair plastic parts. The major large plastic parts include: bumpers, side sill garnishes, and spoilers. They may be constructed of PP, ABS, PC, or nylon-polyester-based materials. In many damage situations, plastic part replacement is preferred over repair.

NOTE:

- **Before attempting repairs, identify the plastic part's construction and select the most appropriate repair materials.**
- **Follow the manufacturer's instructions for the repair materials.**
- **Be careful to avoid part deformation and damage during forced-dry with heat during the repair process.**

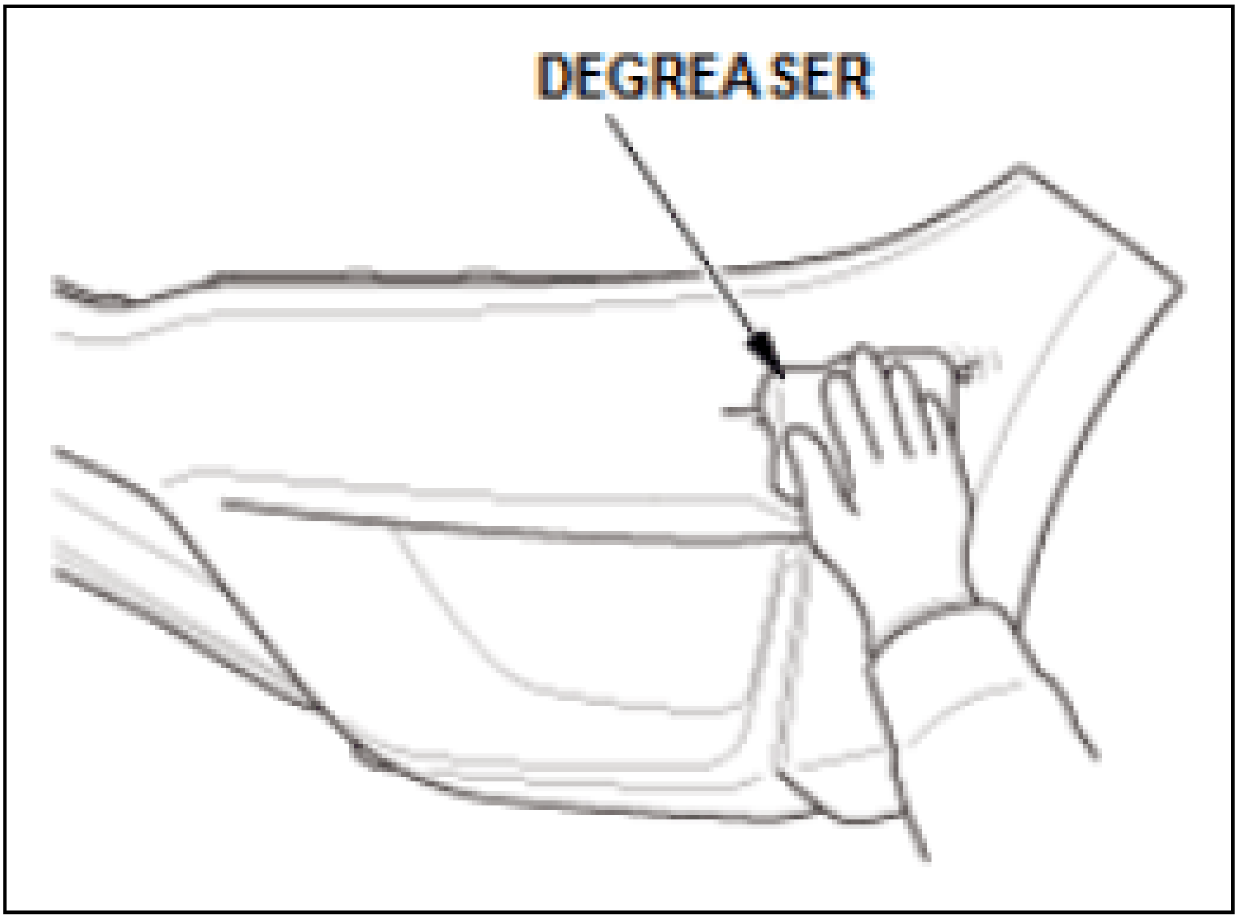
PP Polypropylene Bumper Repair Processes

Example of damage: Scratches and hairlines on PP bumper.



SCRATCHES and HAIRLINES

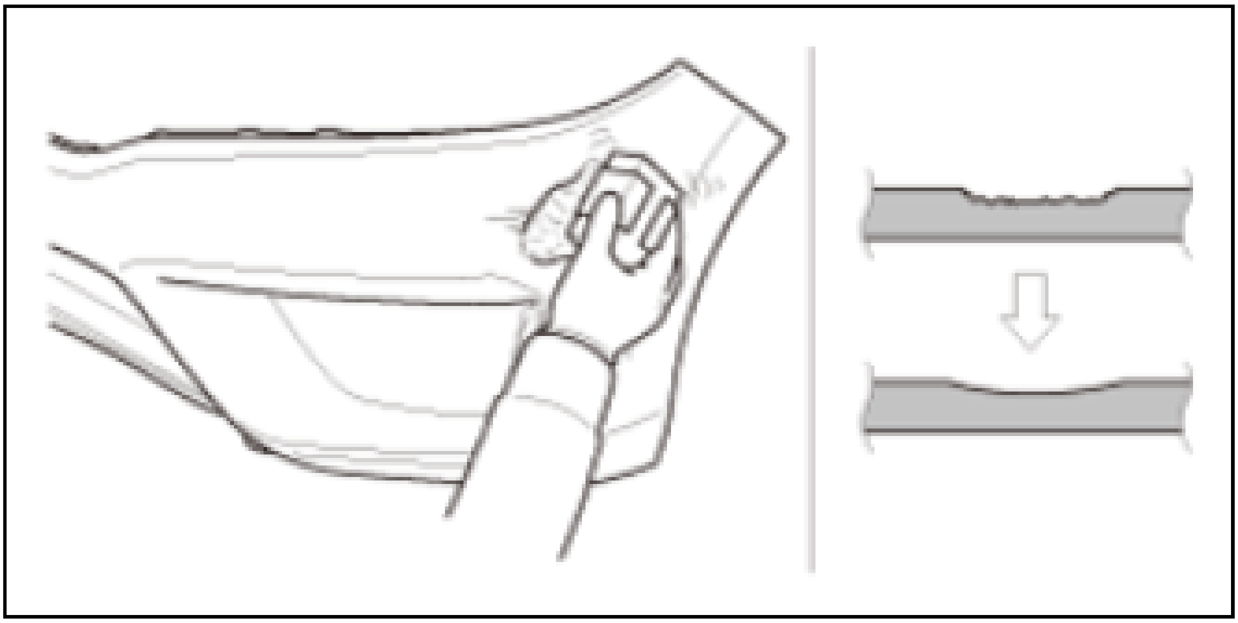
1. Preparation and cleaning:
    - Wash the damaged area with water.
    - Thoroughly clean both the front and rear sides of the damaged area using a degreaser to remove wax and oils.



2. Stand and study raw surface.

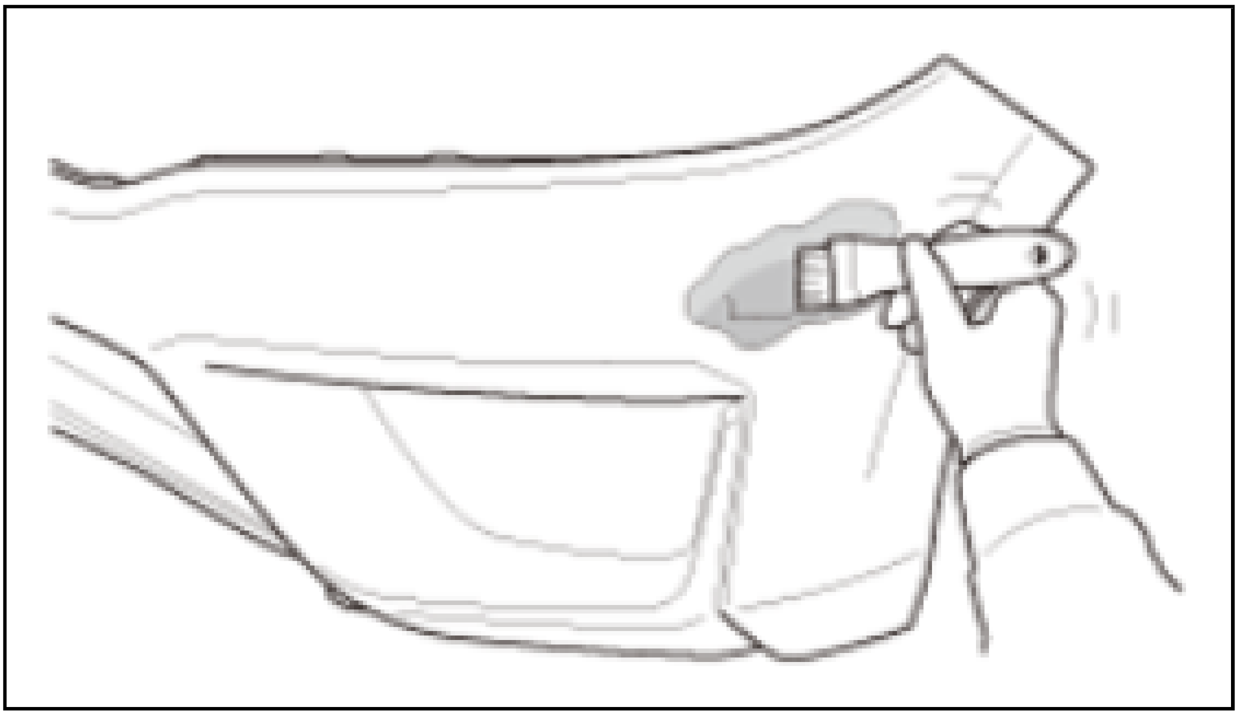
    Featheredge the damaged area using P80 to P120 sandpaper.

Then degrease the surface.

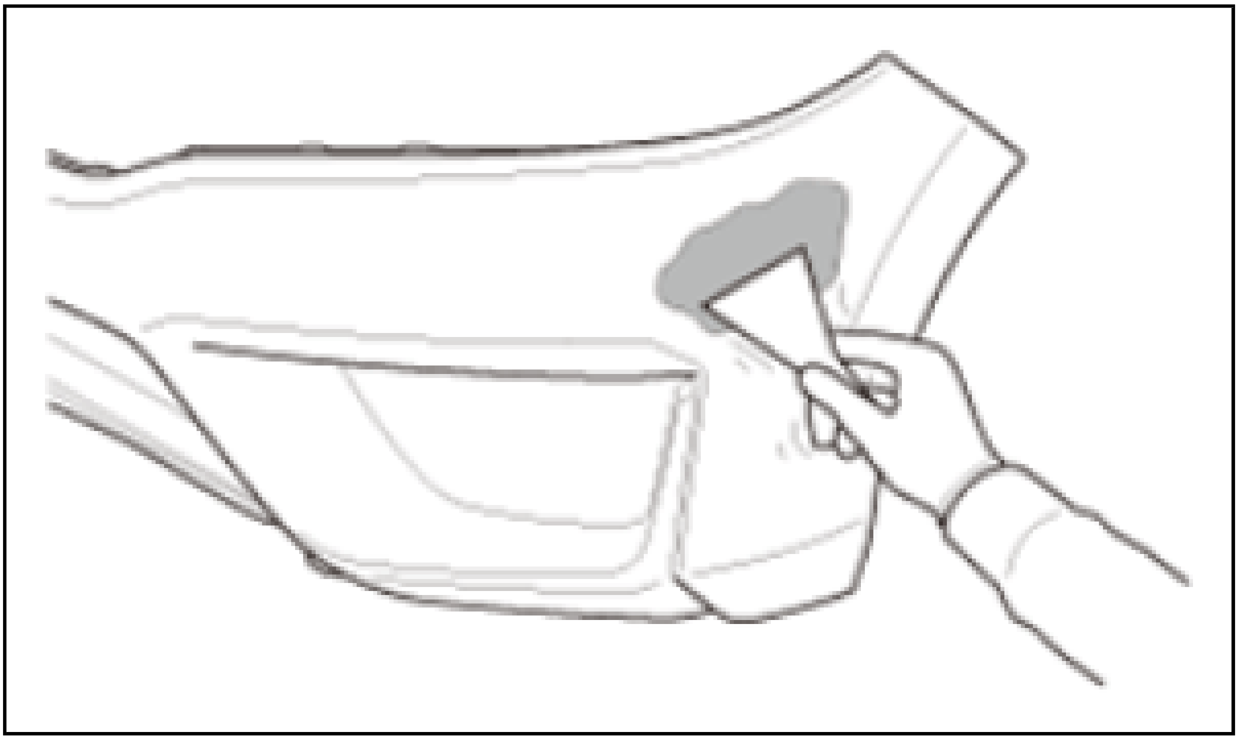


3. Application of primer.

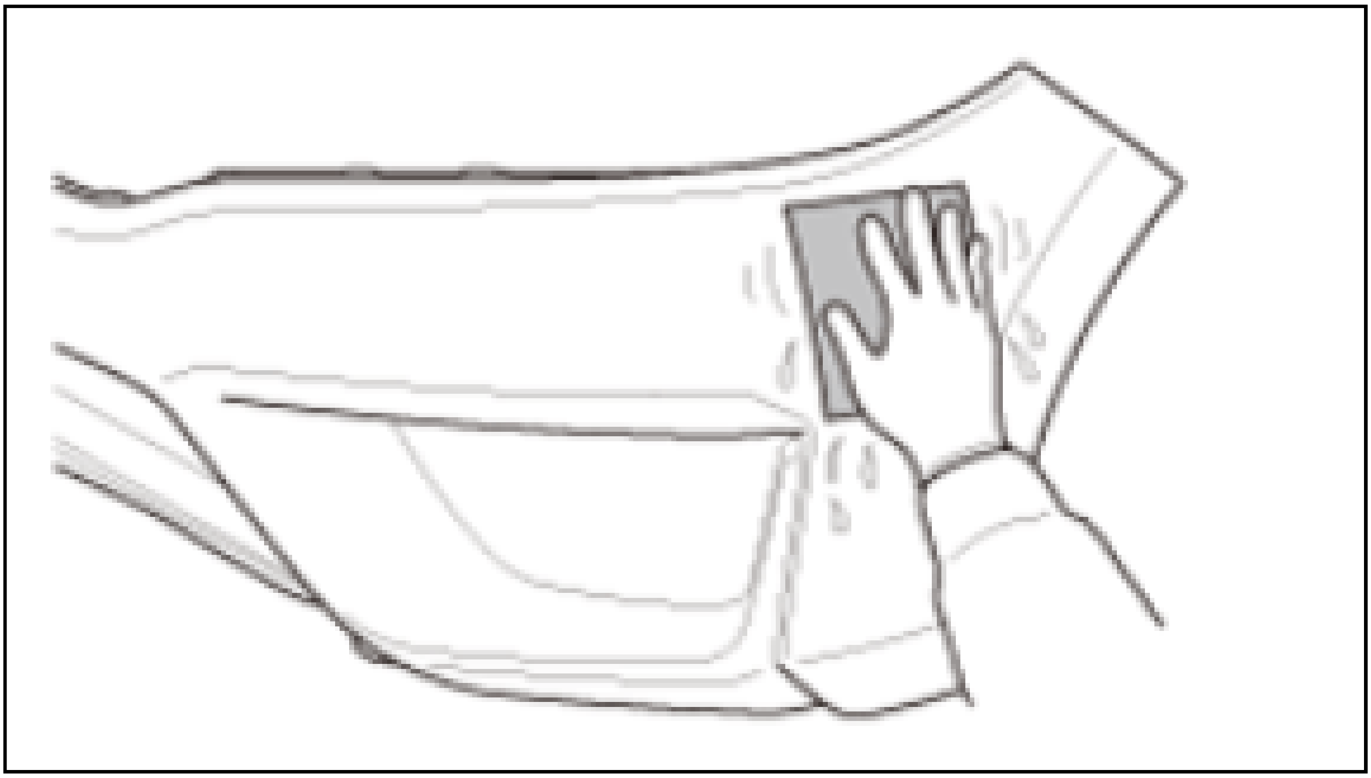
   Apply primer for PP bumper in the damaged area where filler will be applied.



4. Mix the filler and hardener.
5. Filler:
   - Fill in the damaged area using epoxy-type body filler.
   - Restore the part's original shape by applying sufficient filler to the damaged area using 2-3 separate thin coats.



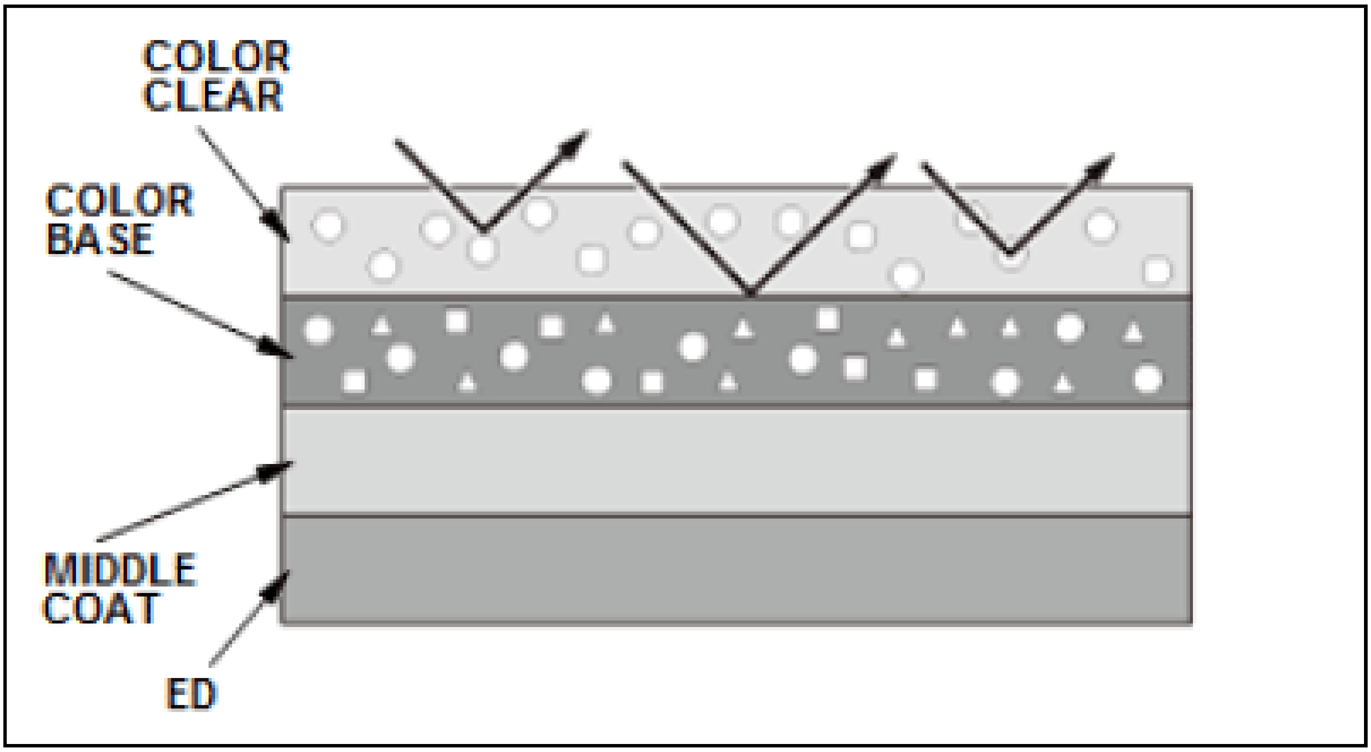
6. Standing and surfacing:
   - Rough sand with P120 sandpaper first and finish sand the surface with P180 to P240 sandpaper.
   - Use the wet sanding method when possible.
7. Refinish the part (base coat/clear coat).



SPECIALIZED PAINTING PROCESSES

Colored Clearcoat Painting

Composition of Color Clear Paint Layer



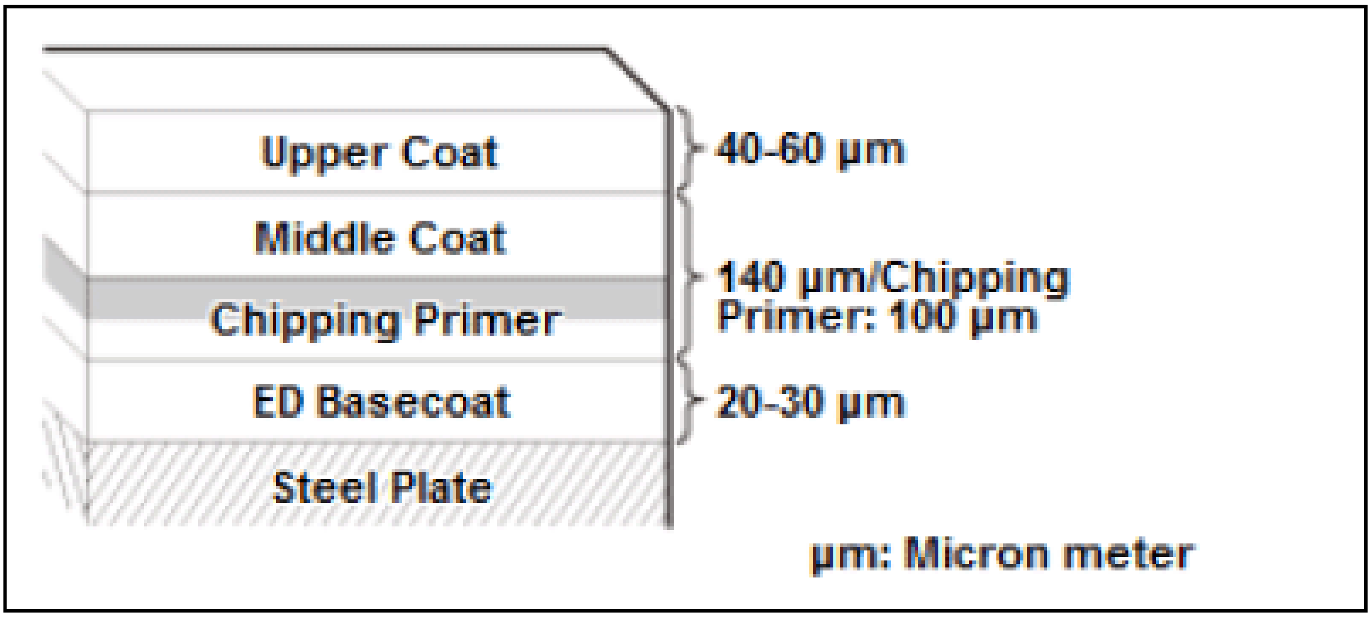
COLOR CLEAR
COLOR BASE
MIDDLE COAT
ED

- Color clear paint is a mixture of clear coat used for metallic painting topcoat, with transparent pigment and dyes. This paint provides vivid, deep, and transparent colors.
- The paint color will be a combination of the translucent colored clear layer and the color base beneath it.

NOTE:

- **Because colored clear paint is translucent and looks different depending upon the paint layer thickness, prepare several paint samples with different layers to compare the color, the same as you would for three-coat pearl.**
- **If the paint used as a color base has poor coverage capability, apply a base color that offers a greater coverage first. Then apply the color base paint.**

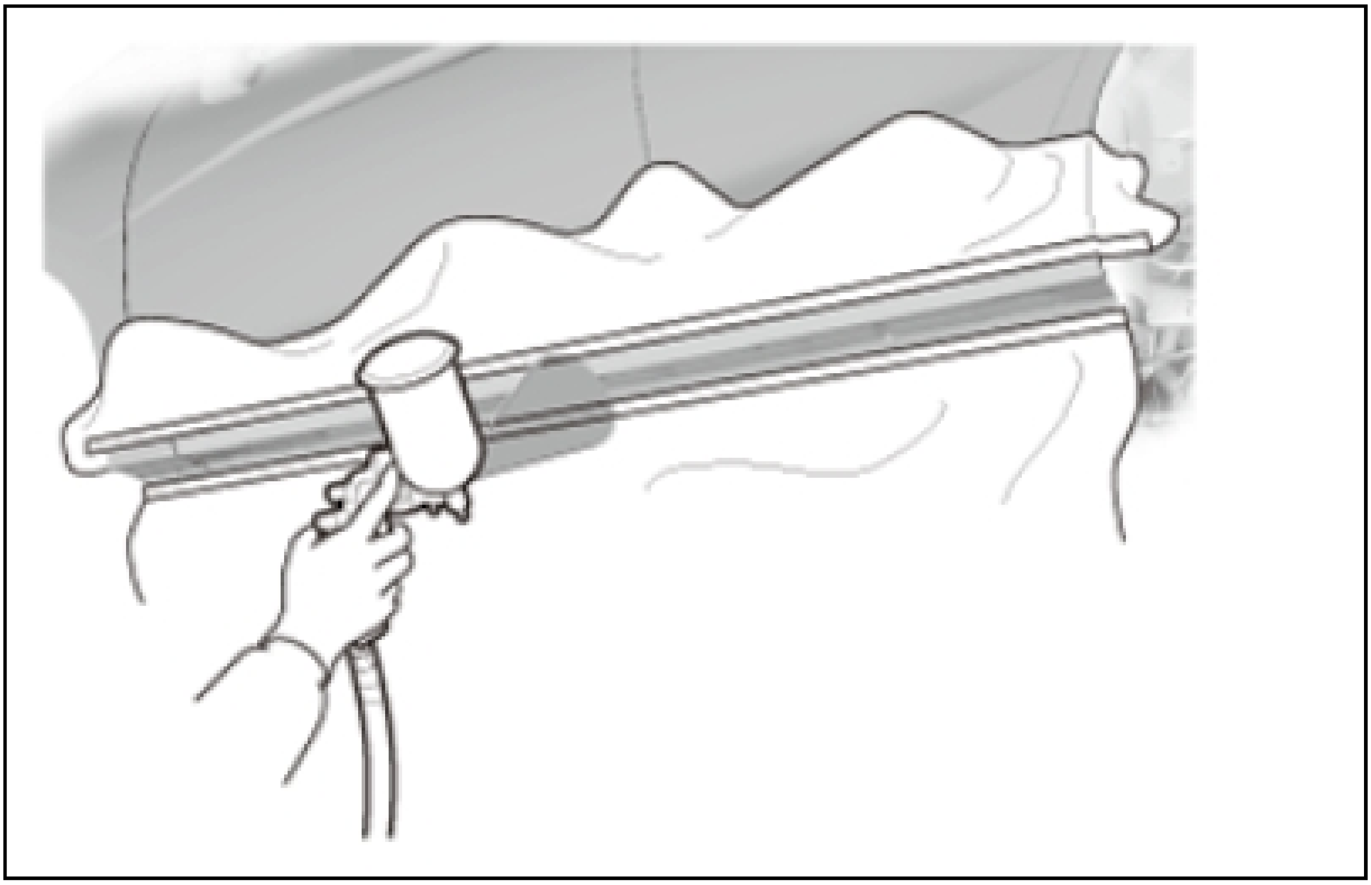
Intermediate Chip Guard Painting



Upper Coat
Middle Coat
Chipping Primer
ED Basecoat
Steel Plate
40-60 µm
140 µm/Chipping Primer: 100 µm
20-30 µm
µm: Micron meter

Helps prevent chipping damage from flying stones while driving. Normally chip guard primer (chloride vinyl resin) is painted on the side sills etc. The painting surface is granular with a layer thickness of 100 to 200 µm.

NOTE: **Check for the paint manufacturer's spec information before use.**



Coating Processes

1. Scuffing:

   Sand the base coat layer using a scuffing pad. (P240 to P400)

   NOTE: **Be careful not to sand excessively down to the base material.**

2. Clean with air blow gun then degrease.
3. Mask.
4. Apply Chip Guard Primer:
   - Apply the first pass lightly but enough to wet the surface, then allow 5 minutes flash time.
   - Match the surface quality of the paint layer with the surrounding surfaces during the second pass to have consistent granular texture.
   - Complete this process with two coats if possible. Do not over-apply.

   NOTE: **Refer to the paint manufacturer's instructions for the specific coating method.**

5. Dry:

   Allow a 15-minute set-up time and force dry the surface for 30 to 40 minutes at a temperature of 86Â°F (30Â°C). For thicker paint layers, allow a longer set-up time.

   NOTE: **Always refer to the paint manufacturer's instructions for the appropriate drying time.**

6. Apply urethane primer-surfacer.

Soft Chip Guard Primer Coat

NOTE: **Depending on the destination, a soft chip guard primer coat is applied. If this chip guard primer coating is applied, read following precautions and follow coating procedures.**

Sectional view of paint coats

Top Coat
Intermediate Coat **+**

Chipping Guard Primer
Electrode position
Base Metal

General Safety Precautions

The removal of paint and undercoating by stone chips immediately exposes metal to the atmosphere, causing it to oxidize. The thickness of this oxidation increases if the process continues unchecked. Soft chip guard primer protects against damage due to the impact of such objects:

- The soft chip guard primer coat is applied over the E.D. (electrostatically deposited) primer. It is followed by the guide coat and the topcoat.
- Soft chip guard primer produces a smooth surface when dry It should be sprayed so the thickness of the protective film is 20 microns.
- Soft chip guard primer coat is then applied to the most susceptible areas.
- Spray the primer-surfacer (dual-component urethane primer-surfacer) on the soft chip guard primer coating areas when you replace parts using soft chip guard primer coat.

Coating Processes

WARNING:

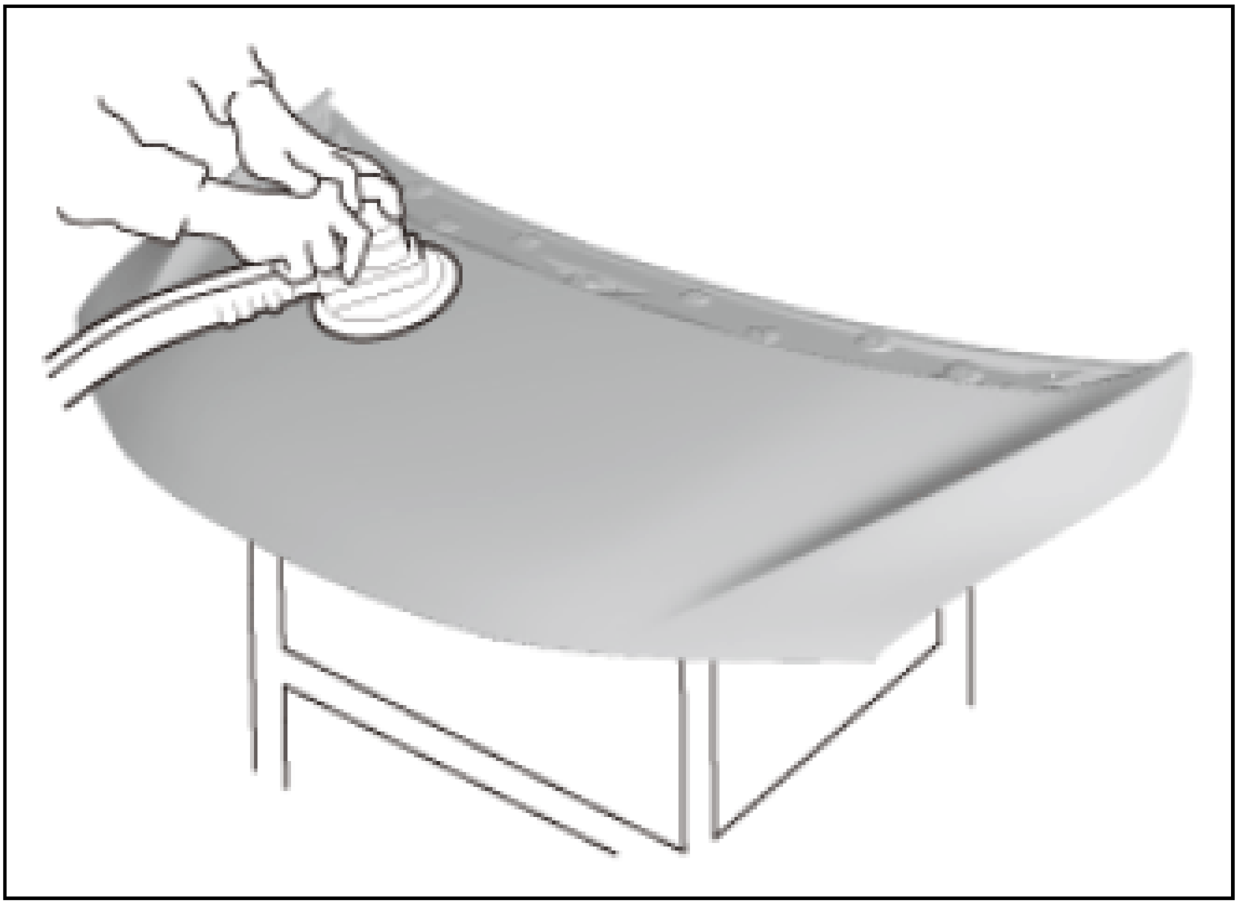
- **Wear goggles or safety glasses to prevent eye injury.**
- **Ventilate when spraying undercoat.**

1. Sanding the replacement part.

   Use a double action sander and P400 sandpaper.

   NOTE:

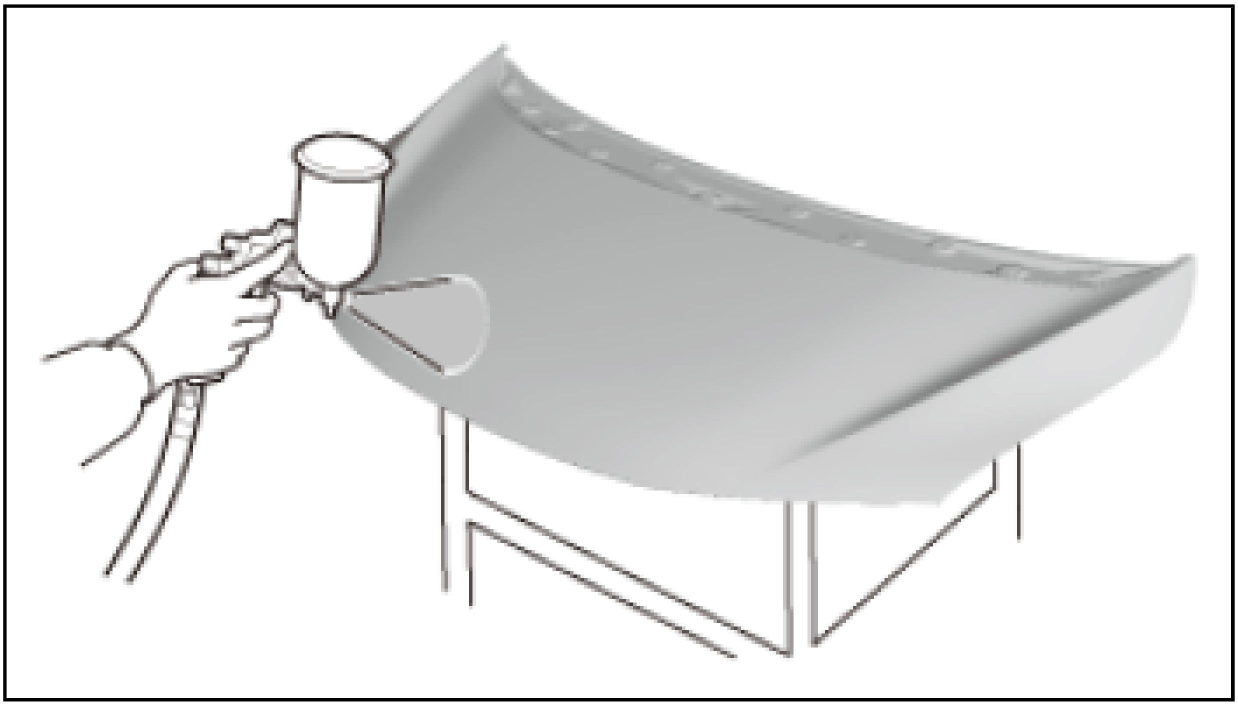
   - **Do not over sand the edges or corners of the part.**
   - **Do not expose base metal.**



2. Air blowing/degreasing.

   Use alcohol, and wax and grease remover.

3. Protect from overspray.



Use masking tape and protect the related areas from overspray.

4. Spraying primer-surfacer:
    - Spray about four to five coats to get 20 microns of thickness. One coat deposits about 5 to 7 microns.
    - Do not try to cover the surface with one heavy coat. Applying several thin coats is recommended.
    - Use a dual-component urethane primer surfacer and a spray gun.
    - Mix the primer-surfacer with the correct ratio of hardener and solvent.
    - Follow the primer-surfacer manufacturer's instructions.
5. Drying.

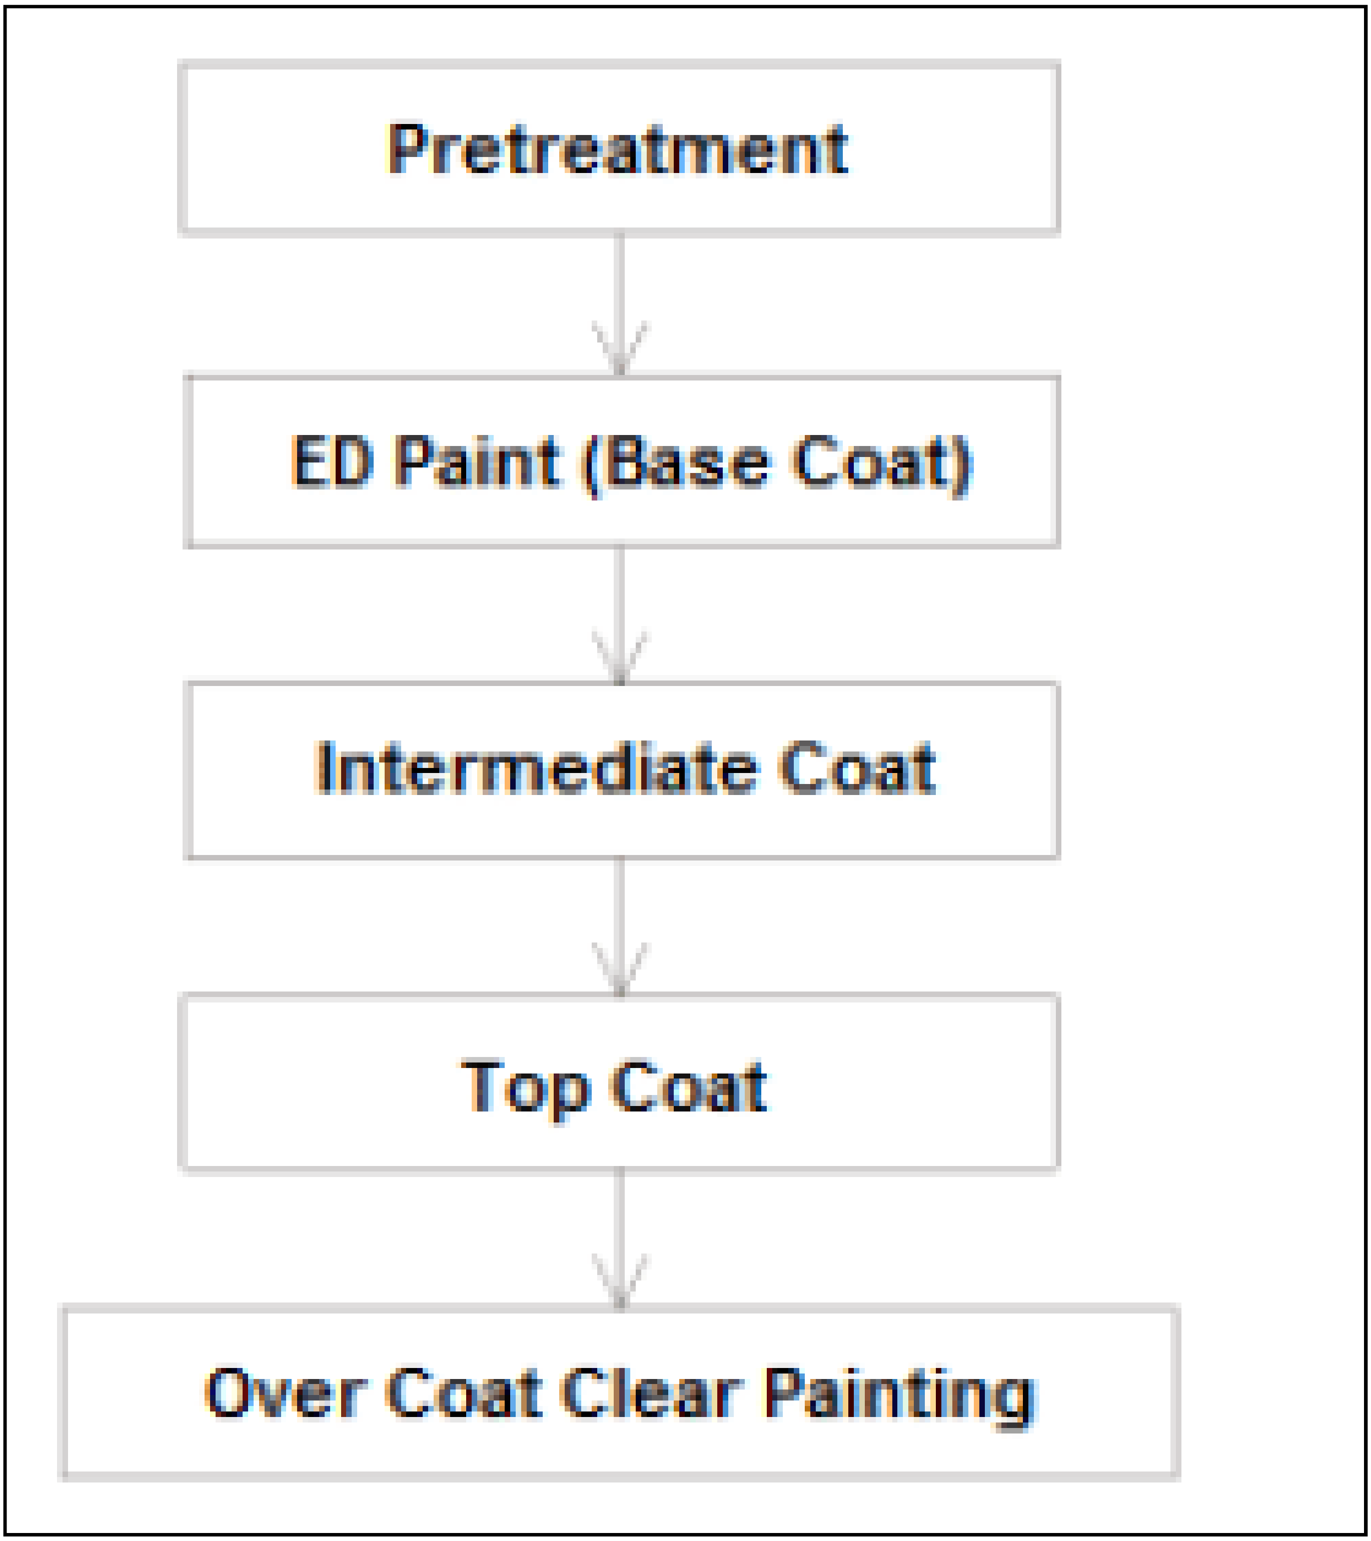
    After spraying primer surfacer, allow 7 to 10 minutes of set-up time, then force dry it with infrared lamps or an industrial dryer.

6. Fine sanding:
    - Check that the primer-surfacer has dried thoroughly then sand the primer-surfacer.
    - Use a double action sander and P400-P600 sandpaper.
7. Apply intermediate coating and topcoat.

Top Clearcoat Painting

Features Of Paint Layer

Coating Processes



Pretreatment
ED Paint (Base Coat)
Intermediate Coat
Top Coat
Over Coat Clear Painting

Pretreatment and Paint Layer Composition

Apply cathode electrodeposition paint to the high density conversion coating to enhance the thickness of the paint film and corrosion resistance.

Intermediate Coating

To improve the finishing quality of the topcoating and chip resistance.

Topcoating

To offer a high quality paint by applying a high-solid premium topcoat with polyester acrylic resin type paint along with a base enamel paint.

Over Coat Clear Painting (Abrasion-Resistant Clear)

Maintains smoothness, flatness, freshness, of the luster. Also the deepness and high apparent thickness of the paint layer.

NOTE: **In particular to the three-coat pearl paint, repeat the intermediate coating to improve the finish quality of the topcoating and expand the color range.**

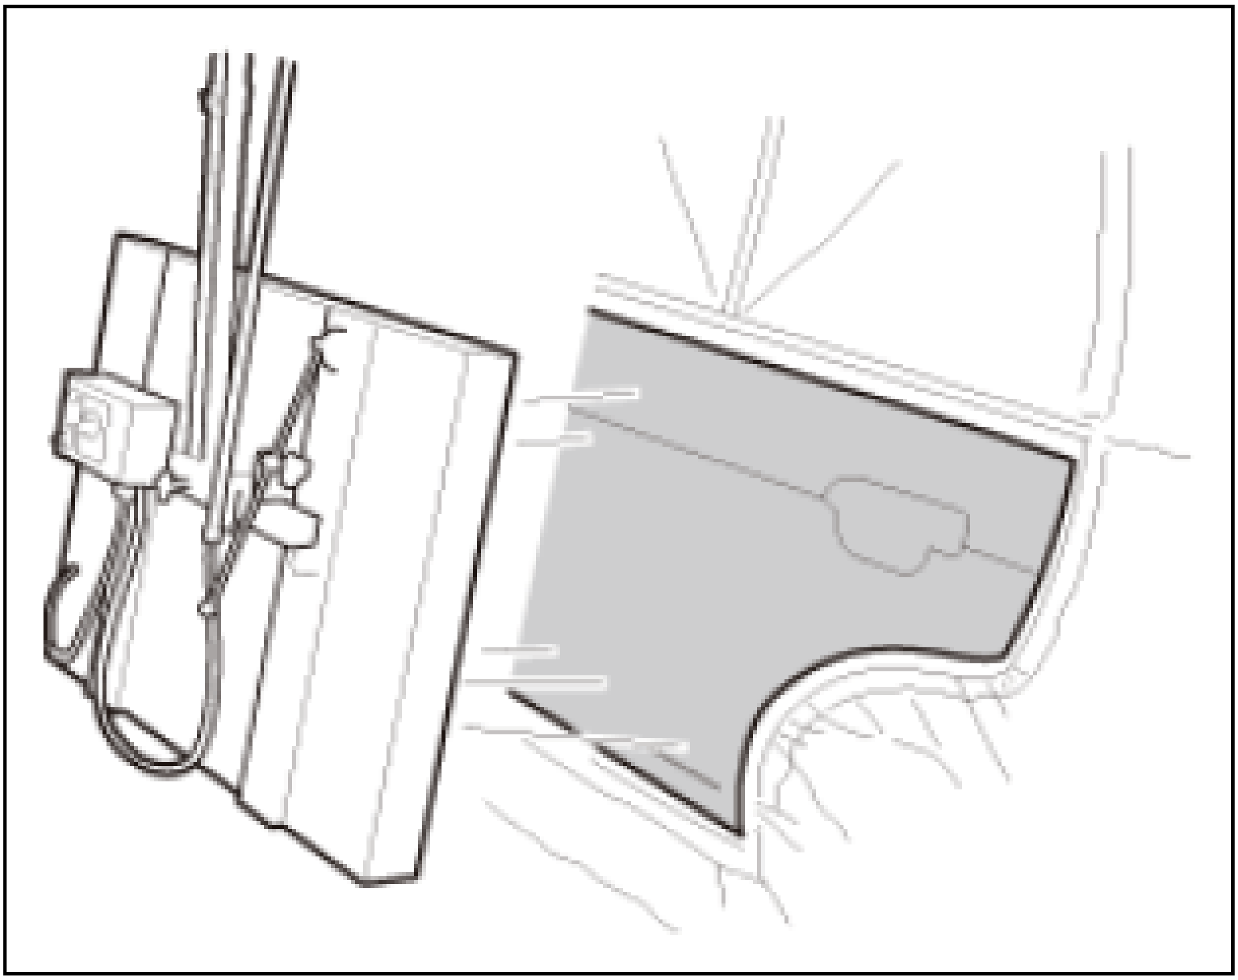
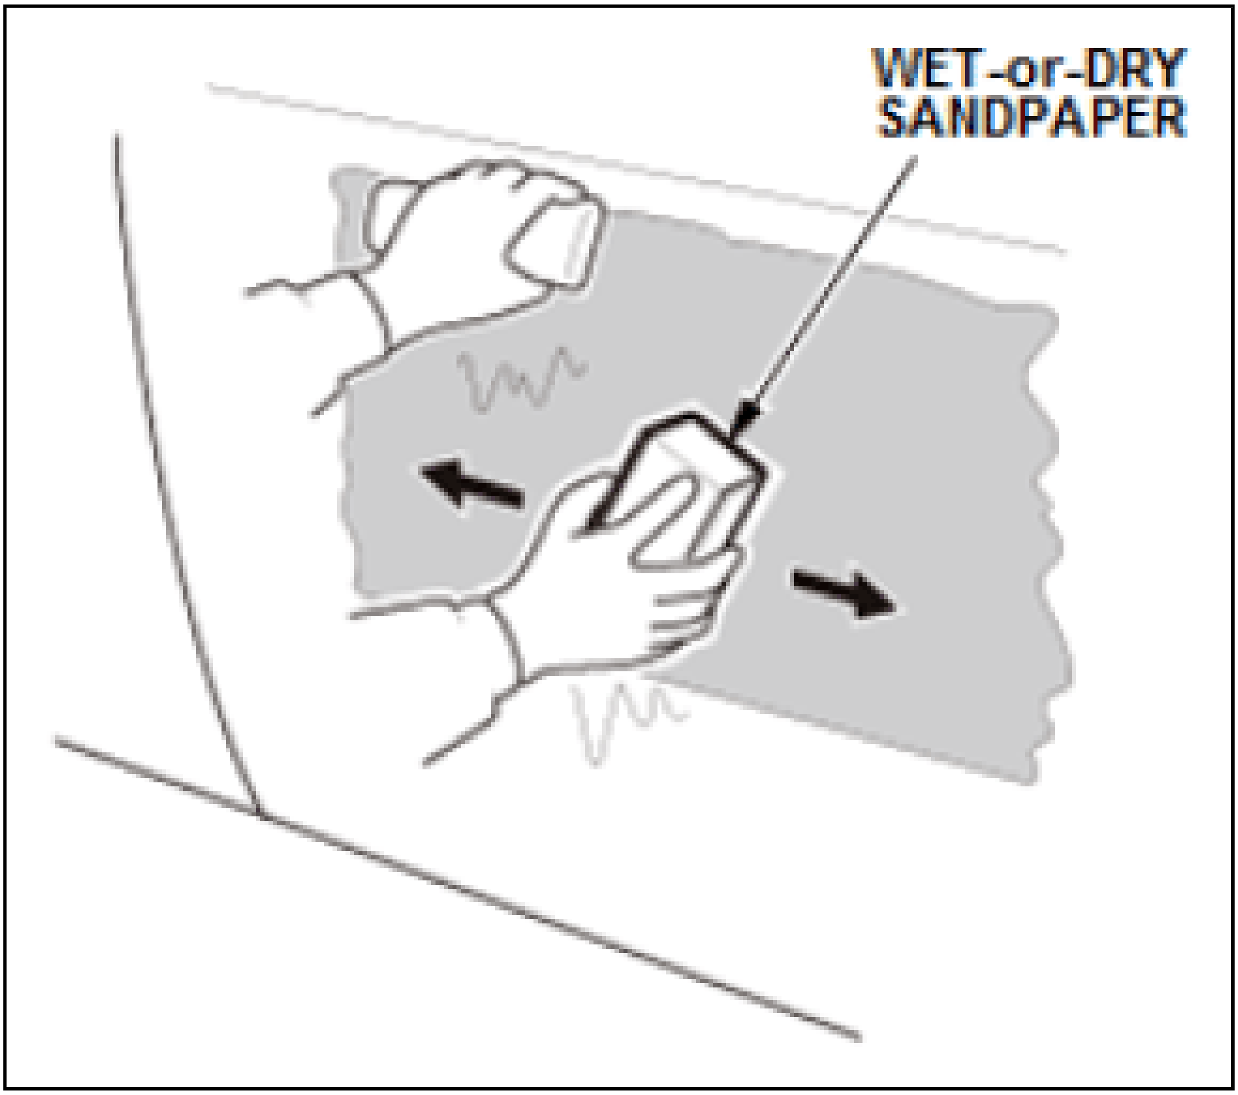
Work Steps After Clear Coating

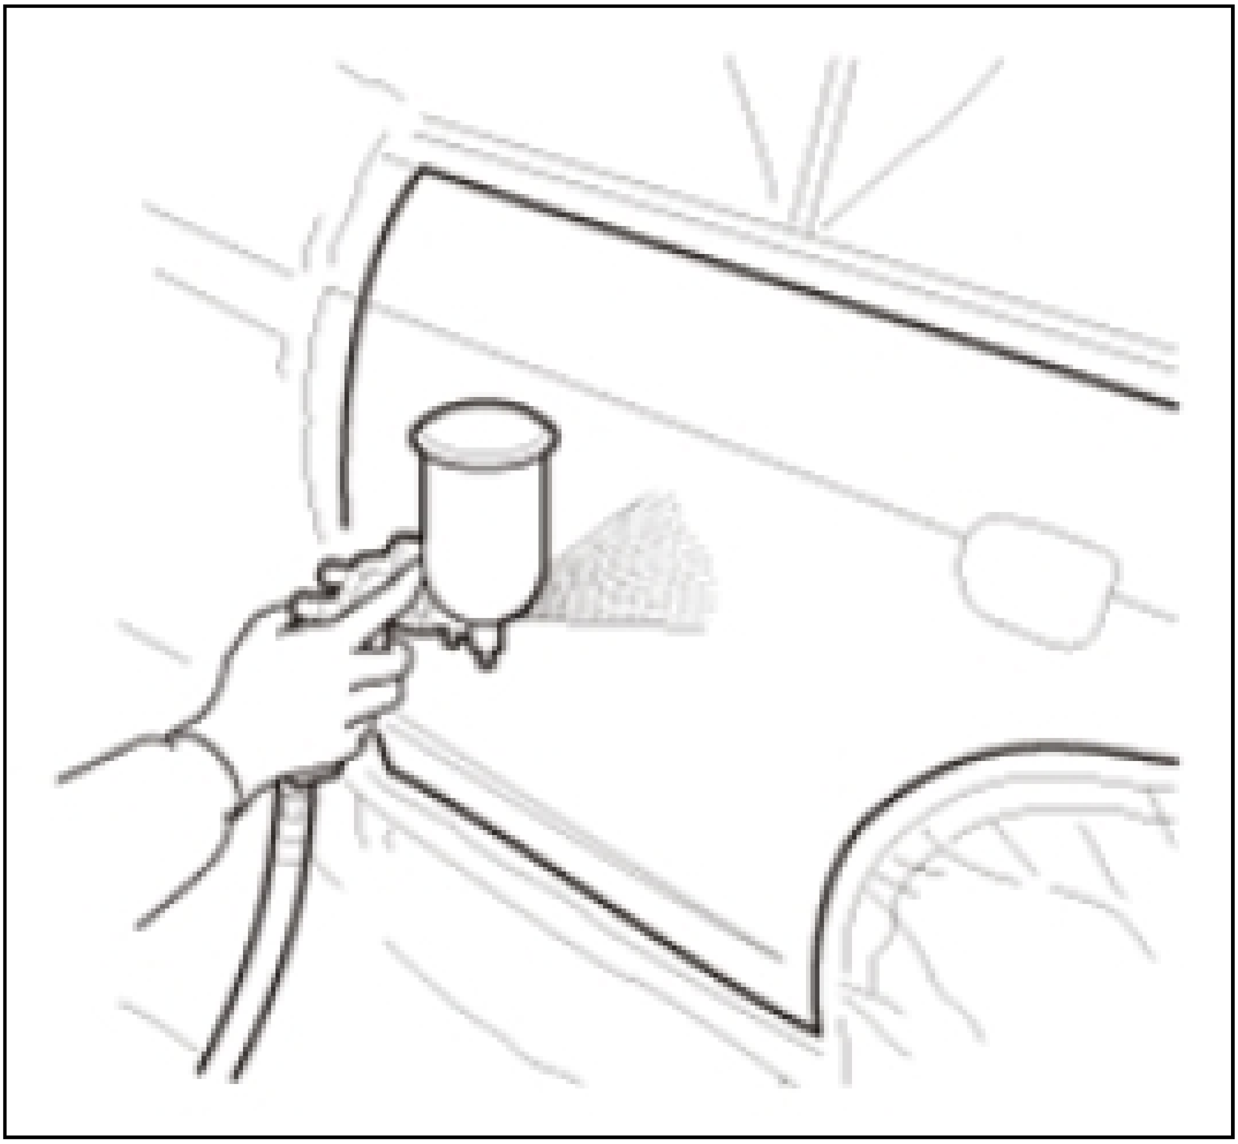
1. Allow Sufficient Set-up Time:

   After painting, leave the surface as is for about 10 to 20 minutes, in order to let the solvent evaporate and prevent defects from occurring during forced drying.





WET-or-DRY
SANDPAPER



NOTE: **Set-up time changes according to ambient temperature or paint layer thickness. Check the paint manufacturer's instructions.**

2. Force Dry Clearcoating:

   Force dry the surface for approximately 30 to 40 minutes at a temperature of 140Â°F (60Â°C).

   NOTE: **Check the paint manufacturer's instructions for the appropriate drying time.**

3. Scuff:

   Wet sand the coated surface using P1200 to P2000 wet-or-dry sand paper. Clean with air blow gun then degrease.

4. Apply Over Coat Clear:

   To allow sufficient set-up time, leave the coated surface as is for about 10 to 20 minutes, in order to let the solvent evaporate and prevent defects from occurring during forced drying.

   NOTE: **Set-up time changes according to ambient temperature or paint layer thickness. Check the paint manufacturer's instructions.**

5. Dry:
   - Force dry the surface for approximately 30 to 40 minutes at a temperature of 140Â°F (60Â°C).
   - If polished before completely dried, the surface may be de-glossed turn a whitish color. At the same time, if dries too much, it will make the paint layer very hard, increasing polishing time.

   NOTE: **Always refer to the paint manufacturer's instructions for the appropriate drying time.**

6. Polishing.

Undercoating

- Front floor, rear floor and inside the front and rear wheel houses of mass produced vehicles are undercoated (mineral-based vinyl chloride) in order to protect those parts from chipping damage caused by flying stones etc. Though the thickness of the paint layer differs depending upon the parts, it is usually 0.5-1.5 mm (0.020-0.060 in).
- When those parts are repaired or replaced with a new one, use a commercially available undercoating (Nox-rust 409-20s, Solton 1000s Hard wax etc.).

  NOTE: **Check the paint manufacturer's instructions for their product specifications when using undercoat agent.**

- Refer to the model specific body repair information for details about undercoating locations.

Coating Processes

1. Mask interface surfaces of the assembly parts including dampers, sub frame, etc. Also all power train and exhaust related parts to avoid overspray when necessary.
2. Clean up the area to apply undercoating and wipe off oily residue with degreaser.
3. Apply undercoating paint to the under floor and inside the wheel houses.

   Make sure the paint layer to be 1 mm (0.039 in) or thicker on the welded joints and each floor joint areas as well as the wheel houses.

4. Dry the undercoat.

   NOTE: **Always refer to the paint manufacturer's instructions for the appropriate drying time.**

5. Give a top coat.

Actions For Environmental Concerns

By eliminating the use of PVC (polyvinyl chloride) for interior plastic parts and body undercoating, the chloride concentration ratio in the shredder dust at recycling is reduced to 1% or less. Recently, the traditional undercoat (mineral-based vinyl chloride) for mass produced vehicles has been replaced with a foam type undercoat. For some models, insulation undercoating is applied to the side sills and rear wheel houses to enhance the noise insulation performance and reduce the number of parts.

NOTE: **As the foam type is very soft, be careful not to damage the paint layer while removing and installing the surrounding parts. The paint layer of foam type is thick, thus apply thicker undercoat when repairing with a commercially available undercoating.**

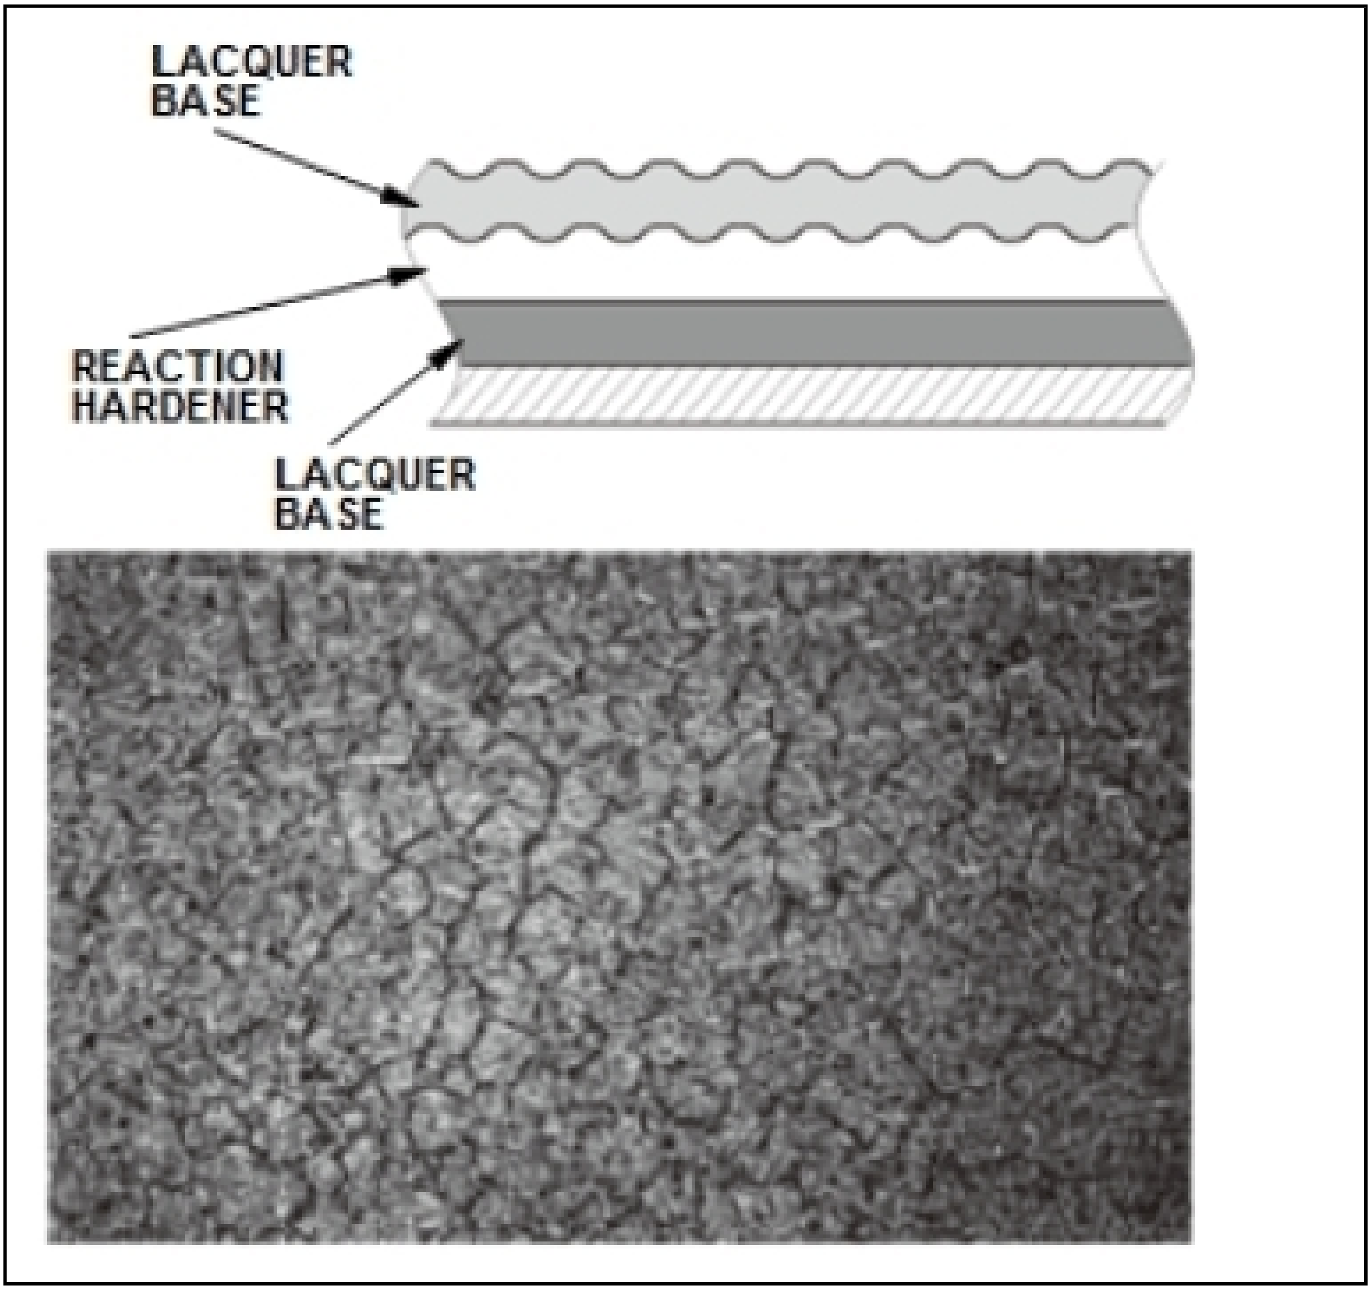
PAINT FINISH DEFECTS AND PREVENTION

PAINT APPLICATION PROBLEMS

Lifting (Shrinkage)



Old paint film or base coat is affected by the solvent contained in the new upper coat. Paint surface warps or shrinks, resulting in finish wrinkles.

CAUSES

- Painting over the existing paint that is in poor condition, or that has poor solvent resistance (oxidation-dry enamel, deteriorated denatured acrylic lacquer or poorly dried paint film).
- Basecoat with poor solvent resistance was covered with polyester body filler and painted over.
- Painting in sandwich layers (lacquer, reaction harder, lacquer).
- Applied additional paint before a previously applied dual-component paint was completely dry.

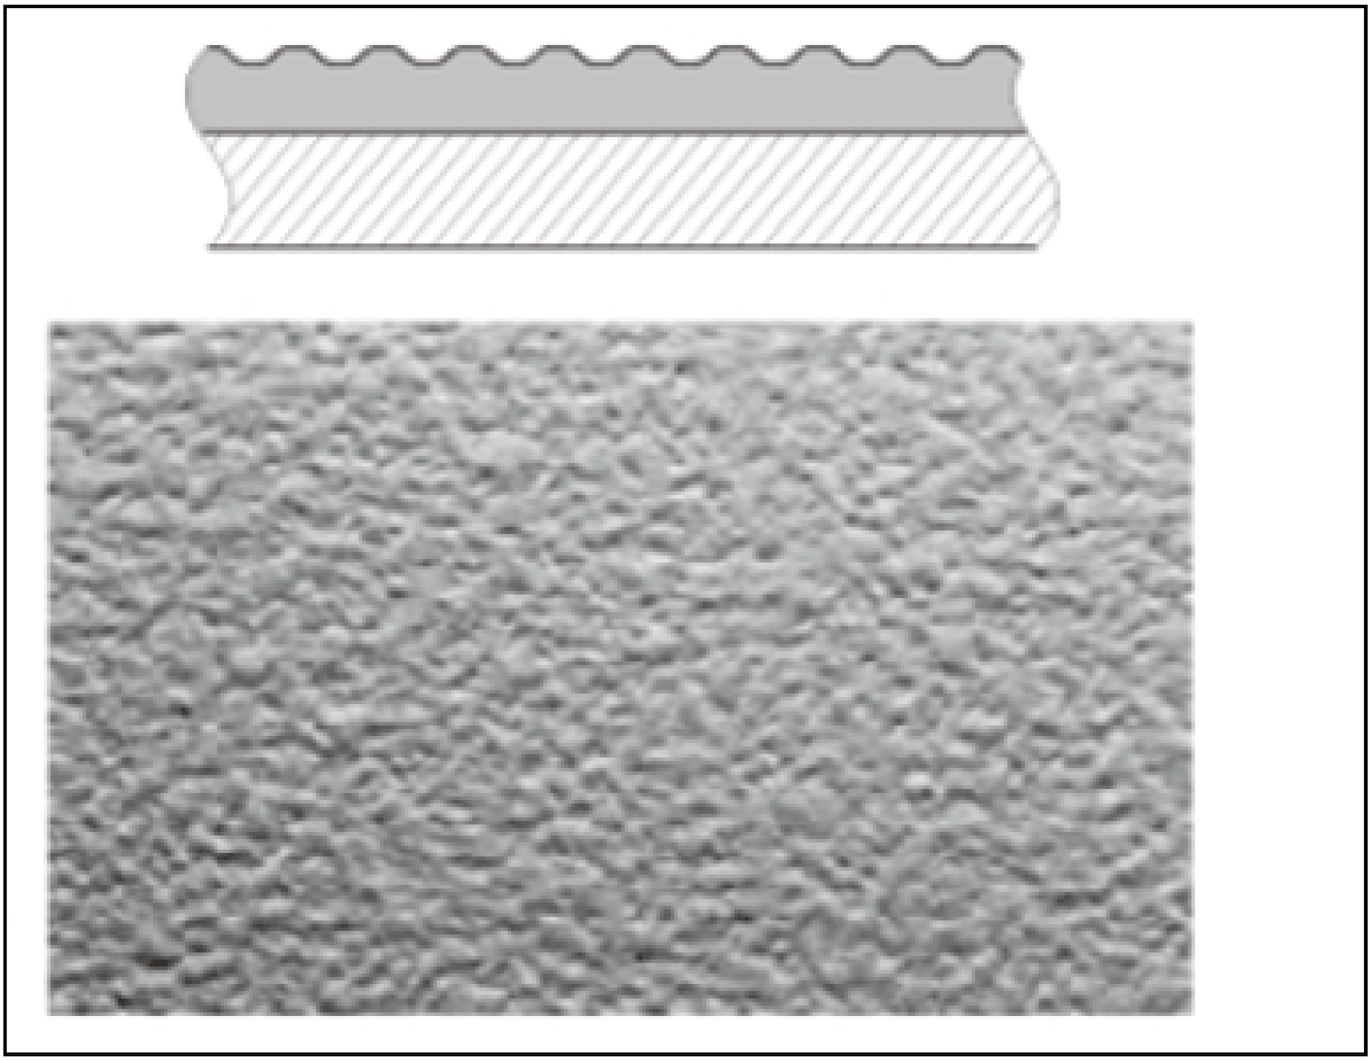
PREVENTION

- Remove the deteriorated old paint film with a sandpaper or remover.
- Apply sealer then urethane-based primer surfacer to the seal and cover the old paint film with poor solvent resistance.
- Do not apply polyester body filler over the old paint film with poor solvent resistance.
- Do not apply additional paint before a dual-component paint is completely dry. Force dry if needed.

CORRECTIVE ACTIONS

- If the symptom is not severe, apply a thin coat of paint to the surface in several steps preventing the solvent from penetrating through the topcoat.
- If the symptom is severe, remove the paint thoroughly and repaint.

Orange Peel (Granular Texture)



Paint surface is rough with a textured appearance that looks like an orange skin.

CAUSES

- Wrong reducer/thinner used for ambient conditions (solvent evaporation too fast).
- Paint diluted improperly (insufficient reducer/thinner).
- Excessive shop or work surface temperatures.
- Moving spray gun too fast or from too far away.

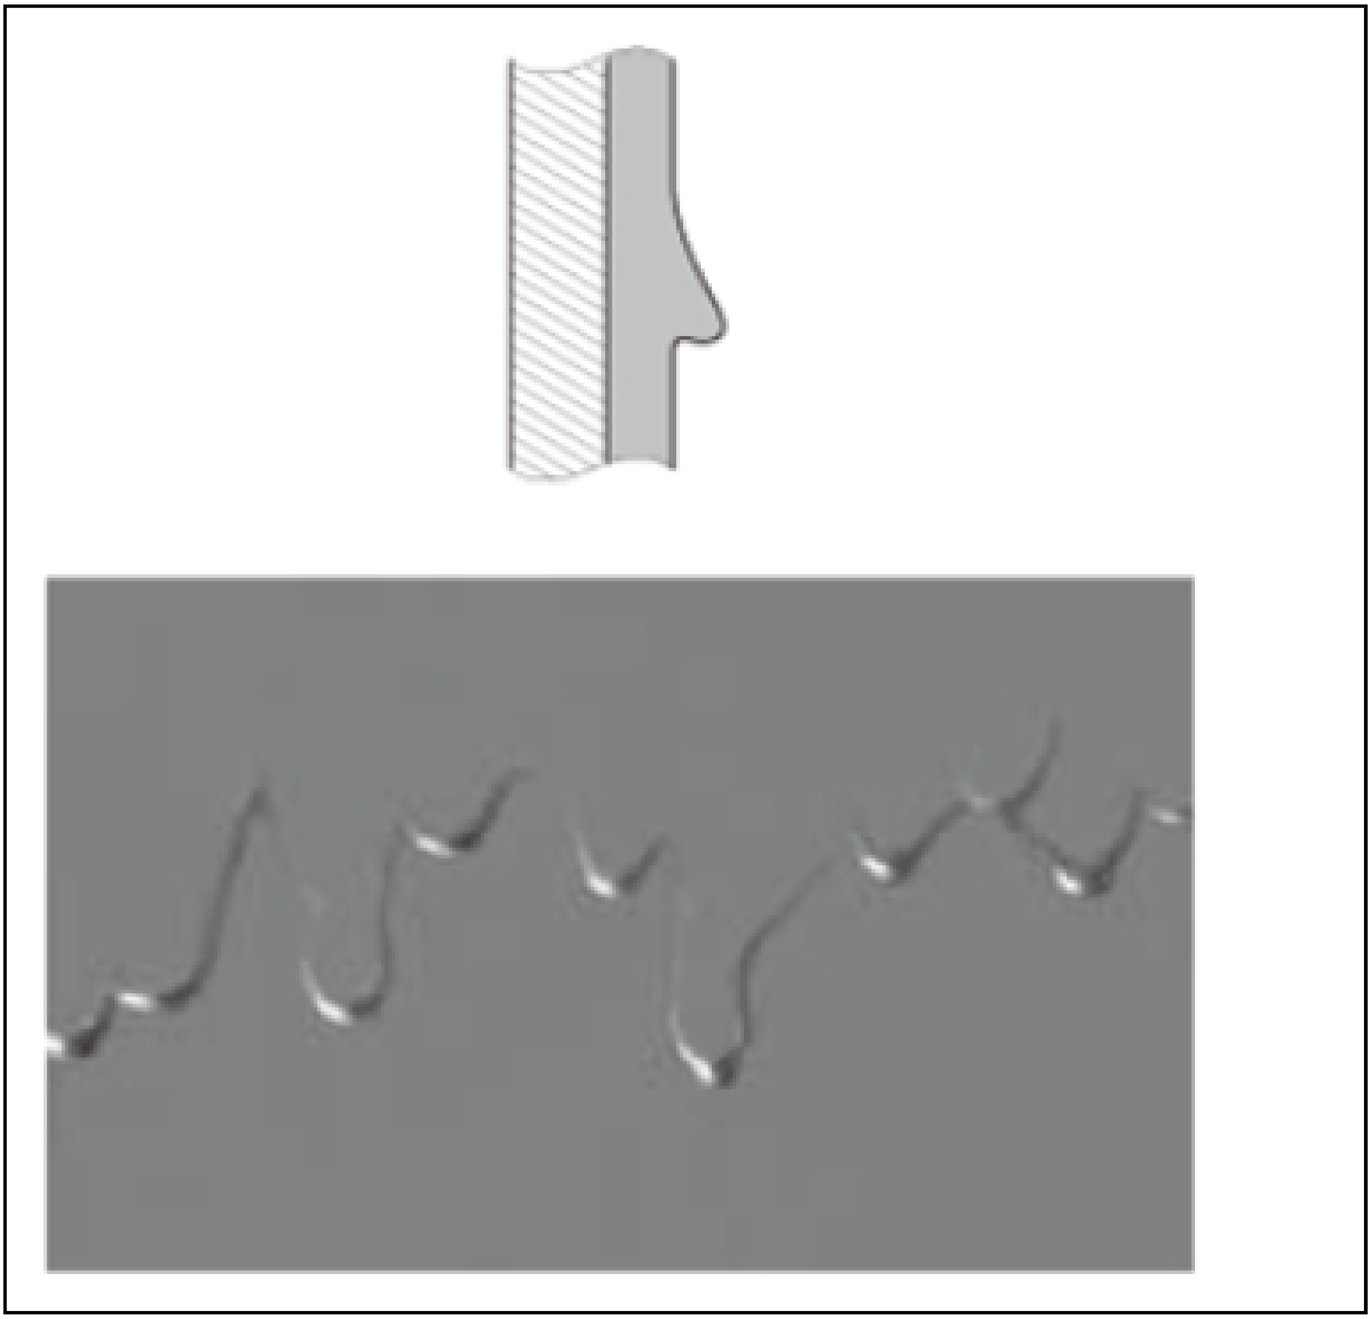
PREVENTION

- Use the appropriate paint reducer/thinner for ambient conditions and dilute with slightly more reducer/thinner.
- Properly adjust the spray gun pattern.

CORRECTIVE ACTIONS

- For light orange peel, wet sand to smooth the surface, then polish with compound.
- For heavy orange peel, sand and repaint surface.

Runs



Paint film is not even and it is partly very thick and running down.

CAUSES

- Wrong reducer/thinner used for ambient conditions (solvent evaporation too slow).
- Paint mixed improperly or coats being applied too thick.
- Spray pattern improperly adjusted or incorrect spaying technique.
- Low temperature slowed drying process.

PREVENTION

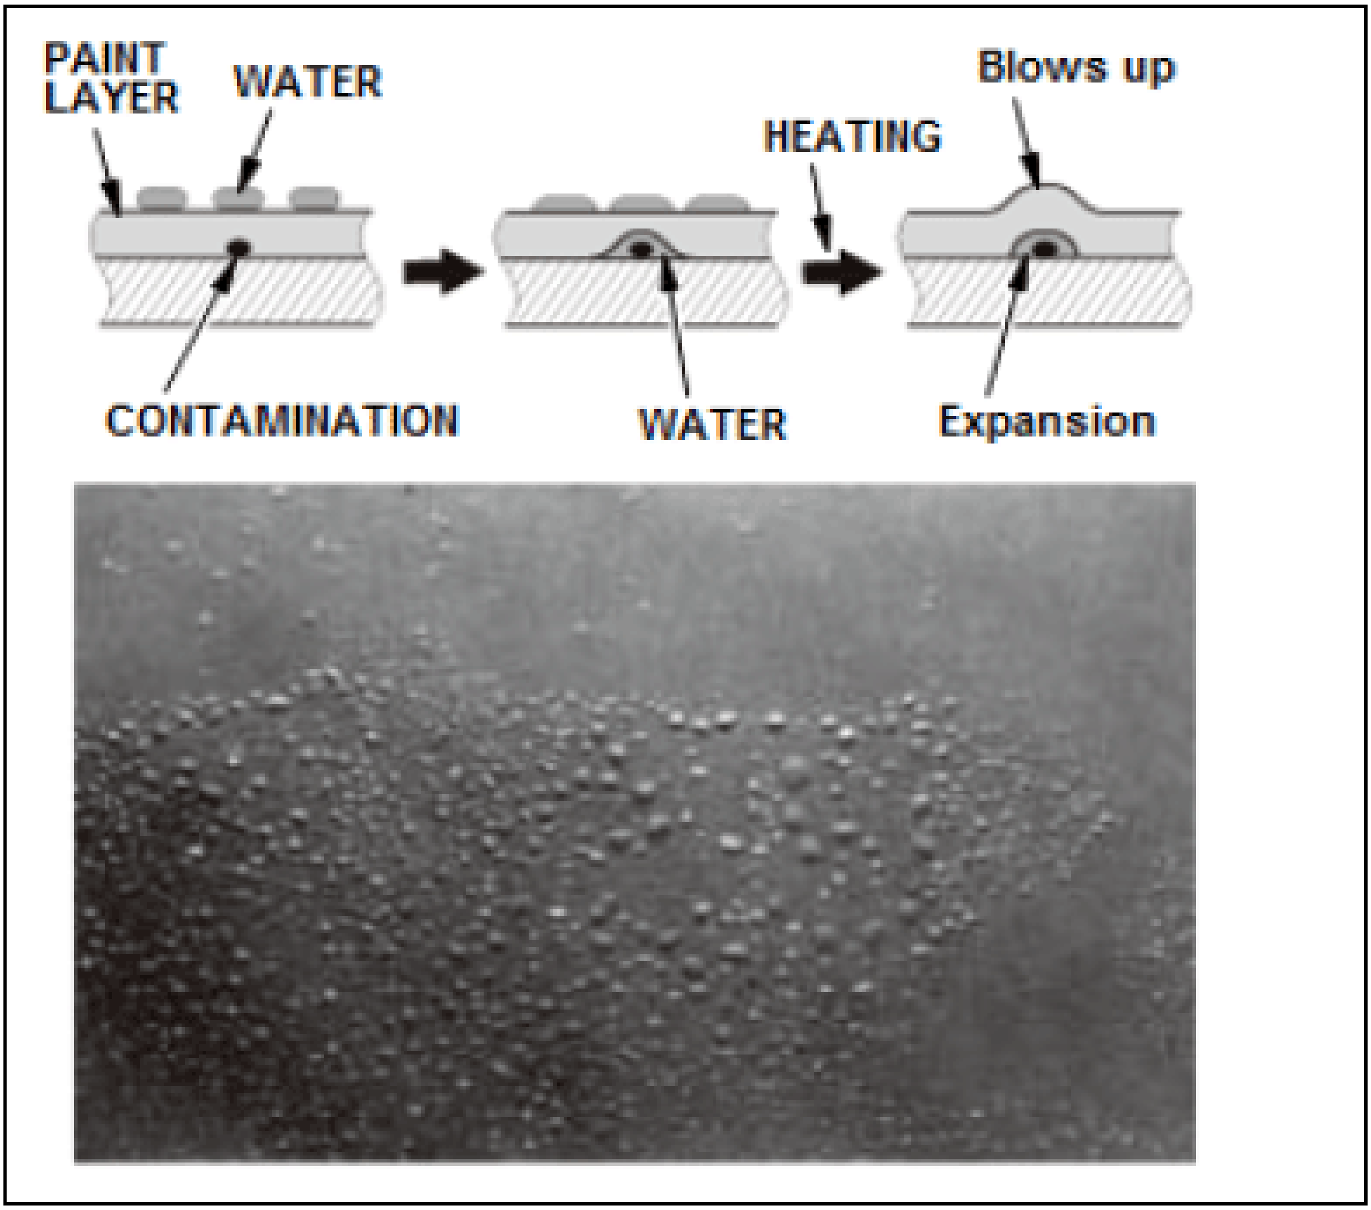
- Use an appropriate paint reducer/thinner.
- Adjust the paint mixing proportions and/or spray viscosity.
- Avoid applying paint in single thick coats. Apply several thin coats, allowing sufficient "flash" time between each.
- Adjust the spray pattern before application. Test-spray the pattern and operate the spray gun with correctly and consistently.

CORRECTIVE ACTIONS

Force dry the affected paint area carefully to prevent pin holes (bubbles). Wet sand to remove the run, then touch up the surface with compound or repaint.

PAINT DEGRADATION

Blistering



Blistering symptom caused by the moisture trapped inside the paint film being expanded by heat, lifting the paint film.

CAUSES

- Paint applied without removing oil/grease, silicone, wax, sweat, finger print, etc. from the surface being painted.
- Sanding dust remained on surface being painted due to poor washing after wet sanding.
- Oil or moisture being mixed in the compressed air supply for the paint gun.

PREVENTION

- Avoid natural drying after wet sanding. Force dry instead. Pay extra attention when sanding body filler.
- Check air compressor and pressure regulator oil and water. Install and maintain oil and water separators on the air line.
- Do not touch the area being painted before paint application.

CORRECTIVE ACTIONS

- If the symptom is severe, strip the base coat or all the way down to the metal surface and repaint.
- If the symptom is light, remove the blisters by sanding, then repaint.

Discoloration, Yellowing

Paint surface partly or entirely disclosed or faded out comparing to the initial state.

CAUSES

- Use of a paint pigment with poor weather resistance.
- Spilled gasoline allowed to stand on some light colors, such as white.

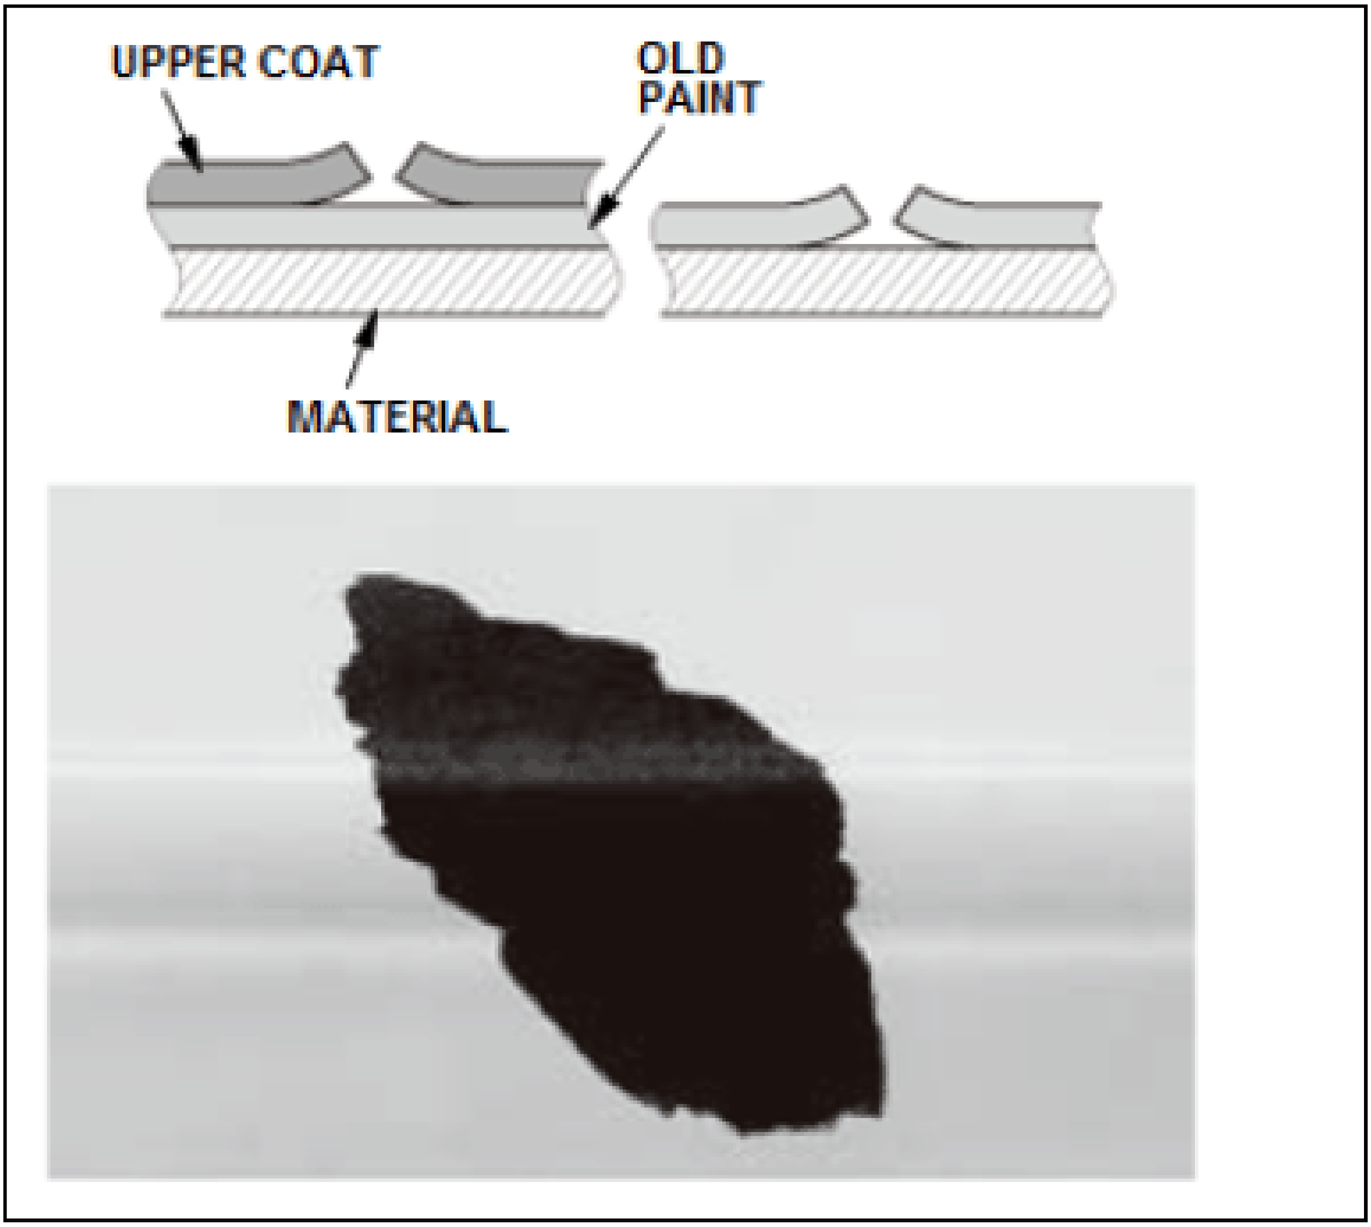
PREVENTION

- Use the good weather resistant paint pigment (characteristics of primary colors shown on the color card).
- Quickly clean off any spilled gasoline in the fuel filler area after refueling.

ACTIONS

If the symptom is light, polish with compound. If the symptom is severe, repaint.

Peeling, Poor Adhesion



Paint peeling off from the old paint film, steel sheet, plastic part or undercoat.

CAUSES

- Inadequate base material preparation applied according to material type (bumper, aluminum alloy etc.).
- Poor sanding of old paint film or coating surface.
- Poor adhesion between basecoat and topcoat layers or between old paint film and topcoat.

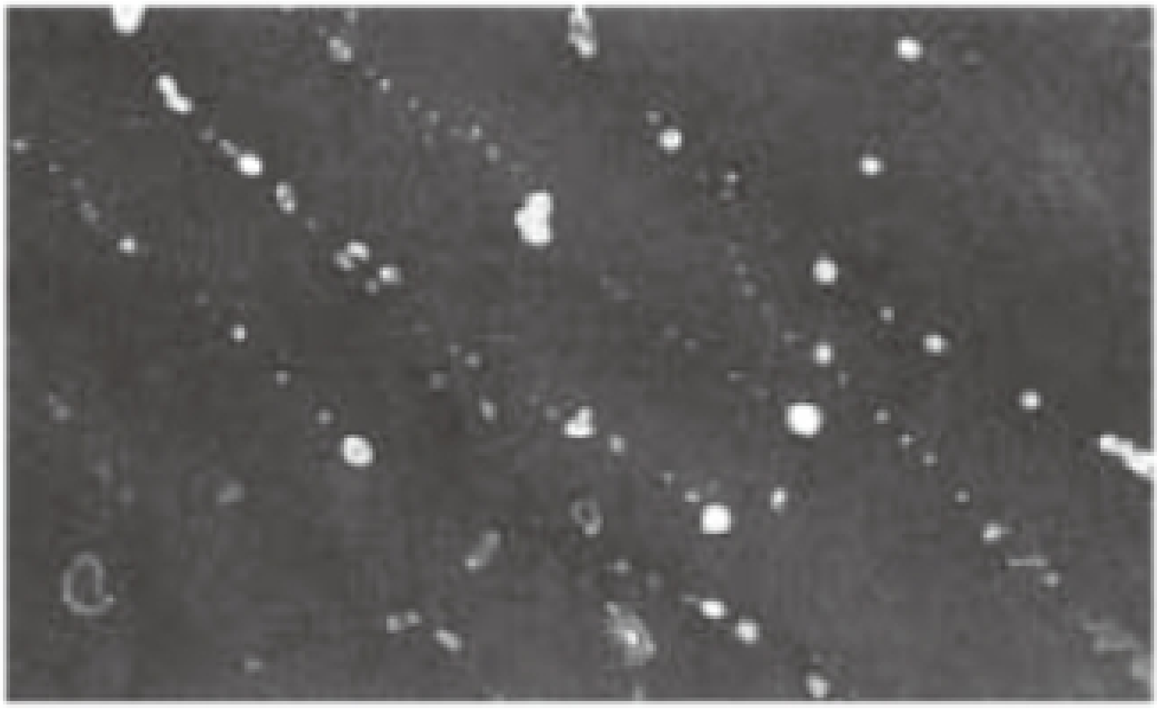
PREVENTION

- Adequately prepare the base material before painting.
- Thoroughly sand the old paint film.
- Clean and degrease the area to be painted.

CORRECTIVE ACTIONS

Sand down the peeling area thoroughly and repaint.

Water Spots Or Stains



Paint surface that has stained or discolored spots.

CAUSES

- Rain drops or dew drops fell on the new paint surface before fully dry.
- Bird droppings, tree resin, gasoline, cement dust, etc. allowed to remain on the paint surface for a long time.

PREVENTION

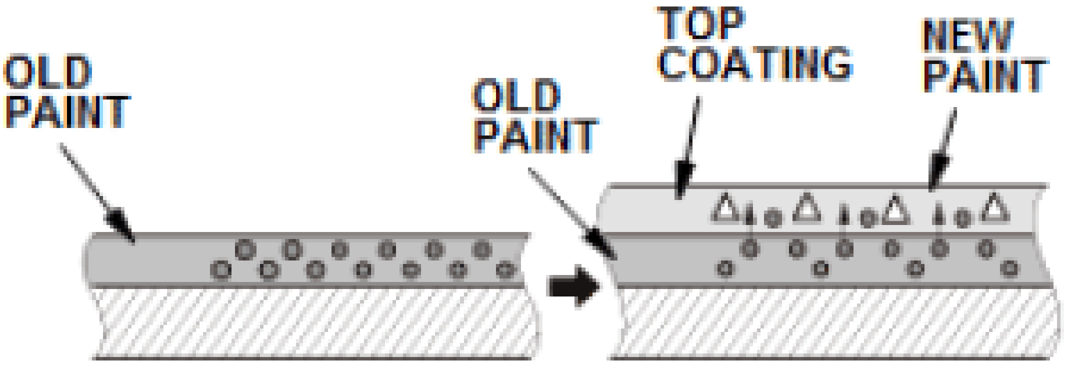
- Protect the paint surface from rain, dew or water until fully dry.
- If any foreign material or water drops fall on the paint surface, wash it down or wipe it up immediately.

CORRECTIVE ACTIONS

- If the symptom is light, polish with a compound to remove the water spot or stain.
- If the symptom is severe, wet sand lightly and repaint.

PAINT FINISH PROBLEMS

Bleeding



Color of the old paint film or basecoat penetrates through the top coat.

CAUSES

- The old paint payer was a primary color (red, yellow, blue), which have a tendency to penetrate or bleed through the topcoat.
- Body filler not allowed to dry sufficiently.
- Tar, etc. adhered to basecoat.

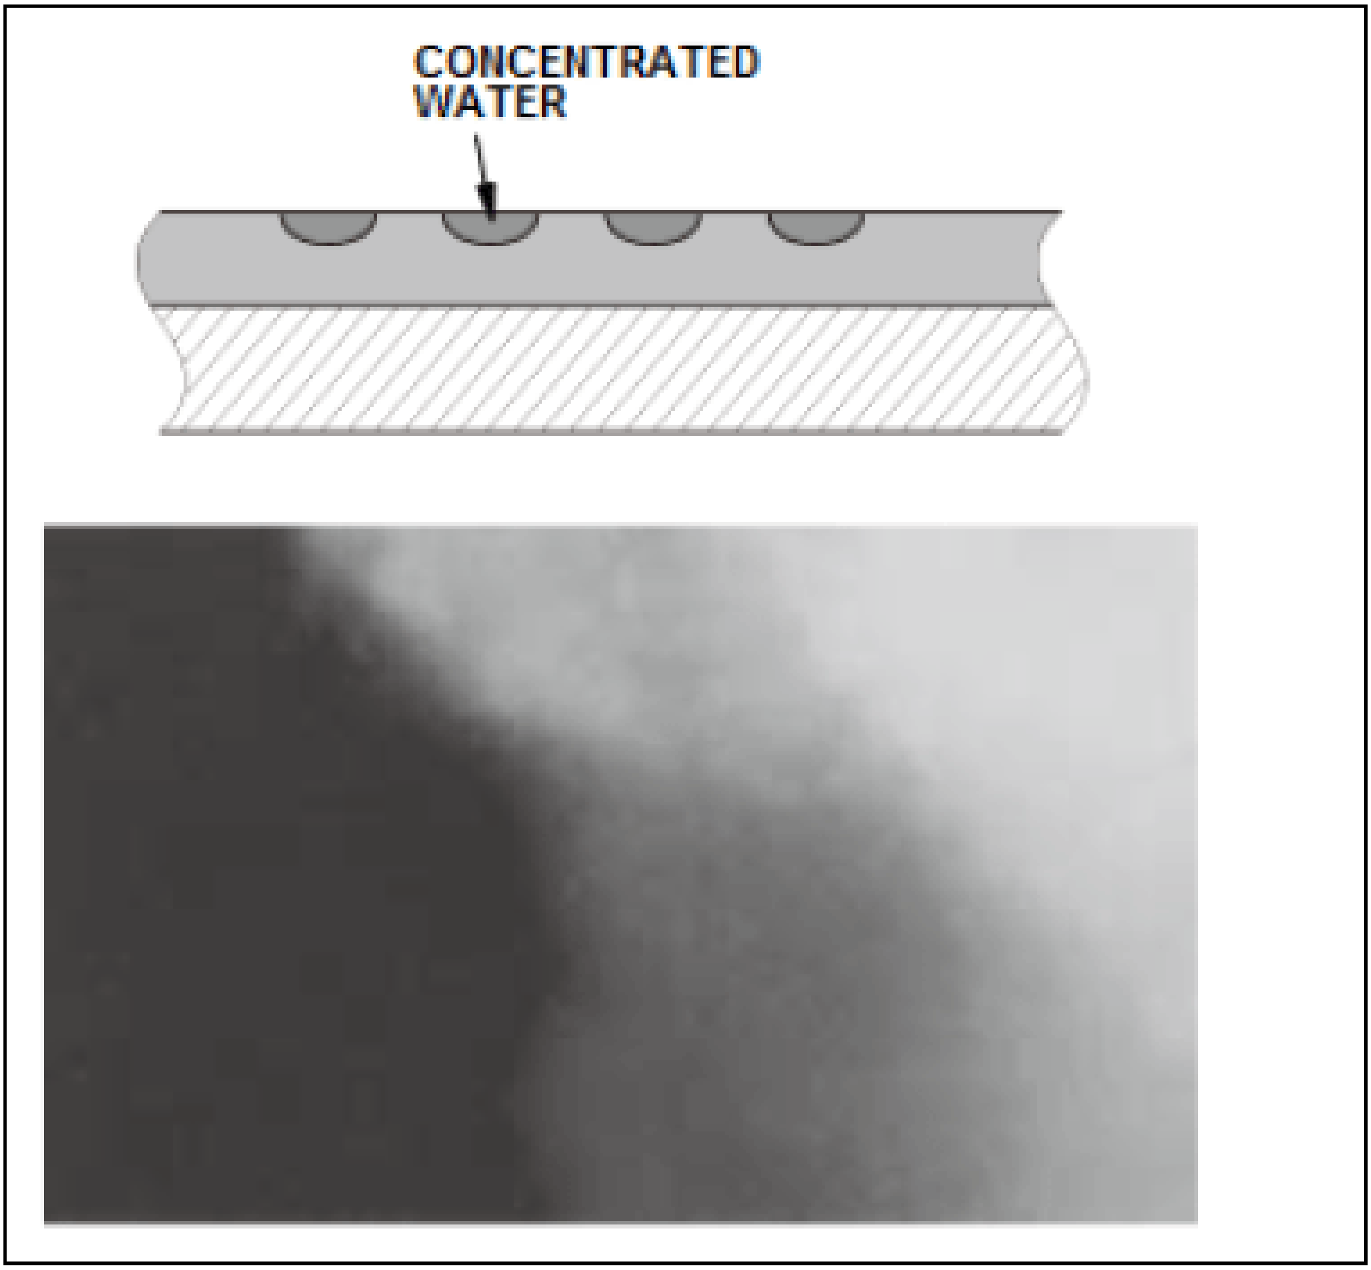
PREVENTION

- Paint a small spot to test for penetration or "bleed".
- Allow body filler to dry thoroughly
- Completely remove tar, etc. from the surface being painted.

CORRECTIVE ACTIONS

- If the symptom is not severe, apply sealer or urethane type primer surfacer and force dry. Then repaint.
- If the symptom is severe, strip off the paint, then repaint.

Chalking (Whitening)



Moisture in the air is concentrated in the paint film making the surface whitish, dulling the desired gloss.

CAUSES

- Using fast evaporating paint reducer/thinner during high temperature and humidity ambient conditions.
- Spray gun air pressure too high.
- Extremely cold paint surface.

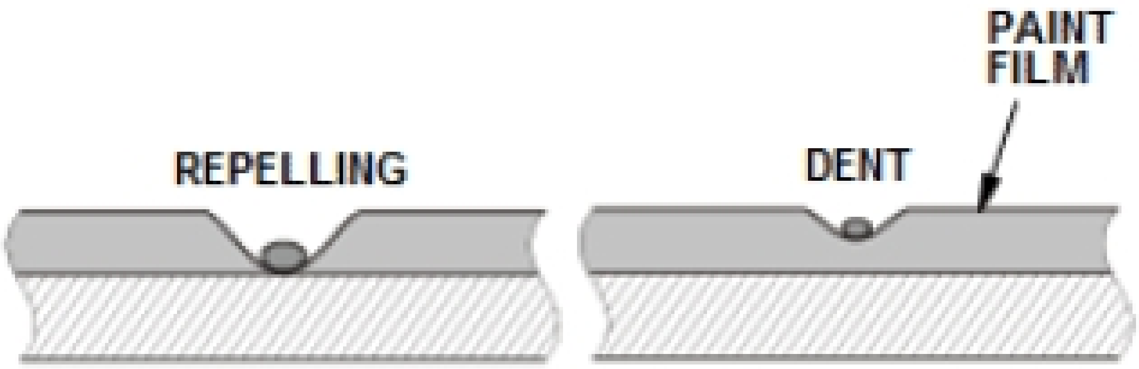
PREVENTION

- Use high quality reducer/thinner with the correct evaporation rate (addition of an evaporation retarder can also help).
- Properly set the spray gun's air pressure.

CORRECTIVE ACTIONS

- If the symptom is not severe, add the retarder to the diluted paint and repaint. Or polish the paint surface with compound.
- If the symptom is severe, sand down the paint surface after drying it thoroughly Then repaint.

Fish Eyes (Cratering)



Dents or crater-like holes appear sporadically on the paint film surface.

CAUSES

- Paint was applied to a surface contaminated with silicone, wax, grease, oil, etc.
- Dust in the air from polishing compound, wax, etc. adhered to the wet paint surface.
- Water or oil contamination in the air supply lines.
- Overspray from an incompatible paint type adhered to the paint surface.

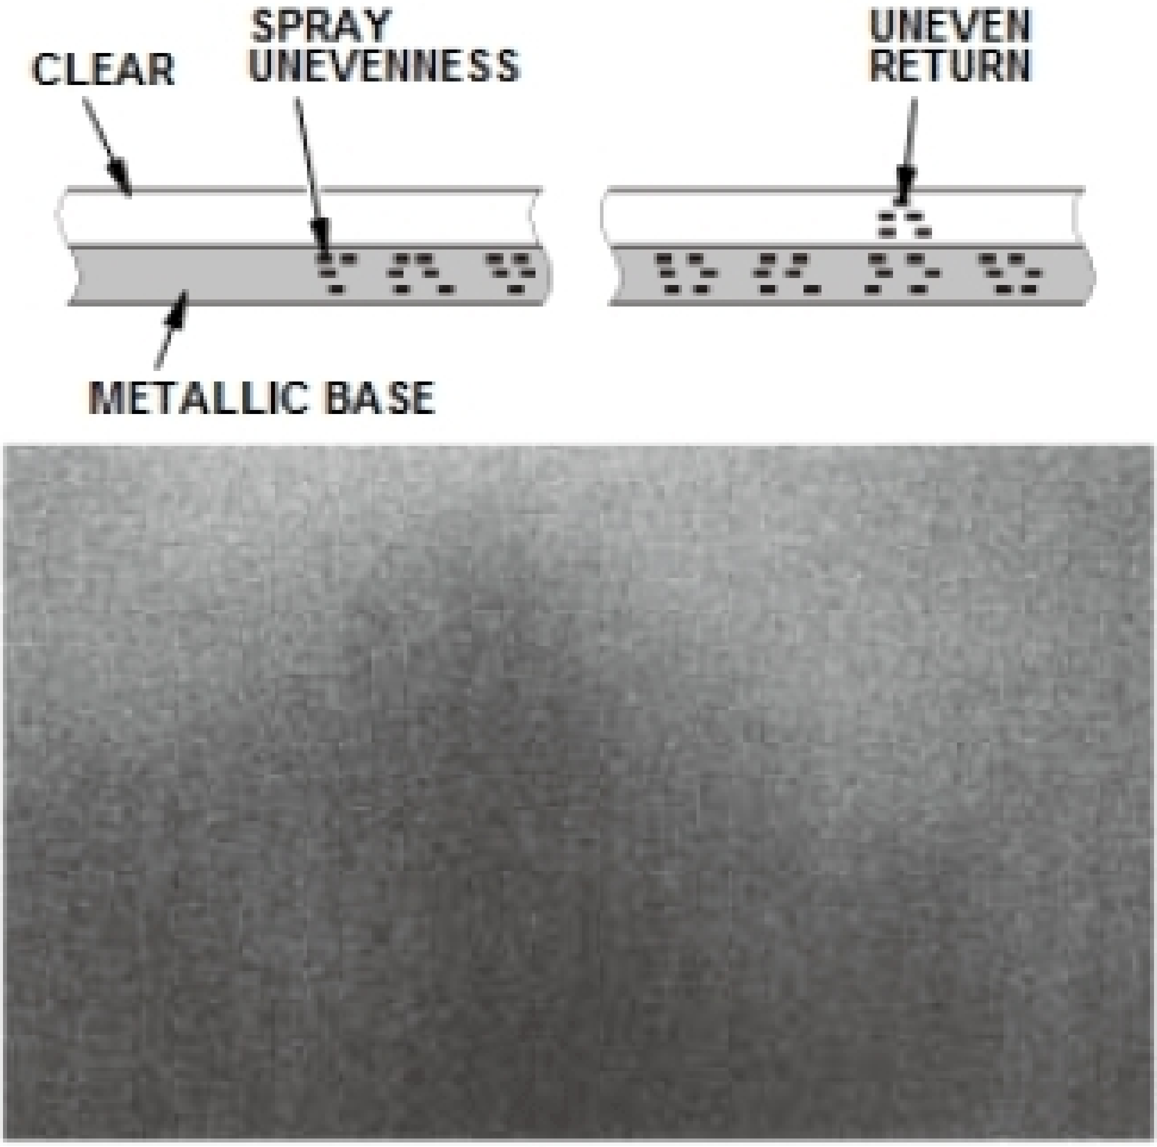
PREVENTION

- Check and service the compressed air supply and lines thoroughly.
- Sand the old paint film only after cleaning the area with degreaser such as pre-solvent or equivalent material.
- Thoroughly remove all sanding dust.
- Do not reuse shop cloths or tack rags.
- Wipe the area with pre-solvent and/or a tack cloth before painting.

CORRECTIVE ACTIONS

- If the fish eye is shallow, level the paint film by spraying dry paint mist.
- After drying, recondition the area by wet sanding and repainting.
- Use a commercially available "fish-eye eliminator", but test it before application.

Metallic Mottling



- Metallic particles in the base coat are dispersed unevenly, partially changing the color's appearance.
- Metallic particles are moved to irregular arrangement during clearcoat application.

CAUSES

- Improper painting conditions (paint reducer/thinner type, paint volume, air pressure, discharge volume, use of spray gun) and painting technique (spray pattern).
- Paint reducer/thinner evaporation rate extremely slow.
- Clearcoat excessively diluted with paint reducer/thinner.
- Insufficient drying time between application of metallic color coat and clearcoat.

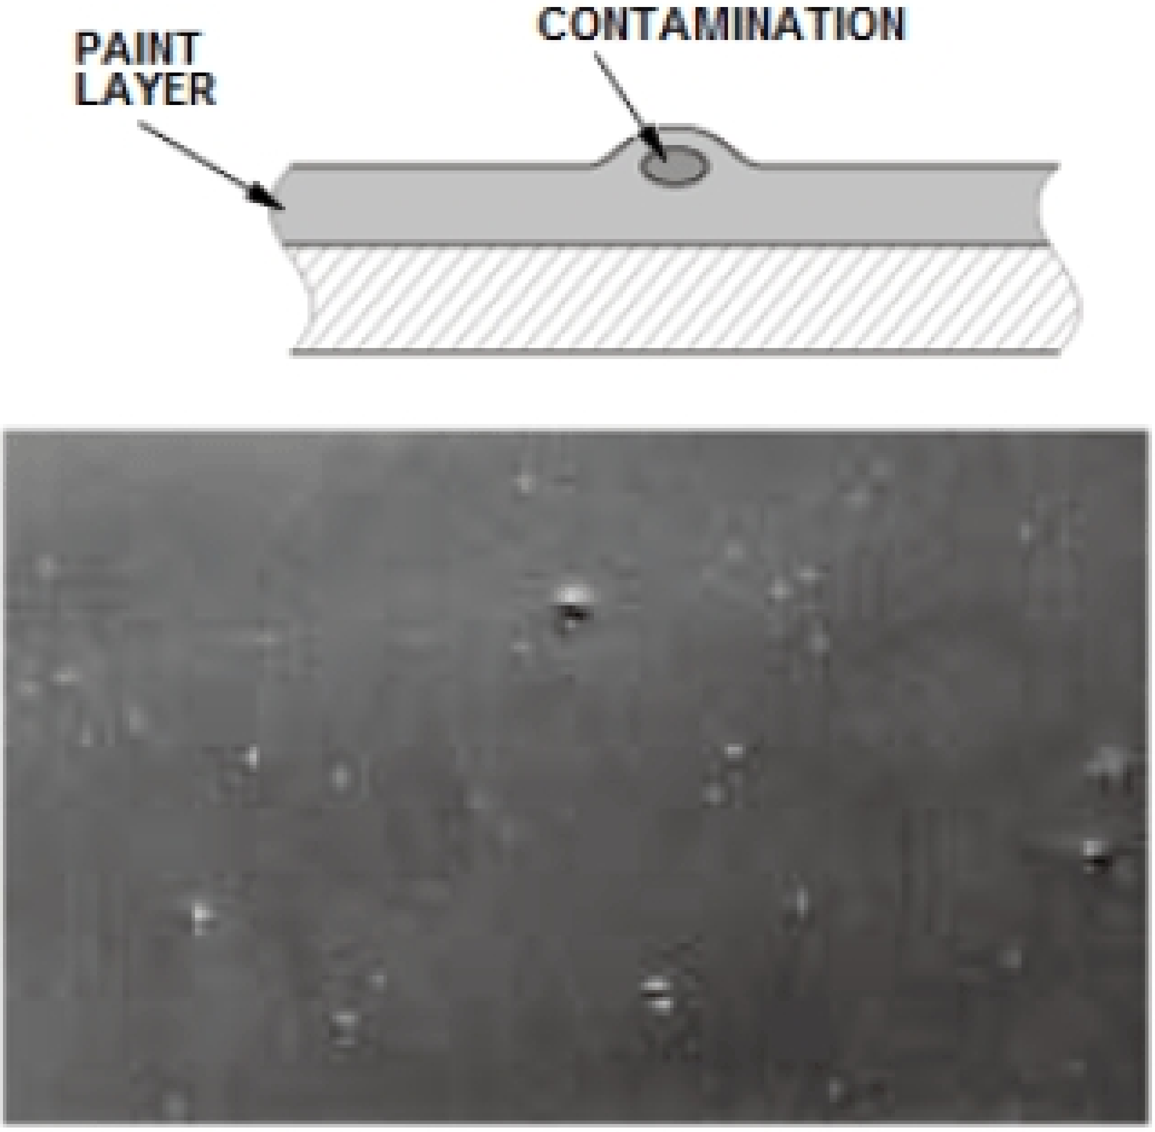
PREVENTION

- Paint under the optimum conditions.
- Inspect and clean the spray gun.
- Properly dilute clearcoat with the paint reducer/thinner.
- Allow sufficient drying time before clearcoat application.
- Apply clearcoat in several thin coats.

CORRECTIVE ACTIONS

- If the clearcoat has not been applied, take enough setting time to and repeat the metallic color coat application steps to remove unevenness.
- If the clear coat had already been applied, dry the surface completely Then sand and repaint.

Paint Contamination (Debris)



Foreign particles are trapped in the finish surface, causing the swelled paint surface. This is caused by the foreign particles entering the paint during storage or application.

CAUSES

- Dust and dirt in the air adheres to the wet paint film.
- Dust and dirt coming out around the fenders, doors and plastic strips during painting.
- Paint applied without being thoroughly stirred.
- Spray gun not cleaned thoroughly after prior use.
- Use of the paint that has skinned inside the container.
- Improper paint straining and/or air filtration.

PREVENTION

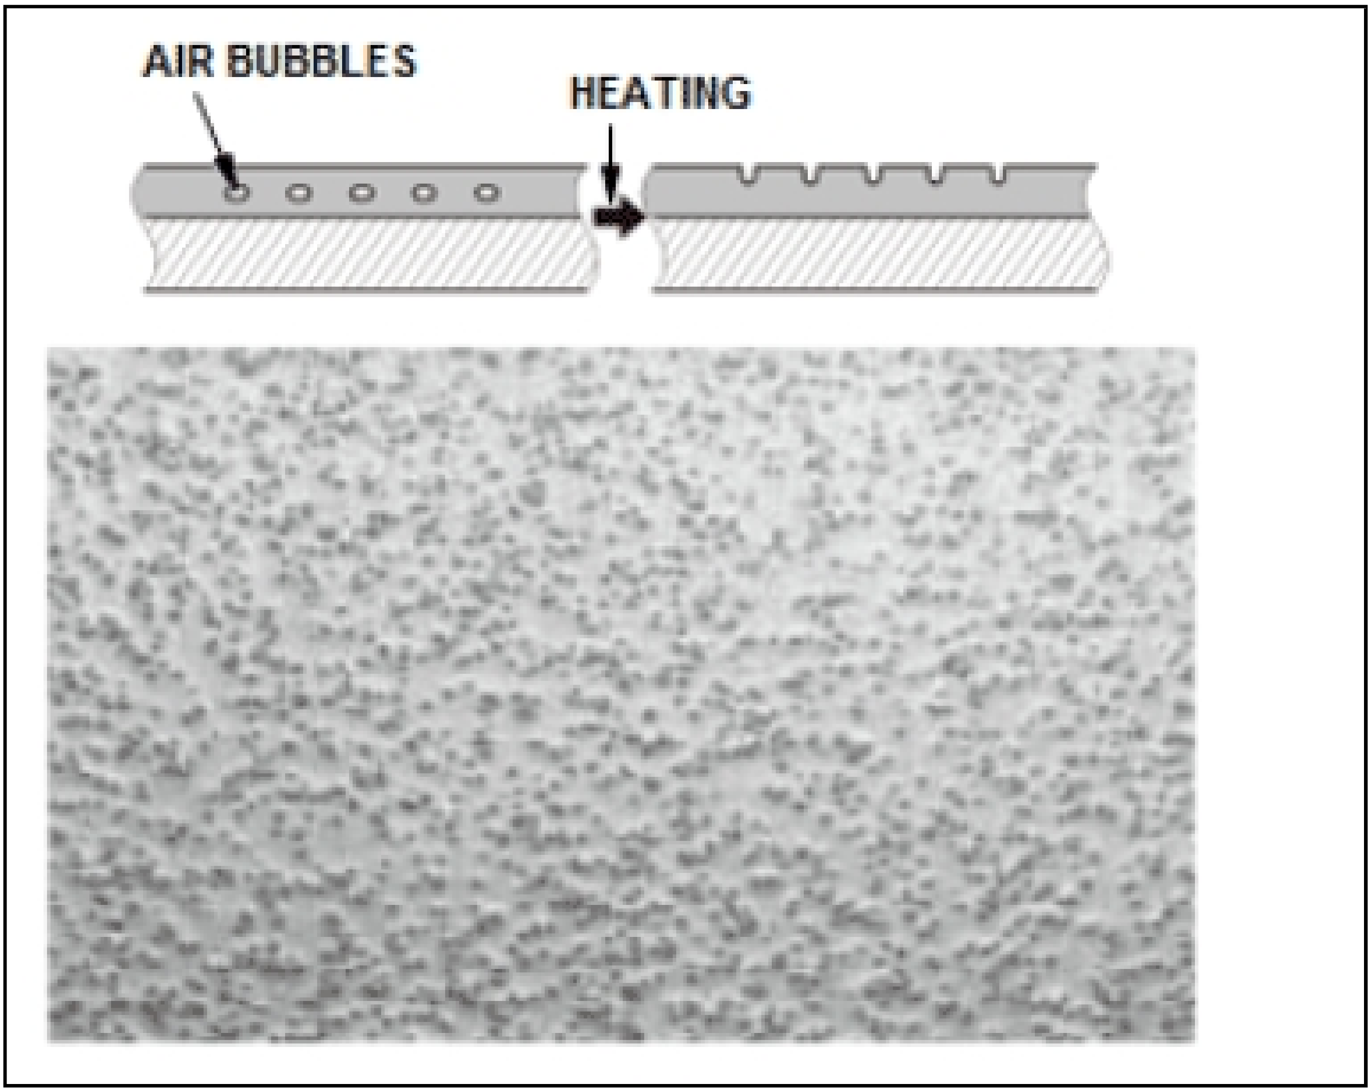
- Keep the paint workshop clean. Use dust prevention methods.
- Remove the dust and dirt thoroughly from the surface being painted.
- Pay special attention to ventilation to draw the fresh air into the workshop.
- Clean the spray gun used thoroughly after each use.
- Stir the mixed paint thoroughly before use.
- Use the recommended paint reducer/thinner and strain mixed paint before use.

CORRECTIVE ACTIONS

- Remove foreign particles from the paint surface using a sharp stick or equivalent tool, if paint is still wet.
- Small foreign particles on the surface of the paint film can be removed with compound or by polishing.

- If the foreign particles are large and deep in the paint film, wet sand the area using P400 or finer sandpaper, then repaint.

Pinholes



Fine perforations like pin holes appear in the paint surface.

CAUSES

- Paint applied too thick or flash time was insufficient.
- Paint spraying viscosity was too high.
- Painted surface was heated quickly soon after painting.
- Existing air bubble holes in the body filler.
- High ambient humidity.

PREVENTION

- Apply paint in several thin coats with sufficient flash time between each.
- Accurately dilute the paint with reducer/thinner.
- Allow sufficient setting time before force-drying paint.
- Correct any air bubble holes in body filler before painting.
- Spray basecoat with care to avoid dry spray.

CORRECTIVE ACTIONS

- If the symptom is light, remove the pin holes by sanding, then apply topcoat again.
- If the pin holes appear in the entire surface or if the pin holes are deep, strip off the paint and repaint.

Sanding Scratches

Paper trace or hairline scratches in the old paint film or basecoat develop and appear magnified by the solvent contained in the topcoat.

CAUSES

- Sandpaper used for sanding too coarse.
- Basecoat was sanded before it completely dried.
- Applied excessively diluted paint in coats that were too thick.
- Paint topcoat film too thin.

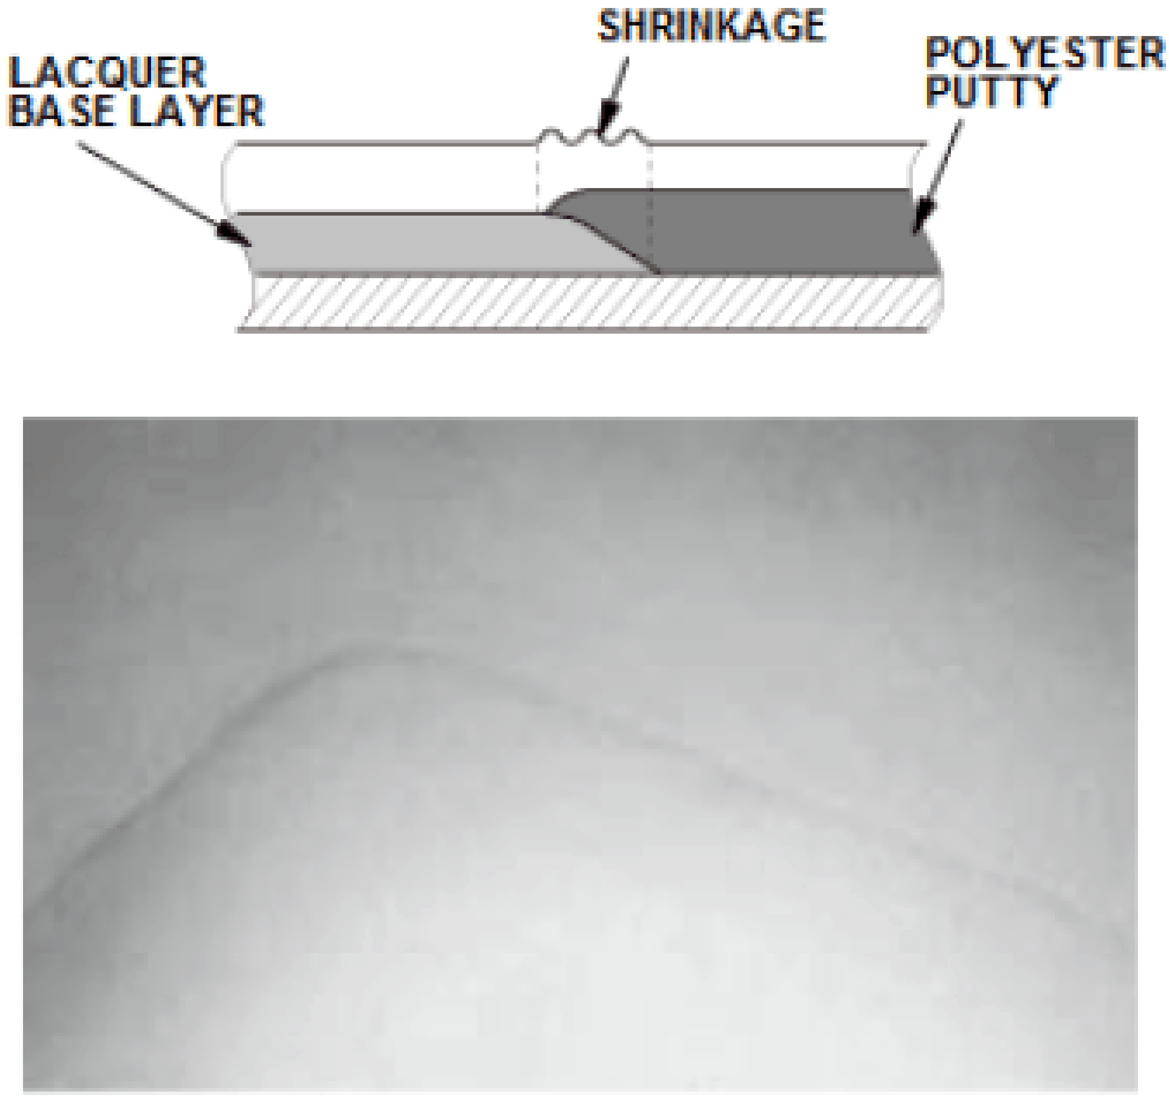
PREVENTION

- Use correct grade of sandpaper according to the type of topcoat.
- Apply basecoat and allow sufficient drying time before sanding.
- Apply topcoat mixed with the proper amount of paint reducer/thinner allowing proper flash time between coats. Apply topcoat in several steps.

CORRECTIVE ACTIONS

- If the symptom is not severe, polish the surface with compound after drying completely.
- If the symptom is noticeable, wet sand the area and repaint.

Swelling



Extension or shrinkage along edge of body filler application.

CAUSES

- Putty was softened when it is coated with the topcoat before fully hardened, producing a "putty trace".
- Basecoat with poor solvent resistance was covered with polyester body filler, then topcoated.
- Insufficient sanding of body filler.
- Paint coat dried too quickly

PREVENTION

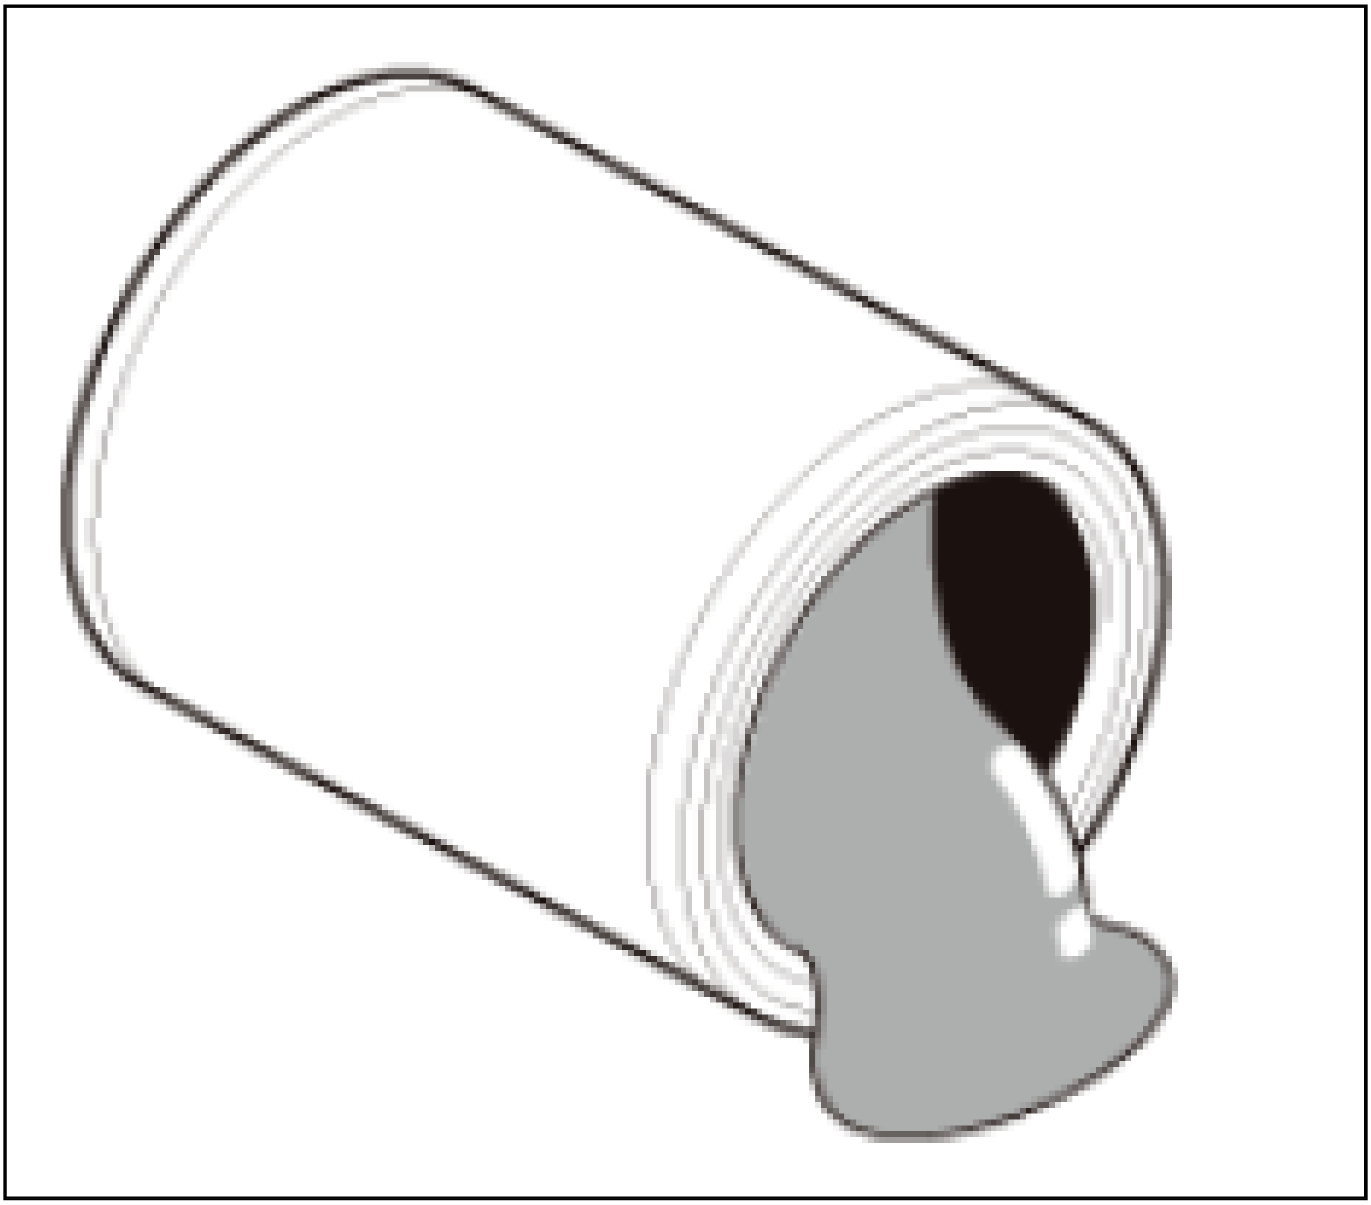
- Allow basecoat to dry completely before applying the topcoat.
- Mix the body filler with specified amount of hardener and allow filler to dry thoroughly after application.
- Do not apply body filler over the old paint with poor solvent resistance.
- Avoid excessively thick paint coat application.

CORRECTIVE ACTIONS

After thorough drying, remove the putty trace by sanding and refinishing affected surface.

PAINT STORAGE PROBLEMS

Paint Gelling (Increased Viscosity)



- Paint loses fluidity causing gelled consistency (increased viscosity).
- Paint partially or entirely reacts and hardens, leading to gelled consistency.

CAUSES

- Prolonged storage in excessive temperatures.
- Paint can (container) not sealed securely, allowing the paint solvent to evaporate and humidity to enter the can.
- Paint accidentally mixed with a different paint type, or hardener, before storage.
- Paint diluted with improper paint reducer/thinner.

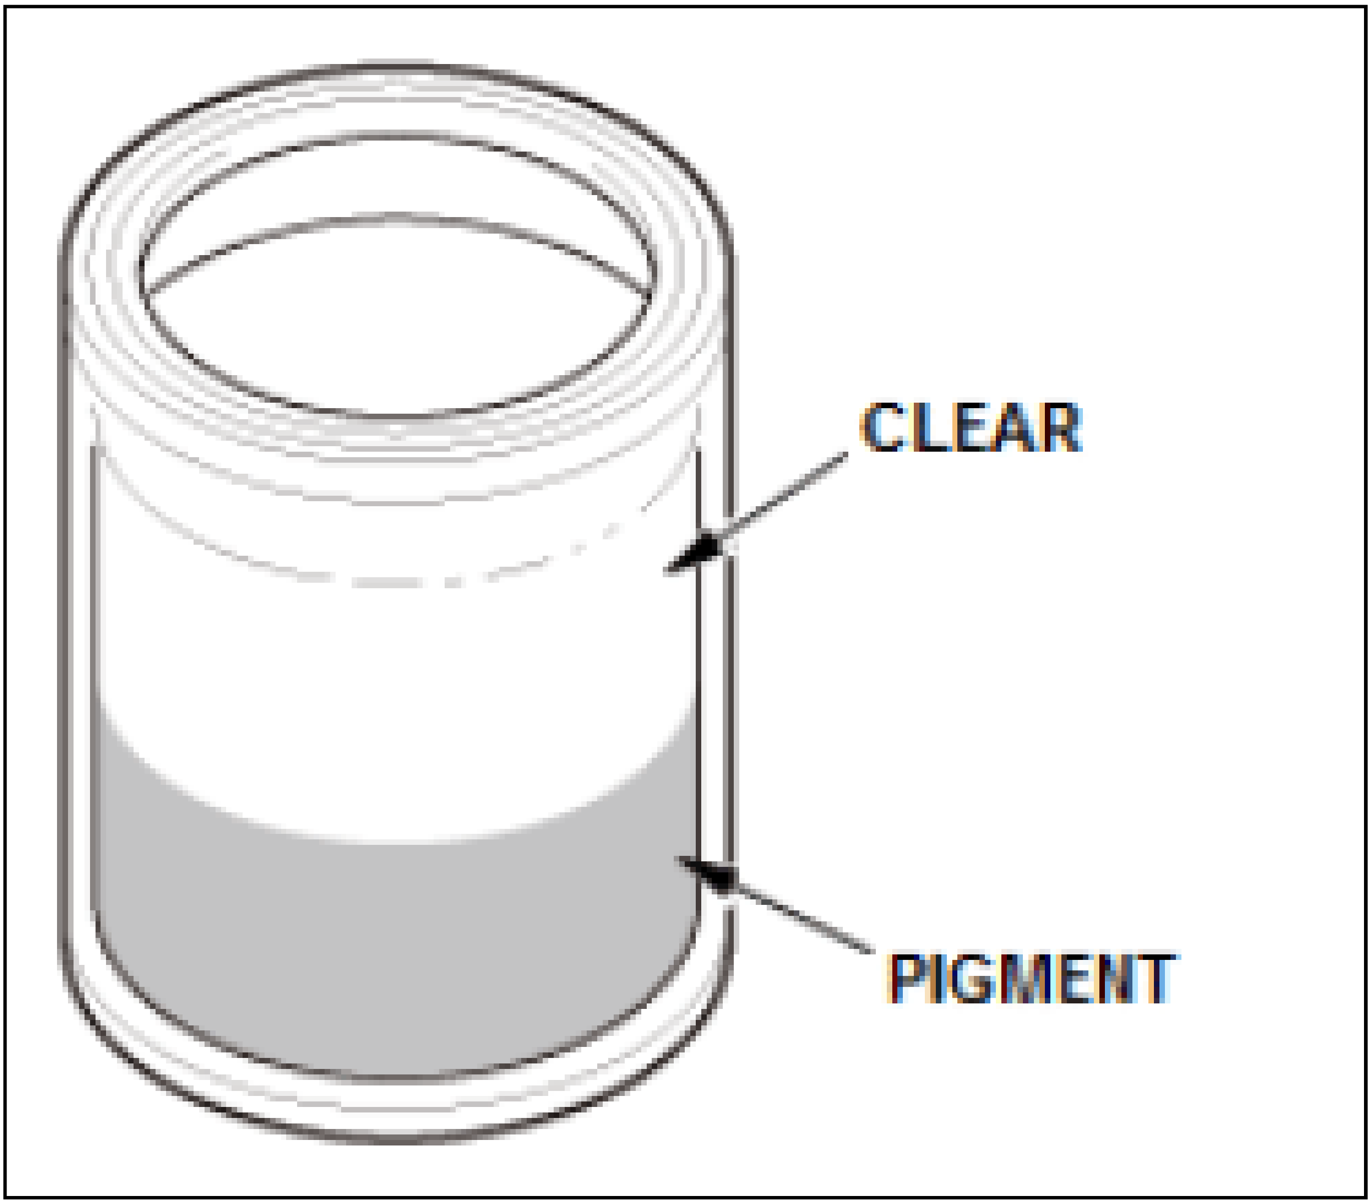
PREVENTION

- Securely seal the paint can (container) with the lid, and store it in a dark, cool place, 68Â°F (20Â°C) or below.
- Avoid mixing the paint with different types of paint, hardener and improper paint reducer/thinner.

CORRECTIVE ACTIONS

Dispose of the paint according to local regulations.

Paint Separation



Paint and pigment separate into two parts during storage, resulting in a clear portion of paint in the upper part of the can.

CAUSES

- Prolonged storage in excessive temperatures.
- Low paint viscosity.
- Paint accidentally mixed with a different paint type.

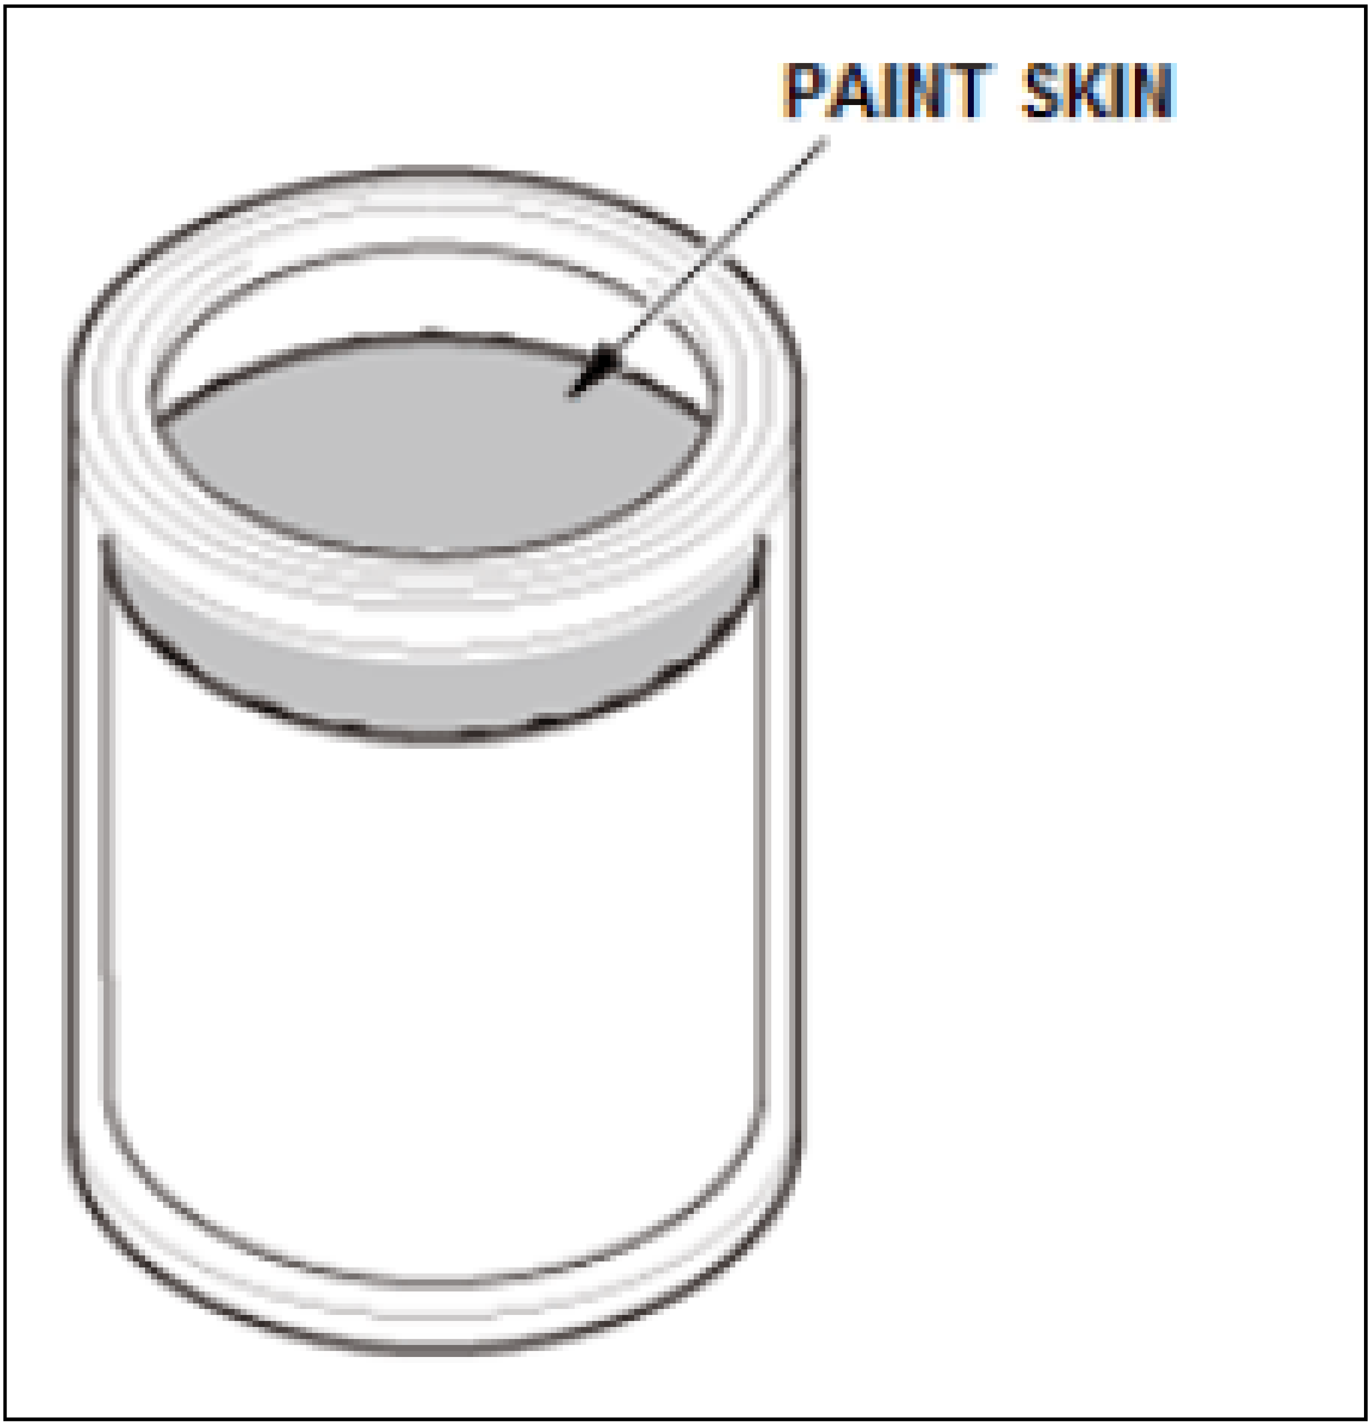
PREVENTION

- Store the paint in a dark, cool place, 68Â°F (20Â°C) or below. If it is stored for a prolonged period, invert the can occasionally.
- Do not return paint diluted with reducer/thinner to the original can.

CORRECTIVE ACTIONS

Stir up the paint thoroughly before reuse.

Paint Skinning



- A "skin" layer appears on top of the paint in a container.
- Most common on air-dry type paints. Paint surface hardens with exposure to oxygen in the air.

CAUSES

- Paint can (container) not sealed with the lid securely
- Prolonged storage in excessive temperatures.
- Paint volume in the can decreased, allowing more space for trapped air (air-dry type).

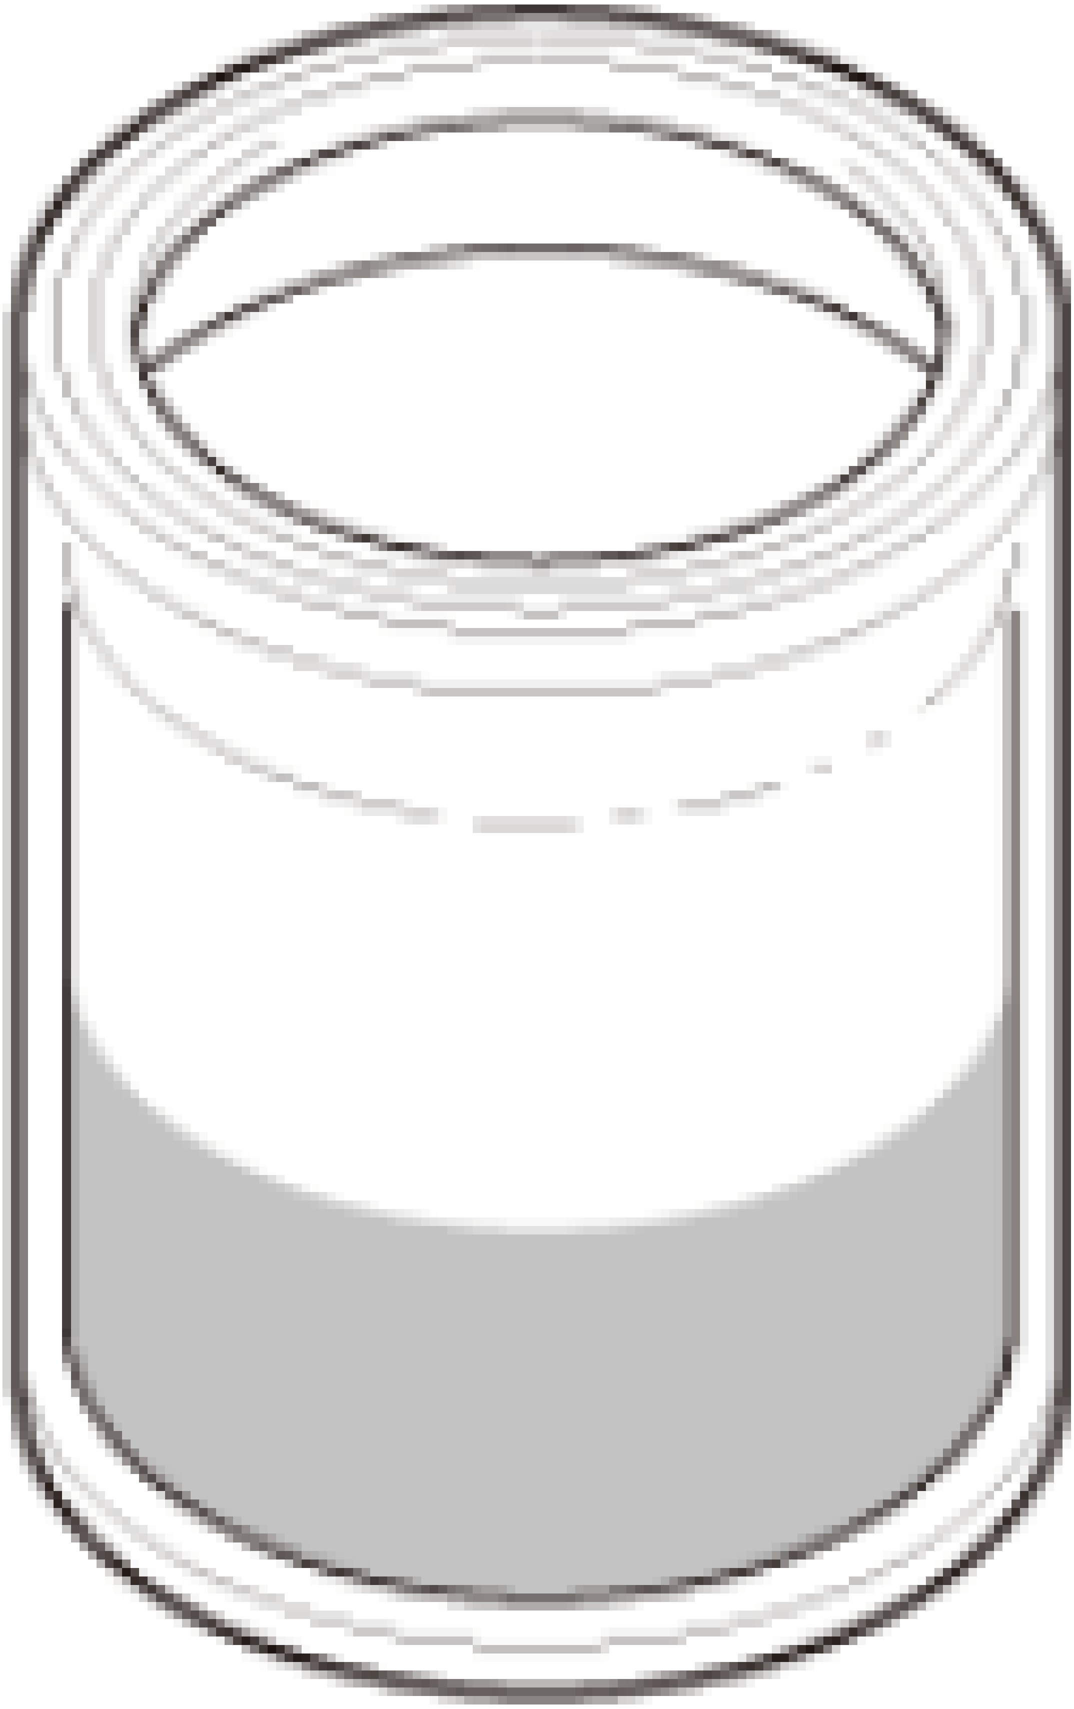
PREVENTION

Securely seal the paint can (container) with the lid and store it in a dark, cool place, 68Â°F (20Â°C) or below.

CORRECTIVE ACTIONS

Dispose of the paint according to local regulations.

Sedimentation (Caking)



Paint pigment is settled in the bottom of the can.

Hard deposit: Hard caking.

Soft deposit: Soft caking.

CAUSES

- Excessive storage temperatures.
- Pigment's specific gravity too high.
- Excessive paint pigment in proportion to other components.
- Low paint viscosity.

PREVENTION

- Store the paint in a dark, cool place, 68Â°F (20Â°C) or below. If it is stored for a prolonged period, invert the can occasionally.
- Do not store the reducer/thinner-diluted paint for a prolonged period. Stir it thoroughly to remix before reuse.

CORRECTIVE ACTIONS

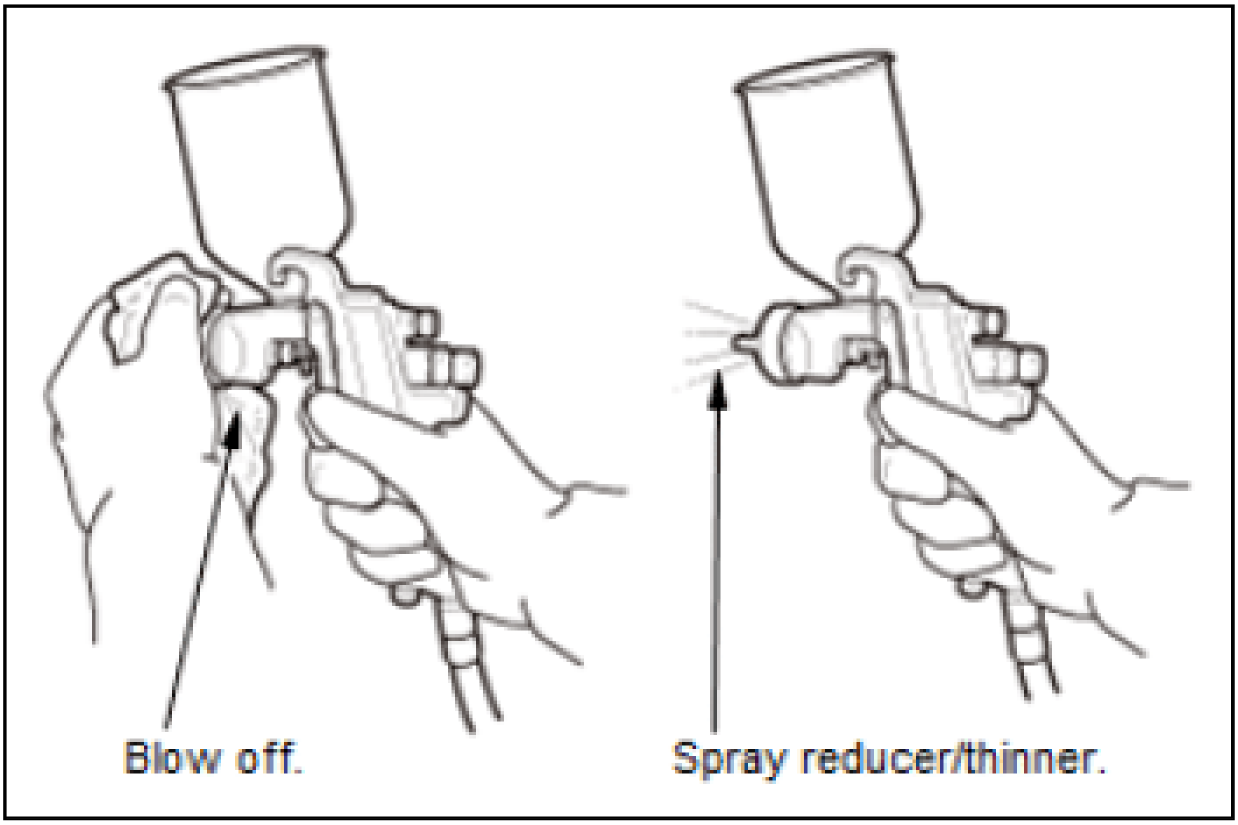
Dispose the hard deposit (hard caking). If the deposit is soft (soft caking), stir it up thoroughly to restore a consistent viscosity before reuse.

SPRAY GUN BASICS

SPRAY GUN CLEANING AND MAINTENANCE

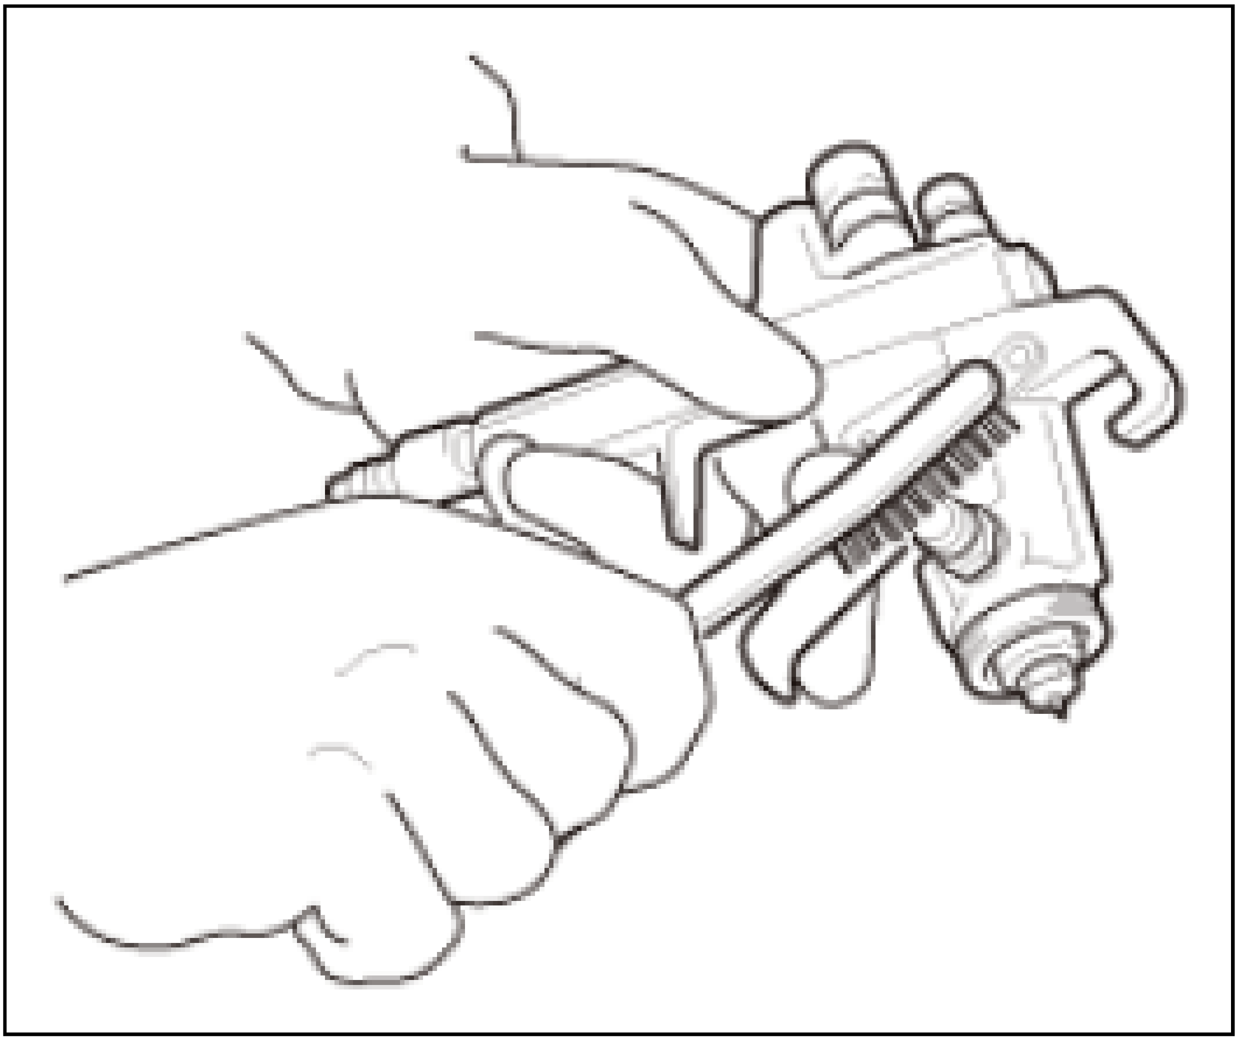
If the spray gun is not cleaned after use, the paint residue hardens clogs the gun. The spray gun may not be able to be used again, depending on the severity of the clogging. Wash the paint gun following the below steps after use.

1. Place a scrap rag in front of the air cap and pull the trigger. The air will blow from the nozzle tip, and pushes paint out. This will remove the remaining paint from the paint path.
2. Properly dispose of the remaining paint in the cup, then pour in some paint reducer/thinner for cleaning.

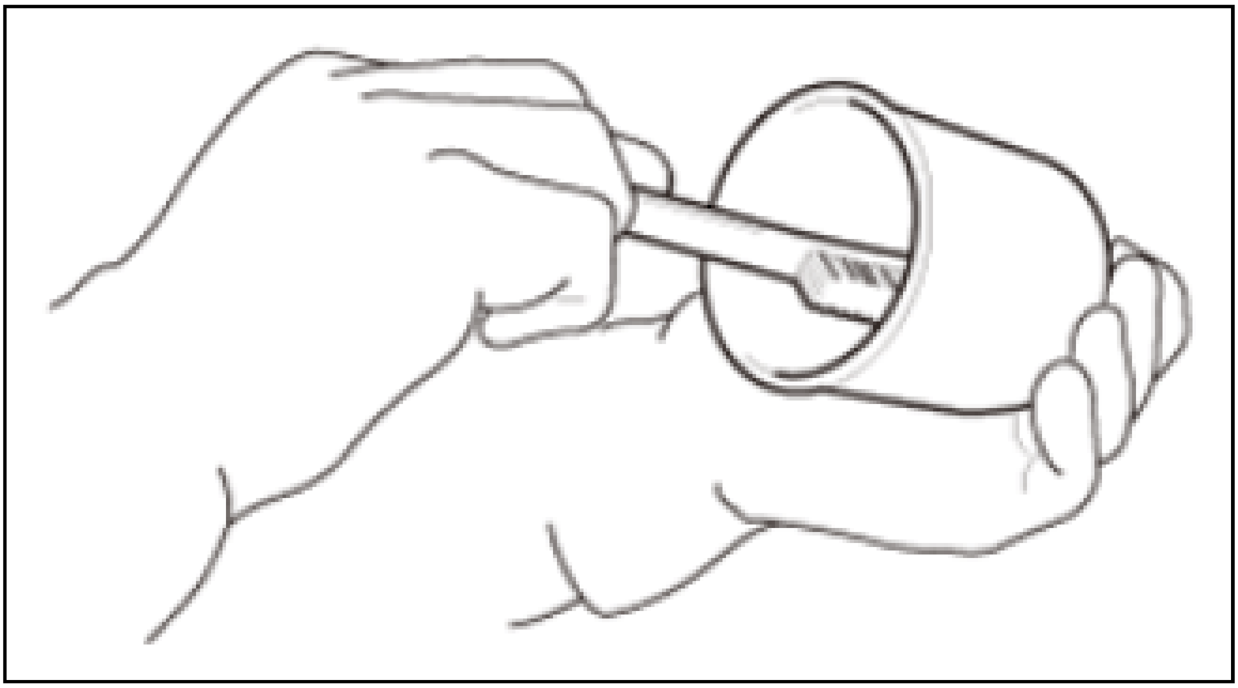


Blow off.
Spray reducer/thinner.

3. Clean the inside and outside of the spray gun itself using the specially designed spray gun cleaning brushes.

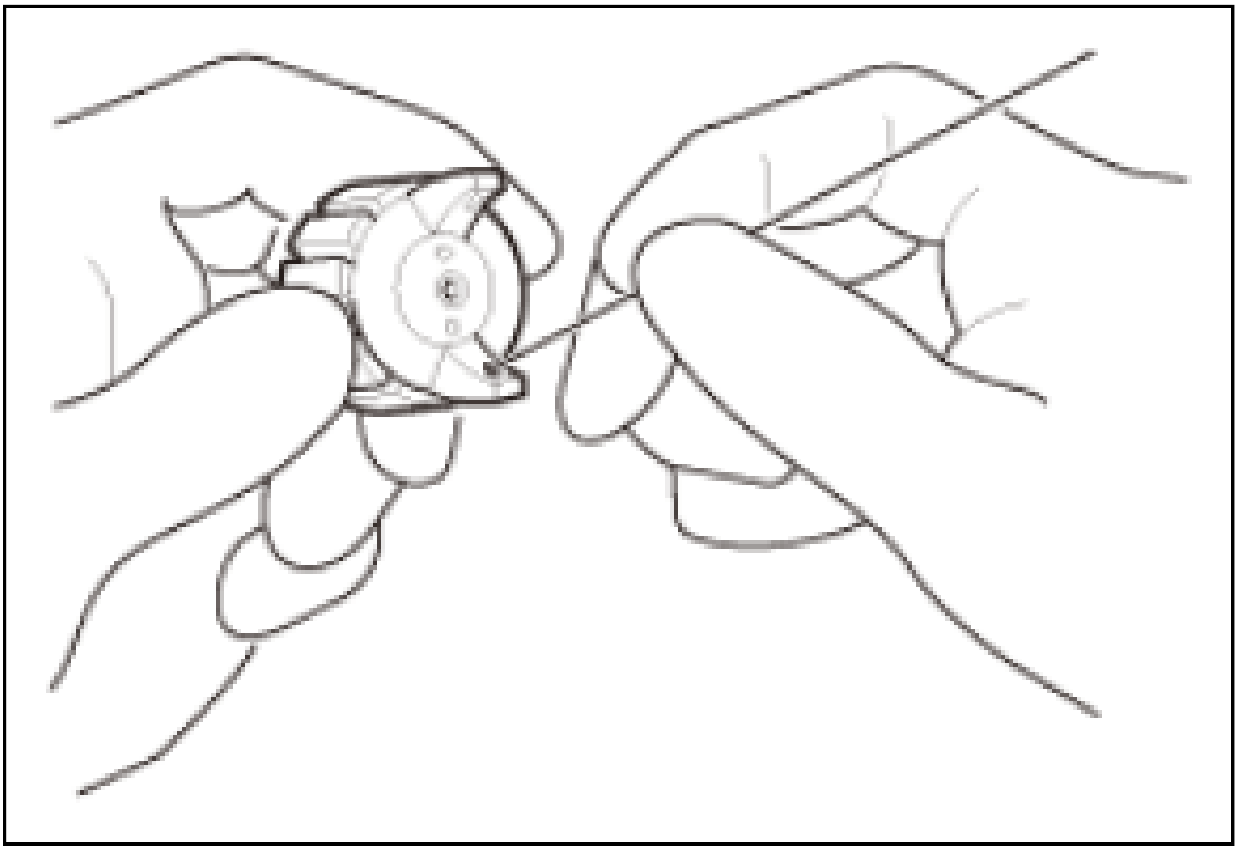


4. Clean the inside of the paint cup.



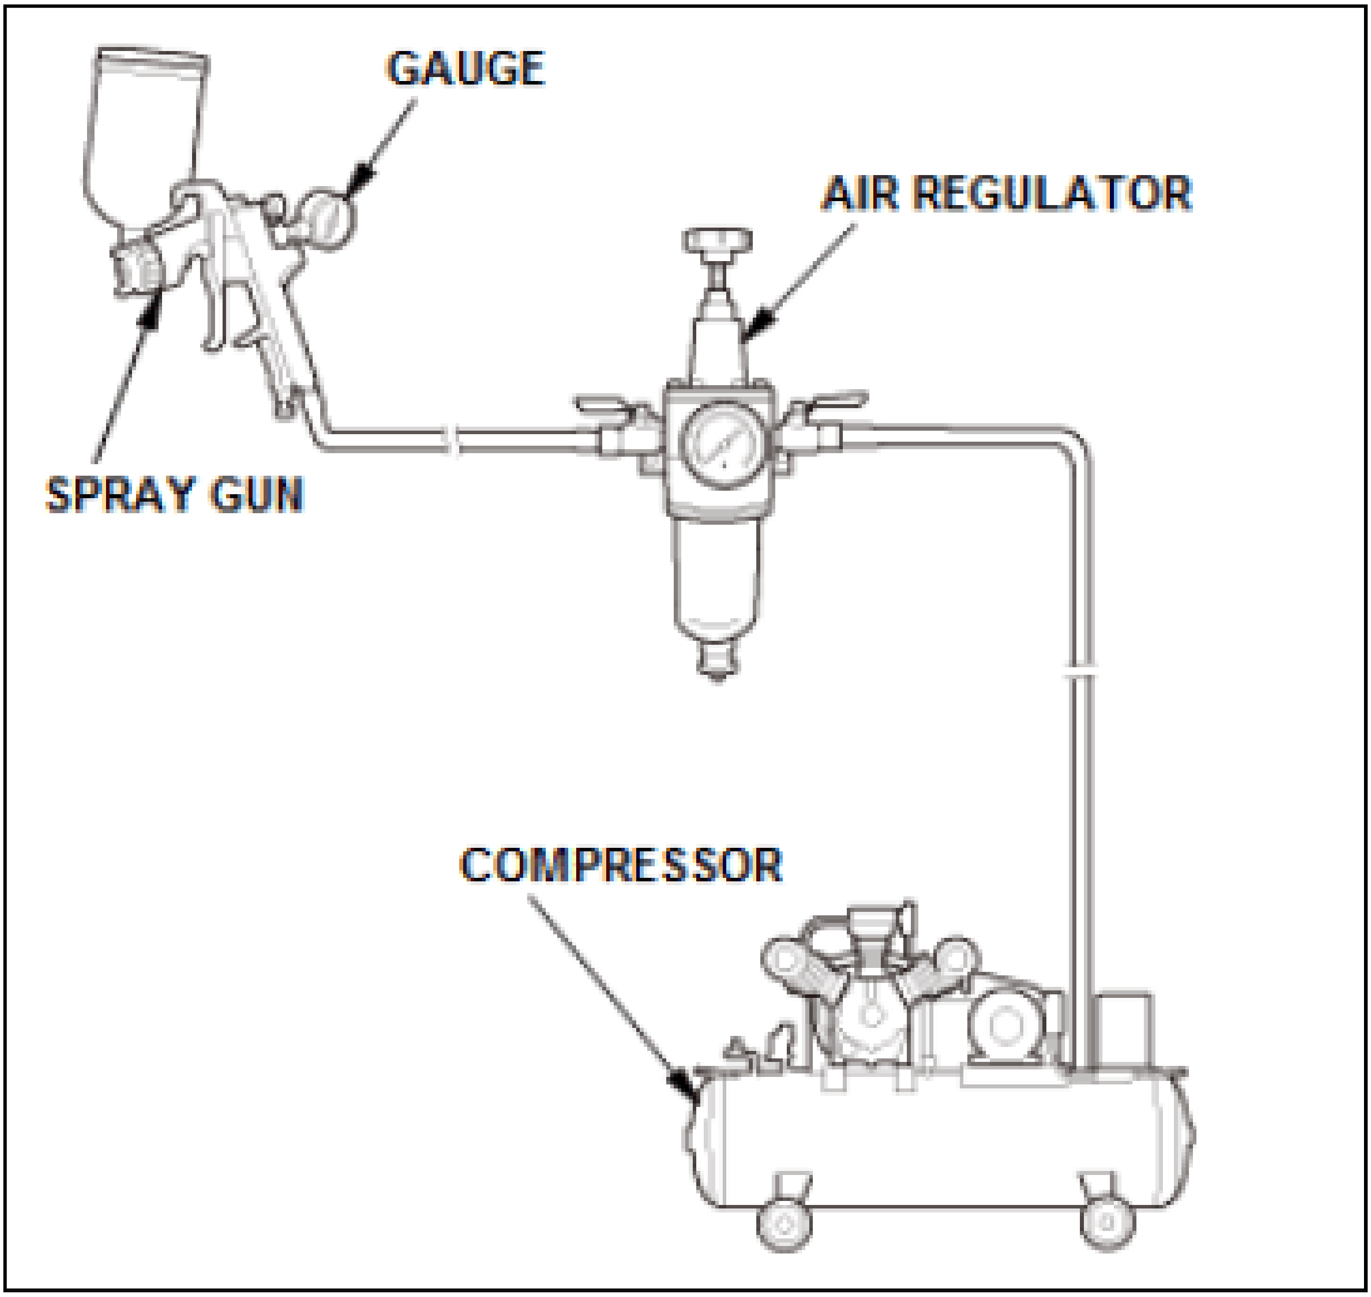
5. Remove the air cap and clean it up with a brush soaked in paint reducer/thinner.

NOTE: **Pay extra attention not to damage the precision air holes of the air cap! Any damage will have a great impact on spray pattern. Also, do not use a wire or wire brush to clean the air cap. If the air hole is clogged, use a specialized tool for this purpose. If the adhered paint does not easily come off, soak it in lacquer thinner then try cleaning again.**



SPRAY GUN CONNECTION AND ADJUSTMENT

Spray Gun Pressure Settings



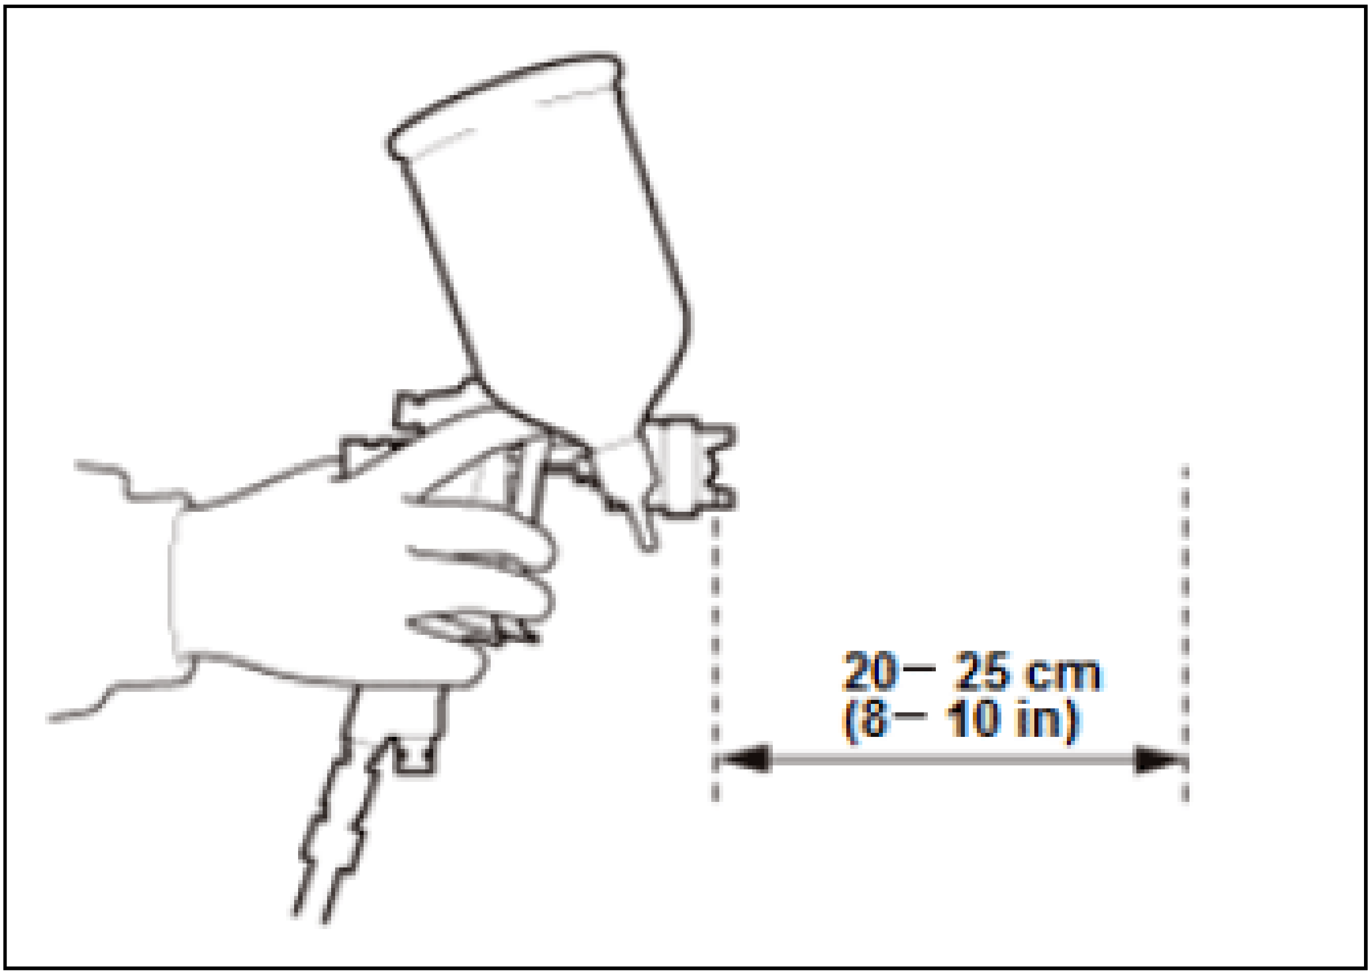
- Set the spray pressure to appropriate level according to the paint used and the size of area to be painted.
- The air pressure is usually initially adjusted at the regulator, which may be some distance from the spray gun. Because of pressure drop caused by the length and diameter of the air hose, the gun pressure may differ significantly from the remote regulator. Therefore, best practice requires a second small air pressure gauge mounted to the spray gun. Use this second gauge to set the correct spraying pressure.

Air Hose	Regulator	Length of Air Hose, m (ft)		
Inside Diameter (ID)	Pressure	4.5 m (15 ft)	7.5 m (25 ft)	15 m (50 ft)
mm (in)	kPa (kgf/cm^2 , psi)	Pressure at End of Air Hose kPa (kgf/cm^2 , psi)		
6 (0.24)	340 (3.5, 50)	260 (2.7, 38)	210 (2.1, 30)	150 (1.5, 22)
	410 (4.2, 60)	310 (3.2, 45)	270 (3.2, 40)	190 (1.9, 28)
	480 (4.9, 70)	360 (3.7, 52)	320 (3.3, 46)	250 (2.5, 36)
8 (0.31)	340 (3.5, 50)	310 (3.2, 45)	310 (3.2, 45)	270 (2.8, 40)
	410 (4.2, 60)	380 (3.9, 55)	370 (3.8, 54)	330 (3.4, 48)
	480 (4.9, 70)	440 (4.5, 64)	430 (4.4, 62)	400 (4.1, 58)

Spray Distance

As the distance of the paint gun from the surface being painted increases, the spray pattern size increases. The paint film gets thinner and more paint is lost as overspray If the paint gun is too close to the surface being painted, the paint will be applied too heavily causing runs. Generally the recommended distance for lacquer type paint is approximately 20 cm (8 in), and approximately 25 cm (10 in) for acrylic urethane type paint.

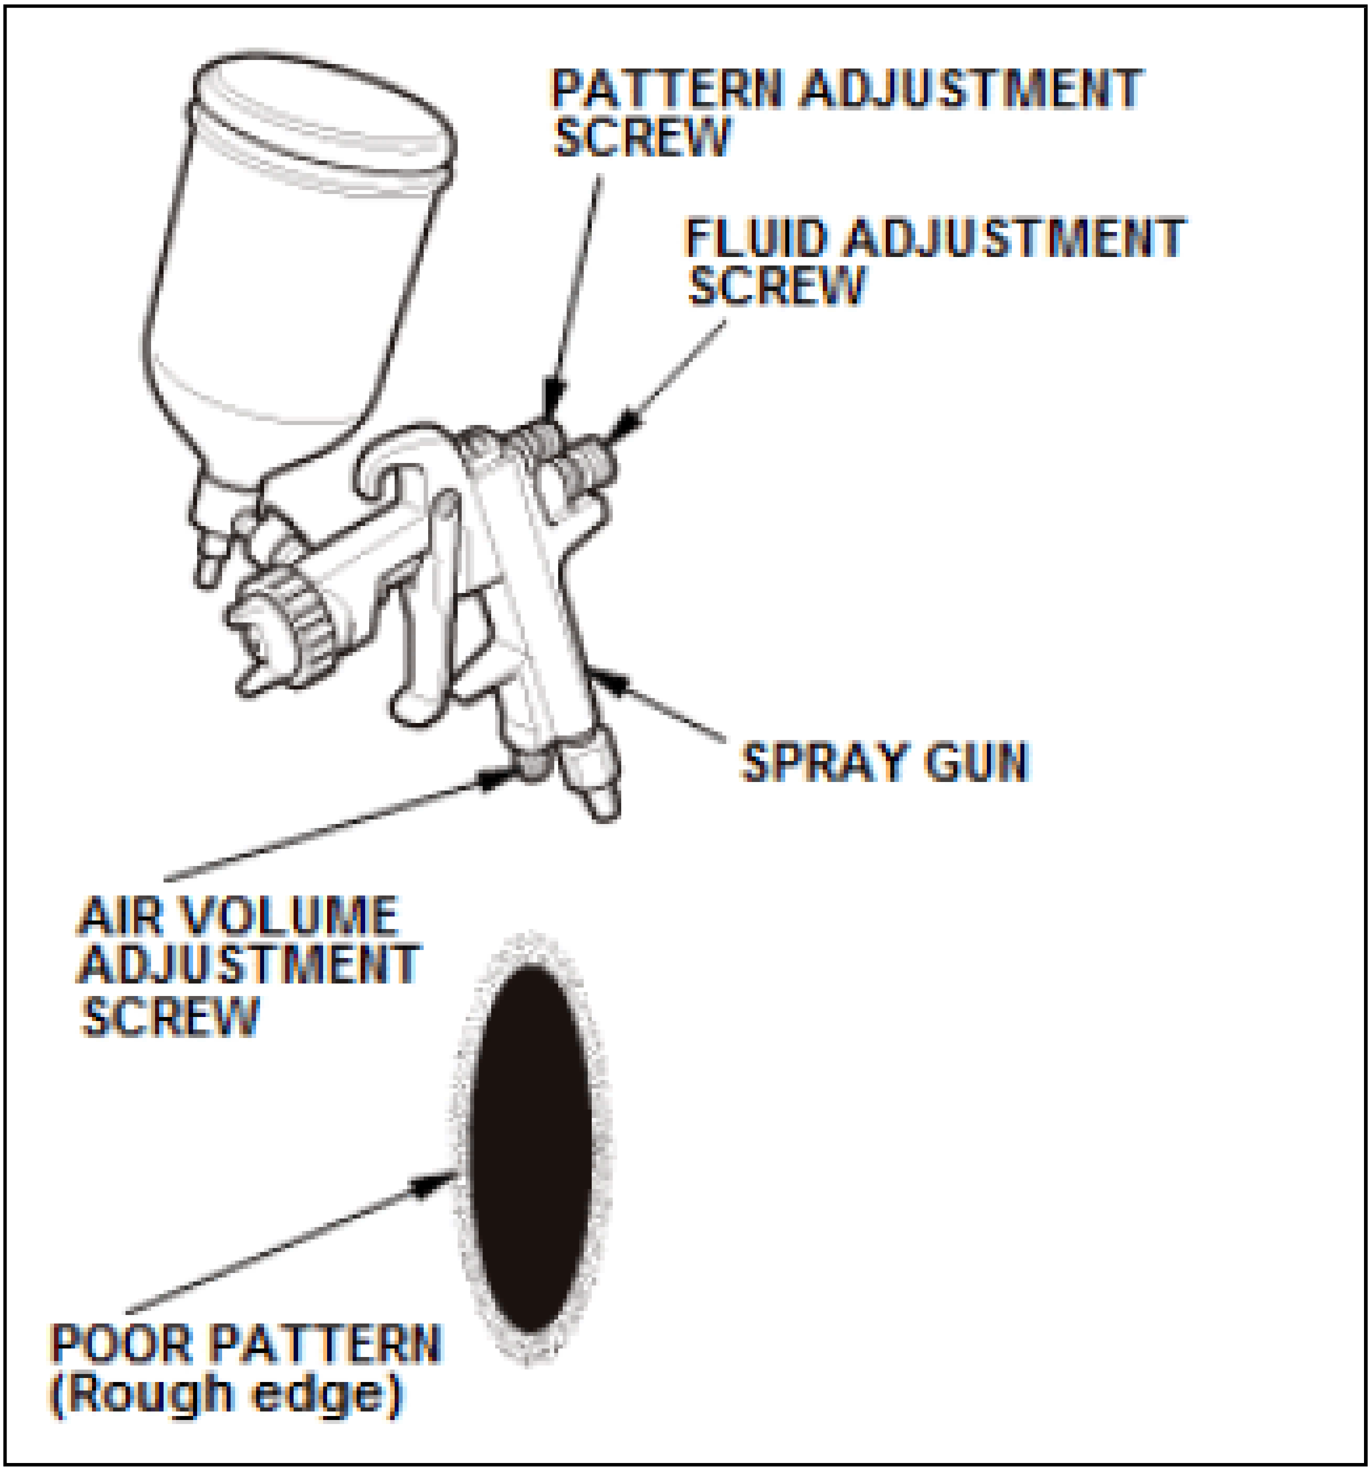
In general, the optimum distance between the paint gun and surface being painted is 15-25 cm (6-10 in).



Spray Pattern Adjustment

- The spray pattern can be adjusted using the pattern and fluid adjustment screws on the spray gun.
- If the spray pattern has a rough surface or edge, Regulate the fluid flow using the fluid adjustment screw, or reduce the air volume by adjusting the air volume adjustment screw.
- If the paint runs, reduce the fluid flow rate. Also check the paint's viscosity and the paint reducer/thinner's evaporation rate.

NOTE: **Be sure to check the product specifications issued by the paint manufacturers as each spray gun has different settings for the paint patterns and distance.**

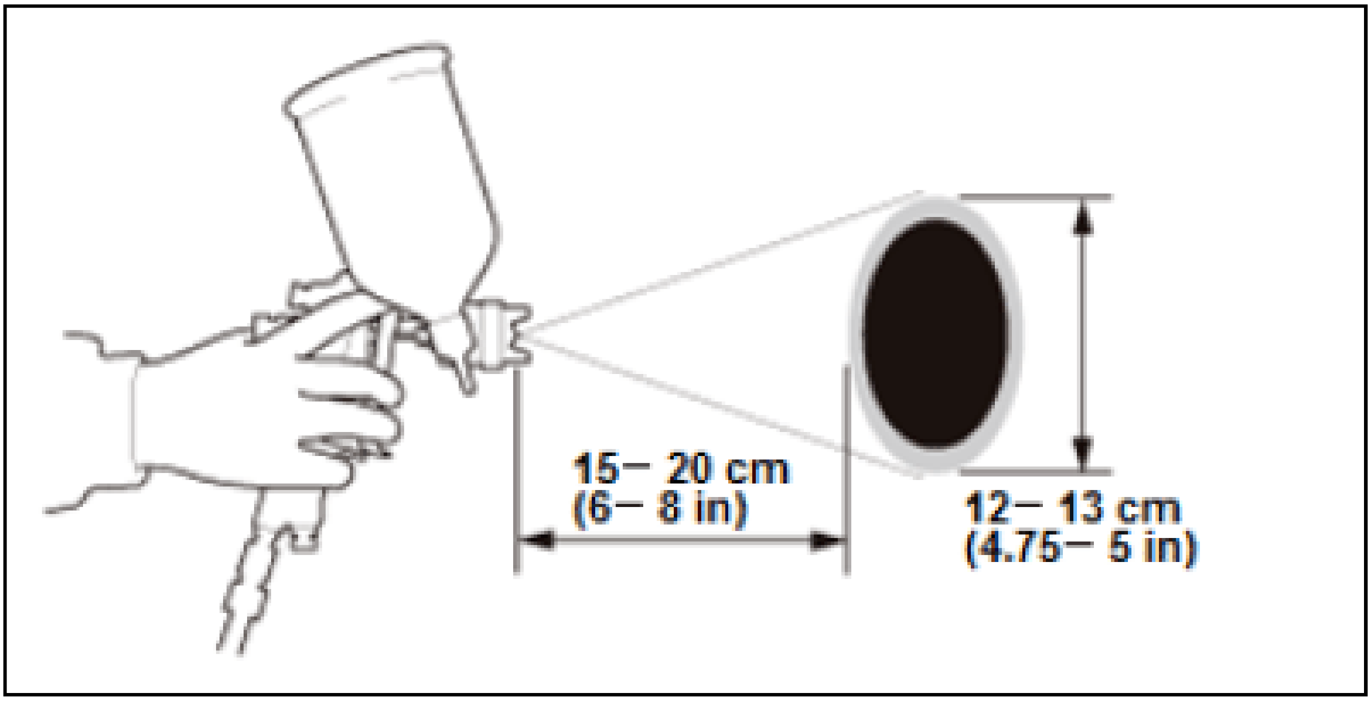


PATTERN ADJUSTMENT SCREW
FLUID ADJUSTMENT SCREW
SPRAY GUN
AIR VOLUME ADJUSTMENT SCREW
POOR PATTERN (Rough edge)

General Recommended Patterns

Spot Painting Pattern

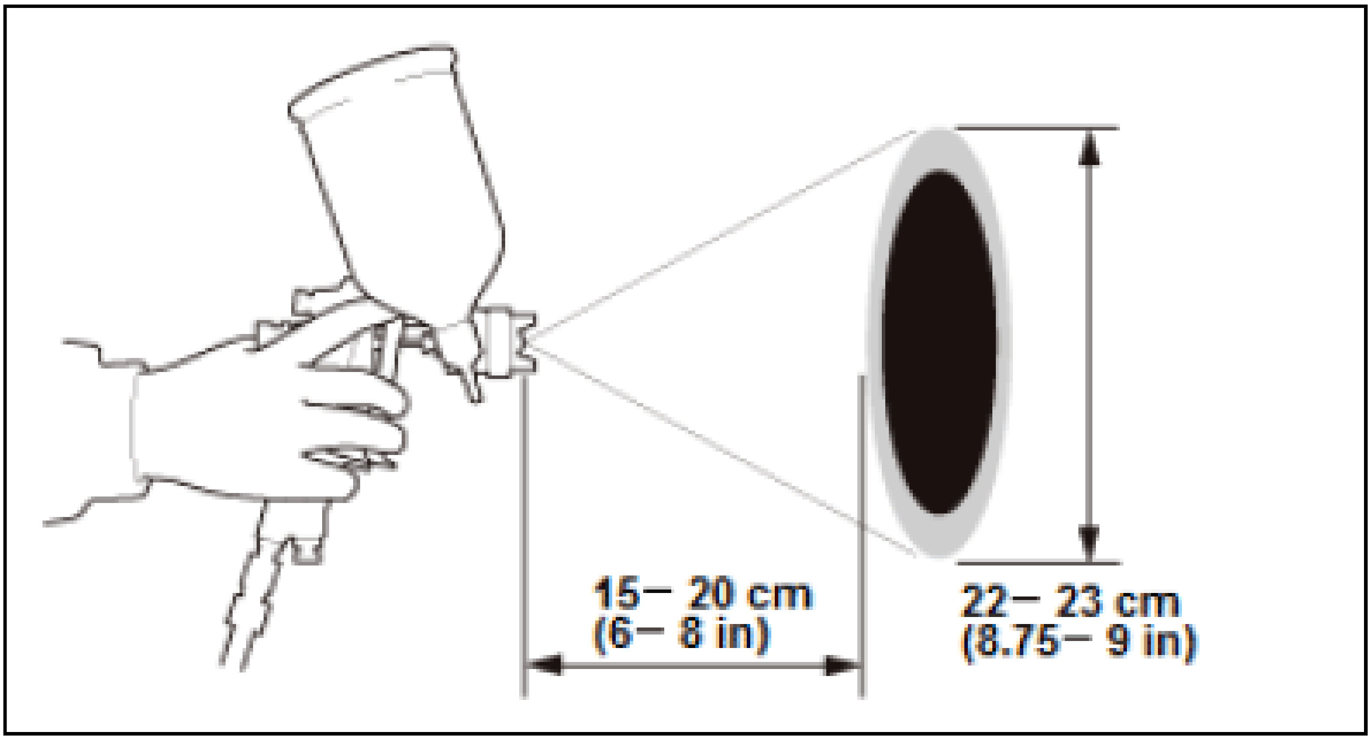
Adjust the pattern and fluid flow rate adjustment screws to create a pattern diameter of 12-13 cm (4.75-5 in) at a distance of 15-20 cm (6-8 in) away from the surface.



15– 20 cm
(6– 8 in)
12– 13 cm
(4.75– 5 in)

Overall Painting Pattern

Adjust the pattern and fluid flow rate adjustment screws to create a pattern diameter of 22-23 cm (8.75-9 in) at a distance of 15-20 cm (6-8 in) away from the surface.



15– 20 cm
(6– 8 in)
22– 23 cm
(8.75– 9 in)

SPRAY GUN INSPECTION AND TROUBLESHOOTING

Inspection And Troubleshooting

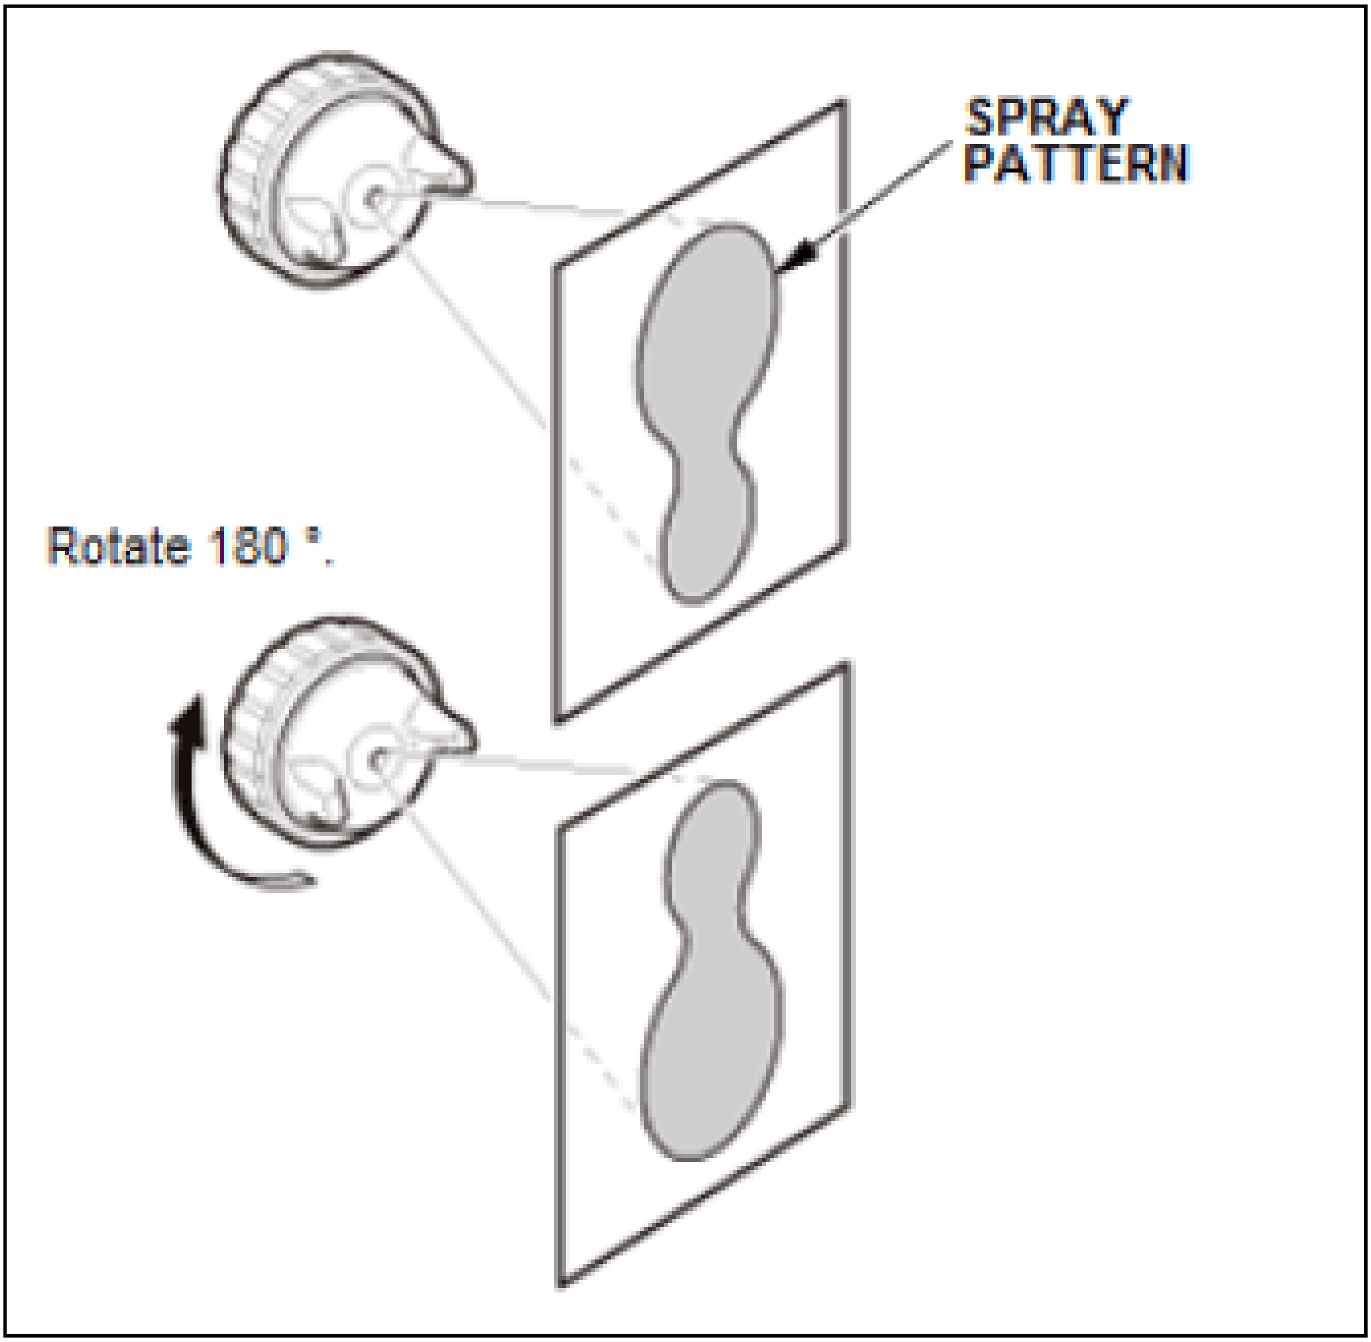
Defects	Cause	Countermeasure
 Out of air	1. Not enough paint in the paint cup. 2. The paint cup is tilted too much. 3. The paint flow path is clogged. 4. The paint nozzle deformed or damaged.	1. Add paint. 2. Correct the position. 3. Clean with solvent. 4. Close or replace.
 Imbalance	1. The air cap angle holes are partially clogged or damaged. 2. Paint or contaminants deposited or damages on the tapered joint area of air cap and paint nozzle. 3. Paint or contaminants deposited on the tip of the nozzle.	1. Clean or replace. 2. Clean or replace. 3. Clean.
 Crescent	1. The air cap angle holes are clogged or damaged, or there are paint deposits or other damage inside the center hole. 2. Paint or contaminants deposited or other damage to outside of the nozzle tip.	1. Clean or replace. 2. Clean or replace.
 Oval	1. The bore of the paint nozzle is too large or has become worn. 2. Too much space between the air cap's center hole and the outside of the nozzle tip became bigger. 3. Low air flow and pressure to the air cap. 4. Paint viscosity too high.	1. Replace. 2. Replace. 3. Increase air flow and pressure. 4. Reduce viscosity

Defects	Cause	Countermeasure
 Constriction	1. Air flow and pressure to the air cap's angle holes too high. 2. Paint or contaminants deposited or other damage to outside of the nozzle tip.	1. Reduce air flow and pressure. 2. Clean.

Judging Defect Type Of Spray Pattern

Check the spray pattern. Then loosen the air cap and turn it 180Â° and spray again. If both of the spray patterns appear identical, the problem is contamination on the paint nozzle or a damaged paint nozzle.

If the spray patterns appear reversed, the problem is contamination on the air cap or a damaged air cap.

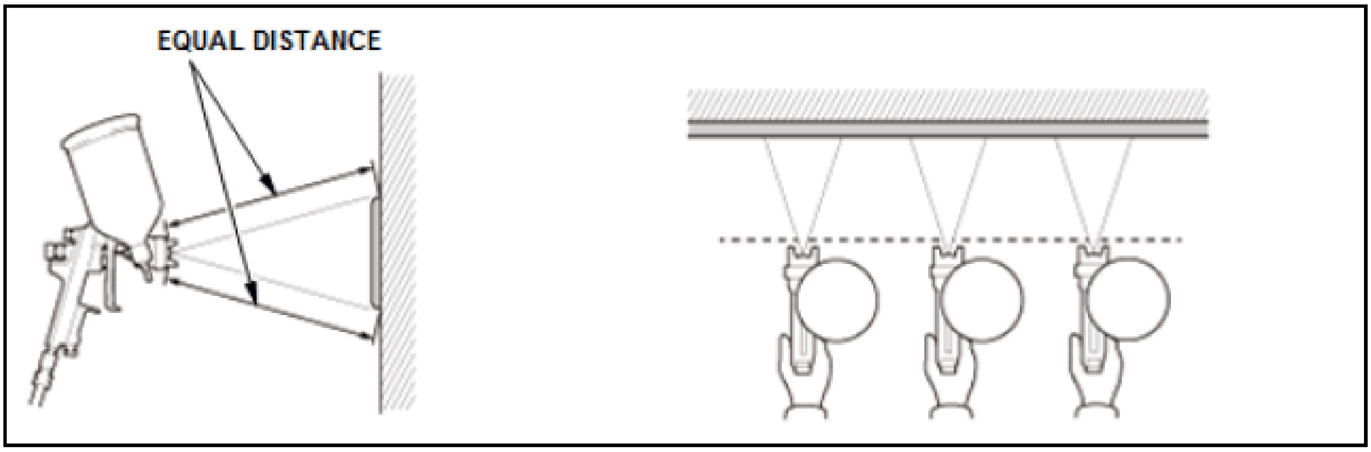


SPRAY GUN OPERATION

Spray Angle

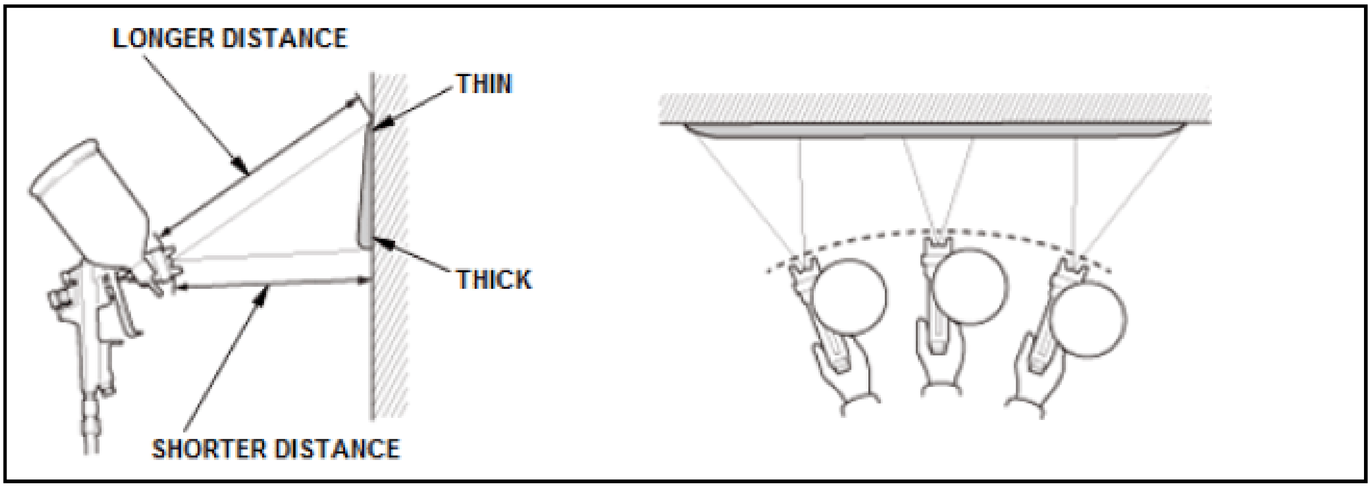
- Hold the spray gun so that the nozzle is perpendicular to the painting surface and move the gun in a parallel direction.
- The spray gun is must be perfectly level with the surface being painted, so that the spray distances from the top and bottom of the nozzle tip are the same. If these distances are uneven, an uneven paint film thickness will result.

Correct Operation



EQUAL DISTANCE

Incorrect Operation



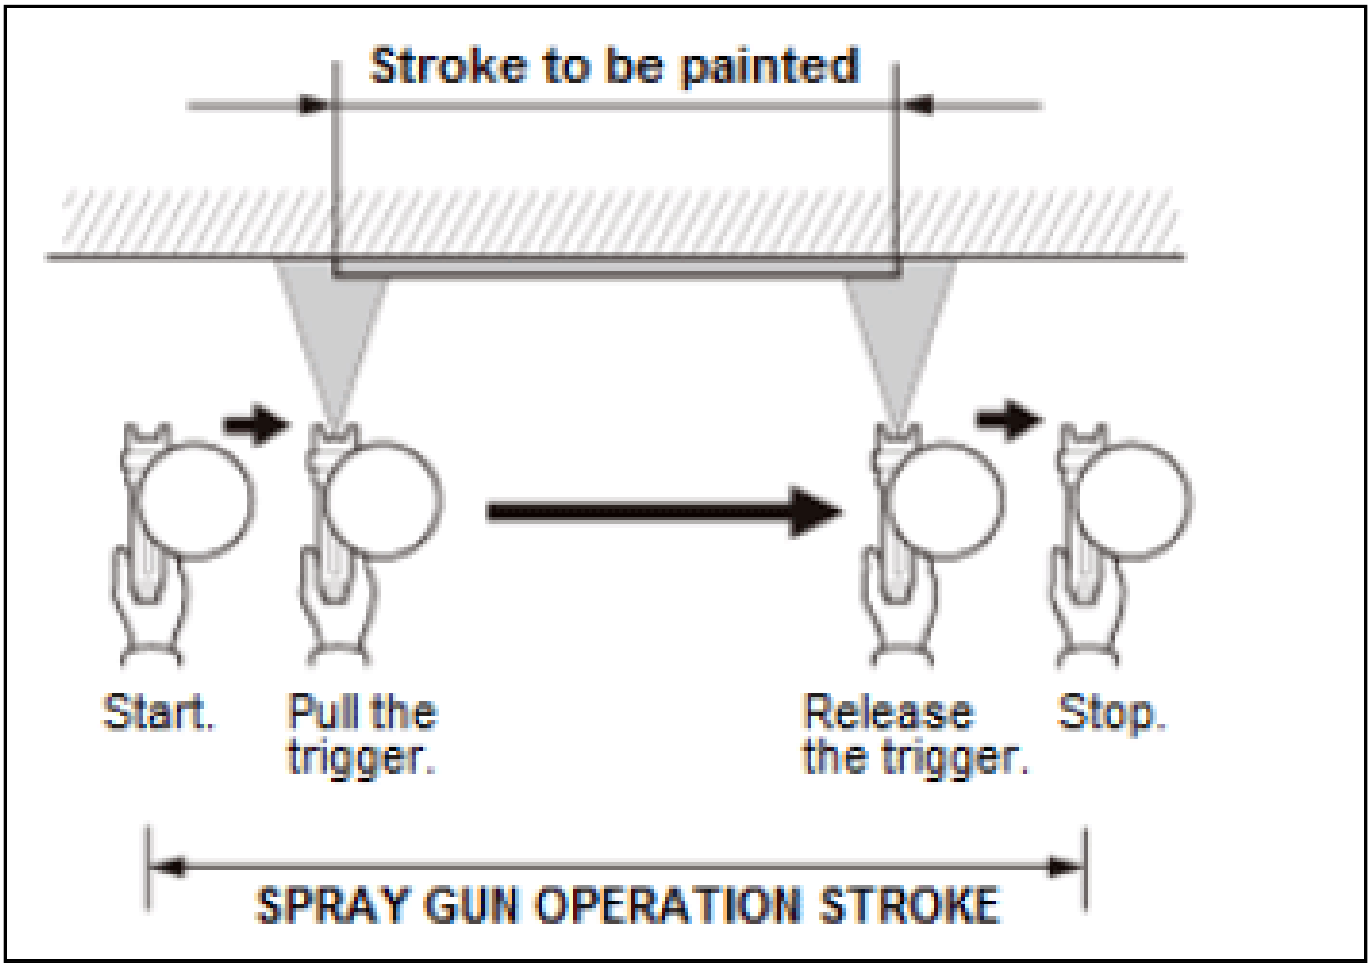
LONGER DISTANCE
THIN
THICK
SHORTER DISTANCE

Operation Speed of Spray Gun

Move the spray gun at a constant speed to avoid paint film unevenness (thick and thin areas).

Trigger Operation

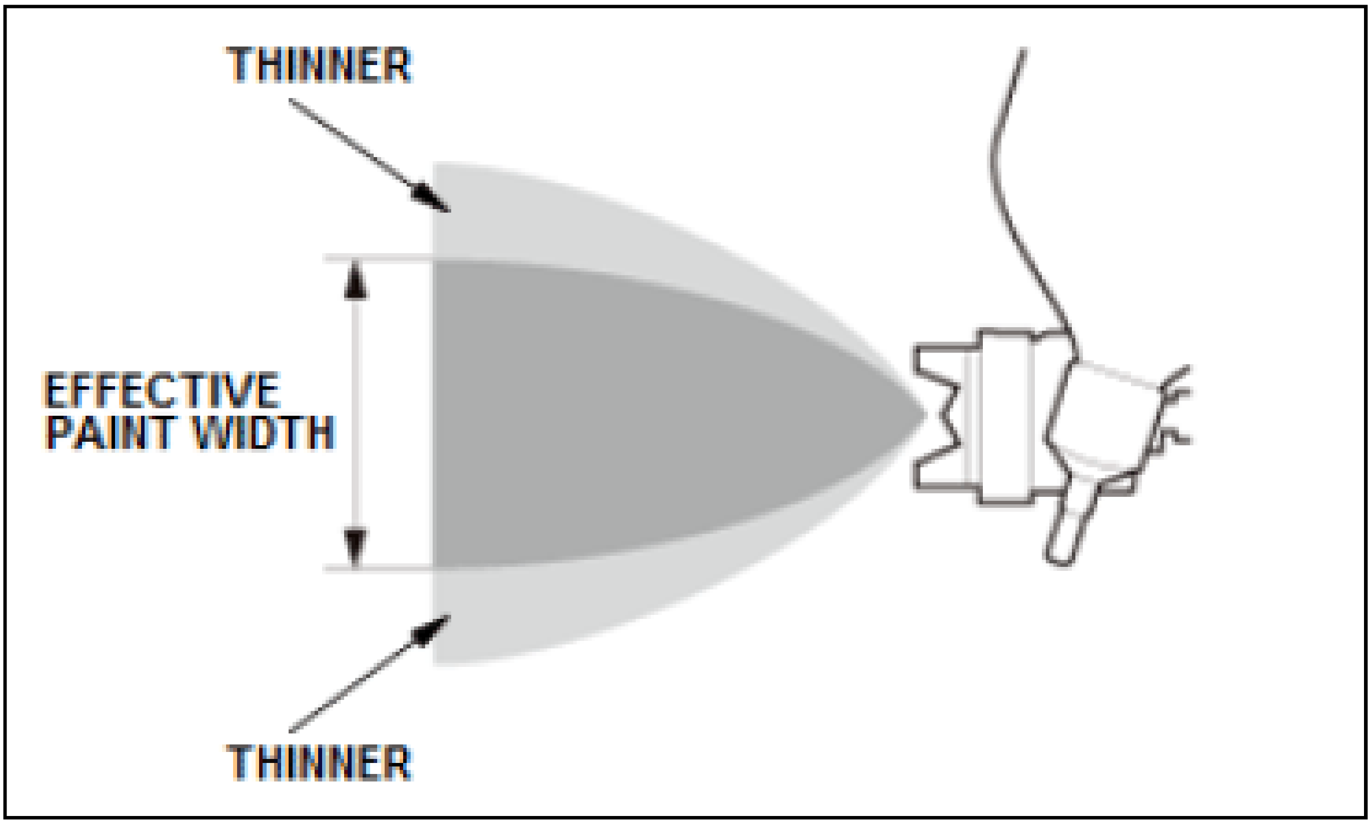
The travel distance of spray gun (stroke) should be approximately 5-10 cm (2-4 in) longer than the actual painting target. At the end of each pass, release the trigger for a moment and pull again before starting the reversed direction of travel.



Stroke to be painted
Start.
Pull the trigger.
Release the trigger.
Stop.
SPRAY GUN OPERATION STROKE

Overlapping Passes

Spray patterns will have an effective coating area. Outside the effective coating area, less paint will be applied, causing a thinner paint film. Maintain an even paint thickness by overlapping the spray gun passes.

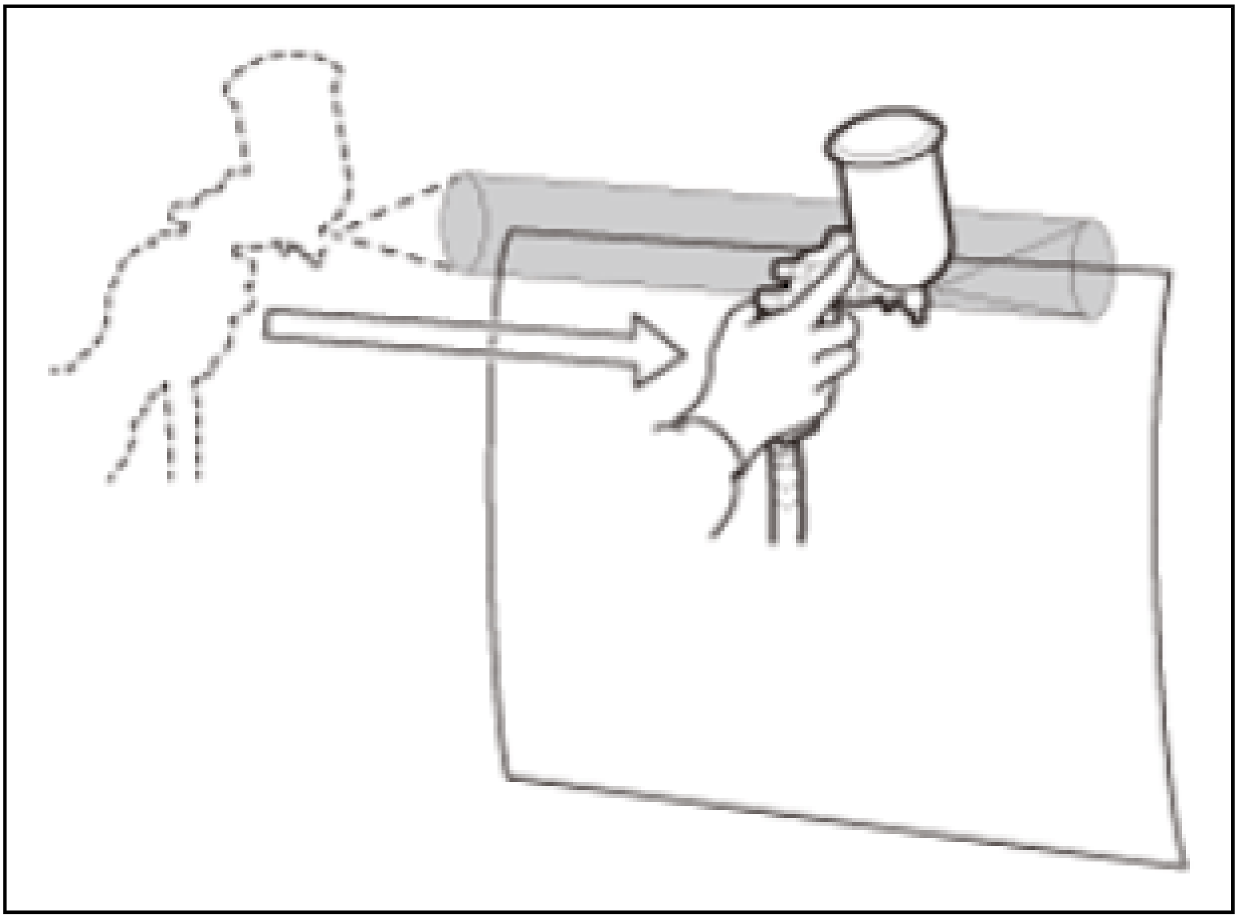


THINNER
EFFECTIVE PAINT WIDTH
THINNER

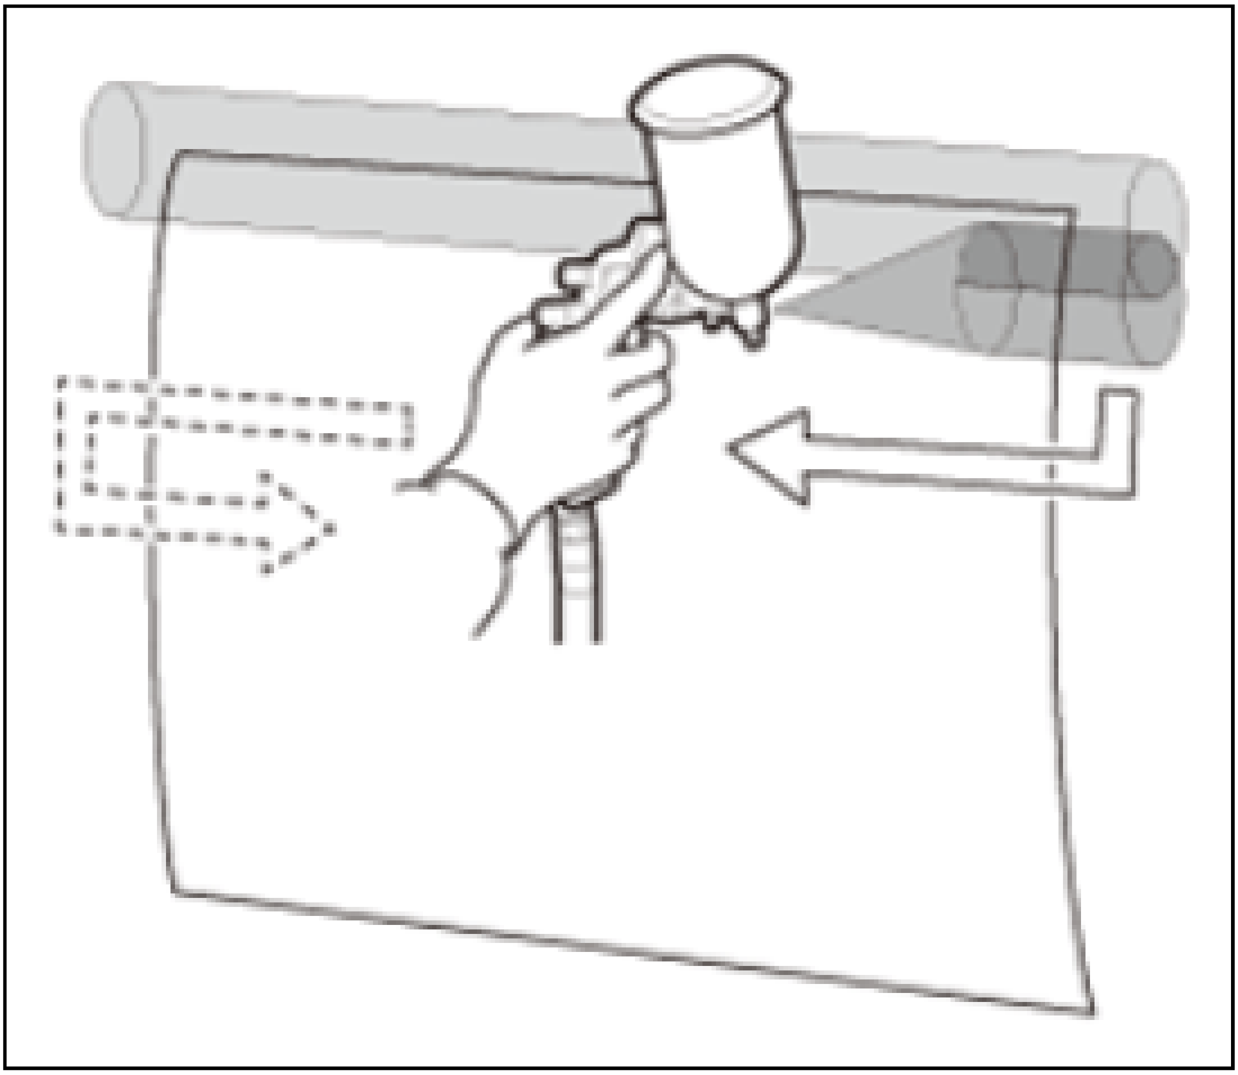
Single And Double Coating

1. Hold the spray gun at the left side of the surface being painted. Set the starting point of your spray pass outside the surface by a distance of 1/3 to 1/2 of the pattern diameter. Then spray horizontally towards the right side of the surface all the way to the

edge.



2. After step 1, move the paint gun lower to the area where the effective area of the pattern will overlap (1/3 to 1/2 of the pattern diameter). Then spray horizontally from the right to the left. This painting method is known as single coating.



3. In comparison, if the same area is overlapped with multiple paint coats, it is called double coating.

Gradation

To apply thinner paint coats towards the outside of the repair center by creating a radial motion with your wrist.

Patch Paint

When painting a large multi-panel surface, follow the gradation coating method to avoid making the overlapped area of paint too thick.

SPRAY GUN OVERVIEW

Structure And Function

One of the most important tools used in collision and paint repair is the spray gun. Their precision construction and proper care have a great impact on the results of paint application and finish quality This chapter includes details about spray gun controls, types, and operation.

Pattern Adjustment Screw

When this screw is rotated fully clockwise, air flows only from the center of cap (T) and the spray pattern would be circular. As the pattern adjustment screw is turned counter clockwise, air flows through the angle hole (R) and support hole (S). The spray pattern will gradually become more oval.

Fluid Adjustment Screw

Turning the fluid adjustment screw fully clockwise shuts off paint flow to the gun. Turn the screw counter clockwise to gradually increase to amount of paint that mixes with the air supply.

Air Valve and Needle Valve

As the trigger is gradually pulled, the air valve begins to open and allows only air to flow through the spray gun. Pulling the trigger further operates the needle valve, allowing paint to begin flowing with the air. This two-stage trigger operation improves paint atomization any time the gun is being used.

Spray Gun Air Cap

The air cap has precision-drilled holes that direct high velocity compressed air. These create a suction that draws paint into the gun and discharges it from the paint nozzle (N). The paint is then atomized and discharged through the area (C) by the force of the air and placement of the holes.

Types

Categorized by the paint supply method:

Paint Supply Method	Pro and Cons
Gravity Feed System (Cup on Top) The paint cup is located above the paint gun nozzle. The paint is supplied by gravity acting on the paint and suction at the nozzle tip.	- Suitable for detailed and precise paint work because cup angle can be readily adjusted. - The cup's capacity is generally 500 mL (16.90 fl oz) or less, so the cup requires frequent refilling. Because of the small cup, gravity fed guns are better suited to spot painting rather than large surfaces. - Paint viscosity has little impact on fluid (paint) flow rate. - Gun must be hung by its hook when not in use because the cup on top makes it unstable.
Suction Feed System (Cup on Bottom) The paint cup is located beneath the paint gun nozzle. The paint is supplied by suction at the nozzle tip alone.	- Larger paint cups generally require fewer refills, so the gun is more suitable for painting large areas. - Larger paint cup capacity makes the gun heavier. - Paint viscosity does impact fluid (paint) flow rate.

Categorized by the nozzle diameter:

Diameter	Use	Characteristics
1.0-1.6 mm (0.040-0.063 in)	Topcoat	High atomization performance, relatively thin and homogeneous paint film suitable for topcoats.
1.5-2.0 mm (0.060-0.080 in)	Basecoat	High discharge rate, suitable for basecoats, such as primer surfacer, which tend to have relatively higher viscosities.

Categorized by the spray pattern:

There are several different spray patterns based on the nozzle diameter and air cap hole etc.

Spray Pattern	Atomization	Paint Film Thickness	Characteristics and Applicable Paint
Tulip Type			- High atomization ensures even application of paint coats. - Suitable for dual component paints such as polyurethane paint, which dries relatively slowly and metallic paint which can easily be applied unevenly.
Semi-Tulip Type			- For general purpose applications. - Applies a greater film thickness than the tulip type. - Suitable for dual component solid and clearcoat polyurethane paint.
Straight Type			Suitable for slower drying lacquer type paints and metallic paint which can easily be applied unevenly

GENERAL INFORMATION

EXTERIOR PARTS REMOVAL/INSTALLATION

NOTE:

- If the bumper reinforcement beam or the door beam is damaged, such as being bent or cracked, it cannot be repaired and must be replaced.
- To adjust the doors, refer to BODY DIMENSIONS (HYBRID) for the door position adjustment procedure.
- The mounting bolts for aluminum alloy panels and parts are special corrosion-resistant bolts and must be replaced prior to installation.
- Apply spot sealer to the mating surfaces of the front fenders, hood, hood hinges, door hinges, fuel fill door hinge, and tailgate hinges.
- When installing the rivnuts, apply sealer to prevent rust.
- Check the hood, the front fenders, the doors, and the tailgate positions; refer to the EXTERNAL PARTS FITTING POSITIONS .
- Apply sealant around the tailgate hinges .

SOFT CHIPPING GUARD PRIMER COATING AREAS

NOTE:

- **The removal of paint and undercoating by stone chips immediately exposes metal to the atmosphere , causing it to oxidize .**
- **For repair in these areas, please apply an additional coat of primer-surfacer in the shaded areas to provide additional stone chip protection.**

GENERAL INFORMATION

NOTE: **Before performing any collision repairs and body work, carefully read the following precautions and notes.**

Supplemental Restraint System (SRS) Service Precautions - Information

- **Component Location Index**
- **Precautions And Procedures**

Precautions For Body Repair

- Avoid any strong impact with a hammer or other tools when doing repair work around the locations of the SRS components (SRS unit and impact sensors). Do not apply heat to these areas with a torch, etc.
- Do not apply heat of more than 212B°F (100B°C) when drying painted surfaces anywhere around the SRS components locations.

SRS Component Replacement/Inspection After Deployment - Information

-

Electric Powertrain - Information

- **Component Location Index**
- **Service Precautions**

Precautions For Body Repair

High temperatures may damage the battery module. When drying paint in a heated paint booth, make sure the temperature does not exceed 149B°F (65B°C).

WELDING CONDITIONS FOR ADHESIVE APPLICATION AREAS

In order to increase the stiffness in certain areas of the body (as indicated with a bold line), the adhesive used are applied to the sheet metal surface and jointed by spot welding.

Take note of the following items when you weld in areas that apply adhesives to replaced parts:

- Use the 3M 07333 adhesive or a commercially available equivalent.
- When the adhesive is applied continuously, apply a bead with a diameter of more than φ 3 mm (0.12 in).
- Apply the same number of spot welds as the mass production body.

NOTE: **See the adhesive manufacturers instructions for details.**

- If you cannot spot weld, MAG or MIG braze welding is acceptable.
- Do not apply adhesives on or near areas where MAG or MIG braze welding is being applied as the adhesive may ignite and burn.

Adhesive Application Areas For Roof Panel And Rear Pillar Gutter

General Information (Collision) - CR-V

GENERAL INFORMATION

Important features for Body Repair.

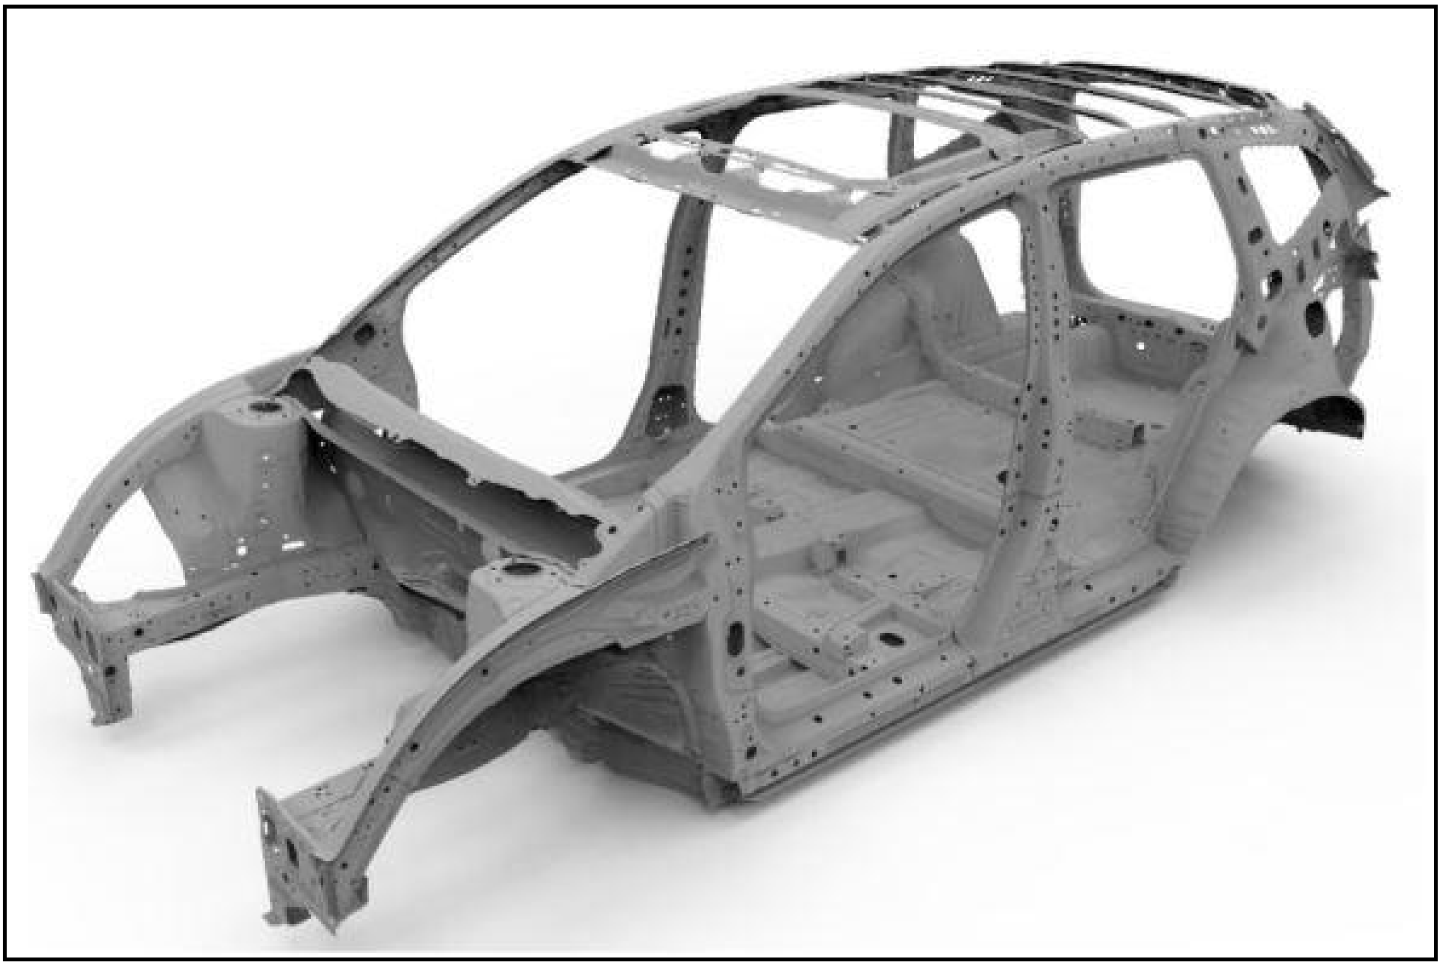
NOTE: **Before servicing and repairing the vehicles body work, read carefully these important feature about Body Repair listed below.**

1. Supplemental Restraint System (SRS) Service Precautions - Information
    - Refer to Component Location Index .
    - Refer to Precautions And Procedures .

   Precautions for Body Repair

   Do not apply heat of more than 212B°F (100B°C) when drying painted surfaces anywhere around the SRS components locations.
2. Refer to SRS Component Replacement/Inspection After Deployment .
3. Refer to 12 Volt Battery Terminal Disconnection and Reconnection .
4. **Identification Number Locations - Information**
5. Refer to Lift And Support Points .
6. **Wheel Alignment - Information**

OVERVIEW OF BODY FEATURES



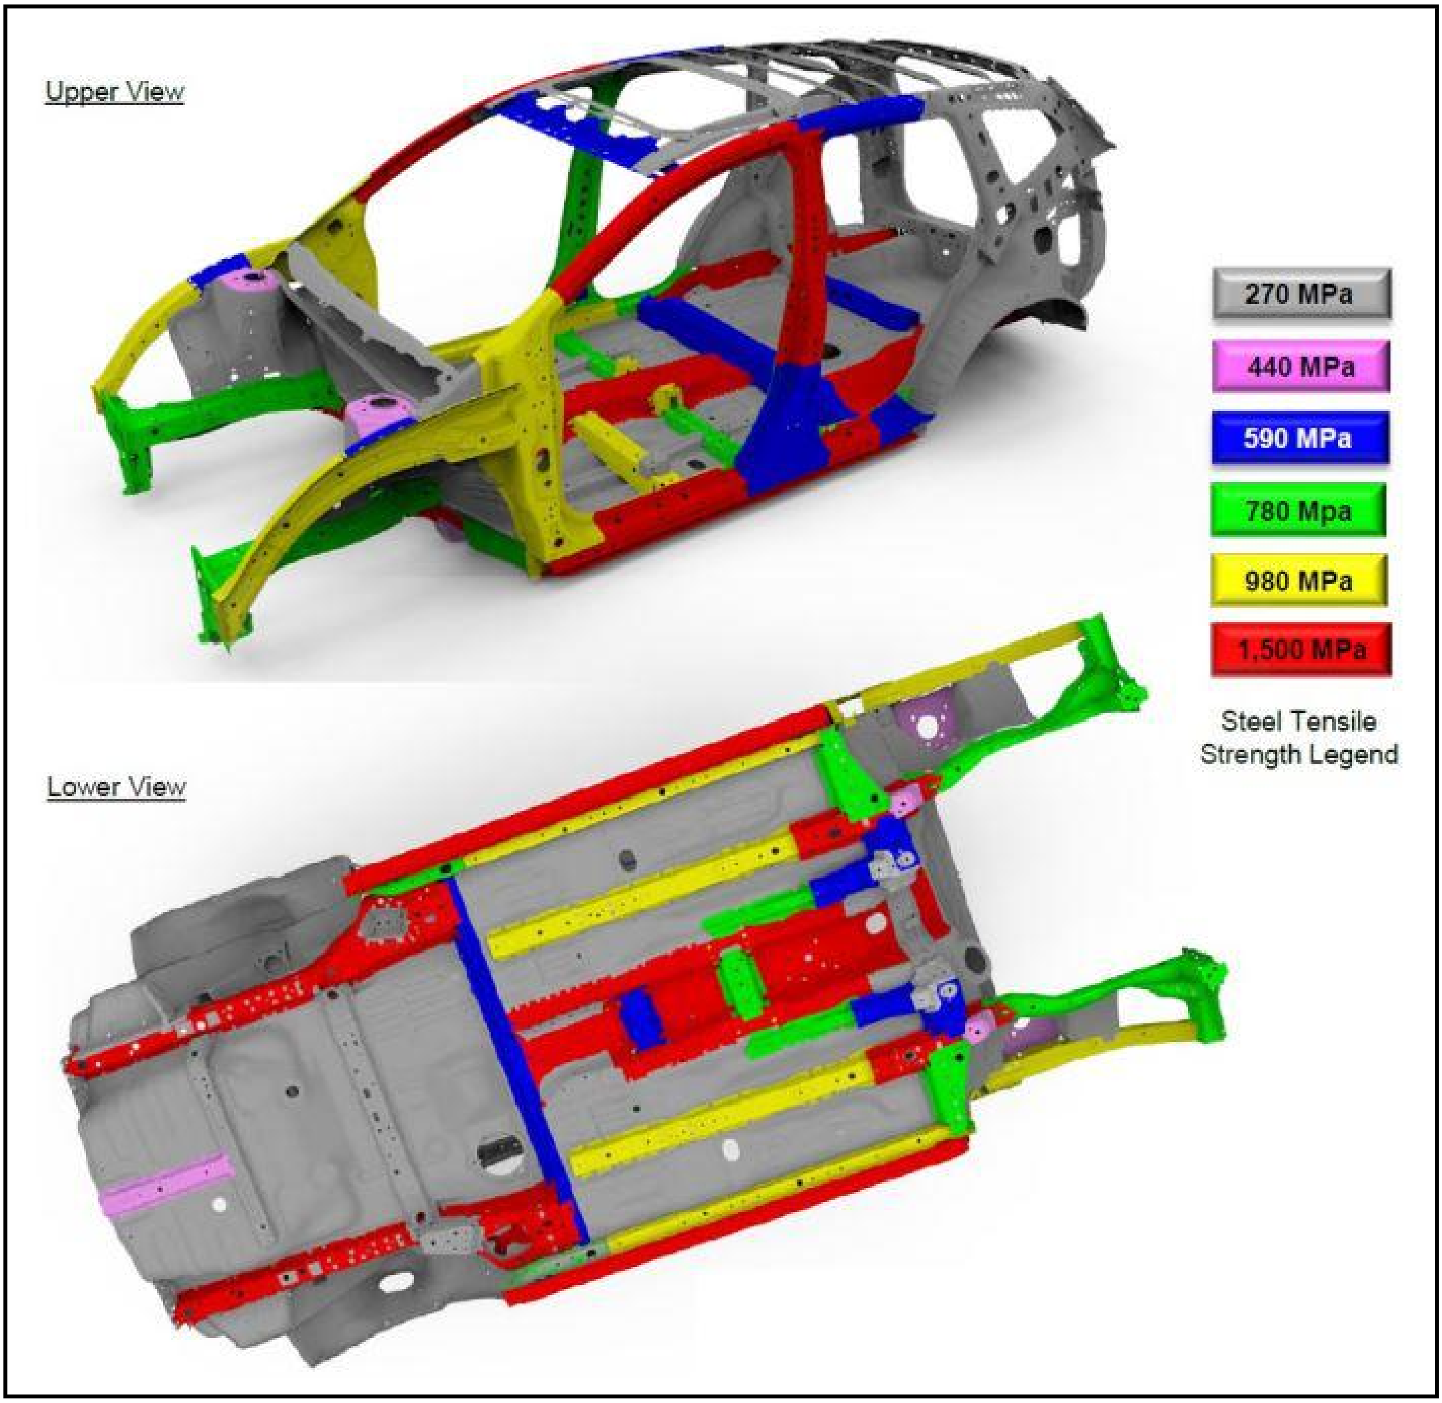
- Next-Generation Advanced Compatibility Engineering™ (ACE™) body structure

- Body construction using extensive amounts of high-tensile-strength steel (HSS), including 26% ultra-high-strength steel (UHSS - 980 MPa and higher)
- Weight-saving 1500 MPa rear frame rails with soft zones for crash performance that may be sectioned in specified areas during collision repairs.
- Bolt-on resin composite front bulkhead assembly

BODY TECHNOLOGY

BODY CONSTRUCTION AND HIGH-STRENGTH STEEL CONTENT

- Steel parts are color coded based on their tensile strength in megapascals (MPa).
- High-strength steel (HSS) is defined as any steel with a tensile strength of 340 MPa or higher.
- Ultra-high-strength steel (UHSS) is defined as any steel with a tensile strength of 980 MPa or higher.
- Steel repair and welding procedures vary depending on the tensile strength of the parts involved.

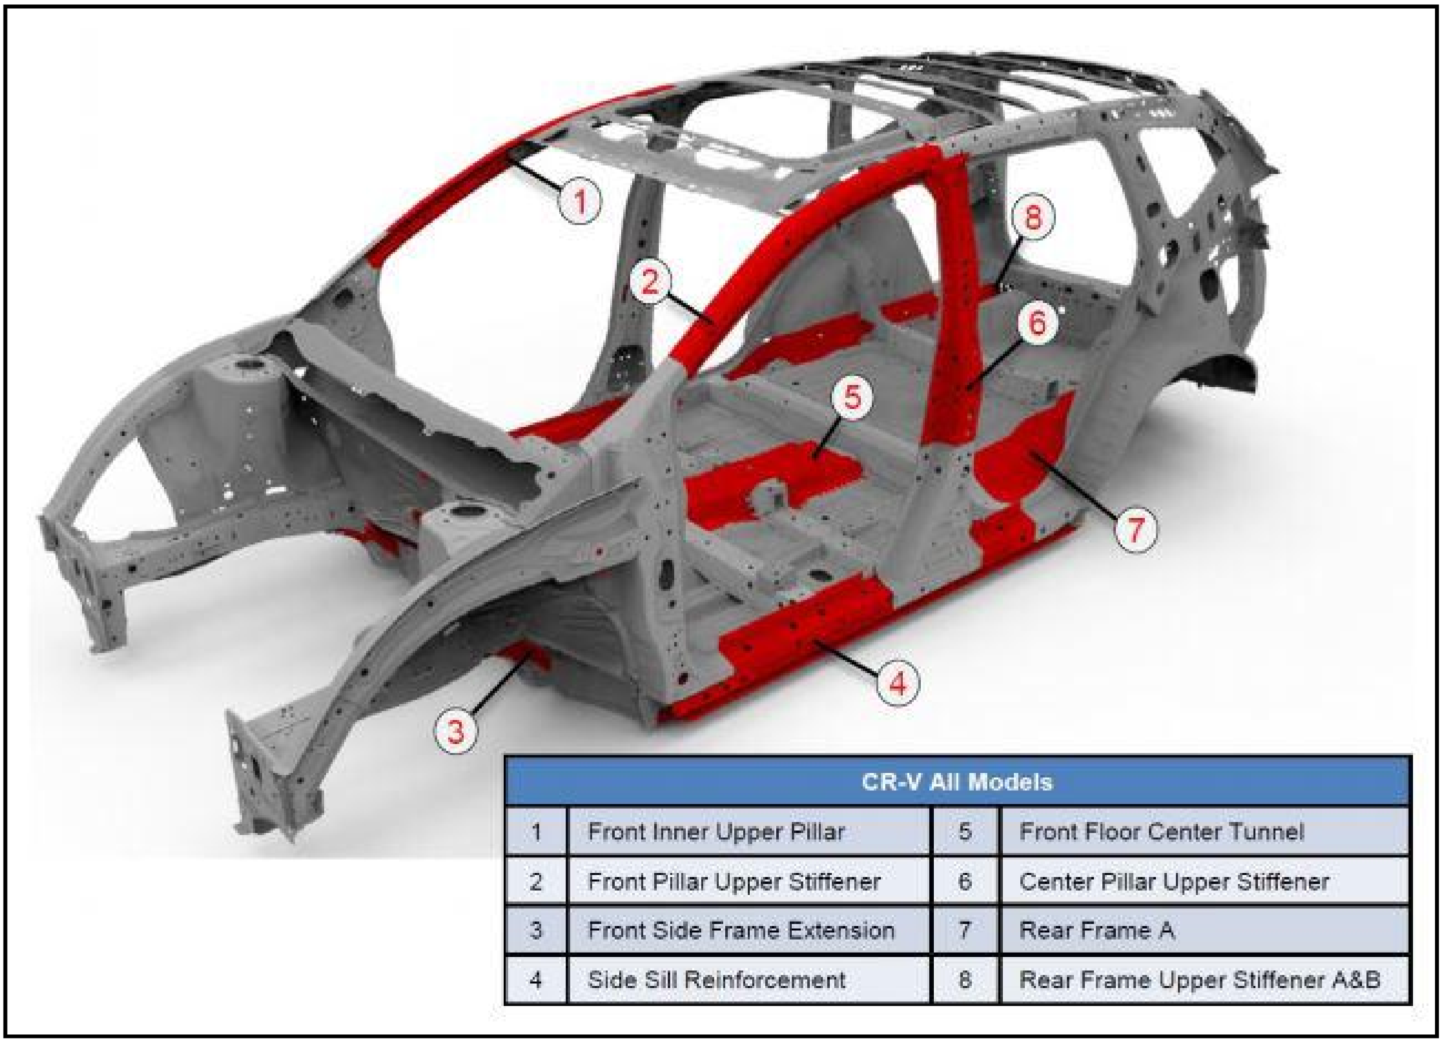


NOTE: **These illustrations are for general reference only. Some body parts are constructed from multiple layers of different tensile strength steels. Always refer**

to the appropriate structural information for specific steel tensile strength information.

1500 MPa (HOT STAMP) STEEL LOCATIONS

1500 MPa steel is stronger than ordinary steel, so it can help protect vehicle occupants while reducing overall vehicle weight to improve fuel efficiency.

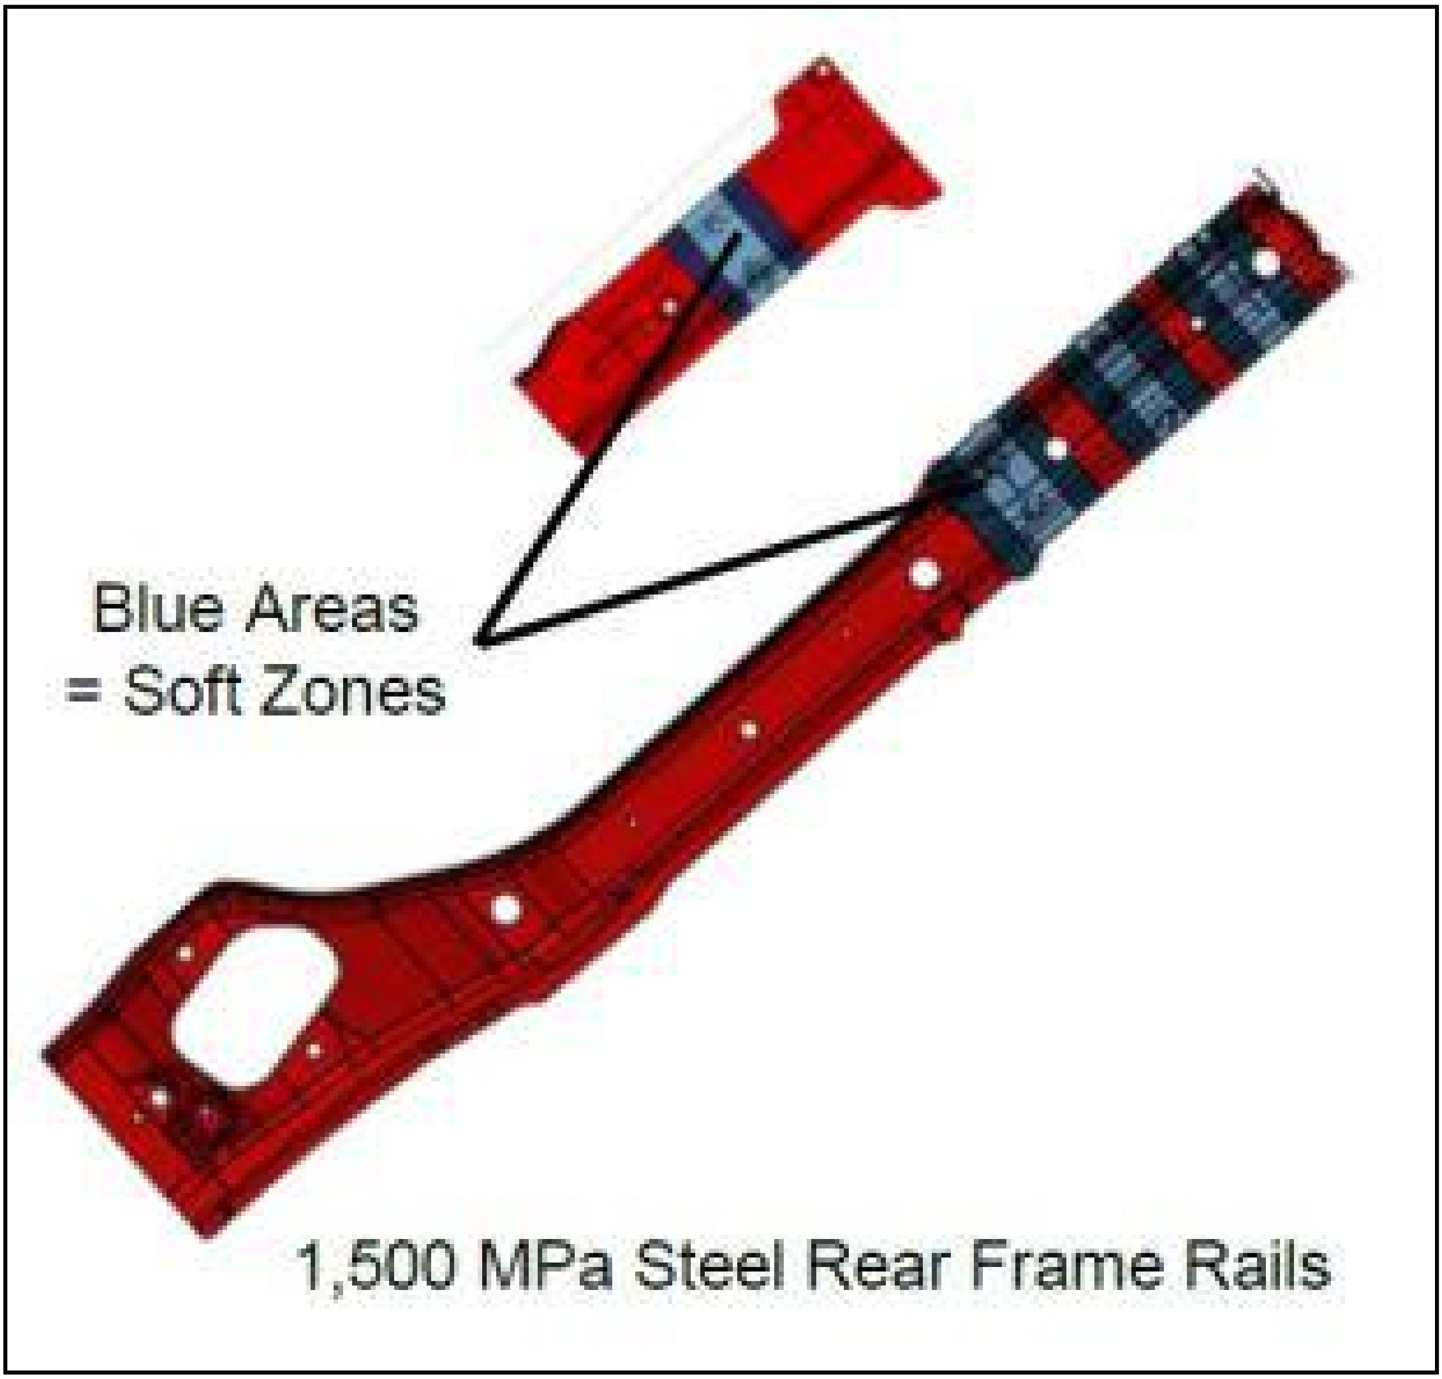


CR-V All Models			
1	Front Inner Upper Pillar	5	Front Floor Center Tunnel
2	Front Pillar Upper Stiffener	6	Center Pillar Upper Stiffener
3	Front Side Frame Extension	7	Rear Frame A
4	Side Sill Reinforcement	8	Rear Frame Upper Stiffener A&B

SECTIONABLE 1500 MPa STEEL REAR FRAME

All models use weight-saving 1500 MPa steel rear frame rails with soft zones for impact crush control.

- If rear frame damage is suspected, measure the entire vehicle using a three-dimensional measuring system.
- If the rear frame is damaged, replace the affected rear frame(s) as necessary depending on the damage.
- Because of a design change to the rear frame soft zones, the rear portion of the rear frame may be sectioned and replaced as specified in the BRM Rear Floor/Rear Frame Replacement procedure.
- For further repair information, refer to the appropriate service information.



Blue Areas
= Soft Zones
1,500 MPa Steel Rear Frame Rails

ALUMINUM PARTS & REPAIRABILITY

The front and rear bumper beams are constructed from aluminum alloy.

Front and Rear Bumper Beams

Repairability Issues

- Do not repair bumper beams if they are damaged.
- To prevent galvanic corrosion, some fasteners for aluminum parts are considered one-time use and must be replaced if removed.

RESIN COMPOSITE FRONT BULKHEAD

This vehicle has a lower bulkhead assembly constructed of resin composite material.

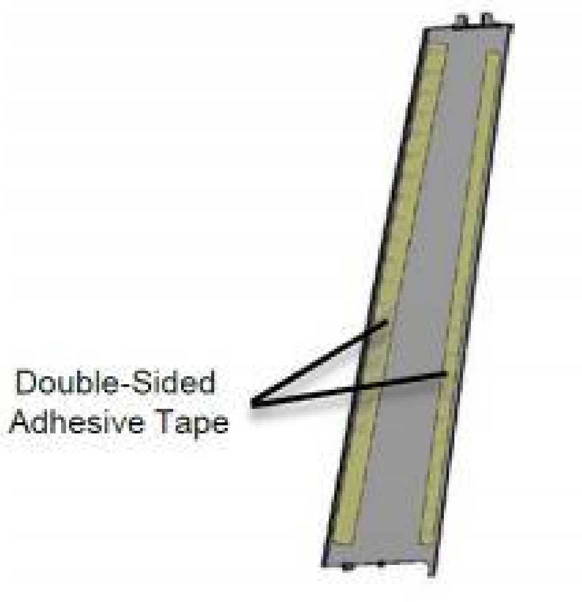
- The bulkhead design improves engine compartment access during factory assembly and service.
- The front bulkhead is attached with multiple bolts and is sold and replaced only as a complete assembly.
- The cooling fans, radiator, A/C condenser, hood lock, outside air temperature sensor, and related piping/ components are attached to the front bulkhead using molded-in M6/M8 threaded inserts.
- Over-torquing or using power tools may break these inserts loose, requiring front bulkhead replacement.
- A damaged bulkhead must be replaced, not repaired.
- For more information, refer to **Exterior Parts Removal/Installation**.

Resin Composite Front Bulkhead

DOUBLE-SIDED ADHESIVE TAPE EXTERIOR PARTS ATTACHMENT

For better appearance/function, the following exterior parts are attached using double-sided adhesive tape instead of the traditional plastic clips:

- Front door sash outer trim
- Rear door sash outer trim
- Rear door wheel arch protector



Front Door Sash Outer Trim

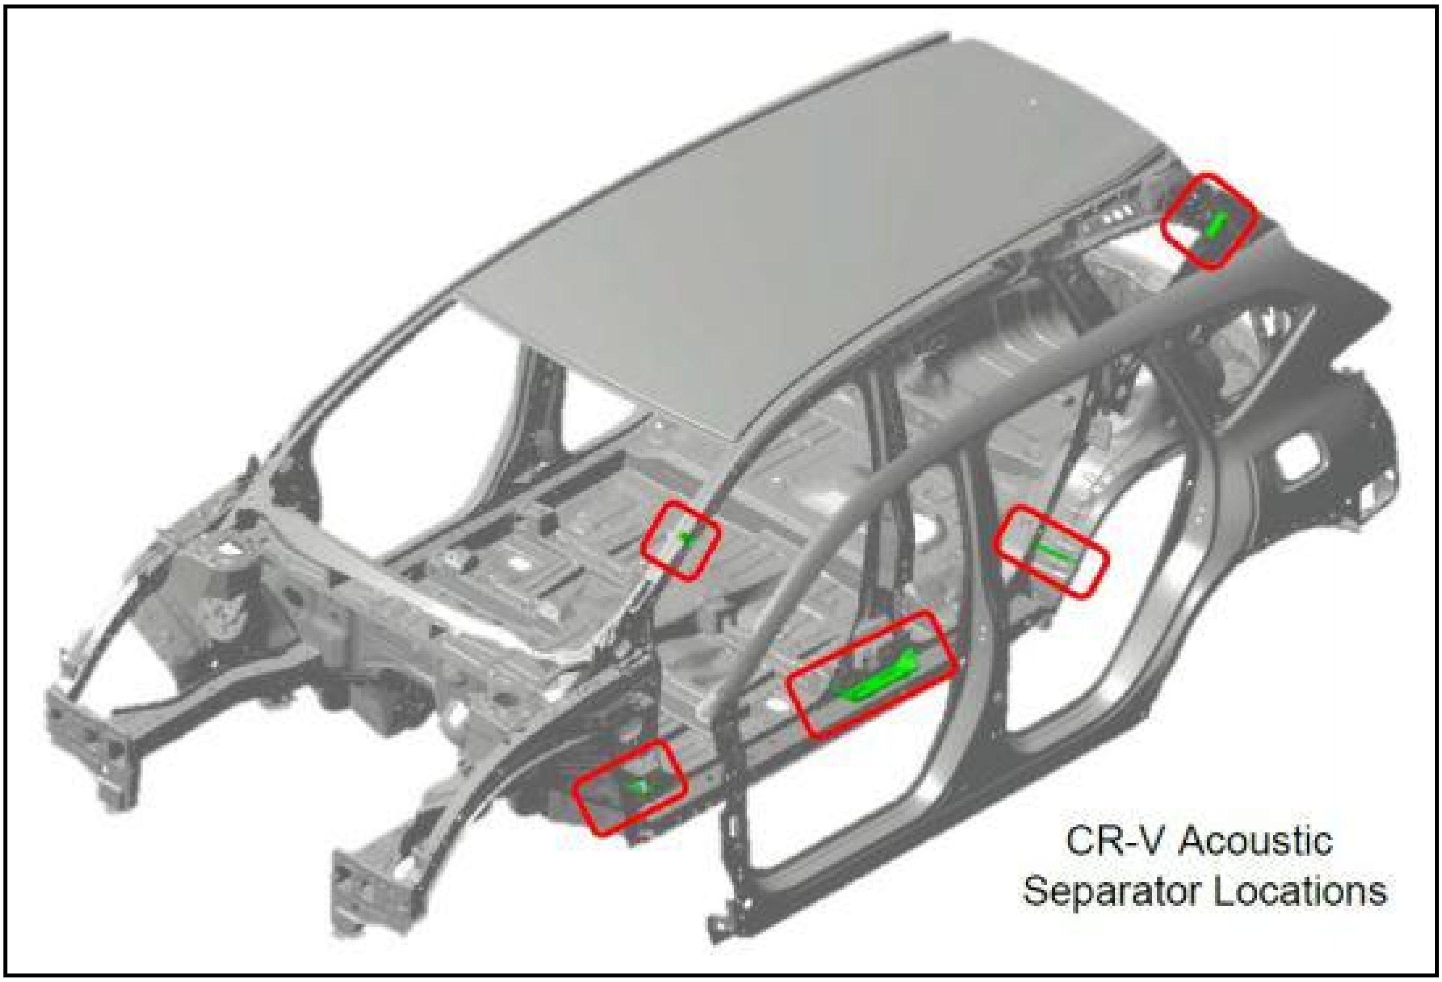
Rear Door Wheel Arch Protector

If these parts are removed, they **must** be replaced with new parts to ensure proper retention.

ACOUSTIC SEPARATOR LOCATIONS

A combination of molded, extruded, and tape acoustic separators are applied in various body locations.

- These are applied within the body pillars.
- Locations are shown in the diagram below.
- They are designed to block the noise paths into the cabin from hollow body cavities.
- Repairs are similar to previous models using commercially-available products.
- Refer to the appropriate service information for specific procedures.



POWER TAILGATE INFORMATION

EX-L and Touring trim levels include a spindle-type power tailgate.

- The motor and actuator are integrated into the drivers side tailgate support strut for weight reduction.
- The Touring trim level also includes a hands-free feature that is activated using a kicking motion under the rear bumper.
- Until it is reset, the power tailgate will not open or close automatically under the following conditions:
    - The battery is disconnected, or the No. 18 BACKUP (10 A) fuse in the under-hood fuse/relay box is removed while the tailgate is operating.
    - Certain power tailgate components have been replaced.
- Refer to Resetting the Power Tailgate Control Unit in the service information.

EXTERIOR PARTS REMOVAL/INSTALLATION

NOTE:

- To adjust the doors in or out, replace the mounting bolts (A) with adjusting bolts; refer to the appropriate parts information for the necessary adjusting bolts.
- Apply spot sealer to the mating surfaces, then install the front fenders, the hood, the doors, the fuel fill door, the tailgate, and the hinges.
- When tightening the battery set base stay mounting bolts, tighten in order of the number shown in the illustration.
- Check the hood, the front fenders, the doors, and the tailgate positions; refer to the External Parts Fitting Positions .
- Apply sealant around the tailgate hinges ; refer to Roof Panel/Rear Pillar Gutter And Rear Panel .

Differential Service Specifications - CR-V

STANDARDS AND SERVICE LIMITS (2020-21)

REAR DIFFERENTIAL

Item	Measurement	Qualification	Standard or New	Service Limit
Rear differential fluid	Capacity	Fluid change	1.2 L (1.3 US qt)	-
		Overhaul	1.5 L (1.6 US qt)	-
	Fluid type	B	Use genuine Honda DPSF-II.	

Gear & Differential Service Specifications - CR-V (Hybrid)

GEAR & DIFFERENTIAL

Item	Measurement	Qualification	Standard or New	Service Limit
Transmission fluid	Capacity	Fluid change	2.4 L (2.5 US qt)	-
		Overhaul	3.5 L (3.7 US qt)	-
	Fluid type	B	Honda ATF DW-1	

Item	Measurement	Qualification	Standard or New	Service Limit
Hydraulic pressure	Line pressure	At 1, 500 rpm in D	750-850 kPa (7.65-8.67 kgf/cm 2, 108.8-123.3 psi)	700 kPa (7.14 kgf/cm 2, 101.5 psi)
		At 3, 000 rpm in D	250-310 kPa (2.55-3.16 kgf/cm 2, 36.3-44.9 psi)	-
	Over drive clutch pressure	At 1, 500 rpm in D	756-844 kPa (7.71-8.61 kgf/cm 2, 109.7-122.5 psi)	700 kPa (7.14 kgf/cm 2, 101.5 psi)
Over drive clutch	Clearance between clutch end-plate and top disc	B	1.2-1.4 mm (0.047-0.055 in)	-
Differential pinion gear	Backlash	B	0.05-0.15 mm (0.0020-0.0059 in)	-
Transfer assembly	Transfer gear backlash	B	0.06-0.16 mm (0.0024-0.0063 in)	-
	Total starting torque	B	2.85-7.40 N.m (29.1-75.5 kgf.cm, 25.2-65.5 lbf.in)	-

☒	Replace

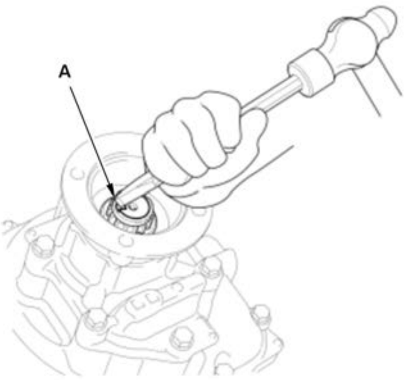
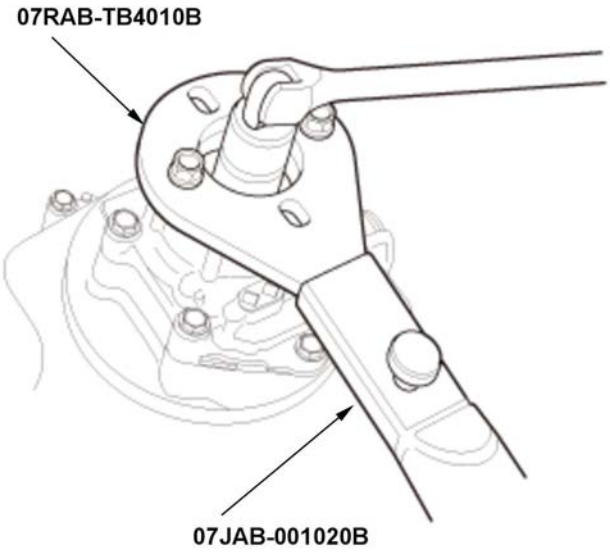
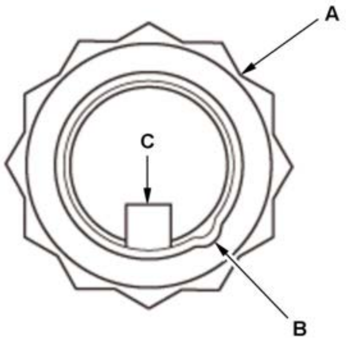
1. Rear Differential Front Mount - Remove
2. Harness Bracket A - Remove
3. Rear Differential Harness - Remove
4. Harness Bracket B - Remove
5. Harness Bracket D - Remove
6. Filler Plug - Remove
7. Drain Plug - Remove
8. Sensor Cover - Remove
9. Rear Differential Fluid Temperature Sensor - Remove
10. Rear Differential Fluid Pressure Sensor - Remove
11. Rear Differential Solenoid Valve Connector Assembly - Remove
12. Rear Differential Pump Motor - Remove
13. Pump Drive Joint - Remove (For Some Models)
14. Locknut - Remove



1. Pry up the stake on the locknut (A) from the groove of the clutch guide shaft, making sure the tab completely clears the groove to prevent damaging the clutch guide shaft.



2. Install the companion flange holder and the holder handle on the companion flange.



3. Loosen the locknut (A) counterclockwise so its tab (B) comes out from the groove (C) in the clutch guide shaft.

	4. Tighten the locknut (A) until its tab (B) aligns with the groove (C). 5. Clean any dirt from inside the groove in the clutch guide shaft, then loosen the locknut.

15. Spring Washer - Remove
16. Back-Up Ring - Remove
17. Companion Flange - Remove

	1. Remove the companion flange (A) with a commercially available puller.

18. Oil Seal - Remove
19. Oil Pump Cover - Remove
20. Fluid Strainer - Remove
21. 8 x 10 mm Dowel Pins - Remove
22. Oil Pump Case - Remove
23. 8 x 10 mm Dowel Pins - Remove
24. Baffle Cover - Remove
25. Differential Clutch Assembly - Remove
26. 94.6 mm Shim - Remove
27. 32.3 mm Shim - Remove
28. Oil Pump Body Assembly - Remove
29. Rear Differential Solenoid Valve - Remove
30. 8 x 10 mm Dowel Pins - Remove
31. Oil Seals - Remove

Reassembly

NOTE:

- 📖 Where icon is shown, see below for further information.
- Apply a light coat of clean rear differential fluid on all O-rings before installation.

*1	For some models

1. Oil Seals - Install

	1. Install a new oil seal (A) even and flush with the machined edge of the differential carrier assembly using the 40 mm I.D. driver handle.

2. 8 x 10 mm Dowel Pins - Install
3. Rear Differential Solenoid Valve - Install
4. Oil Pump Body Assembly - Install
5. 32.3 mm Shim - Install
6. 94.6 mm Shim - Install
7. Differential Clutch Assembly - Install
8. Baffle Cover - Install
9. 8 x 10 mm Dowel Pins - Install
10. Oil Pump Case - Install

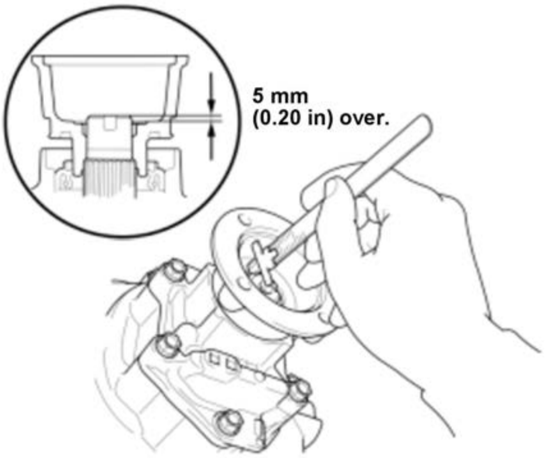
	1. Remove the dirt and oil from the sealing surfaces. 2. Apply liquid gasket (P/N 08718-0004 or 08718-0009) evenly to the sealing surface. 3. Install the component within 5 minutes of applying the liquid gasket. Make sure you seal the entire circumference of the bolt holes to prevent fluid leakage. **NOTE:** • If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply the new liquid gasket. • Allow it to cure at least 30 minutes after assembly before filling the differential with recommended fluid.

11. 8 x 10 mm Dowel Pins - Install
12. Fluid Strainer - Install
13. Oil Pump Cover - Install
14. Oil Seal - Install

 07746-0030100 A	1. Install a new oil seal (A) even and flush with the rear differential oil pump cover using the 40 mm I.D. driver handle.

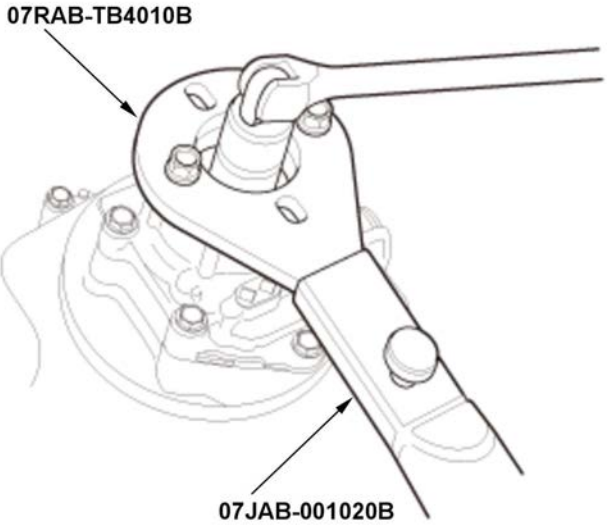
15. Companion Flange - Install

 07947-6890100 A	1. Set the companion flange (A) to the clutch guide shaft. 2. Drive on the companion flange using the 41.8 mm oil seal driver.



3. Check the length of clutch guide shaft as shown.

NOTE: Make sure to drive on the companion flange until 2 to 3 thread pitches of the clutch guide shaft appears.



4. Apply rear differential fluid to the used locknut.

5. Set the used locknut to the clutch guide shaft.

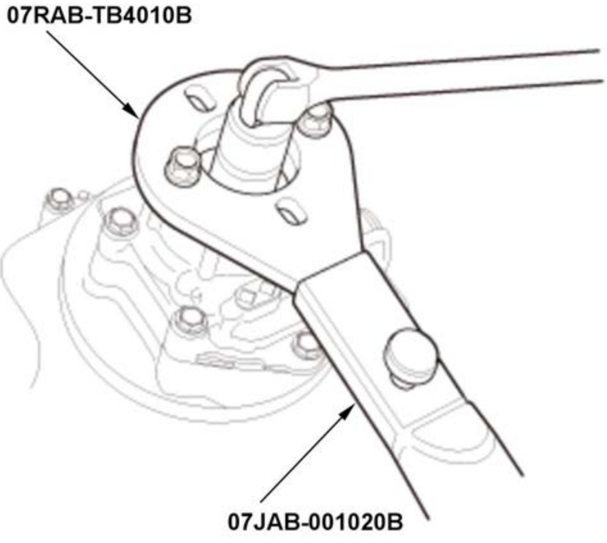
6. Install the companion flange holder and the holder handle on the companion flange.

7. Tighten the used locknut.

8. Remove the used locknut, the companion flange holder, and the holder handle.

9. Check the companion flange has been set to the bottom.

16. Back-Up Ring - Install
17. Spring Washer - Install
18. Locknut - Install



1. Install the companion flange holder and the holder handle on the companion flange.

2. Tighten the locknut to the specified torque.

	3. Stake the locknut tab (A) into the groove in the clutch guide shaft.

19. Pump Drive Joint - Install (For Some Models)
20. Rear Differential Pump Motor - Install
21. Rear Differential Solenoid Valve Connector Assembly - Install
22. Rear Differential Fluid Pressure Sensor - Install
23. Rear Differential Fluid Temperature Sensor - Install
24. Sensor Cover - Install
25. Drain Plug - Install
26. Filler Plug - Install
27. Harness Bracket D - Install
28. Harness Bracket B - Install
29. Harness Bracket A - Install
30. Rear Differential Harness - Install
31. Rear Differential Front Mount - Install

31. Rear Differential Front Mount - Install

REMOVAL AND INSTALLATION

AWD CONTROL UNIT REMOVAL AND INSTALLATION (AWD)

Removal

1. Rear Left Side Trim Panel - Remove
2. AWD Control Unit - Remove

	1. Turn the vehicle to the OFF (LOCK) mode. 2. Loosen the AWD control unit mounting bolts (A) and remove the AWD control unit (B). 3. Disconnect connector (C) by pushing the lock (D) and pulling up the lever (E); the connector disconnects itself.

Installation

NOTE:

- How to read the torque specifications .
- The AWD control unit must be initialized after replacement, otherwise the AWD with intelligent control system will not function.

1. AWD Control Unit - Install

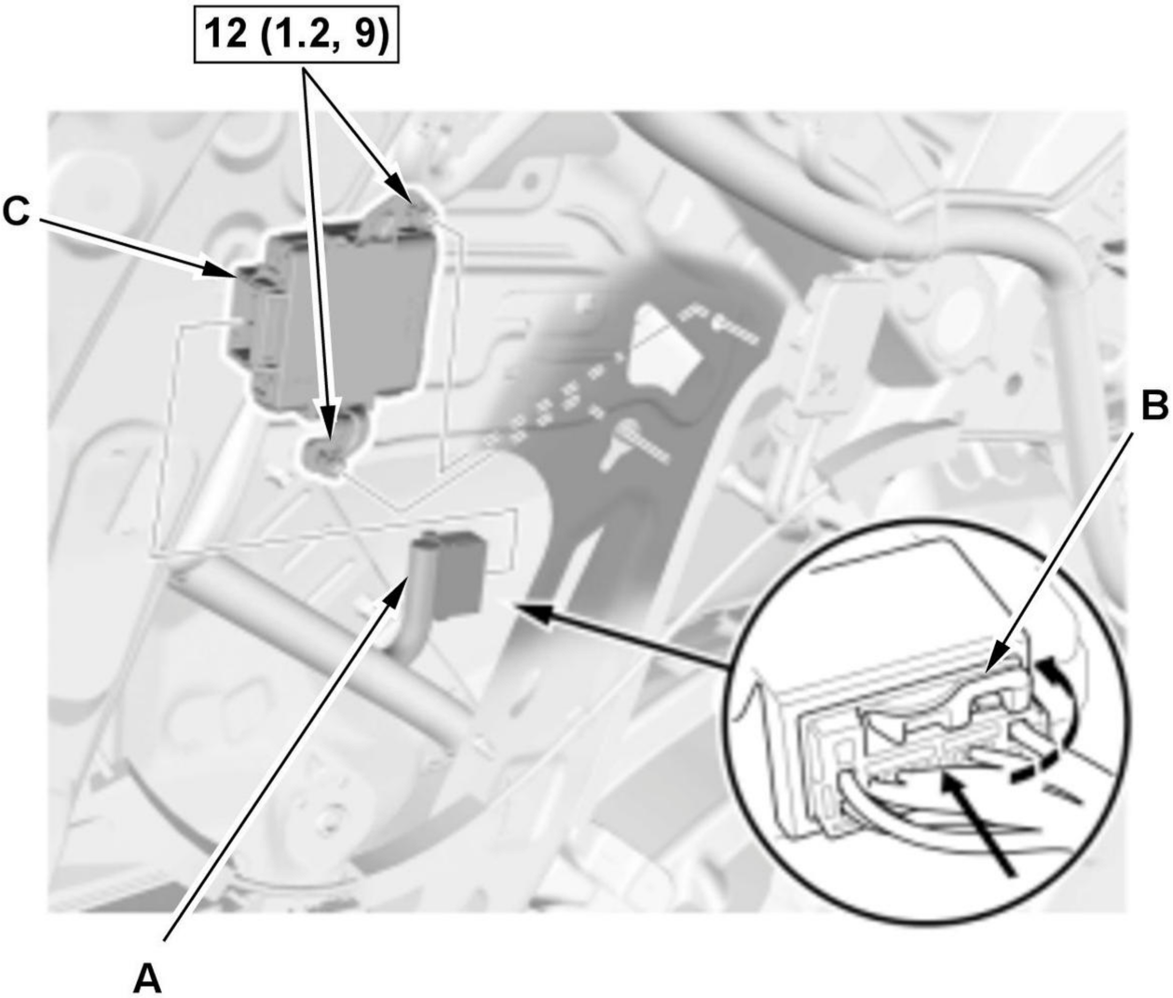

Fig. 5: AWD Control Unit (C) Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Align the connecting surface of the connector (A).
2. Pull down the lever (B) of the connector, then confirm the connector is fully seated.
3. Install the AWD control unit (C).

2. **Rear Left Side Trim Panel - Install**
3. **AWD Control Unit - Initialization**

☒	Replace

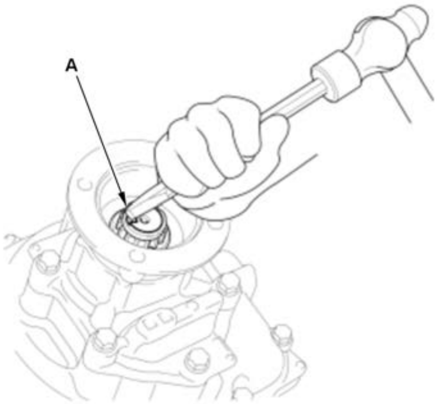
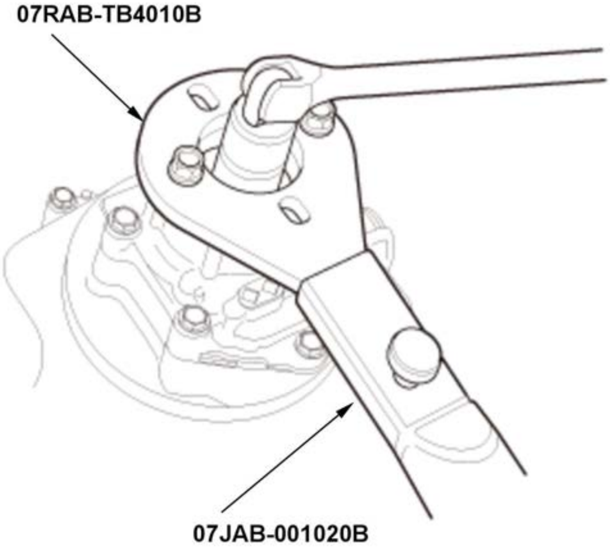
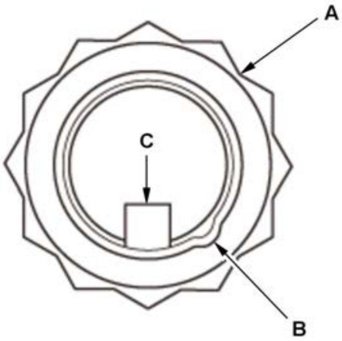
1. Rear Differential Subharness - Remove
2. Harness Bracket A - Remove
3. Harness Bracket B - Remove
4. Harness Bracket D - Remove
5. Filler Plug - Remove
6. Drain Plug - Remove
7. Oil Seal (Driveshaft Side) - Remove
8. Sensor Cover - Remove
9. Rear Differential Fluid Temperature Sensor - Remove
10. Rear Differential Fluid Pressure Sensor - Remove
11. Rear Differential Solenoid Valve Connector Assembly - Remove
12. Rear Differential Pump Motor - Remove
13. Pump Drive Joint - Remove
14. Locknut - Remove



1. Pry up the stake on the locknut (A) from the groove of the clutch guide shaft, making sure the tab completely clears the groove to prevent damaging the clutch guide shaft.



2. Install the companion flange holder and the holder handle on the companion flange.



3. Loosen the locknut (A) counterclockwise so its tab (B) comes out from the groove (C) in the clutch guide shaft.

	4. Tighten the locknut (A) until its tab (B) aligns with the groove (C). 5. Clean any dirt from inside the groove in the clutch guide shaft, then loosen the locknut.

15. Spring Washer - Remove
16. Back-Up Ring - Remove
17. Companion Flange - Remove

	1. Remove the companion flange (A) with a commercially available puller.

18. Oil Seal (Propeller Shaft Side) - Remove
19. Oil Pump Cover - Remove
20. Inner Rotor/Outer Rotor - Remove
21. Fluid Strainer - Remove
22. Oil Pump Case - Remove
23. Baffle Cover - Remove
24. Differential Clutch Assembly - Remove
25. Oil Pump Body Assembly - Remove
26. Rear Differential Solenoid Valve - Remove

Reassembly

NOTE:

- Where icon is shown, for further information see below.

- Apply a light coat of clean rear differential fluid on all O-rings, the clutch, and the bearings before installation.

Procedure

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

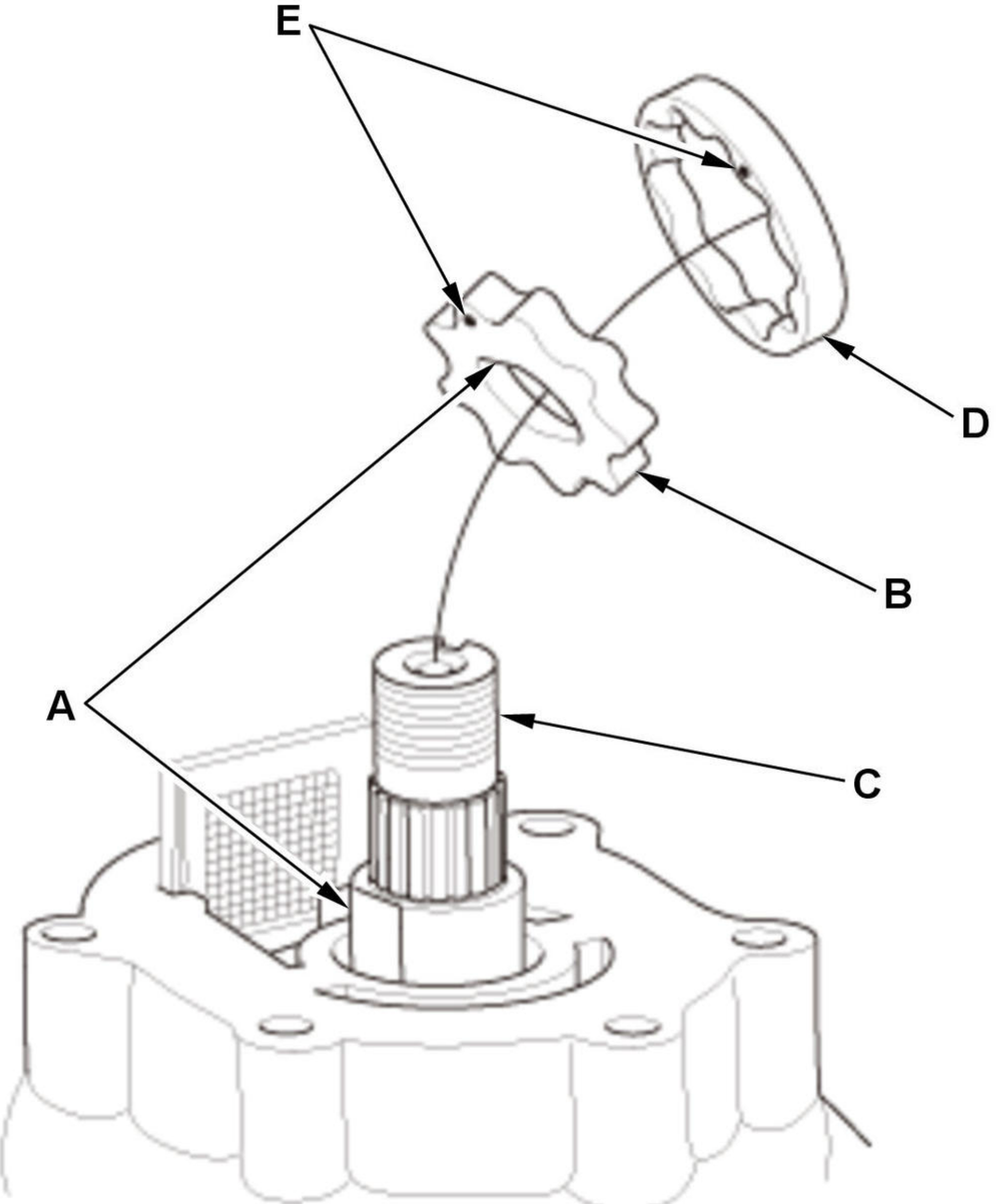
1. Rear Differential Solenoid Valve - Install
2. Oil Pump Body Assembly - Install
3. Differential Clutch Assembly - Install
4. Baffle Cover - Install
5. Oil Pump Case - Install

 Apply liquid gasket	1. Remove the dirt and oil from the sealing surfaces. 2. Apply liquid gasket (P/N 08718-0004 or 08718-0009) evenly to the sealing surface. 3. Install the component within 5 minutes of applying the liquid gasket. Make sure you seal the entire circumference of the bolt holes to prevent fluid leakage. **NOTE:** - If too much time has passed after applying the liquid gasket, remove the old liquid gasket and

	residue, then reapply the new liquid gasket. • Allow it to cure at least 30 minutes after assembly before filling the differential with recommended fluid.

6. Fluid Strainer - Install
7. Inner Rotor/Outer Rotor - Install



NOTE:

- While aligning the notch-cut (A) of the inner rotor (B) with the notch-cut of the clutch guide shaft (C), install the inner rotor and the outer rotor (D).
- Install the inner rotor and the outer rotor with the marks (E) facing the oil pump case side.

8. Oil Pump Cover - Install
9. Oil Seal (Propeller Shaft Side) - Install

 07746-0030100 A	1. Install the oil seal (A) even and flush with the rear differential oil pump cover using the 40 mm I.D. driver handle.

10. Companion Flange - Install

 07947-6890100 A	1. Set the companion flange (A) to the clutch guide shaft. 2. Drive on the companion flange using the 41.8 mm oil seal driver.

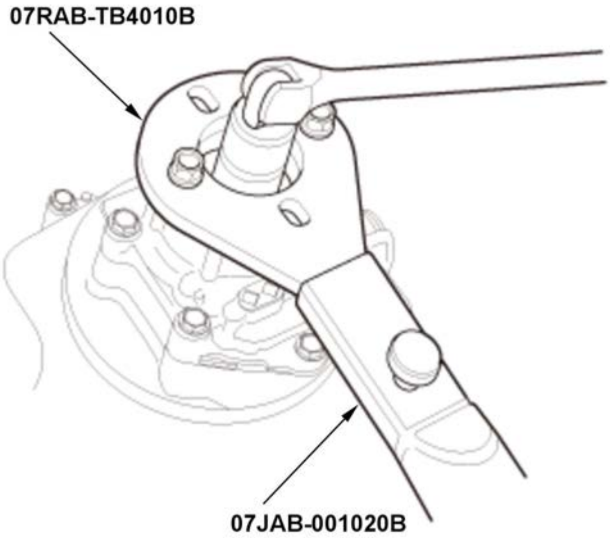
	3. Check the length of clutch guide shaft as shown. **NOTE:** Make sure to drive on the companion flange until 2 to 3 thread pitches of the clutch guide shaft appears.

	4. Apply rear differential fluid to the used locknut. 5. Set the used locknut to the clutch guide shaft. 6. Install the companion flange holder and the holder handle on the companion flange. 7. Tighten the used locknut. 8. Remove the used locknut, the companion flange holder, and the holder handle. 9. Check the companion flange has been set to the bottom.

11. Back-Up Ring - Install
12. Spring Washer - Install

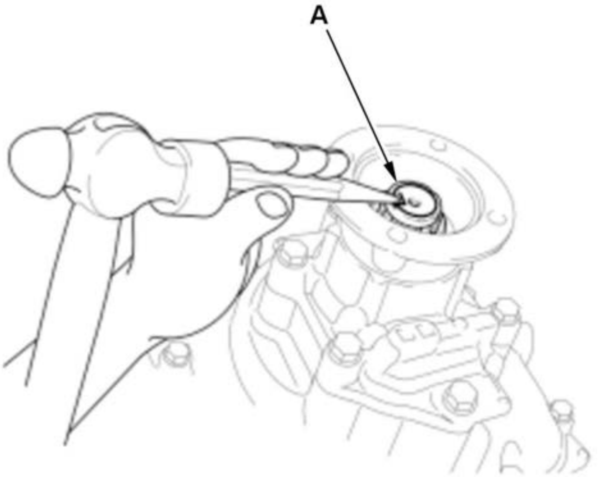
    NOTE: Make sure the spring washer is installed in the correct direction.

13. Locknut - Install



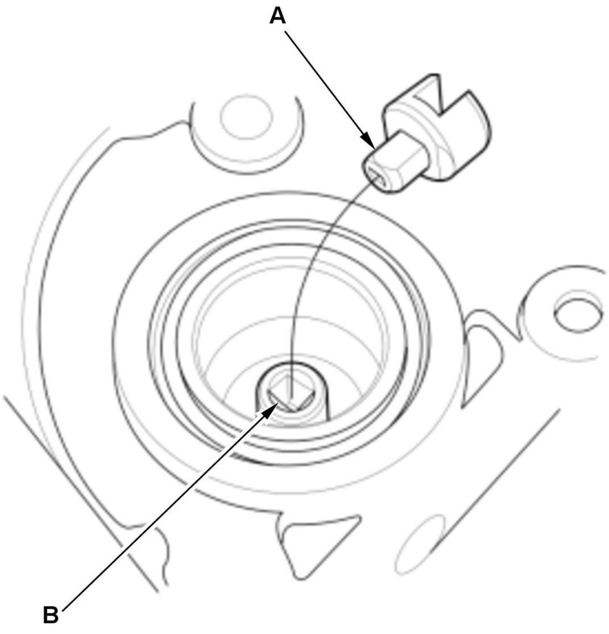
1. Install the companion flange holder and the holder handle on the companion flange.

2. Tighten the locknut to the specified torque.



3. Stake the locknut tab (A) into the groove in the clutch guide shaft.

14. Pump Drive Joint - Install



1. Align the bulge (A) of pump drive joint with the groove (B) of the rear differential.

15. Rear Differential Pump Motor - Install

	1. Align the shaft (A) of the rear differential pump motor with the groove (B) of the pump drive joint.

16. Rear Differential Solenoid Valve Connector Assembly - Install
17. Rear Differential Fluid Pressure Sensor - Install
18. Rear Differential Fluid Temperature Sensor - Install
19. Sensor Cover - Install
20. Oil Seals (Driveshaft Side) - Install

	1. Install the oil seal (A) even and flush with the machined edge of the differential carrier assembly using the 40 mm I.D. driver handle.

21. Drain Plug - Install
22. Filler Plug - Install
23. Harness Bracket D - Install
24. Harness Bracket B - Install
25. Harness Bracket A - Install
26. Rear Differential Subharness - Install

DESCRIPTION & OPERATION

REAR DIFFERENTIAL SYSTEM DESCRIPTION

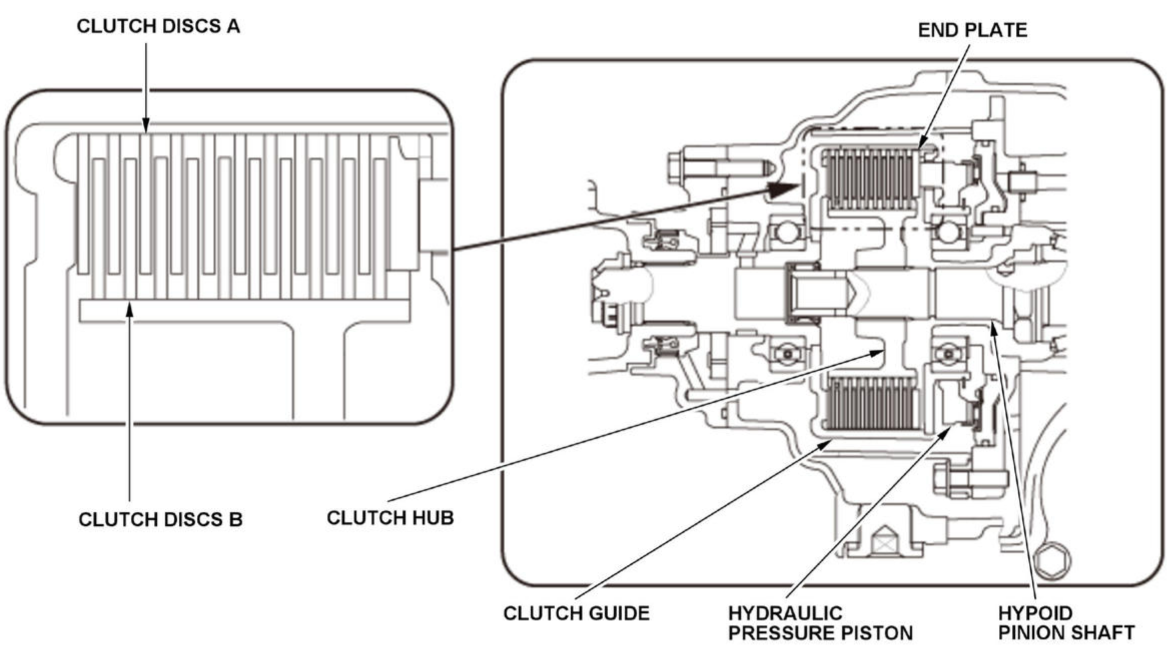
Overview

The All Wheel Drive (AWD) system is adopted into the rear differential. The AWD features a built-in real-time controlling mechanism that distributes the proper torque to the rear wheels as needed depending on the rotating difference between front and rear wheels or the engine power. The hydraulic circuit of the AWD is equipped with a motor-driven oil pump and an electronically-controlled valves, resulting in a wide range of torque controls, improvements in responsiveness, reduction of excessive torque, and compact size/lightening.

Construction

The AWD Differential Assembly consists of a wet-disc clutch assembly, differential, and a hydraulic system.The main components of the wet-disc clutch assembly are as follow:

Components	Purpose
Clutch Disc A	Clutch discs A are splined to the clutch guide.
Clutch Disc B	Clutch discs B are splined to the clutch hub.
Clutch Guide	Clutch guide is connected to the propeller shaft.
Clutch Hub	Clutch hub is connected to the hypoid pinion shaft.
Hydraulic Pressure Piston	The end plate is pressed by an oil pressure, and the clutch plates A and B are engaged.



Hydraulic Circuit

The main components in the hydraulic circuit are as follows:

COMPONENT	FUNCTION
Oil Pump	Operated by the rear differential pump motor, the oil pump receives the oil from the strainer and sends it to the hydraulic circuit. The rear differential pump motor is controlled by the AWD control unit.
1-Way Valve	Retains the oil pressure in the hydraulic circuit.
Pressure Relief Valve	Operates when the oil pressure failed, and release the oil pressure into the strainer.
Rear Differential Solenoid Valve	Turns ON/OFF to adjust the oil pressure in the hydraulic circuit.
Rear Differential Fluid Pressure Sensor	The fluid pressure sensor monitors the pressure in the hydraulic circuit and reports this to the AWD control unit.
Rear Differential Fluid Temperature Sensor	The fluid temperature sensor monitors the fluid temperature and reports this to the AWD control unit.

The AWD control unit receives signals from the PCM, VSA Modulator-Control Unit, Gauge Control Module, EPS Control Unit and SRS Unit. These signals are used to calculate the amount of torque to be provided to the rear wheels. The AWD control unit actuates controls on the differential that generates variable hydraulic pressure in the hydraulic circuits. This pressure causes a clutch assembly inside the housing to be applied, delivering variable amounts of power to the rear wheels.

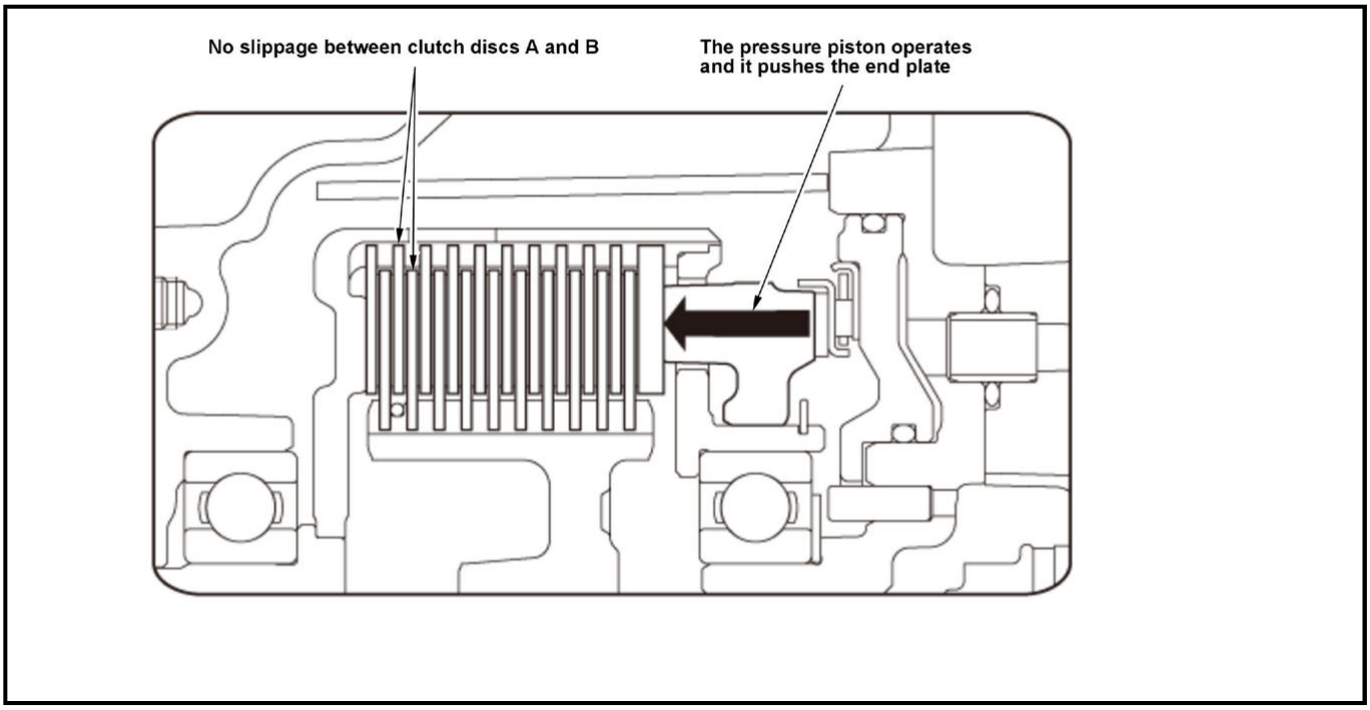
Operation

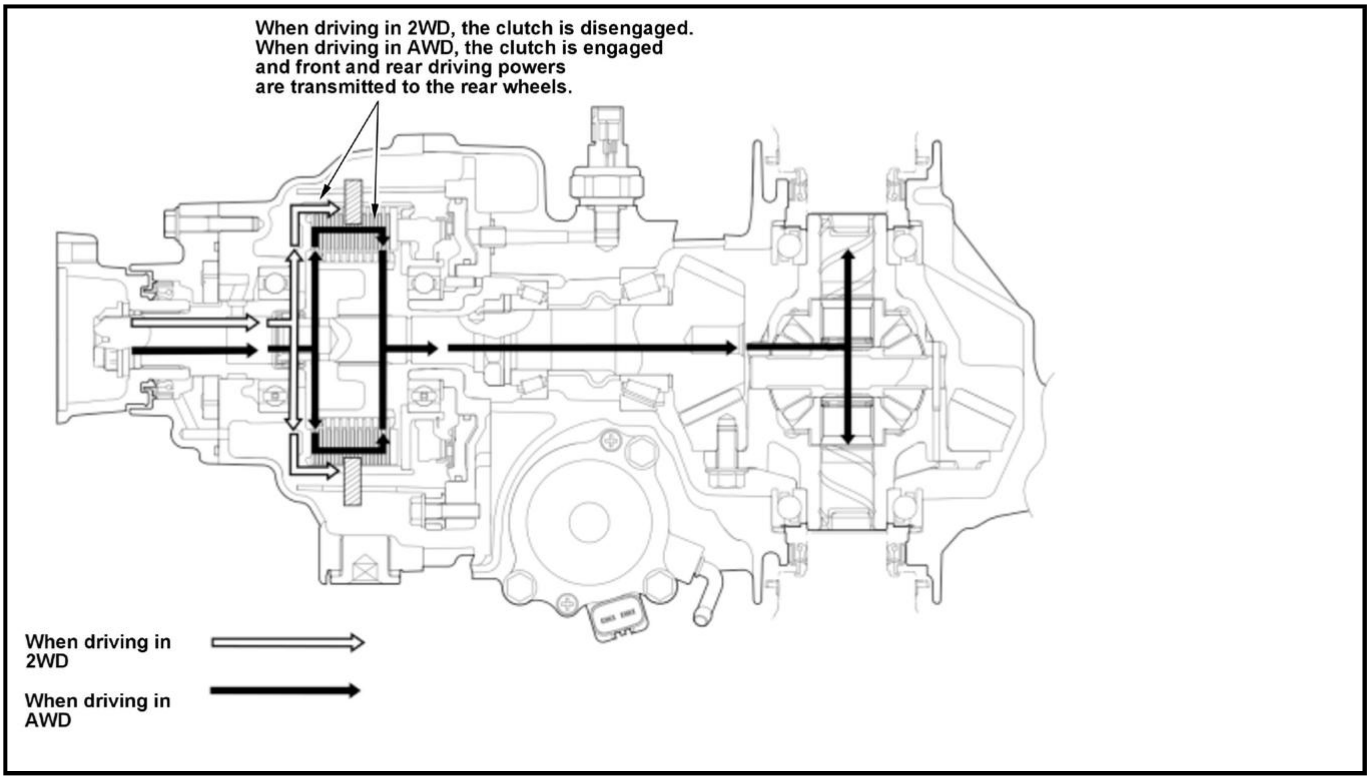
Driving Power Delivery

The driving power delivered from the propeller shaft is transmitted to the clutch guide and clutch discs. Since the clutch is not engaged when the oil pressure is not generated, the pinion gear is not driven by the propeller shaft. In this case, the driving power is not transmitted to the rear wheels, but it is only rotated by the vehicle movement. The generated hydraulic pressure presses the pressure piston against the end plate, compressing the clutch discs. This compression reduces the slippage between clutch discs A and B, thus rotating the clutch drum together with the clutch hub.



No slippage between clutch discs A and B
The pressure piston operates and it pushes the end plate

The drive power delivered to the propeller shaft is outputted from the clutch hub to the drive pinion gear, ring gear, differential and rear drive shafts when the clutch is applied. In this situation, the drive power is transmitted to the rear wheels.



When driving in 2WD, the clutch is disengaged.
When driving in AWD, the clutch is engaged and front and rear driving powers are transmitted to the rear wheels.
When driving in 2WD
When driving in AWD

In addition, the clutch drum and the clutch hub are not in complete contact but linked to each other with a maximum of 80% contact rate. This slippage reduces the friction caused by the rotational difference between the front and rear.

Hydraulic Control

Torque is distributed to the front and rear wheels by controlling the amount of clutch application in the differential. Clutch application force is controlled through oil pressure created by the oil pump drive motor and a solenoid valve.

By applying pressure and depressurization control, the AWD control unit sets the optimum level of pressure in stages to suit the driving conditions and road conditions. The basic control method involves the hydraulic circuit being pressurized by the motor to a level close to, but generally exceeding, the target pressure calculated from the vehicle conditions and road conditions received by the AWD control unit.

The hydraulic controls in a normal driving condition are as follows:

- In the pressurization mode, the oil pump driving motor generates a target oil pressure in the hydraulic circuit during a period of time calculated by the AWD control unit. The 1-way valve is opened by the oil pressure and the AWD control unit closes the solenoid valve (energized), thus, the pressure piston squeezes the clutch discs.
- In the retention mode, if the oil pressure reaches the pressure level set by the AWD control unit, the motor stops pressurizing. The 1-way valve closes and the solenoid valve keeps closed (energized), and the oil pressure generated in the hydraulic circuit is kept as-is. Thus, the pressure piston is fixed in a place and maintains the pressure on the clutch discs.
- In the depressurization mode, if the AWD control unit determines that it is not necessary to distribute a torque to the rear wheels, it turns on electricity to open the solenoid valve (de-energized), and releases the oil pressure from the hydraulic circuit. Thus, the pressure piston returns back and releases the clutch disc.

Basic Operation

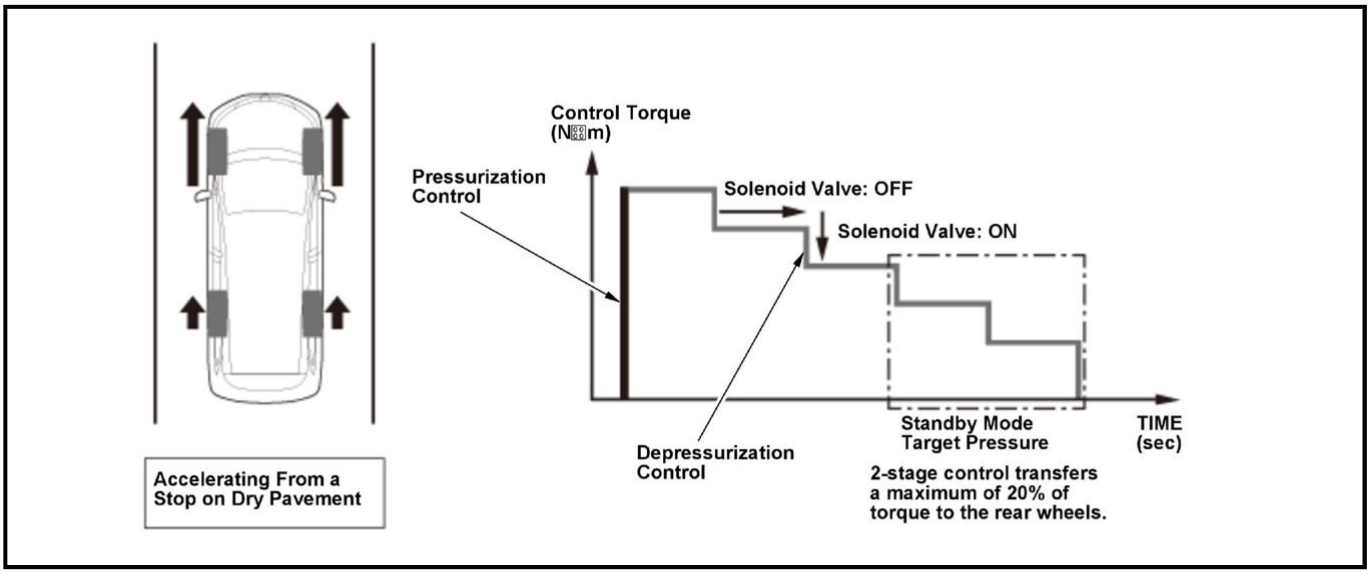
Operating Modes

The operations of AWD are performed appropriately to meet the driving conditions. The following examples show the AWD performance against several driving conditions.

Accelerating From a Stop on Dry Pavement

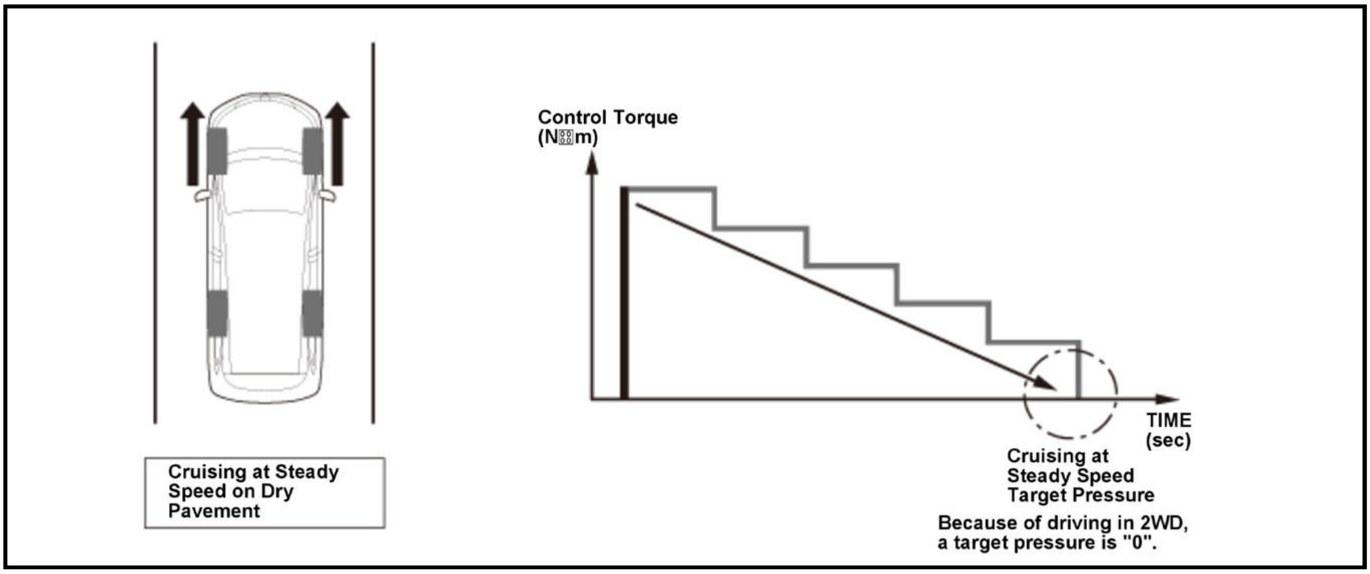
When the vehicle is stopped on a dry level surface, the AWD control unit puts the system in Standby Mode. This mode pressurizes the hydraulic system and applies the clutch pressure, and distributes a maximum of 20% of torque to the rear wheels for an initial acceleration. To achieve this, the AWD control unit receives information from the VSA system to determine the longitudinal angle of the vehicle. Upon determining the vehicle is on level ground, the AWD control unit activates the oil pump drive motor to pressurize the hydraulic system, then cycles the oil pressure solenoid on and off until the target pressure is met. Two levels of system pressurization can be created, depending on conditions. When the target pressure is achieved, the oil pressure solenoid remains closed to maintain the pressure in the hydraulic circuit until the vehicle begins to accelerate.



Control Torque
(N·m)
Pressurization Control
Solenoid Valve: OFF
Solenoid Valve: ON
Depressurization Control
Standby Mode Target Pressure
TIME (sec)
2-stage control transfers a maximum of 20% of torque to the rear wheels.
Accelerating From a Stop on Dry Pavement

Cruising at Steady Speed on Dry Pavement

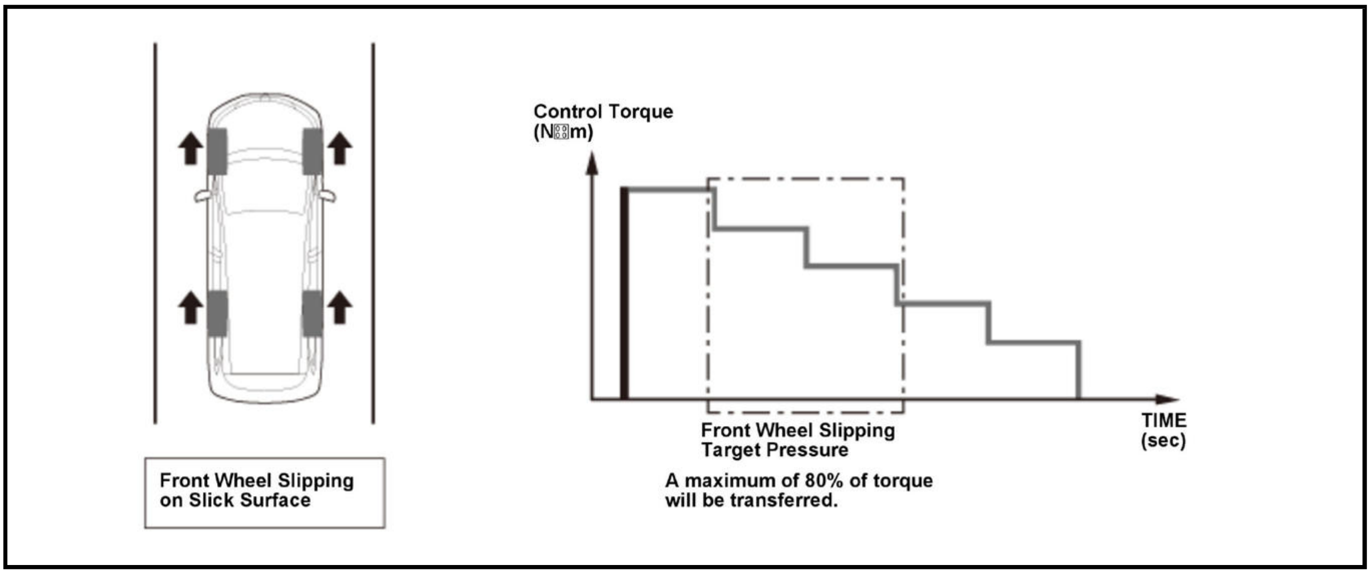
When the vehicle is cruising at a steady speed on dry pavement, the AWD control unit deactivates the All Wheel Drive system. The vehicle operates in 2WD mode, helping to increase fuel efficiency. To achieve this, the AWD control unit receives information from the PCM, VSA, EPS and SRS to determine the stability of the vehicle. When it determines that the vehicle is traveling at a steady speed and no wheel slippage is occurring, all pressure is released from the hydraulic circuit, enabling 2WD-only operation. This mode continues until the AWD control unit determines that torque needs to be transferred to the rear wheels.



Control Torque
(N·m)
TIME (sec)
Cruising at Steady Speed Target Pressure
Because of driving in 2WD, a target pressure is "0".
Cruising at Steady Speed on Dry Pavement

Front Wheel Slipping on Slick Surface

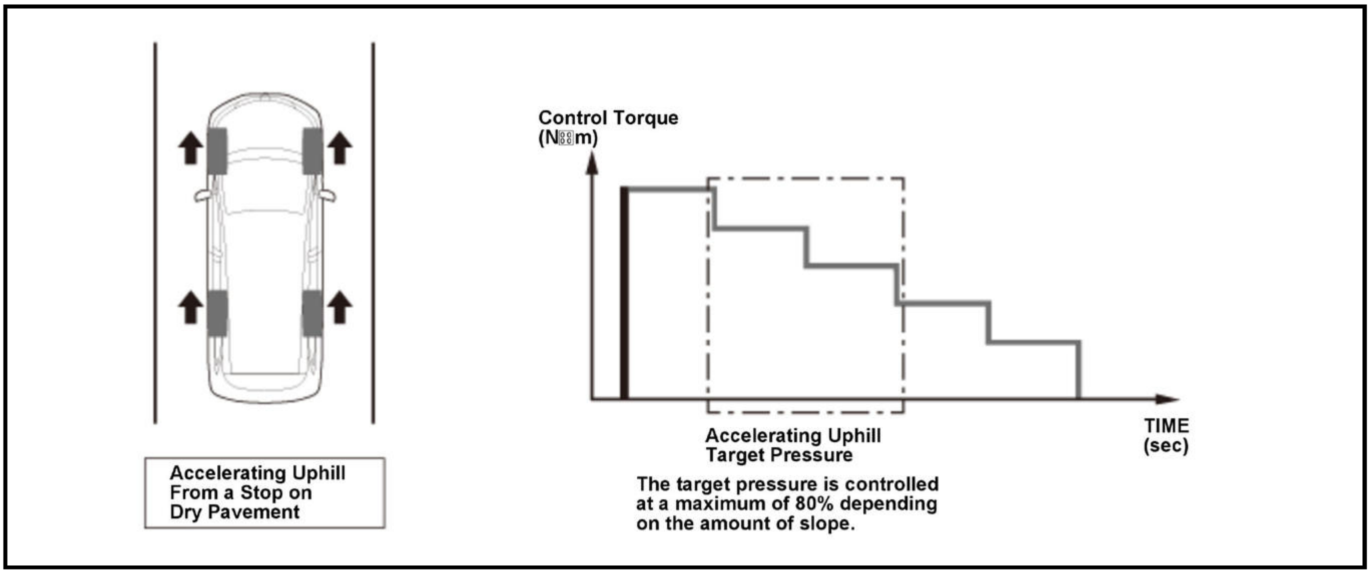
When the front wheels are slipping, for example on a low friction surface such as wet or icy roads, the AWD control unit receives information from the VSA, EPS and SRS that the front wheels are slipping. When the slipping of the front wheels occur, 80% of torque will be transferred to the rear wheels to reduce the load on the front wheels, and to regain vehicle stability. This mode continues until the AWD control unit determines that the front wheels are no longer slipping.



Front Wheel Slipping on Slick Surface
Control Torque (N·m)
TIME (sec)
Front Wheel Slipping Target Pressure
A maximum of 80% of torque will be transferred.

Accelerating Uphill From a Stop on Dry Pavement

To stabilize the vehicle while driving uphill, the AWD control unit transfers more of the available torque to the rear wheels than when driving on a flat road. To achieve this, the AWD control unit receives information from the VSA system to determine the slope where the vehicle is driving. Upon determining this, the AWD control unit activates the oil pump drive motor to pressurize the hydraulic system, then cycles the oil pressure solenoid on and off until the target pressure is reached. The level of pressurization varies depending on the calculated slope the vehicle is driving on. The torque transfer to the rear wheels will be controlled at a maximum of 80% depending on driving force. This mode continues until the AWD control unit determines that the vehicle is no longer accelerating uphill.



Accelerating Uphill From a Stop on Dry Pavement
Control Torque (N·m)
TIME (sec)
Accelerating Uphill Target Pressure
The target pressure is controlled at a maximum of 80% depending on the amount of slope.

SYMPTOM TROUBLESHOOTING INDEX

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING INDEX

Symptom	Probable Cause	Remedy
Rear differential overheats	• Fluid level too low • Incorrect fluid type	• Add recommended fluid • Drain and fill the differential with the recommended fluid
Rear differential leaks fluid	• Fluid level too high • Clogged breather hose	• Lower to proper level • Clean or replace

Symptom	Probable Cause	Remedy

REWRITE

AWD CONTROL UNIT UPDATE

Procedure

1. AWD Control Unit - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for more information about updating control units.

INSPECTION REPLACEMENT

REAR DIFFERENTIAL FLUID INSPECTION AND REPLACEMENT

Inspection

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Rear Differential Fluid - Check

	1. Use solvent and a brush to wash any oil and dirt off the oil filler plug and dry them with compressed air. 2. Remove the oil filler plug (A) and the sealing washer (B). 3. Check the condition of the rear differential fluid, if the fluid is dirty or burnt, replace it. 4. Make sure the rear differential fluid is at the proper level (C). **NOTE:**

	- The fluid level must reach up to the bottom of the oil filler plug hole. - If the level is below the proper level, check for rear differential fluid leaks at the differential. - If a problem is found, fix it before filling the differential with fluid. 5. If necessary, add rear differential fluid until it runs out, then reinstall the oil filler plug with a new sealing washer.

Replacement

NOTE:

- **How to read the torque specifications** .
- Check that the AWD system indicator does not come on. If it does, **check for AWD with intelligent control system DTCs.**

1. **Vehicle - Lift**
2. Rear Differential Fluid - Replace

	1. Remove the oil filler plug (A) and the sealing washer (B).

	2. Remove the drain plug (A) and the sealing washer (B), then drain the rear differential fluid.

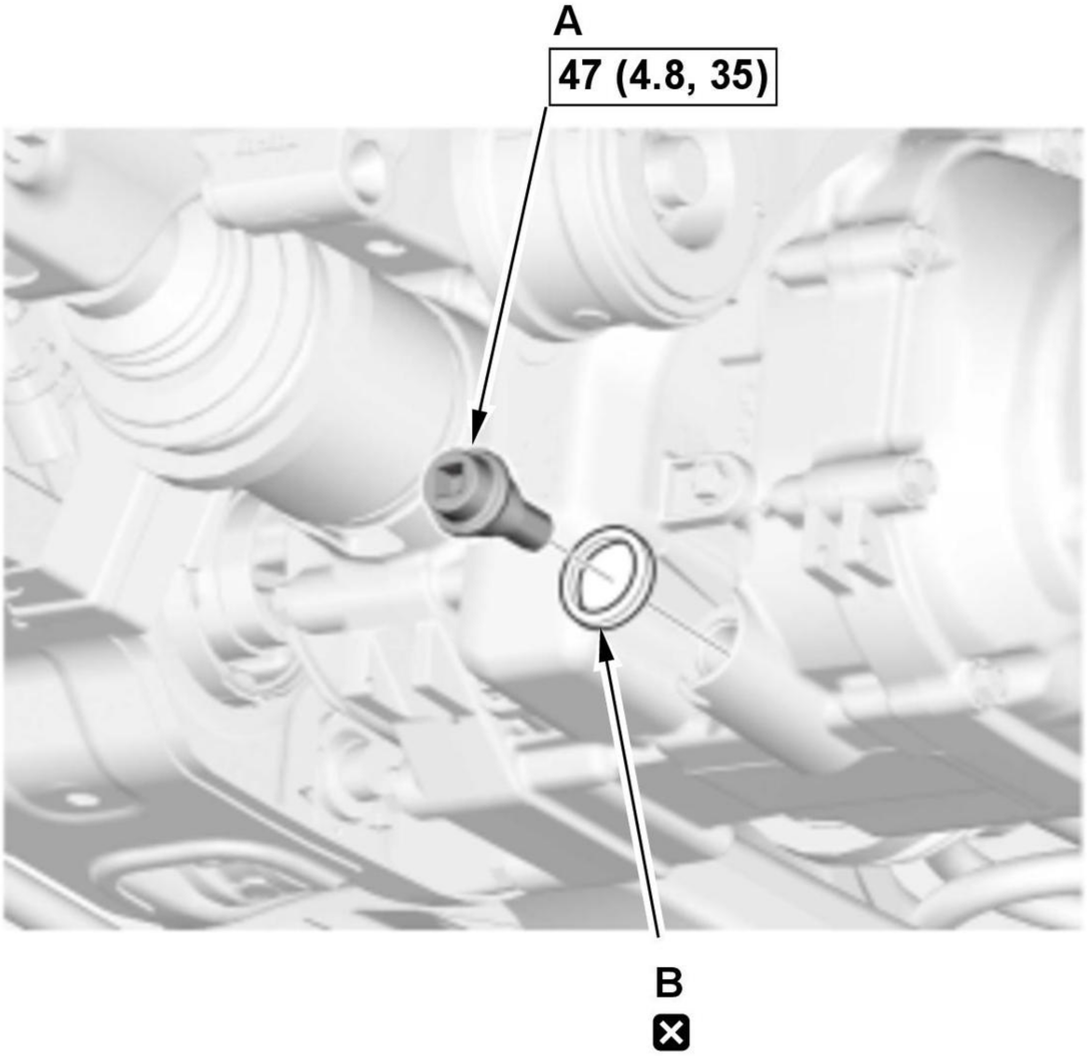

Fig. 1: Drain Plug And Washer With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

3. Remove metal particles from the magnetic surface of the drain plug (A). 4. Install the drain plug with a new sealing washer (B). 5. Refill the rear differential with rear differential fluid to the proper level.

NOTE: If you disassemble the differential, check the rear differential fluid level again after the AWD with intelligent control system check is finished. Add fluid if necessary.

Recommended fluid:	
B	**Honda DPSF-II**

Fluid Capacity:	
B	**1.2 L (1.3 US qt) at fluid change**
B	**1.5 L (1.6 US qt) at overhaul**

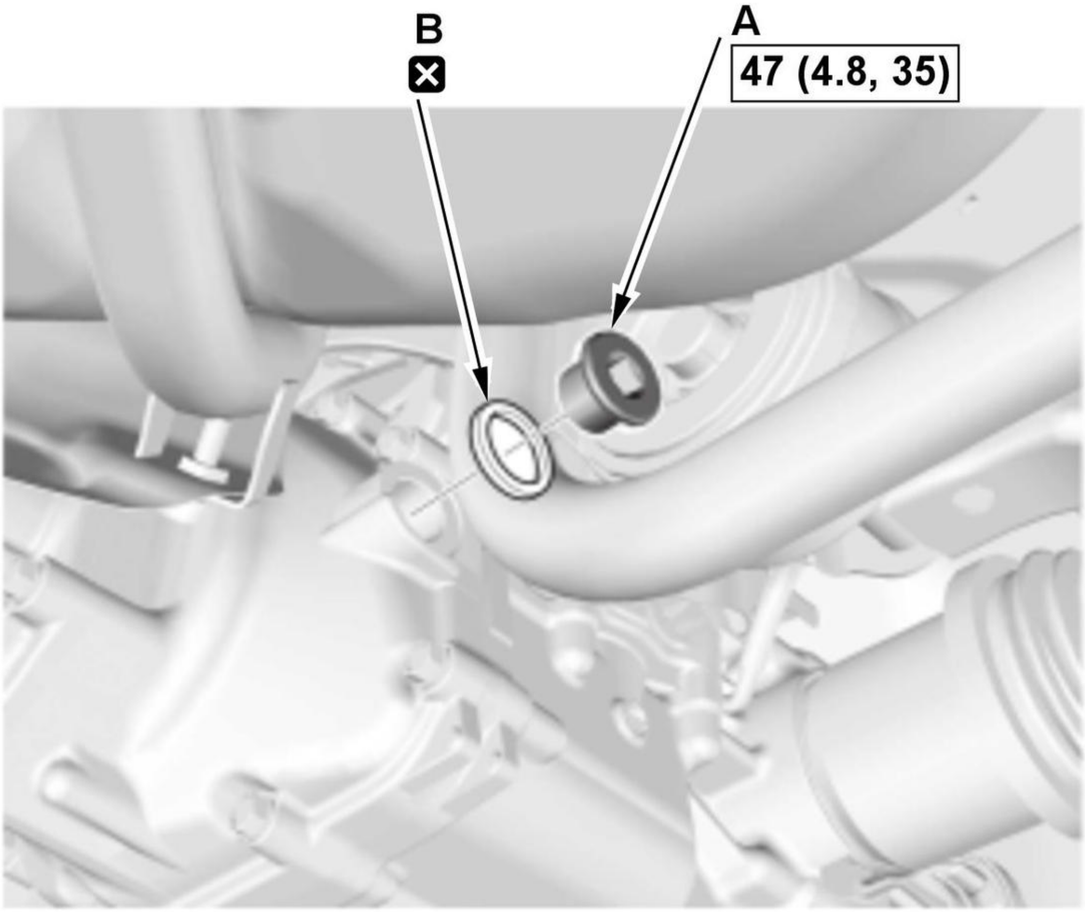

Fig. 2: Oil Filler Plug And Washer With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

6. Install the oil filler plug (A) with a new sealing washer (B).

3. Rear Differential Fluid After Replacement - Check

1. Apply the parking brake and block all wheels.

2. **Enter the maintenance mode and start the engine**

Let it idle more than 6 seconds, then turn the engine off. Repeat this step three more times.

3. Shift the transmission to D position/mode while pressing the brake pedal firmly. Press the accelerator pedal for 2 seconds, then let it idle. Repeat this step three more times.

4. Check that the AWD system indicator does not come on. If it does, check for AWD with intelligent control system DTCs

.

4. AWD System - Air Bleed
5. Rear Differential Fluid - Check
6. Maintenance Minder - Reset

1. If the Maintenance Minder required to replace the rear differential fluid, reset the Maintenance Minder with the gauge .
If the Maintenance Minder did not require to replace the rear differential fluid, reset the Maintenance Minder with the HDS .

INITIALIZATION

AWD CONTROL UNIT INITIALIZATION

Procedure

NOTE:

- Whenever the AWD control unit is replaced, it must be initialized.
- Park the vehicle on a flat and level surface.

1. HDS - Connect
2. AWD Control Unit - Initialization

1. Select the ADJUSTMENT in the AWD WITH INTELLIGENT CONTROL with the HDS.

2. Select the E-DPS CONTROL MODULE REPLACEMENT in the ADJUSTMENT with the HDS.

NOTE: See the HDS Help menu for specific instructions.

REPLACEMENT

REAR DIFFERENTIAL OIL SEAL REPLACEMENT

Special Tools Required

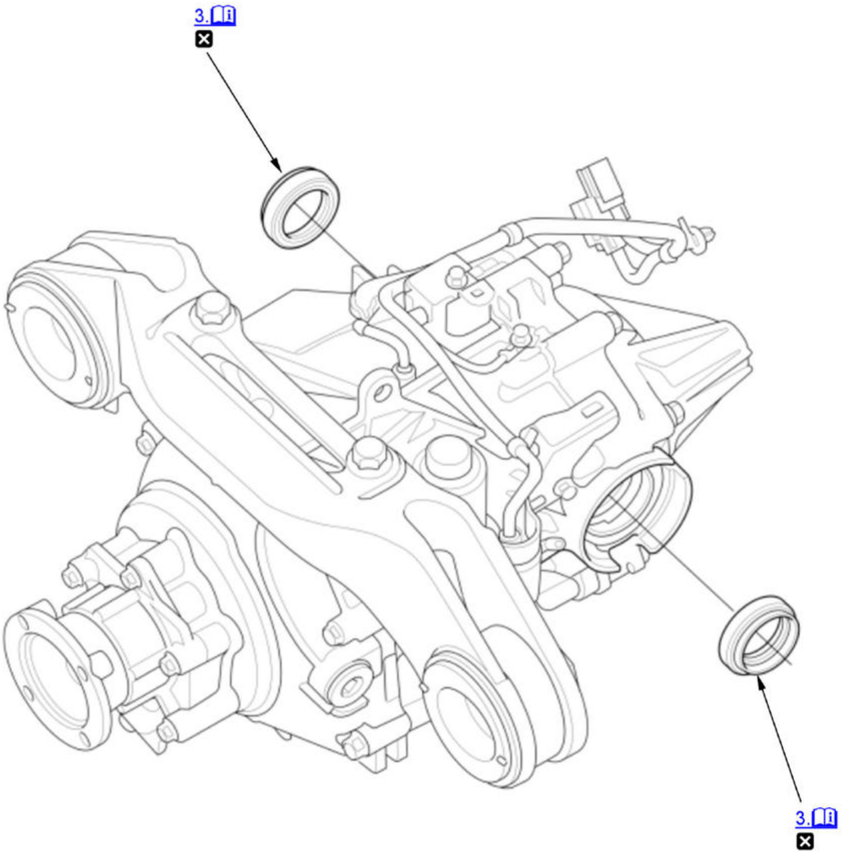
Image	Description/Tool Number
	Driver Handle, 40 mm I.D. 07746-0030100

Replacement

NOTE: ℹ Where icon is shown, for further information see below.

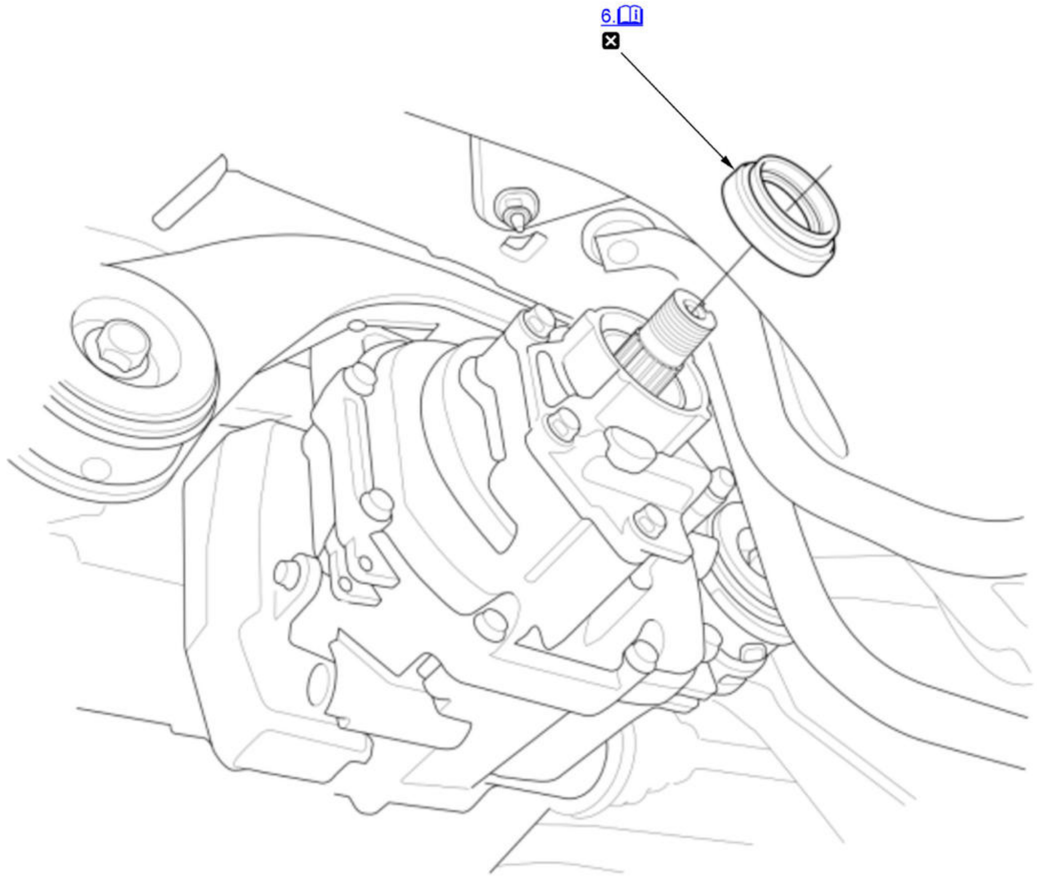
Procedure

Driveshaft Side



ℹ	Detailed information, notes, and precautions
☒	Replace

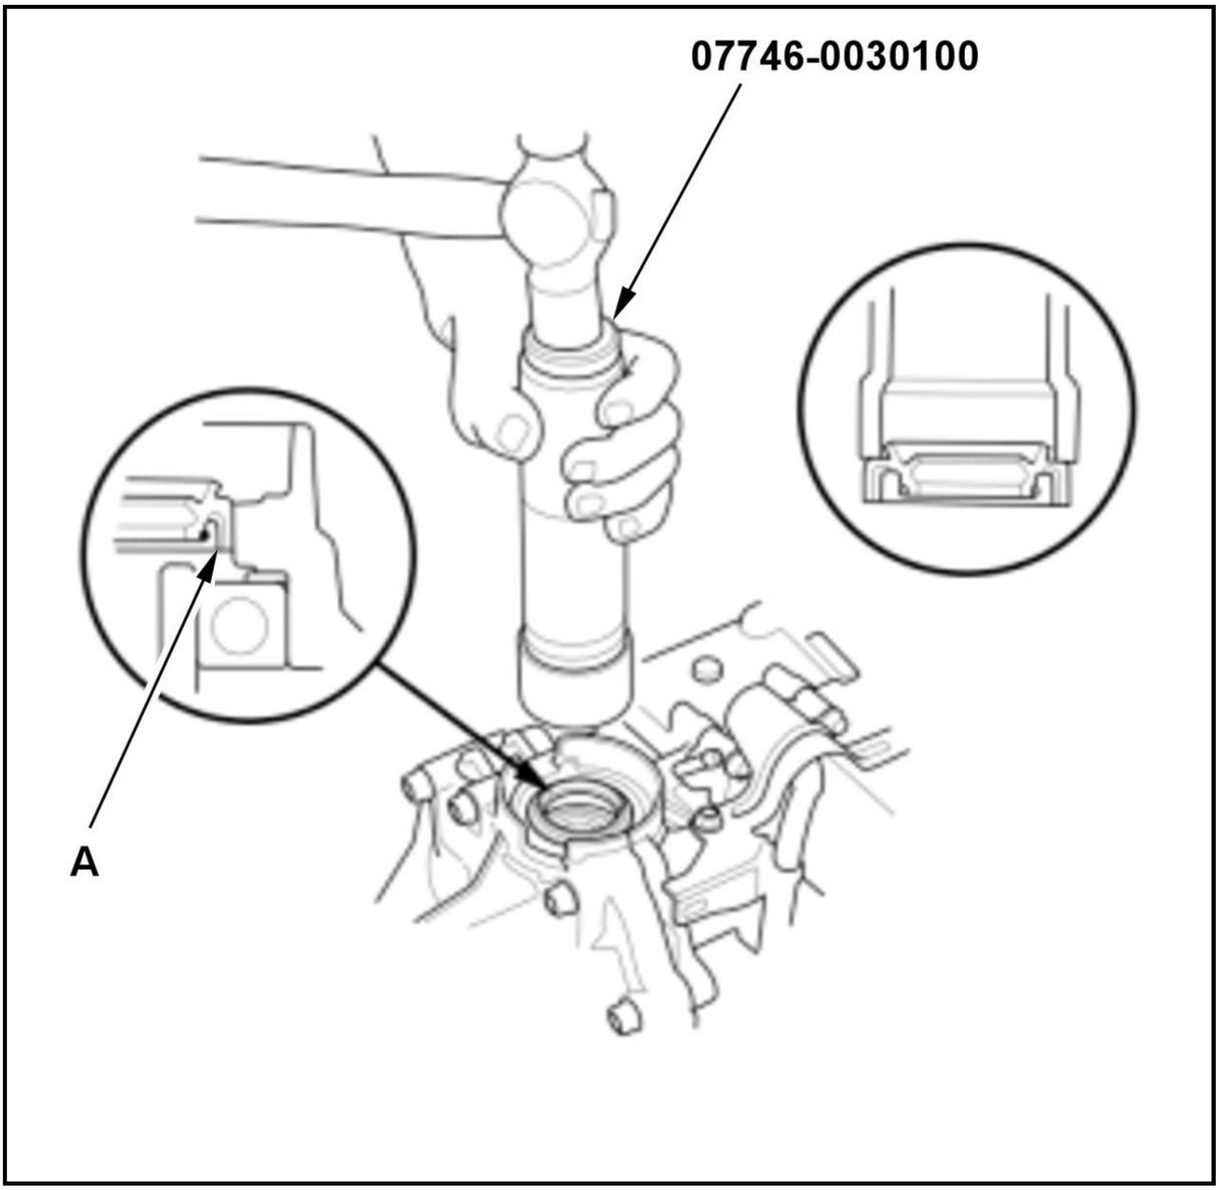
Propeller Shaft Side



ℹ	Detailed information, notes, and precautions
☒	Replace

Driveshaft Side

1. Vehicle - Lift
2. Rear Differential Assembly - Remove
3. Oil Seal - Remove



Note for installation

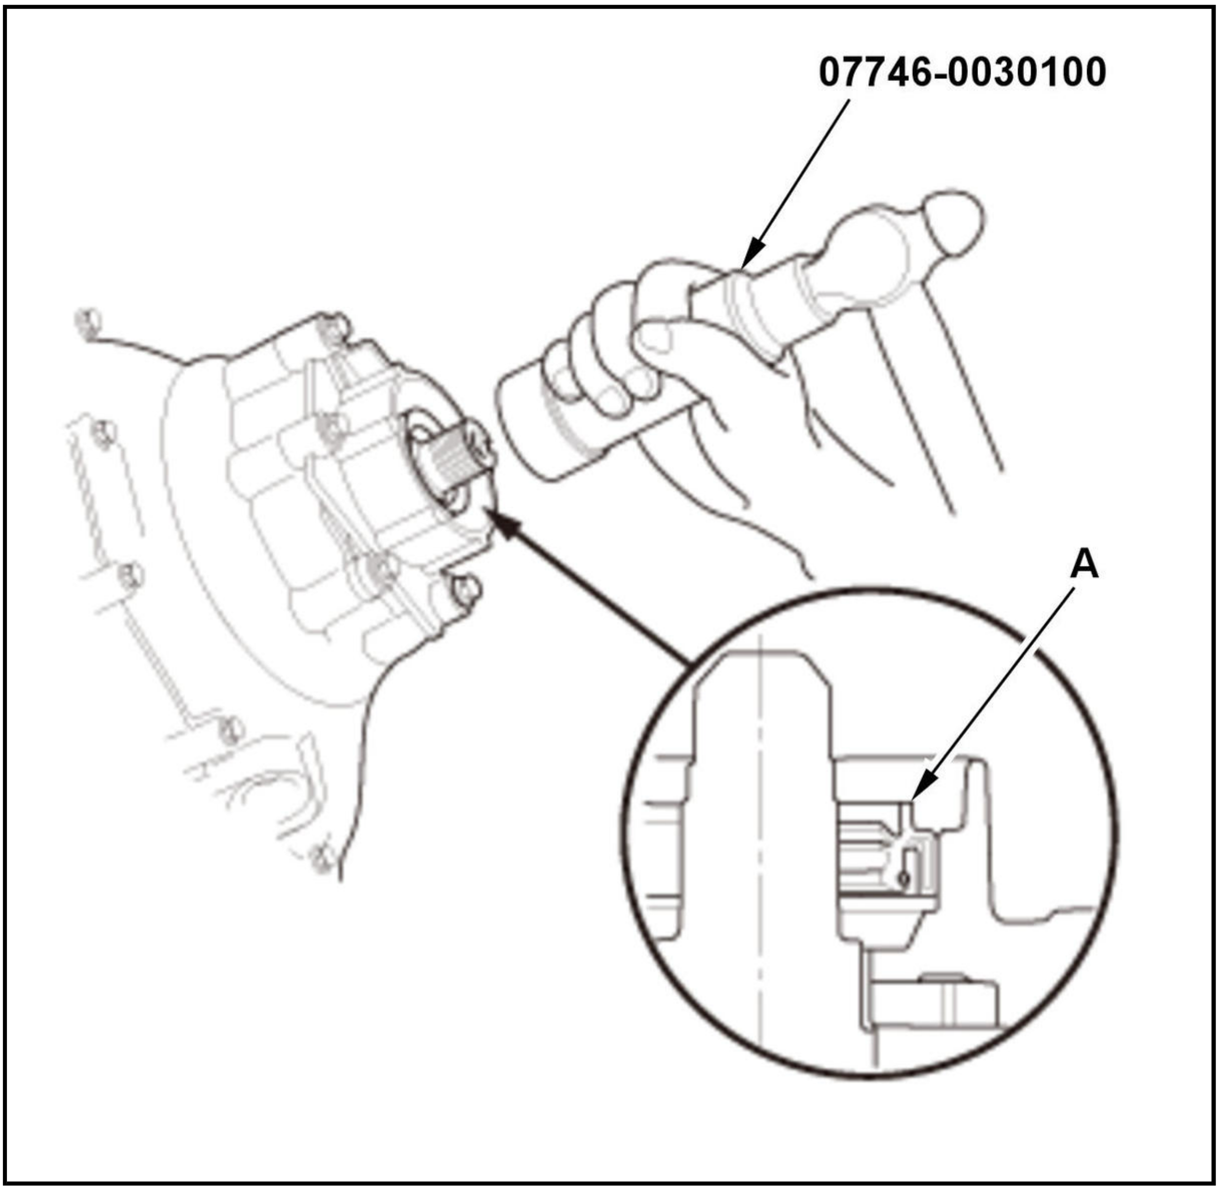
Install the oil seal (A) even and flush with the machined edge of the differential carrier assembly using the 40 mm I.D. driver handle.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Propeller Shaft Side (In Car)

5. **Vehicle - Lift**
6. **Rear Differential Fluid - Drain**
7. **Propeller Shaft - Remove**
8. **Fuel Tank Protector (Rear Side) - Remove**
9. **Companion Flange - Remove**
10. Oil Seal - Remove



Note for installation

Install the oil seal (A) even and flush with the rear differential oil pump cover using the 40 mm I.D. driver handle.

11. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

12. Rear Differential Fluid - Refill
13. AWD System - Air Bleed

SYMPTOM TROUBLESHOOTING

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - ABNORMAL NOISE

NOTE: If necessary, compare the noise with a known-good vehicle of the same type, if the noise is remarkably abnormal, do the following troubleshooting.

1. Problem verification (abnormal noise check) 1

-1. Test-drive the vehicle and check for the abnormal noise.

Did abnormal noise reappear?

YES

The failure is duplicated. Go to step 2.

NO

Check the following items.

- **Check the rear differential fluid level and the fluid condition**.
- Check for rear differential fluid leaks.
- Check for interference with items such as the harness.
- Rotate either rear wheel by hand, and check that the other wheel rotates.
- **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS**.
- **Do the rear differential fluid pressure sensor test**.

2. Rear differential visual check:

Check the following items.

- **Check the rear differential fluid level and the fluid condition**.
- Check for rear differential fluid leaks.
- Check for interference with items such as the harness.

Are the check results OK?

YES

The rear differential visual is OK. Go to step 3.

NO

Replace the rear differential fluid or add recommended fluid.

3. Problem verification (rear differential companion flange rotate check)

-1. **Raise the vehicle on a lift** .

-2. Release the parking brake.

-3. Shift the transmission to N position/mode, then **enter the neutral position holding mode** .

-4. **Do the 12 volt battery terminal disconnection procedure** .

-5. **Disconnect the No. 2 propeller shaft from the rear differential companion flange** .

-6. Rotate the companion flange by hand.

Can the rear differential companion flange be rotated smoothly by hand?

YES

The companion flange rotate is OK. Go to step 4.

NO

The failure is duplicated. **Replace the torque control differential (TCD) assembly or the differential carrier assembly** .

4. Rear differential operation check

-1. **Connect the No. 2 propeller shaft** .

-2. **Do the 12 volt battery terminal reconnection procedure** .

-3. Rotate either rear wheel by hand, and check that the other wheel rotates.

Does the other wheel rotate?

YES

The rear differential operation is OK. Go to step 5.

NO

Replace the differential carrier assembly .

5. Torque control differential (TCD) assembly check

-1. Remove the following fuse.

Fuse	**No. A4-3**
B	**No. B7**

-2. Test-drive the vehicle on the lift.

Is the abnormal noise still present?

YES

Replace the torque control differential (TCD) assembly .

NO

The torque control differential (TCD) assembly is OK. Reinstall the fuse, then go to step 6.

6. Rear differential solenoid valve check

-1. Turn the vehicle to the ON mode.

-2. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

-3. Select the SOLENOID TEST in the FUNCTIONAL TEST with the HDS.

-4. Do LEVEL 7 of the SOLENOID TEST with the HDS.

Solenoid Test

Do LEVEL 1 of the SOLENOID TEST with the HDS.

Solenoid Test

Did the abnormal noise happen when changing from LEVEL 7 to LEVEL 1?

YES

Replace the rear differential solenoid valve .

NO

The rear differential solenoid valve is OK. Go to step 7.

7. Rear differential pump motor check

   -1. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

   -2. **Do the AIR BLEEDING in the ADJUSTMENT with the HDS**.

   Air Bleeding

   Listen for any abnormal noise coming from the rear differential pump motor.

   Did abnormal noise happen while doing air bleeding?

   YES

   Replace the rear differential pump motor .

   NO

   The rear differential pump motor is OK. Go to step 8.

8. Problem verification (abnormal noise check) 2

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Replace the rear differential fluid**.

   -3. Turn the vehicle to the ON mode.

   -4. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

   -5. **Do the AIR BLEEDING in the ADJUSTMENT with the HDS**.

   Air Bleeding

   Test-drive the vehicle on the lift.

   Did abnormal noise reappear?

   YES

   The failure is duplicated. **Replace the torque control differential (TCD) assembly or the differential carrier assembly** .

   NO

   Intermittent failure, the system is OK at this time.

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - HDS DOES NOT COMMUNICATE

1. HDS communication check

   -1. Turn the vehicle to the ON mode.

   -2. Check that the HDS communicates with the vehicle.

   Does the HDS communicate with the vehicle?

   YES

   The HDS communication is OK. Go to step 2.

NO

Go to the DLC circuit troubleshooting .

2. Real time AWD system communication check

-1. Check the Main Menu of the REAL TIME AWD with the HDS.

Does the HDS show the Main Menu of the REAL TIME AWD?

YES

The real time AWD system communication is OK. Intermittent failure, the system is OK at this time.

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuses.

Fuse	**No. A4-3**
B	**No. B7**

Are the fuses OK?

YES

The fuses are OK. Reinstall the fuses, then go to step 4.

NO

Replace the fuse(s). If the fuse(s) blows again, repair a short to ground in the No. A4-3 and/or the No. B7 fuse circuit, then recheck.

4. CAN gateway system DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 5.

5. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

AWD CONTROL UNIT is Detected

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , then recheck. If this DTC goes away and the AWD control unit was substituted, **replace the original AWD control unit** .

AWD CONTROL UNIT is Not Available

Go to step 6.

6. Rear differential fluid pressure sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear differential fluid pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the Main Menu of the REAL TIME AWD with the HDS.

Does the HDS show the Main Menu of the REAL TIME AWD?

YES

Replace the rear differential fluid pressure sensor .

NO

The rear differential fluid pressure sensor is OK. Go to step 7.

7. Open wire check (IG1_METER line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Real time AWD control unit 24P connector

-3. **Enter the maintenance mode and start the engine** .

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode (idling)
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	Real time AWD control unit 24P connector: disconnected
Test point 1	**Real time AWD control unit 24P connector No. 12**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1_METER wire is OK. Go to step 8.

NO

Repair an open in the IG1_METER wire between the real time AWD control unit and the **No. B7** fuse.

8. Open wire check (+B_E-DPS line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode (idling)
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_E-DPS wire is OK. Go to step 9.

NO

Repair an open in the +B_E-DPS wire between the real time AWD control unit and the **No. A4-3** fuse.

9. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 8**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 10.

NO

Repair an open in the GND wire between the AWD control unit and ground (G503).

10. Shorted wire check (SVCC line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 20**

Test point 2	Body ground

1.0 MΩ or more?

YES

The SVCC wire is OK. Go to step 11.

NO

Repair a short to ground in the SVCC wire between the AWD control unit and the rear differential fluid pressure sensor.

11. Open wire check (F-CAN D_H line, F-CAN D_L line)

-1. Disconnect the following connector.

CAN gateway 16P connector

-2. Measure the resistance between test points 1 and 2 individually.

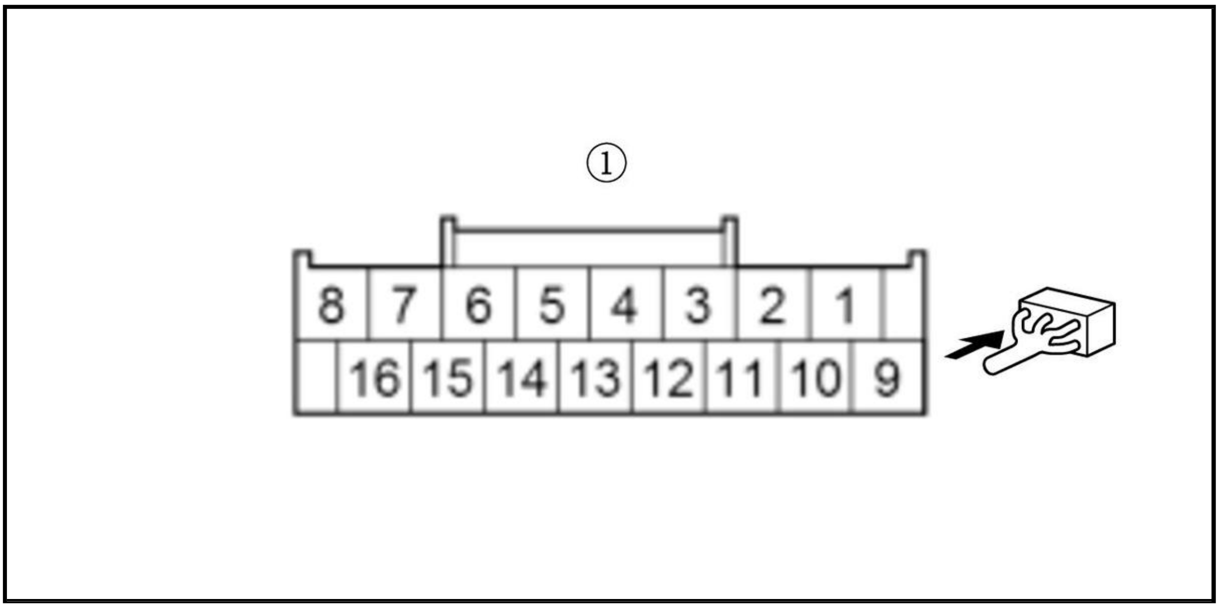
F-CAN D_H wire

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 14**
Test point 2	CAN gateway 16P connector (female terminals) No. 7: ①

F-CAN D_L wire

Test condition	Vehicle OFF (LOCK) mode
	Rear differential fluid pressure sensor 3P connector: disconnected
	AWD control unit 24P connector: disconnected
	CAN gateway 16P connector: disconnected

Test point 1	**AWD control unit 24P connector No. 24**
Test point 2	CAN gateway 16P connector (female terminals) No. 15: ①



Is there 1.0 Ω or less?

YES

The F-CAN D_H wire and the F-CAN D_L wire are OK. Go to step 12.

NO

Repair an open in the F-CAN D_H wire and/or the F-CAN D_L wire between the AWD control unit and the CAN gateway.

12. Open wire check (DIAG-CAN_H line, DIAG-CAN_L line)

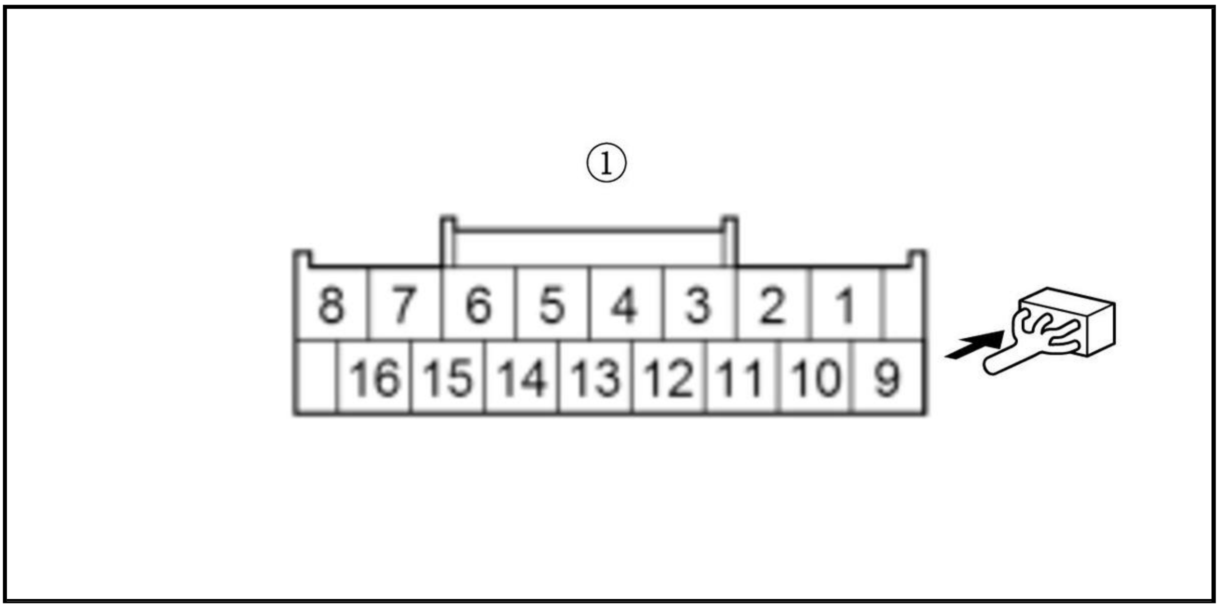
-1. Measure the resistance between test points 1 and 2 individually.

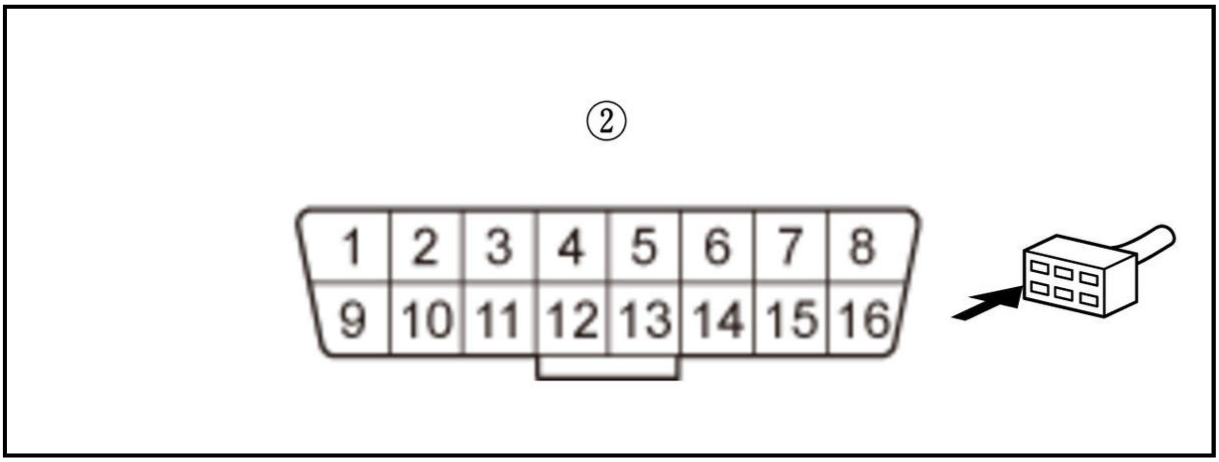
DIAG-CAN_H wire

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 2: ①
Test point 2	DLC (16P) (female terminals) No. 6: ②

DIAG-CAN_L wire

Test condition	Vehicle OFF (LOCK) mode
	Rear differential fluid pressure sensor 3P connector: disconnected
	AWD control unit 24P connector: disconnected
	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 10: ①
Test point 2	DLC (16P) (female terminals) No. 14: ②





Is there 1.0 Ω or less?

YES

The DIAG-CAN_H wire and the DIAG-CAN_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , then recheck. If this DTC goes away and the AWD control unit was substituted, **replace the original AWD control unit** .

NO

Repair an open in the DIAG-CAN_H wire and/or the DIAG-CAN_L wire between the CAN gateway and the DLC.

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - REAL TIME AWD SYSTEM INDICATOR DOES NOT COME ON

1. Problem verification

-1. Turn the vehicle to the ON mode.

Does the AWD system indicator come on?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated. Go to step 2.

2. Gauge control module operation check

-1. **Do the gauge control module self-diagnostic function** .

Does the AWD system indicator blinkΩ

YES

Go to step 3.

NO

Replace the gauge control module .

3. AWD control unit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the following fuse.

Fuse	**No. A4-3**
B	**B7**

-3. Turn the vehicle to the ON mode.

Does the AWD system indicator come on?

YES

The gauge control module is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** .

NO

Replace the gauge control module .

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - REAL TIME AWD SYSTEM INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED

NOTE: Do not jump the SCS line.

1. Problem verification

-1. **Test the 12 volt battery** . Charge or replace the 12 volt battery if necessary.

-2. Turn the vehicle to the ON mode.

Does the AWD system indicator come on?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. HDS communication check

-1. Check that the HDS communicates with the vehicle.

Does the HDS communicate with the vehicle?

YES

The HDS communication is OK. Go to step 3.

NO

Go to the DLC circuit troubleshooting .

3. Real time AWD system communication check

-1. Check the Main Menu of the REAL TIME AWD with the HDS.

Does the HDS show the Main Menu of the REAL TIME AWD?

YES

The real time AWD system communication is OK. Go to step 4.

NO

Go to the real time AWD system symptom troubleshooting for HDS does not communicate.

4. AWD control unit status check 1

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Longitudinal G sensor learning	Complete	B	B	B
Air purge for rear differential	Complete	B	B	B
AWD operation check	Complete	B	B	B

Do the current condition(s) match the threshold?

YES

Go to step 5.

NO

Go to step 7.

5. Gauge control module operation check

-1. **Do the gauge control module self-diagnostic function** .

Does the AWD system indicator blinkΩ

YES

The gauge control module is OK. Go to step 6.

NO

Replace the gauge control module .

6. Gauge control module DTC check

-1. Check for DTCs in the METER system with the HDS.

DTC Description	DTC
B	B

Is DTC indicated?

YES

Go to the indicated DTC's troubleshooting in the gauge control module.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

7. AWD control unit status check 2

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Longitudinal G sensor learning	Incomplete	B	B	B
Air purge for rear differential	Incomplete	B	B	B
AWD operation check	Incomplete	B	B	B

Do the current condition(s) match the threshold?

Longitudinal G sensor learning is incomplete

Do the G SENSOR LEARNING in the ADJUSTMENT with the HDS.

Air purge for rear differential is incomplete

Do the ECU REPLACEMENT in the ADJUSTMENT with the HDS.

AWD operation check is incomplete

Do the ECU REPLACEMENT in the ADJUSTMENT with the HDS.

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - REAL TIME AWD SYSTEM IS STUCK IN 4WD MODE

1. Problem verification (rear differential clutch test)

-1. **Do the rear differential clutch test**.

Is the test result OK?

YES

Go to step 2.

NO

The failure is duplicated. **Do the repair depending on the test result**.

2. Oil pressure control check

   -1. Turn the vehicle to the ON mode.

   -2. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -3. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS**.

   Oil Pressure Control Test

   Is the test result OK?

   1. **YES**

      Check the following items.

      - **Check the rear differential fluid level and the fluid condition**.
      - Check for rear differential fluid leaks.
      - **Do the rear differential fluid pressure sensor test**.

      NO

      Follow the instructions indicated on the HDS according to the test result.

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - WILL NOT GO INTO 4WD MODE, POOR TRACTION, POOR ACCELERATION (AT START), POOR CLIMBING ABILITY

1. Rear differential clutch check

   -1. **Do the rear differential clutch test**.

   Is the test result OK?

   1. **YES**

      Check the following items.

      - **Check the rear differential fluid level and the fluid condition**.
      - Check for rear differential fluid leaks.
      - **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS**.
      - **Do the rear differential fluid pressure sensor test**.

      NO

      Do the repair depending on the test result.

SERVICE PROCEDURE

AWD SYSTEM BLEEDING

Procedure

NOTE: Whenever the rear differential assembly is disassembled or fluid replaced, air bleed must be needed.

1. **HDS - Connect**
2. AWD System - Air Bleed

1. Select the ADJUSTMENT in the AWD WITH INTELLIGENT CONTROL with the HDS.

2. Select the AIR BLEEDING in the ADJUSTMENT with the HDS.

NOTE: See the HDS Help menu for specific instructions.

3. Rear Differential Fluid - Check

TEST

REAR DIFFERENTIAL CLUTCH TEST

Test

1. HDS - Connect
2. Rear Differential Clutch - Test

	1. Block the front wheels (A), raise the left rear wheel and support the vehicle with a safety stand (B) as shown. 2. Release the parking brake.

	3. Hold the left rear tire and turn it counterclockwise continuously for more than one rotation. • If the wheel rotates, go to step 4. • If the wheel does not rotate, replace the rear differential fluid and retest. If the result is the same, replace the rear differential assembly.

	4. Select the FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS. 5. Select the SOLENOID TEST in the FUNCTIONAL TEST with the HDS. 6. Do LEVEL 7 of the SOLENOID TEST with the HDS. 7. Hold the left rear tire and turn it counterclockwise continuously for more than one rotation. • If the wheel rotates, go to step 8. • If the wheel does not rotate, the system is OK at this time and the test is complete.

8. **Check the condition of the rear differential fluid**.

- If the fluid is dirty or burnt, **replace the rear differential fluid**.
- If the fluid is normal, go to step 9.

9. **Make sure the rear differential fluid is at the proper level**.

- If the level is below the proper level, check for rear differential fluid leaks at the differential assembly and retest.
- If the level is normal, go to step 10.

10. Visually check the rear differential for damage.

- If any damage is found on the rear differential, replace the defective part as needed.
- If the rear differential is normal, go to step 11.

11. **Do the rear differential pressure test with the HDS** If Normal is displayed, go to step 12.

12. **Do the rear differential fluid pressure sensor test**

If the rear differential fluid pressure sensor is OK, **replace the rear differential fluid** and retest. If the result is the same, **replace the rear differential assembly** .

REAR DIFFERENTIAL FLUID PRESSURE SENSOR TEST

Special Tools Required

Image	Description/Tool Number
	A/T Low Pressure Gauge w/Panel 07406-0070301

Image	Description/Tool Number
	A/T Pressure Test Hose 07AAJ-PY4A100
	A/T Pressure Adapter 07MAJ-PY40120
	Pressure Gauge Adapter 07NAJ-P07010A
	Oil Pressure Hose 07ZAJ-S5AA200

Test

NOTE: How to read the torque specifications .

1. Rear Differential Fluid Pressure Sensor - Remove

	1. **Remove the rear differential fluid pressure sensor** . 2. Reconnect the connector (A) to the rear differential fluid pressure sensor (B).

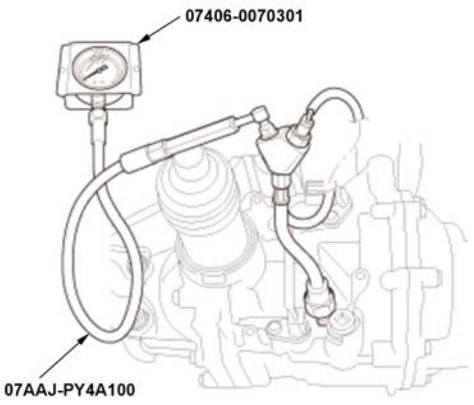
2. **HDS - Connect**

3. Rear Differential Fluid Pressure Sensor - Test

 07AAJ-PY4A100 07NAJ-P07010A A 20 (2.0, 15) B 07MAJ-PY40120 07ZAJ-S5AA200	**NOTE:** Check that the AWD system indicator does not come on. If it does, **check for AWD with intelligent control system DTCs** . 1. Turn the vehicle to the OFF (LOCK) mode. 2. Turn the vehicle to the ON mode. 3. Select the DATA LIST in the AWD WITH INTELLIGENT CONTROL with the HDS. 4. Check the ACTUAL OIL PRESSURE OF THE OIL PRESSURE SENSOR FOR REAR DIFFERENTIAL in the DATA LIST with the HDS. • If the fluid pressure is not within -50-50 kPa (-0.51-0.51 kgf/cm 2, -7.3-7.3 psi), **replace the rear differential fluid pressure sensor** . • If the fluid pressure is within the range of -50-50 kPa (-0.51-0.51 kgf/cm 2, -7.3-7.3 psi), go to step 5. 5. Turn the vehicle to the OFF (LOCK) mode. 6. Remove the oil pressure gauge from the A/T low pressure gauge set. 7. Attach the A/T pressure test hose, the A/T pressure adapter, the pressure gauge adapter, and the oil pressure hose as shown, then Install the rear differential fluid pressure sensor (A) to the pressure gauge adapter. 8. Place the end for the A/T pressure test hose into a drain pan (B). 9. Start the engine, the AWD pump will do a brief low pressure purge of the system, this will cause air and fluid to flow out of the A/T pressure test hose.

10. Turn the vehicle to the OFF (LOCK) mode.

11. Repeat step 9 again to assure the A/T pressure test hose is full of fluid without air bubbles.



12. Attach the A/T low pressure gauge w/panel onto the end of the A/T pressure test hose.

13. Turn the vehicle to the ON mode.

14. Select the ADJUSTMENT in the AWD WITH INTELLIGENT CONTROL with the HDS.

15. Select the AIR BLEEDING in the ADJUSTMENT with the HDS.

NOTE: See the HDS Help menu for specific instructions.

16. Select the FUNCTION TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

17. Select the SOLENOID TEST in the FUNCTION TEST with the HDS.

18. Do LEVEL 7 of the SOLENOID TEST with the HDS.

19. Check the differential fluid pressure value of the oil pressure gauge.

- If the fluid pressure is not within the range of 350-500 kPa (3.57-5.10 kgf/cm 2, 50.8-72.5 psi), **replace the rear differential pump motor** .
- If the fluid pressure is within the range of 350-500 kPa (3.57-5.10 kgf/cm 2, 50.8-72.5 psi), go to step 20.

20. Check the ACTUAL OIL PRESSURE OF THE OIL PRESSURE SENSOR FOR REAR DIFFERENTIAL in the DATA LIST with the HDS.

- If the fluid pressure is not within the range of 350-500 kPa (3.57-5.10 kgf/cm 2, 50.8-72.5 psi), **replace the rear differential fluid pressure sensor** .
- If the fluid pressure is within the range of 350-500 kPa (3.57-5.10 kgf/cm 2, 50.8-72.5 psi), rear differential fluid pressure sensor is OK and the test is complete.

4. **Rear Differential Fluid Pressure Sensor - Install**
5. **Rear Differential Fluid - Check**
6. **AWD System - Air Bleed**

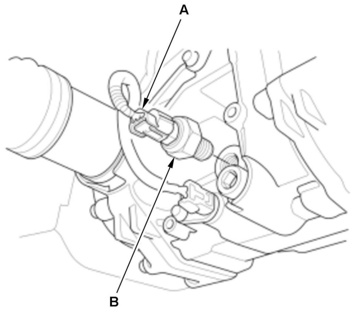
REAR DIFFERENTIAL PRESSURE TEST

Test

NOTE: Before doing the pressure test, check the following conditions.

- Check that the AWD system indicator does not come on. If it does, **check for AWD with intelligent control system DTCs** .
- **Check the rear differential fluid level**.
- Check for rear differential fluid leaks at the rear differential assembly.

1. **HDS - Connect**
2. Rear Differential Fluid Pressure - Test



1. Select DATA LIST in the AWD WITH INTELLIGENT CONTROL with the HDS.

2. Select OIL TEMPERATURE FOR REAR DIFFERENTIAL in the DATA LIST with the HDS.

   - If the temperature is above 68 deg.F (20 deg.C), go to step 3.
   - If the temperature is below 68 deg.F (20 deg.C), drive the vehicle to warm up the rear differential until fluid temperature reaches at least 68 deg.F (20 deg.C), then go to step 3.

3. **Enter the maintenance mode and start the engine**

4. Select FUNCTION TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

5. Select OIL PRESSURE CONTROL TEST in the FUNCTION TEST with the HDS.

6. Check the results displayed on the HDS.

   - If Normal is displayed, the test is completed.
   - If 1-1 is displayed, go to steps 7 through 21.
   - If 2-1 and 5-1 are displayed: go to steps 22 through 36.
   - If 3-1 is displayed: go to steps 37 through 50.
   - If 4-1 and 6-1 are displayed: go to steps 51 through 58.

7. Turn the vehicle to the OFF (LOCK) mode.

8. Disconnect the connector (A).

9. Remove the rear differential fluid pressure sensor (B).

10. Reconnect the connector (A) to the rear differential fluid pressure sensor (B).

11. Turn the vehicle to the ON mode.

12. Select the DATA LIST in the AWD WITH INTELLIGENT CONTROL with the HDS.

13. Check the ACTUAL OIL PRESSURE OF THE OIL PRESSURE SENSOR FOR REAR DIFFERENTIAL in the DATA LIST with the HDS.

- If the fluid pressure is not within -50-50 kPa (-0.51-0.51 kgf/cm 2, -7.3-7.3 psi), replace the rear differential fluid pressure sensor .
- If the fluid pressure is within the range of -50-50 kPa (-0.51-0.51 kgf/cm 2, -7.3-7.3 psi), go to step 14.

14. Replace the rear differential fluid.

15. Install the rear differential fluid pressure sensor
16. Do the AWD system bleeding with the HDS.
17. Enter the maintenance mode and start the engine

18. Select FUNCTION TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

19. Select OIL PRESSURE CONTROL TEST in the FUNCTION TEST with the HDS.

20. Check the results displayed on the HDS.

- If Normal is displayed, the test is completed.
- If 1-1 is displayed: go to step 21.

21. Do the rear differential fluid pressure sensor test with the HDS. If the rear differential fluid pressure sensor test is OK, replace the rear differential assembly

22. Turn the vehicle to the OFF (LOCK) mode.

23. Turn the vehicle to the ON mode.

24. Do the AWD system bleeding with the HDS

26. Select FUNCTION TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

27. Select OIL PRESSURE CONTROL TEST in the FUNCTION TEST with the HDS.

28. Check the results displayed on the HDS.

25. Enter the maintenance mode and start the engine

- If Normal is displayed, intermittent failure, the system is OK at this time, the test is completed.
- If 2-1 and 5-1 are displayed: go to step 29.

29. Replace the rear differential fluid.

30. Do the AWD system bleeding with the HDS.

31. Enter the maintenance mode and start the engine

32. Select FUNCTION TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

33. Select OIL PRESSURE CONTROL TEST in the FUNCTION TEST with the HDS.

34. Check the results displayed on the HDS.

- If Normal is displayed, the test is completed.
- If 2-1 and 5-1 are displayed: go to step 35.

35. Replace the rear differential fluid.

36. Do the rear differential fluid pressure sensor test and the rear differential solenoid valve test with the HDS. If the rear differential fluid pressure sensor test and the rear differential solenoid valve test is OK, replace the rear differential assembly

37. Turn the vehicle to the OFF (LOCK) mode.

38. Turn the vehicle to the ON mode.

39. Do the AWD system bleeding with the HDS

41. Select FUNCTION TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

42. Select OIL PRESSURE CONTROL TEST in the FUNCTION TEST with the HDS.

43. Check the results displayed on the HDS.

40. Enter the maintenance mode and start the engine

- If Normal is displayed, intermittent failure, the system is OK at this time, the test is completed.
- If 3-1 is displayed: go to step 44.

44. Replace the rear differential fluid.

45. Do the AWD system bleeding with the HDS.

46. Enter the maintenance mode and start the engine

47. Select FUNCTION TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

48. Select OIL PRESSURE CONTROL TEST in the FUNCTION TEST with the HDS.

49. Check the results displayed on the HDS.

- If Normal is displayed, the test is completed.
- If 3-1 is displayed: go to step 50.

50. Do the rear differential solenoid valve test with the HDS. If the rear differential solenoid valve test is OK, replace the rear differential assembly

51. Turn the vehicle to the OFF (LOCK) mode.

52. Replace the rear differential fluid

53. Do the AWD system bleeding with the HDS.

54. **Enter the maintenance mode and start the engine**

55. Select FUNCTION TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

56. Select OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS.

57. Check the results displayed on the HDS.

- If Normal is displayed, the test is completed.
- If 4-1 and 6-1 are displayed: go to step 58.

58. **Do the rear differential solenoid valve test with the HDS**.
If the rear differential solenoid valve test is OK, **replace the rear differential assembly** .

REAR DIFFERENTIAL SOLENOID VALVE TEST

Test

1. **HDS - Connect**
2. Rear Differential Solenoid Valve - Test (With HDS)

1. **Enter the maintenance mode and start the engine**

2. Select the FUNCTION TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

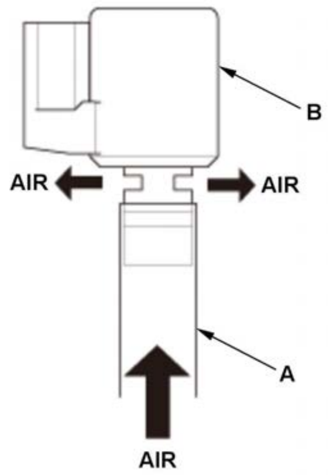
3. Select the SOLENOID TEST in the FUNCTION TEST with the HDS.

4. Do LEVEL 1, then do LEVEL 7 of the SOLENOID TEST in that order with the HDS.

5. Check the rear differential solenoid valve for operation with the HDS. A clicking sound should be heard.

- If no clicking sound is heard, **replace the rear differential solenoid valve** .
- If a clicking sound is heard, go to the next procedure.

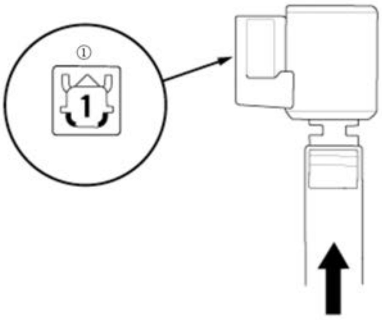
3. **Vehicle - Lift**
4. **Rear Differential Solenoid Valve - Remove**
5. Rear Differential Solenoid Valve - Test



1. Connect a tube (A) to the rear differential solenoid valve (B).

2. Blow the air to the tube.

- If the air flows out of the port, go to step 3.
- If the air does not flow out of the port, **replace the rear differential solenoid valve** .



3. Connect a jumper wire from the negative battery terminal to the rear differential solenoid valve body and connect another jumper wire from the positive battery terminal to connector (male terminal) terminal No. 1. : ①

4. Blow the air to the tube.

- If the air flows out of the port, **replace the rear differential solenoid valve** .
- If the air does not flow out of the port, the rear differential solenoid valve is OK and the test is complete.

6. **Rear Differential Solenoid Valve - Install**
7. **Rear Differential Fluid - Refill**
8. **AWD System - Air Bleed**
9. Test Drive - Check

11. Oil Seal - Install

	1. Install a new oil seal (A) even and flush with the rear differential oil pump cover using the 40 mm I. D. driver handle.

12. Companion Flange - Install
13. No. 2 Propeller Shaft - Connect
14. Rear Differential Fluid - Refill

DESCRIPTION & OPERATION

REAR DIFFERENTIAL SYSTEM DESCRIPTION (AWD)

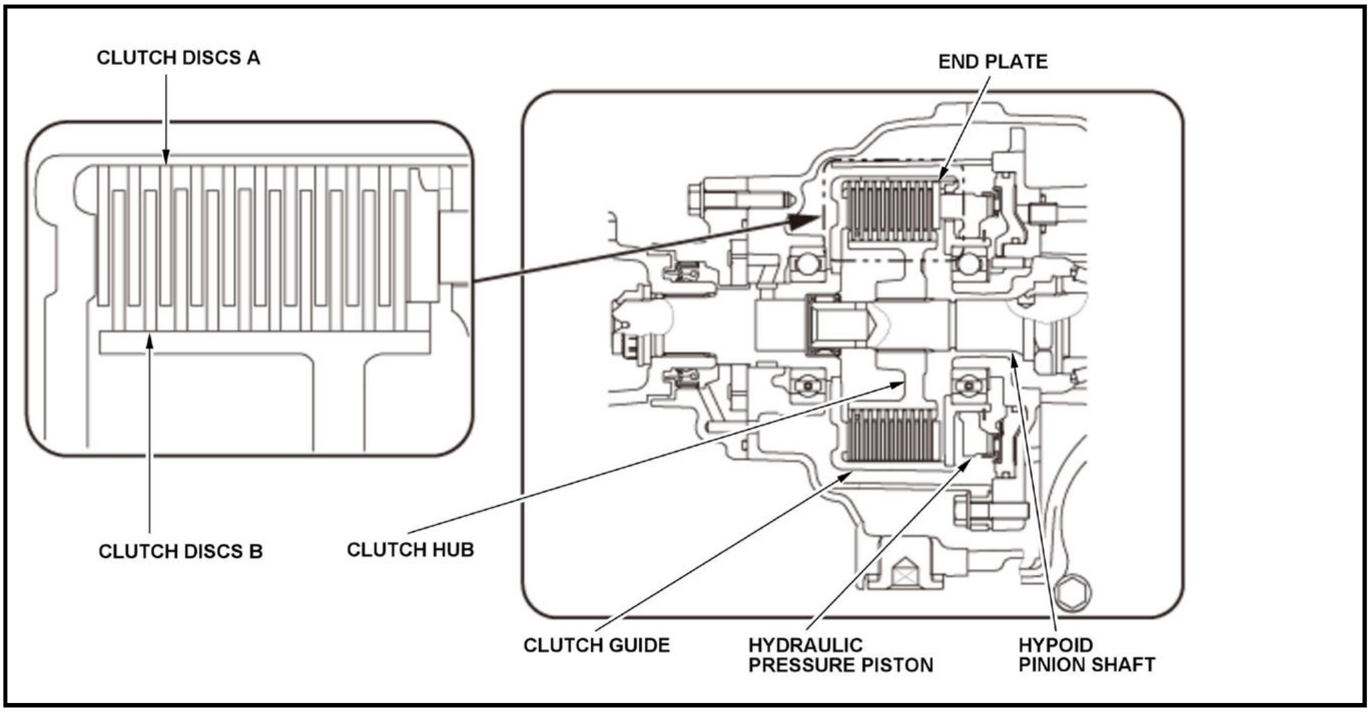
Overview

The All Wheel Drive (AWD) system is adopted into the rear differential. The AWD features a built-in real-time controlling mechanism that distributes the proper torque to the rear wheels as needed depending on the rotating difference between front and rear wheels or the engine power. The hydraulic circuit of the AWD is equipped with a motor-driven oil pump and an electronically-controlled valves, resulting in a wide range of torque controls, improvements in responsiveness, reduction of excessive torque, and compact size/lightening.

Construction

The AWD Differential Assembly consists of a wet-disc clutch assembly, differential, and a hydraulic system. The main components of the wet-disc clutch assembly are as follow:

Components	Purpose
Clutch Disc A	Clutch discs A are splined to the clutch guide.
Clutch Disc B	Clutch discs B are splined to the clutch hub.
Clutch Guide	Clutch guide is connected to the propeller shaft.
Clutch Hub	Clutch hub is connected to the hypoid pinion shaft.
Hydraulic Pressure Piston	The end plate is pressed by an oil pressure, and the clutch plates A and B are engaged.

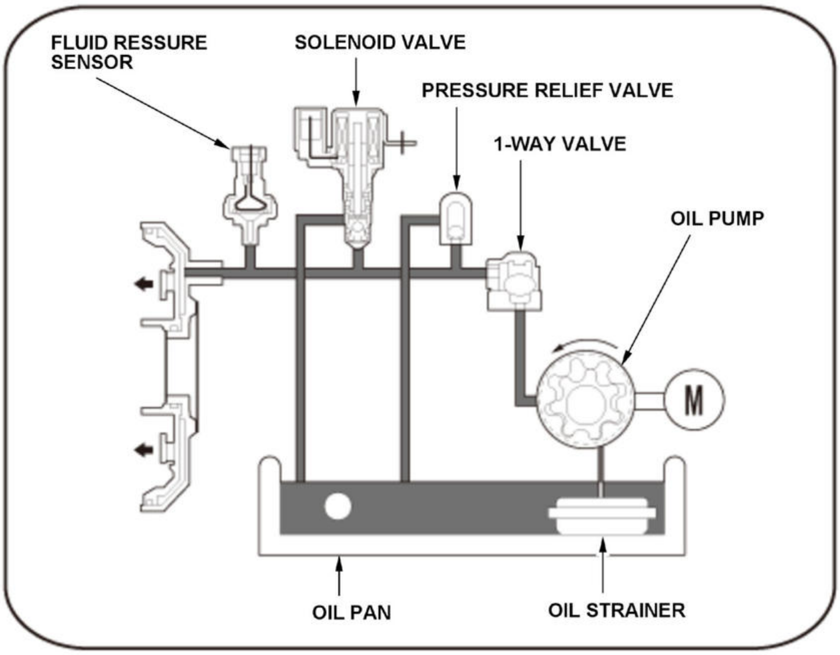


Hydraulic Circuit

The main components in the hydraulic circuit are as follows:

COMPONENT	FUNCTION
Oil Pump	Operated by the rear differential pump motor, the oil pump receives the oil from the strainer and sends it to the

COMPONENT	FUNCTION
	hydraulic circuit. The rear differential pump motor is controlled by the AWD control unit.
1-Way Valve	Retains the oil pressure in the hydraulic circuit.
Pressure Relief Valve	Operates when the oil pressure failed, and release the oil pressure into the strainer.
Rear Differential Solenoid Valve	Turns ON/OFF to adjust the oil pressure in the hydraulic circuit.
Rear Differential Fluid Pressure Sensor	The fluid pressure sensor monitors the pressure in the hydraulic circuit and reports this to the AWD control unit.
Rear Differential Fluid Temperature Sensor	The fluid temperature sensor monitors the fluid temperature and reports this to the AWD control unit.



The AWD control unit receives signals from the PCM, VSA Control Module, Gauge Control Module, EPS Control Unit and SRS Unit. These signals are used to calculate the amount of torque to be provided to the rear wheels. The AWD control unit actuates controls on the differential that generates variable hydraulic pressure in the hydraulic circuits. This pressure causes a clutch assembly inside the housing to be applied, delivering variable amounts of power to the rear wheels.

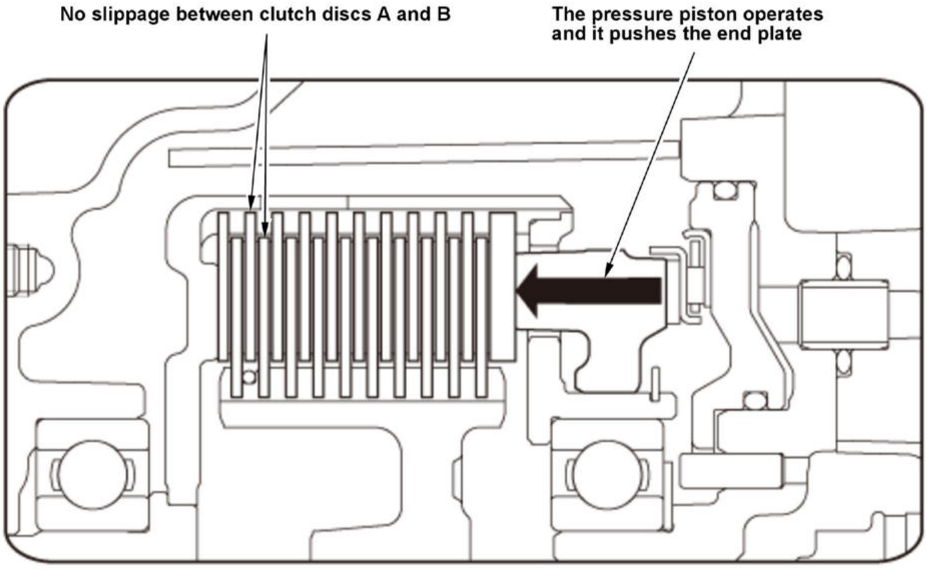
Operation

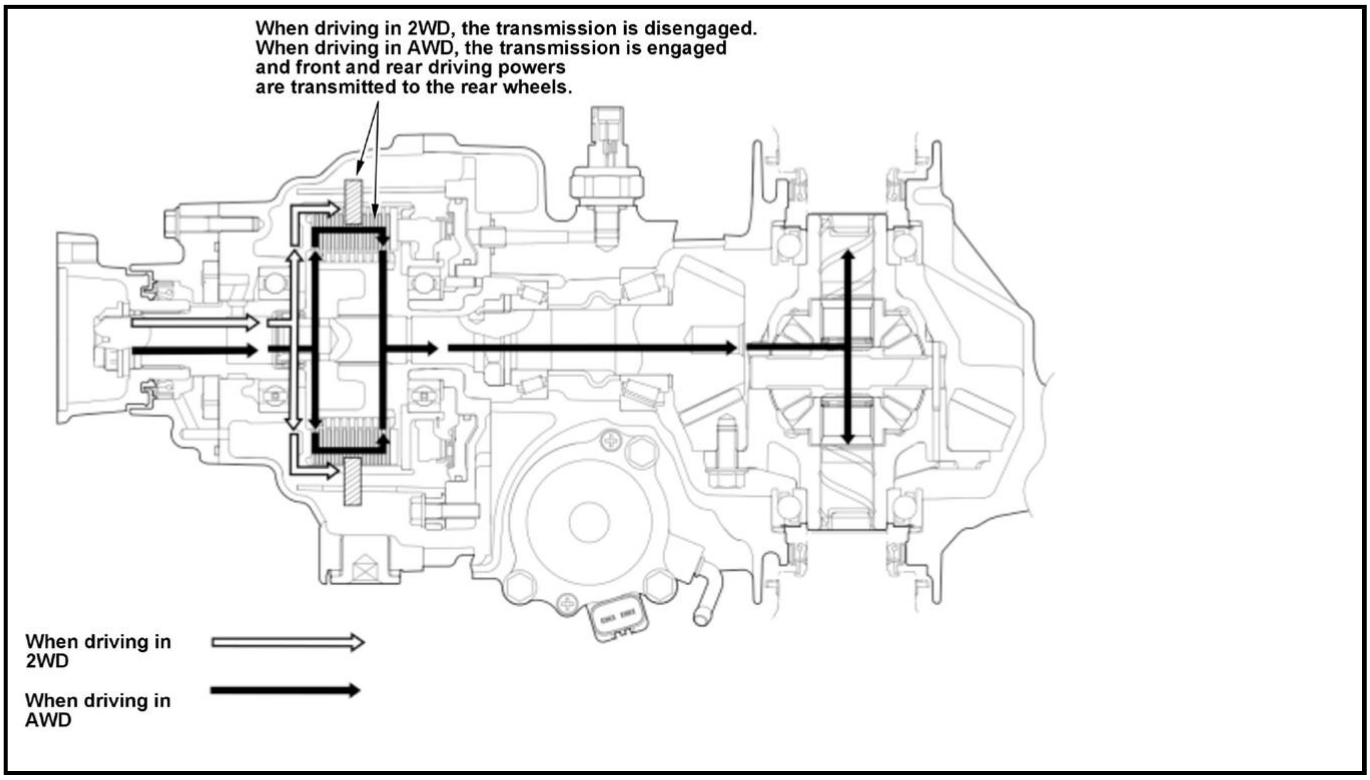
Driving Power Delivery

The driving power delivered from the propeller shaft is transmitted to the clutch guide and clutch plate. Since the clutch is not engaged when the oil pressure is not generated, the pinion gear is not driven by the propeller shaft. In this case, the driving power is not transmitted to the rear wheels, but it is only rotated by the vehicle movement. The generated hydraulic pressure presses the pressure piston against the end plate, compressing the clutch discs. This compression reduces the slippage between clutch discs A and B, thus rotating the clutch drum together with the clutch hub.



No slippage between clutch discs A and B
The pressure piston operates and it pushes the end plate

The drive power delivered to the propeller shaft is outputted from the clutch hub to the drive pinion gear, ring gear, differential and rear drive shafts when the clutch is applied. In this situation, the drive power is transmitted to the rear wheels.



When driving in 2WD, the transmission is disengaged.
When driving in AWD, the transmission is engaged and front and rear driving powers are transmitted to the rear wheels.
When driving in 2WD
When driving in AWD

In addition, the clutch drum and the clutch hub are not in complete contact but linked to each other with a maximum of 80% contact rate. This slippage reduces the friction caused by the rotational difference between the front and rear.

Hydraulic Control

Torque is distributed to the front and rear wheels by controlling the amount of clutch application in the differential. Clutch application force is controlled through oil pressure created by the oil pump drive motor and a solenoid valve.

By applying pressure and depressurization control, the AWD control unit sets the optimum level of pressure in stages to suit the driving conditions and road conditions. The basic control method involves the hydraulic circuit being pressurized by the motor to a level close to, but generally exceeding, the target pressure calculated from the vehicle conditions and road conditions received by the AWD control unit.

The hydraulic controls in a normal driving condition are as follows:

- In the pressurization mode, the oil pump driving motor generates a target oil pressure in the hydraulic circuit during a period of time calculated by the AWD control unit. The 1-way valve is opened by the oil pressure and the AWD control unit closes the solenoid valve (energized), thus, the pressure piston squeezes the clutch discs.
- In the retention mode, if the oil pressure reaches the pressure level set by the AWD control unit, the motor stops pressurizing. The 1-way valve closes and the solenoid valve keeps closed (energized), and the oil pressure generated in the hydraulic circuit is kept as-is. Thus, the pressure piston is fixed in a place and maintains the pressure on the clutch discs.
- In the depressurization mode, if the AWD control unit determines that it is not necessary to distribute a torque to the rear wheels, it turns on electricity to open the solenoid valve (de-energized), and releases the oil pressure from the hydraulic circuit. Thus, the pressure piston returns back and releases the clutch disc.

Basic Operation

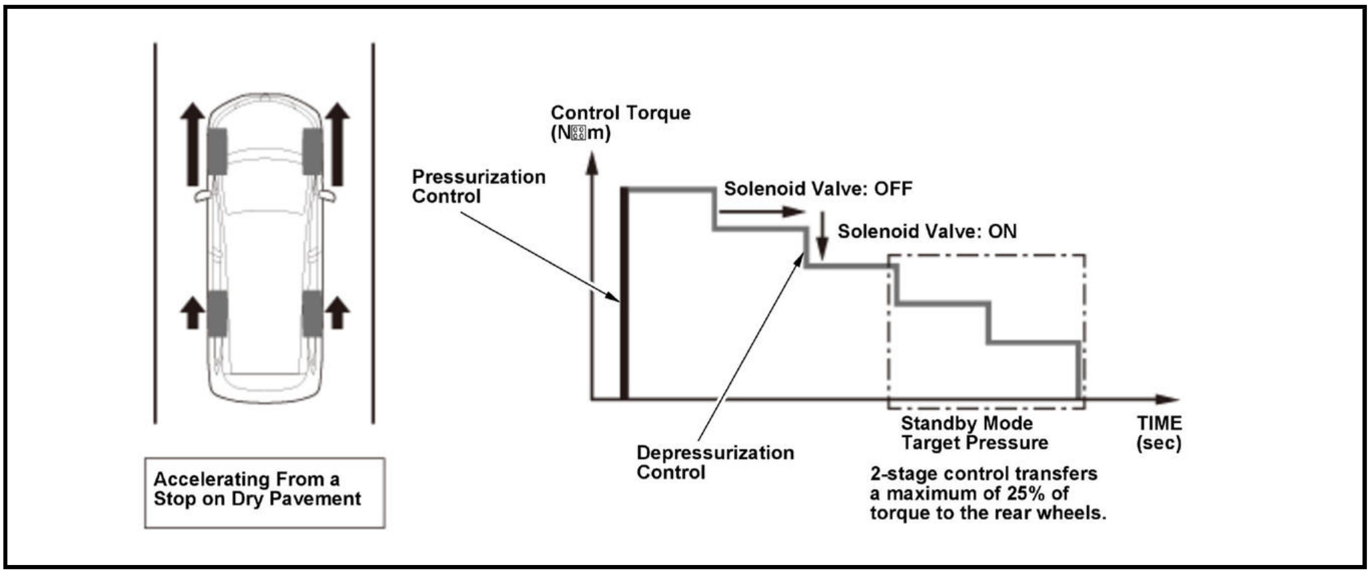
Operating Modes

The operations of AWD are performed appropriately to meet the driving conditions. The following examples show the AWD performance against several driving conditions.

Accelerating From a Stop on Dry Pavement

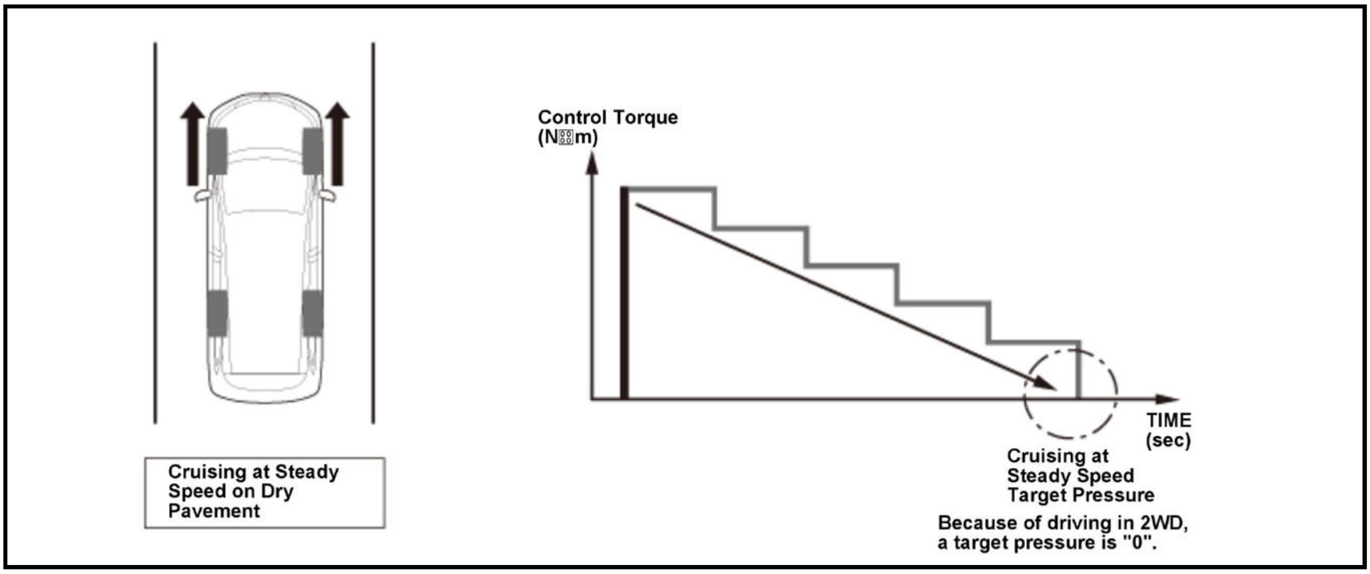
When the vehicle is stopped on a dry level surface, the AWD control unit puts the system in Standby Mode. This mode pressurizes the hydraulic system and applies the clutch pressure, and distributes a maximum of 20% of torque to the rear wheels for an initial acceleration. To achieve this, the All Wheel Drive control unit receives information from the VSA system to determine the longitudinal angle of the vehicle. Upon determining the vehicle is on level ground, the AWD control unit activates the oil pump drive motor to pressurize the hydraulic system, then cycles the oil pressure solenoid on and off until the target pressure is met. Two levels of system pressurization can be created, depending on conditions. When the target pressure is achieved, the oil pressure solenoid remains closed to maintain the pressure in the hydraulic circuit until the vehicle begins to accelerate.



Accelerating From a Stop on Dry Pavement
Control Torque (N·m)
Pressurization Control
Solenoid Valve: OFF
Solenoid Valve: ON
Depressurization Control
Standby Mode Target Pressure
TIME (sec)
2-stage control transfers a maximum of 25% of torque to the rear wheels.

Cruising at Steady Speed on Dry Pavement

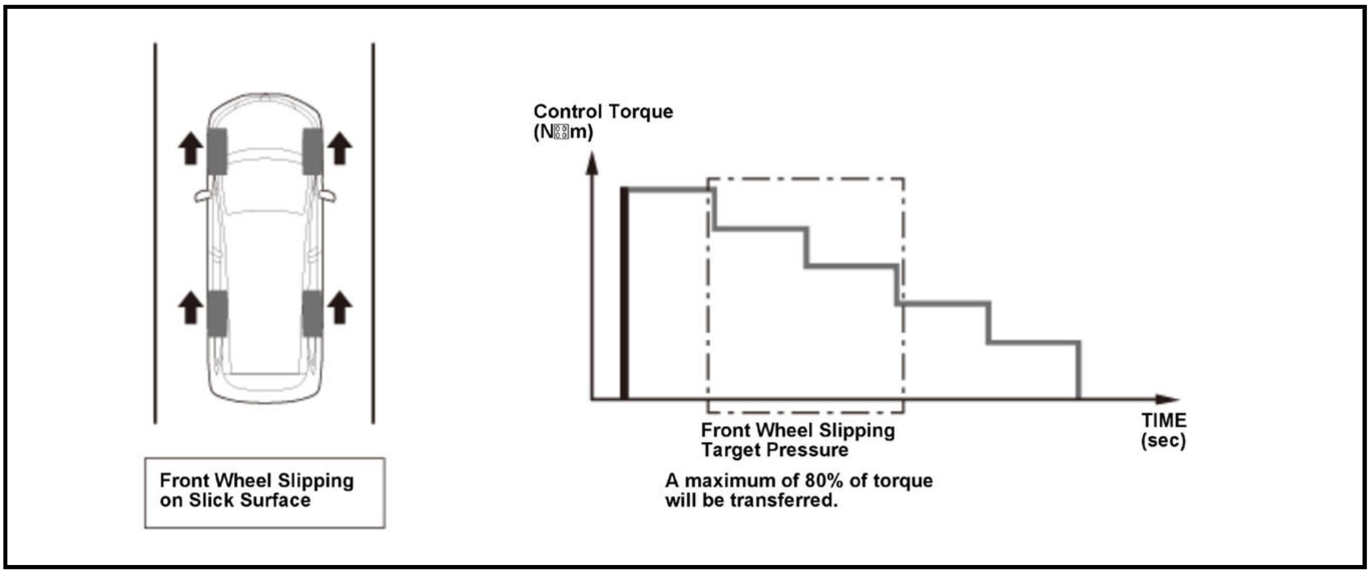
When the vehicle is cruising at a steady speed on dry pavement, the AWD control unit deactivates the All Wheel Drive system. The vehicle operates in 2WD mode, helping to increase fuel efficiency. To achieve this, the AWD control unit receives information from the PCM, VSA, EPS and SRS to determine the stability of the vehicle. When it determines that the vehicle is traveling at a steady speed and no wheel slippage is occurring, all pressure is released from the hydraulic circuit, enabling 2WD-only operation. This mode continues until the AWD control unit determines that torque needs to be transferred to the rear wheels.



Cruising at Steady Speed on Dry Pavement
Control Torque (N·m)
TIME (sec)
Cruising at Steady Speed Target Pressure
Because of driving in 2WD, a target pressure is "0".

Front Wheel Slipping on Slick Surface

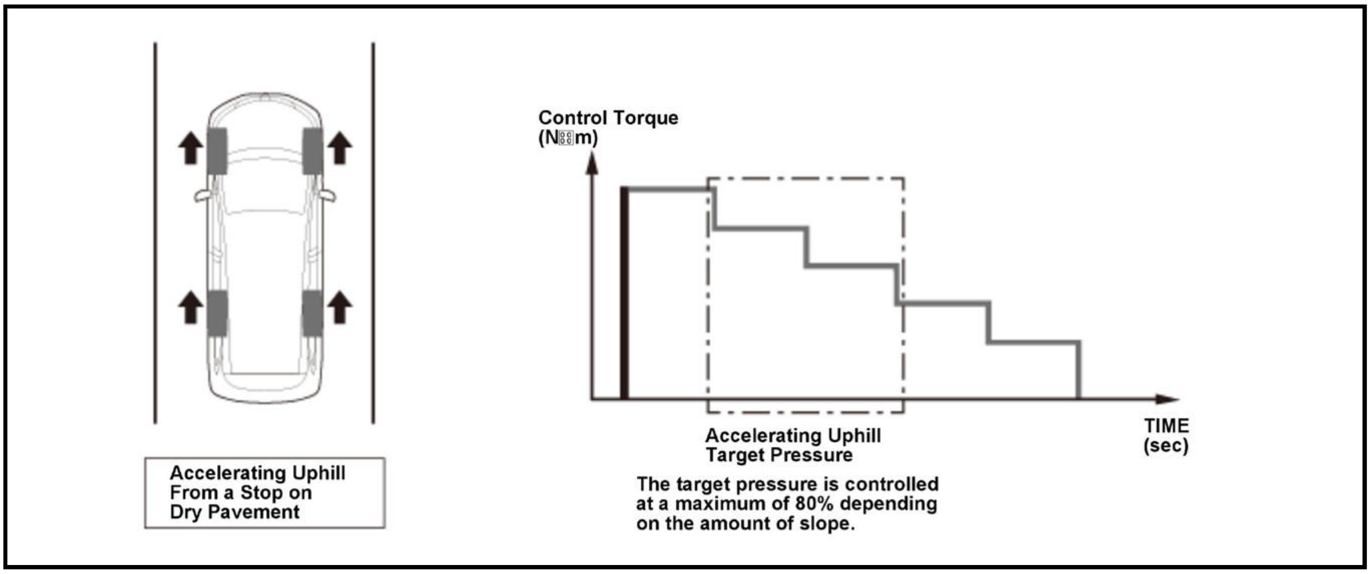
When the front wheels are slipping, for example on a low friction surface such as wet or icy roads, the AWD control unit receives information from the VSA, EPS and SRS that the front wheels are slipping. When the slipping of the front wheels occur, 80% of torque will be transferred to the rear wheels to reduce the load on the front wheels, and to regain vehicle stability. This mode continues until the All Wheel Drive control unit determines that the front wheels are no longer slipping.



Front Wheel Slipping on Slick Surface
Control Torque (N m)
TIME (sec)
Front Wheel Slipping Target Pressure
A maximum of 80% of torque will be transferred.

Accelerating Uphill From a Stop on Dry Pavement

To stabilize the vehicle while driving uphill, the AWD control unit transfers more of the available torque to the rear wheels than when driving on a flat road. To achieve this, the AWD control unit receives information from the VSA system to determine the slope where the vehicle is driving. Upon determining this, the AWD control unit activates the oil pump drive motor to pressurize the hydraulic system, then cycles the oil pressure solenoid on and off until the target pressure is reached. The level of pressurization varies depending on the calculated slope the vehicle is driving on. The torque transfer to the rear wheels will be controlled at a maximum of 80% depending on driving force. This mode continues until the AWD control unit determines that the vehicle is no longer accelerating uphill.



Accelerating Uphill From a Stop on Dry Pavement
Control Torque (N m)
TIME (sec)
Accelerating Uphill Target Pressure
The target pressure is controlled at a maximum of 80% depending on the amount of slope.

INSPECTION REPLACEMENT

REAR DIFFERENTIAL FLUID INSPECTION AND REPLACEMENT (AWD)

Inspection

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Rear Differential Fluid - Check

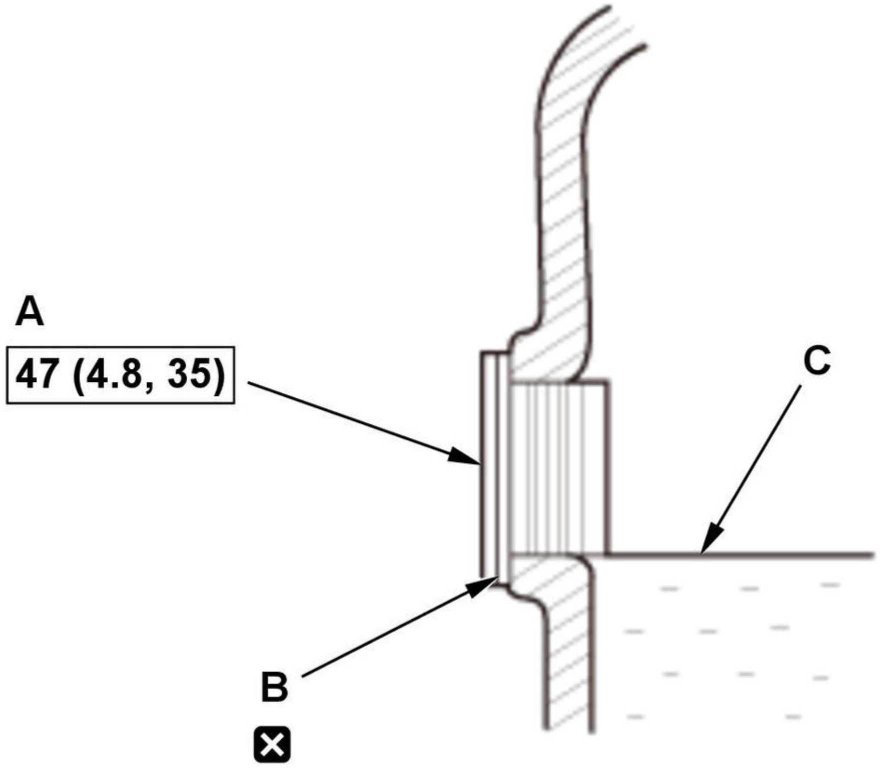

Fig. 1: Oil Filler Plug With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Use solvent and a brush to wash any oil and dirt off the oil filler plug and dry them with compressed air.

2. Remove the oil filler plug (A) and the sealing washer (B).

3. Check the condition of the rear differential fluid, if the fluid is dirty or burnt, replace it.

4. Make sure the rear differential fluid is at the proper level (C).

   - The fluid level must reach up to the bottom of the oil filler plug hole.
   - If the level is below the proper level, check for rear differential fluid leaks at the differential.
   - If a problem is found, fix it before filling the differential with fluid.

5. If necessary, add rear differential fluid until it runs out, then reinstall the oil filler plug with a new sealing washer.

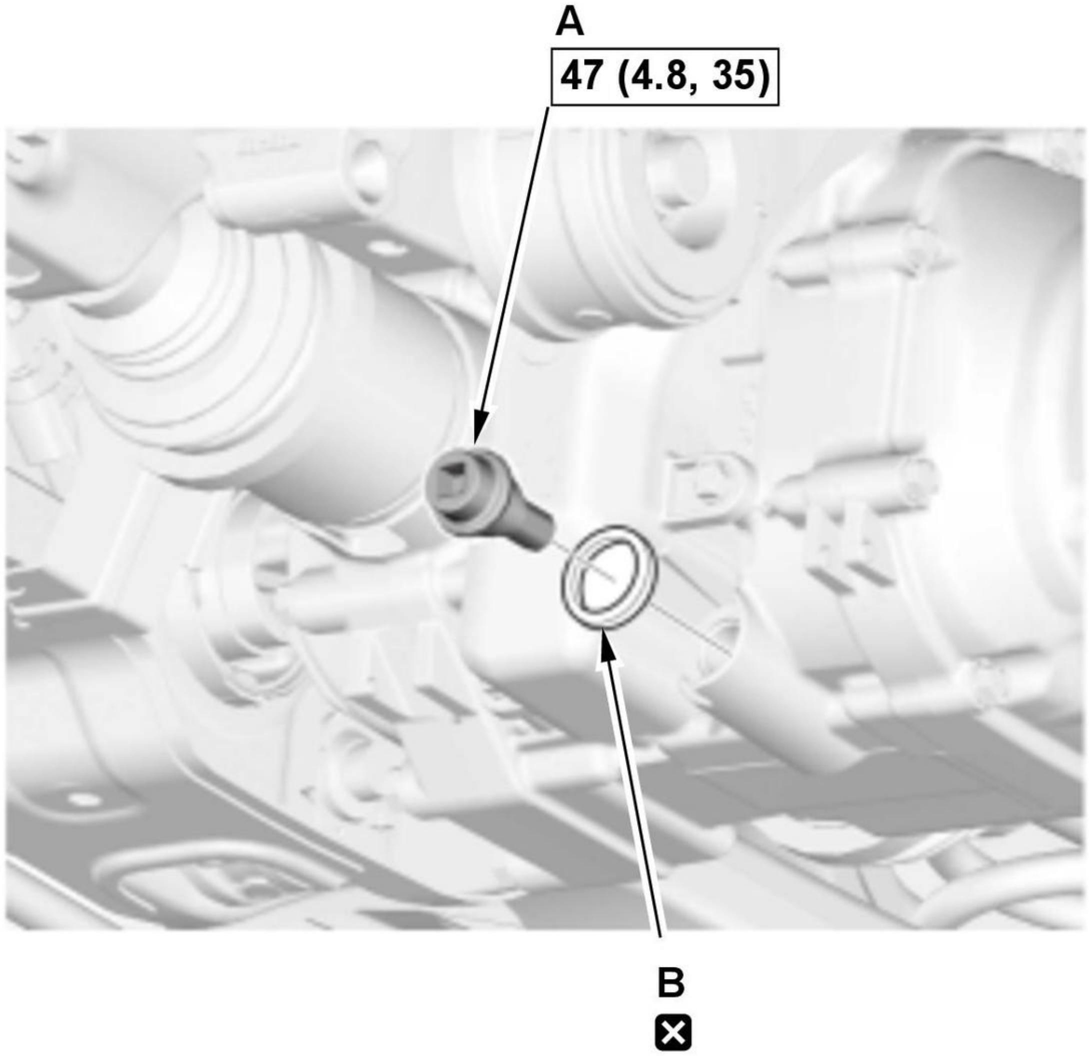
Replacement

NOTE:

- **How to read the torque specifications** .
- Check that the AWD system indicator does not come on. If it does, **check for AWD with intelligent control system DTCs.**

1. **Vehicle - Lift**
2. Rear Differential Fluid - Replace

	1. Remove the oil filler plug (A) and the sealing washer (B).
	2. Remove the drain plug (A) and the sealing washer (B), then drain the rear differential fluid.



[Fig. 2: Drain Plug With Torque Specifications](#)
Courtesy of HONDA, U.S.A., INC.

3. Remove metal particles from the magnetic surface of the drain plug (A).

4. Install the drain plug with a new sealing washer (B).

5. Refill the rear differential with rear differential fluid to the proper level.

NOTE: If you disassemble the differential, check the rear differential fluid level again after the AWD with intelligent control system check is finished. Add fluid if necessary.

Recommended fluid:	
B	**Honda DPSF-II**

Fluid Capacity:	
B	**1.2 L (1.3 US qt) at fluid change**
B	**1.5 L (1.6 US qt) at overhaul**

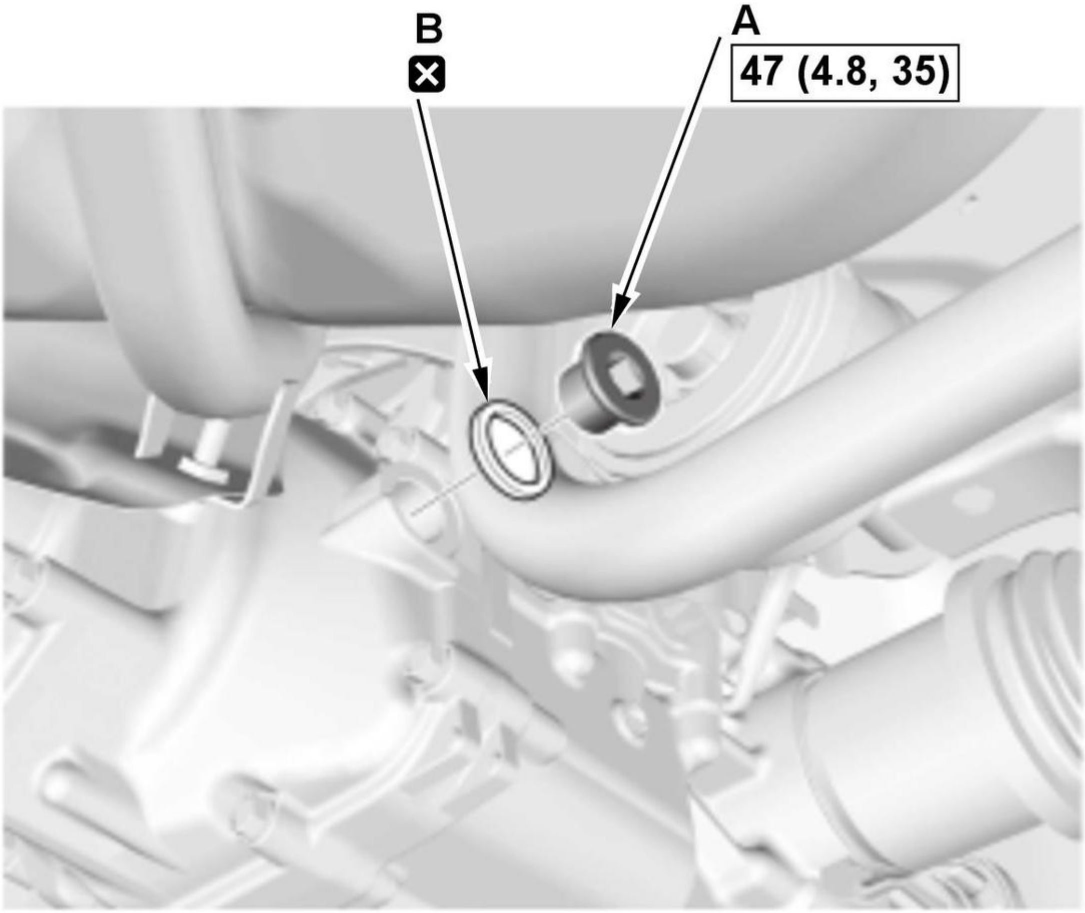


Fig. 3: Oil Filler Plug With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

6. Install the oil filler plug (A) with a new sealing washer (B).

3. Rear Differential Fluid After Replacement - Check

1. Apply the parking brake and block all wheels.

2. Start the engine and let it idle more than 6 seconds, then turn the engine off. Repeat this step three more times.

3. Shift the transmission to D position/mode while pressing the brake pedal firmly. Press the accelerator pedal for 2 seconds, then let it idle. Repeat this step three more times.

4. Check that the AWD system indicator does not come on. If it does, check for AWD with intelligent control system DTCs

.

4. Maintenance Minder - Reset

1. If the Maintenance Minder required to replace the rear differential fluid, reset the Maintenance Minder with the gauge . If the Maintenance Minder did not require to replace the rear differential fluid, reset the Maintenance Minder with the HDS .

SERVICE INFORMATION

AWD SYSTEM BLEEDING (AWD)

Procedure

NOTE: Whenever the rear differential assembly is disassembled, the AWD with intelligent control system must be bled.

1. **HDS - Connect**
2. AWD System - Air Bleed

1. Select the ADJUSTMENT in the AWD WITH INTELLIGENT CONTROL with the HDS. 2. Select the AIR BLEEDING in the ADJUSTMENT with the HDS. **NOTE:** See the HDS Help menu for specific instructions.

3. **Rear Differential Fluid - Check**

TEST

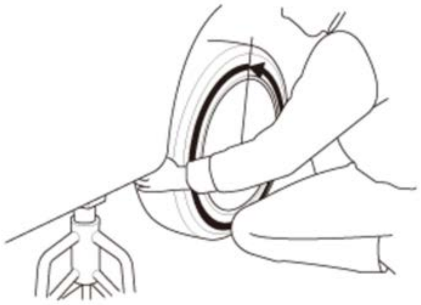
REAR DIFFERENTIAL CLUTCH TEST (AWD)

Test

1. **HDS - Connect**
2. Rear Differential Clutch - Test

	1. Block the front wheels (A), raise the left rear wheel and support the vehicle with a safety stand (B) as shown. 2. Release the parking brake.

	3. Hold the left rear tire and turn it counterclockwise continuously for more than one rotation. - If the wheel rotates, go to step 4. - If the wheel does not rotate, **replace the rear differential fluid** and retest. If the result is the same, **replace the rear differential assembly** .



4. Select the FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

5. Select the SOLENOID TEST in the FUNCTIONAL TEST with the HDS.

6. Do LEVEL 7 of the SOLENOID TEST with the HDS.

7. Hold the left rear tire and turn it counterclockwise continuously for more than one rotation.

- If the wheel rotates, go to step 8.
- If the wheel does not rotate, the system is OK at this time and the test is complete.

8. **Check the condition of the rear differential fluid**.

- If the fluid is dirty or burnt, **replace the rear differential fluid**.
- If the fluid is normal, go to step 9.

9. **Make sure the rear differential fluid is at the proper level**.

- If the level is below the proper level, check for rear differential fluid leaks at the differential assembly and retest.
- If the level is normal, go to step 10.

10. Visually check the rear differential for damage.

- If any damage is found on the rear differential, replace the defective part as needed.
- If the rear differential is normal, go to step 11.

11. **Do the rear differential pressure test with the HDS**

If Normal is displayed, go to step 12.

12. **Do the rear differential fluid pressure sensor test**

If the rear differential fluid pressure sensor is OK, **replace the rear differential fluid** and retest. If the result is the same, **replace the rear differential assembly** .

REAR DIFFERENTIAL FLUID PRESSURE SENSOR TEST (AWD)

Special Tools Required

Image	Description/Tool Number
	A/T Low Pressure Gauge w/Panel 07406-0070301

	A/T Pressure Adapter 07MAJ-PY40120
	Pressure Gauge Adapter 07NAJ-P07010A

Image	Description/Tool Number
	Oil Pressure Hose 07ZAJ-S5A0200

Test

NOTE: **How to read the torque specifications** .

1. Rear Differential Fluid Pressure Sensor - Remove

	1. **Remove the rear differential fluid pressure sensor** . 2. Reconnect the connector (A) to the rear differential fluid pressure sensor (B).

2. **HDS - Connect**
3. Rear Differential Fluid Pressure Sensor - Test

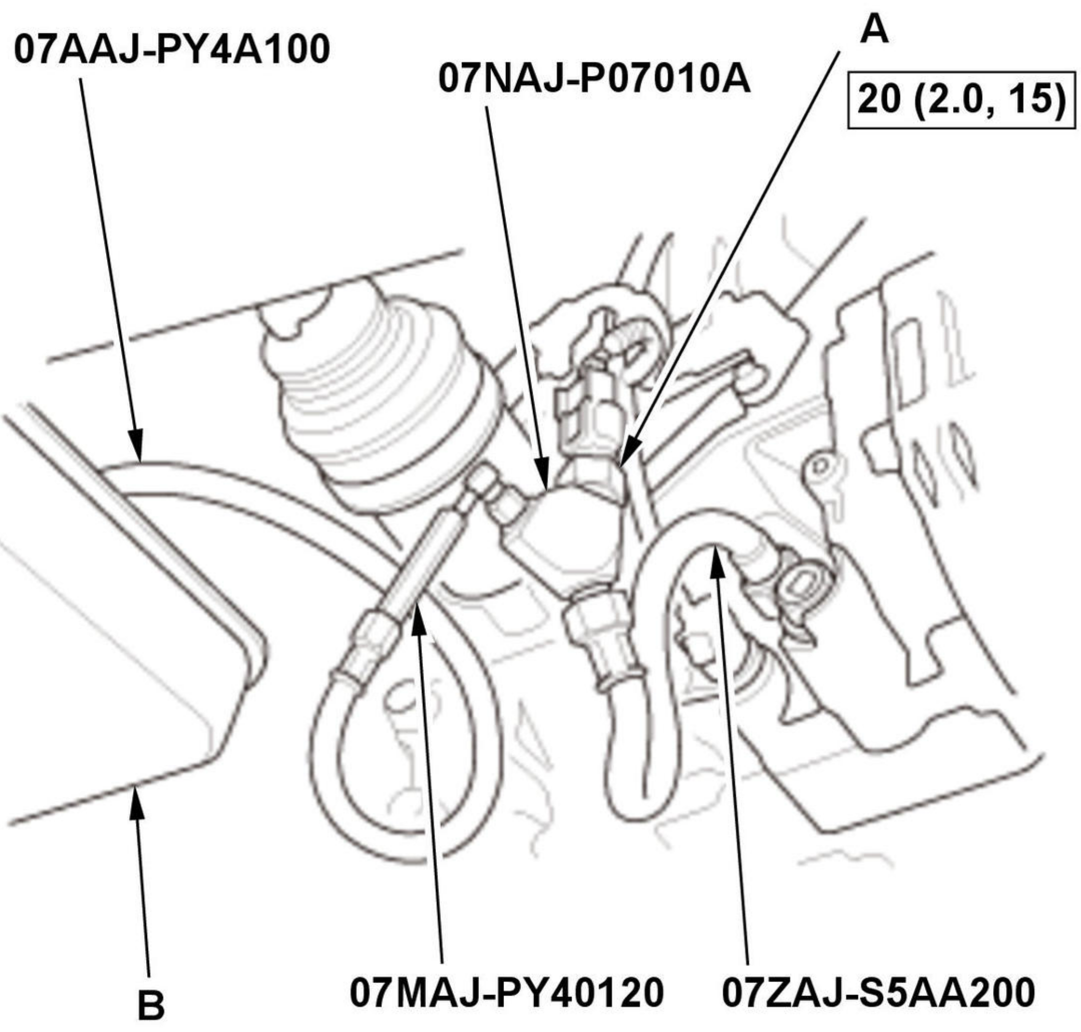

Fig. 4: Rear Differential Fluid Pressure Sensor With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

NOTE: Check that the AWD system indicator does not come on. If it does, check for AWD with intelligent control system DTCs .

1. Turn the vehicle to the OFF (LOCK) mode.

2. Turn the vehicle to the ON mode.

3. Select the DATA LIST in the AWD WITH INTELLIGENT CONTROL with the HDS.

4. Check the ACTUAL OIL PRESSURE OF THE OIL PRESSURE SENSOR FOR REAR DIFFERENTIAL in the DATA LIST with the HDS.

   - If the fluid pressure is not within -30-30 kPa (-0.31-0.31 kgf/cm 2, -4.4-4.4 psi), replace the rear differential fluid pressure sensor .
   - If the fluid pressure is within the range of -30-30 kPa (-0.31-0.31 kgf/cm 2, -4.4-4.4 psi), go to step 5.

5. Turn the vehicle to the OFF (LOCK) mode.

6. Remove the oil pressure gauge from the A/T low pressure gauge set.

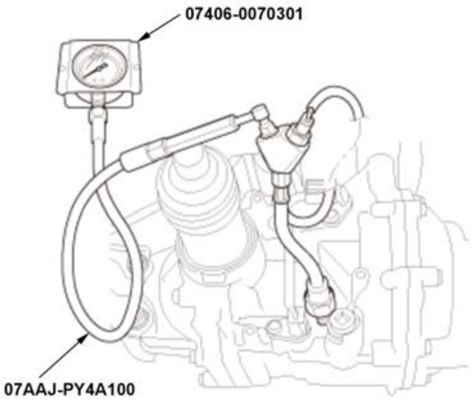
7. Attach the A/T pressure test hose, the A/T pressure adapter, the pressure gauge adapter, and the oil pressure hose as shown, then Install the rear differential fluid pressure sensor (A) to the pressure gauge adapter.

8. Place the end for the A/T pressure test hose into a drain pan (B).

9. Start the engine, the AWD pump will do a brief low pressure purge of the system, this will cause air and fluid to flow out of the A/T pressure test hose.

10. Turn the vehicle to the OFF (LOCK) mode.

11. Repeat step 9 again to assure the A/T pressure test hose is full of fluid without air bubbles.



12. Attach the A/T low pressure gauge w/panel onto the end of the A/T pressure test hose.

13. Turn the vehicle to the ON mode.

14. Select the ADJUSTMENT in the AWD WITH INTELLIGENT CONTROL with the HDS.

15. Select the AIR BLEEDING in the ADJUSTMENT with the HDS.

NOTE: See the HDS Help menu for specific instructions.

16. Select the FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

17. Select the SOLENOID TEST in the FUNCTIONAL TEST with the HDS.

18. Do LEVEL 7 of the SOLENOID TEST with the HDS.

19. Check the differential fluid pressure value of the oil pressure gauge.

- If the fluid pressure is not within the range of 434-599 kPa (4.43-6.11 kgf/cm 2, 62.9-86.9 psi), **replace the rear differential pump motor** .
- If the fluid pressure is within the range of 434-599 kPa (4.43-6.11 kgf/cm 2, 62.9-86.9 psi), go to step 20.

20. Check the ACTUAL OIL PRESSURE OF THE OIL PRESSURE SENSOR FOR REAR DIFFERENTIAL in the DATA LIST with the HDS.

- If the fluid pressure is not within the range of 434-599 kPa (4.43-6.11 kgf/cm 2, 62.9-86.9 psi), **replace the rear differential fluid pressure sensor** .
- If the fluid pressure is within the range of 434-599 kPa (4.43-6.11 kgf/cm 2, 62.9-86.9 psi), rear differential fluid pressure sensor is OK and the test is complete.

4. **Rear Differential Fluid Pressure Sensor - Install**
5. **Rear Differential Fluid - Check**

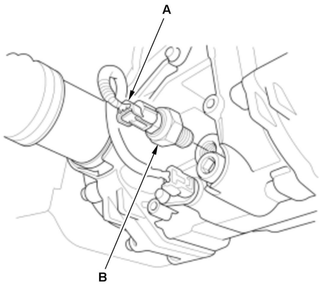
REAR DIFFERENTIAL PRESSURE TEST (AWD)

Test

NOTE: Before doing the pressure test, check the following conditions.

- Check that the AWD system indicator does not come on. If it does, **check for AWD with intelligent control system DTCs** .
- **Check the rear differential fluid level**.
- Check for rear differential fluid leaks at the rear differential assembly.

1. **HDS - Connect**
2. Rear Differential Fluid Pressure - Test



1. Select DATA LIST in the AWD WITH INTELLIGENT CONTROL with the HDS.

2. Select OIL TEMPERATURE FOR REAR DIFFERENTIAL in the DATA LIST with the HDS.

   - If the temperature is above 68 deg. F (20 deg. C), go to step 3.
   - If the temperature is below 68 deg. F (20 deg. C), drive the vehicle to warm up the rear differential until fluid temperature reaches at least 68 deg. F (20 deg. C), then go to step 3.

3. Start the engine.

4. Select FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

5. Select OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS.

6. Check the results displayed on the HDS.

   - If Normal is displayed, the test is completed.
   - If 1-1 is displayed, go to steps 7 through 21.
   - If 2-1 and 5-1 are displayed: go to steps 22 through 36.
   - If 3-1 is displayed: go to steps 37 through 50.
   - If 4-1 and 6-1 are displayed: go to steps 51 through 58.

7. Turn the vehicle to the OFF (LOCK) mode.

8. Disconnect the connector (A).

9. Remove the rear differential fluid pressure sensor (B).

10. Reconnect the connector (A) to the rear differential fluid pressure sensor (B).

11. Turn the vehicle to the ON mode.

12. Select the DATA LIST in the AWD WITH INTELLIGENT CONTROL with the HDS.

13. Check the ACTUAL OIL PRESSURE OF THE OIL PRESSURE SENSOR FOR REAR DIFFERENTIAL in the DATA LIST with the HDS.

- If the fluid pressure is not within -30-30 kPa (-0.31-0.31 kgf/cm 2, -4.4-4.4 psi), **replace the rear differential fluid pressure sensor** .
- If the fluid pressure is within the range of -30-30 kPa (-0.31-0.31 kgf/cm 2, -4.4-4.4 psi), go to step 14.

14. **Replace the rear differential fluid**.

15. **Install the rear differential fluid pressure sensor** .

16. **Do the AWD system bleeding with the HDS**

17. Start the engine.

18. Select FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

19. Select OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS.

20. Check the results displayed on the HDS.

- If Normal is displayed, the test is completed.
- If 1-1 is displayed: go to step 21.

21. **Do the rear differential fluid pressure sensor test with the HDS**. If the rear differential fluid pressure sensor test is OK, **replace the rear differential assembly**

22. Turn the vehicle to the OFF (LOCK) mode.

23. Turn the vehicle to the ON mode.

24. **Do the AWD system bleeding with the HDS**

25. Start the engine.

26. Select FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

27. Select OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS.

28. Check the results displayed on the HDS.

- If Normal is displayed, intermittent failure, the system is OK at this time, the test is completed.
- If 2-1 and 5-1 are displayed: go to step 29.

29. **Replace the rear differential fluid**.30. **Do the AWD system bleeding with the HDS**

31. Start the engine.

32. Select FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

33. Select OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS.

34. Check the results displayed on the HDS.

- If Normal is displayed, the test is completed.
- If 2-1 and 5-1 are displayed: go to step 35.

35. **Replace the rear differential fluid**.36. **Do the rear differential fluid pressure sensor test** and **the rear differential solenoid valve test** with the HDS. If the rear differential fluid pressure sensor test and the rear differential solenoid valve test is OK, **replace the rear differential assembly**

37. Turn the vehicle to the OFF (LOCK) mode.

38. Turn the vehicle to the ON mode.

39. **Do the AWD system bleeding with the HDS**

40. Start the engine.

41. Select FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

42. Select OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS.

43. Check the results displayed on the HDS.

- If Normal is displayed, intermittent failure, the system is OK at this time, the test is completed.
- If 3-1 is displayed: go to step 44.

44. **Replace the rear differential fluid**.45. **Do the AWD system bleeding with the HDS**

46. Start the engine.

47. Select FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

48. Select OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS.

49. Check the results displayed on the HDS.

- If Normal is displayed, the test is completed.
- If 3-1 is displayed: go to step 50.

50. **Do the rear differential solenoid valve test with the HDS**. If the rear differential solenoid valve test is OK, **replace the rear differential assembly**

51. Turn the vehicle to the OFF (LOCK) mode.

52. **Replace the rear differential fluid**

54. Start the engine.

55. Select FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

56. Select OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS.

57. Check the results displayed on the HDS.

.53. **Do the AWD system bleeding with the HDS**

- If Normal is displayed, the test is completed.
- If 4-1 and 6-1 are displayed: go to step 58.

58. **Do the rear differential solenoid valve test with the HDS**. If the rear differential solenoid valve test is OK, **replace the rear differential assembly** .

REAR DIFFERENTIAL SOLENOID VALVE TEST (AWD)

Test

1. **HDS - Connect**
2. Rear Differential Solenoid Valve - Test (With HDS)

1. Start the engine.

2. Select the FUNCTIONAL TEST in the AWD WITH INTELLIGENT CONTROL with the HDS.

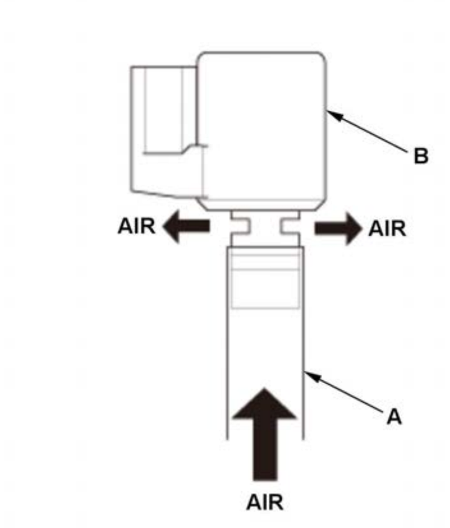
3. Select the SOLENOID TEST in the FUNCTIONAL TEST with the HDS.

4. Do LEVEL 1, then do LEVEL 7 of the SOLENOID TEST in that order with the HDS.

5. Check the rear differential solenoid valve for operation with the HDS. A clicking sound should be heard.

- If no clicking sound is heard, **replace the rear differential solenoid valve** .
- If a clicking sound is heard, go to the next procedure.

3. **Vehicle - Lift**
4. **Rear Differential Solenoid Valve - Remove**
5. Rear Differential Solenoid Valve - Test



1. Connect a tube (A) to the rear differential solenoid valve (B).

2. Blow the air to the tube.

- If the air flows out of the port, go to step 3.
- If the air does not flow out of the port, **replace the rear differential solenoid valve** .

	3. Connect a jumper wire from the negative battery terminal to the rear differential solenoid valve body and connect another jumper wire from the positive battery terminal to connector (male terminal) terminal No. 1. : ① 4. Blow the air to the tube. - If the air flows out of the port, **replace the rear differential solenoid valve** . - If the air does not flow out of the port, the rear differential solenoid valve is OK and the test is complete.

6. **Rear Differential Solenoid Valve - Install**
7. **Rear Differential Fluid - Refill**
8. **AWD System - Air Bleed**
9. Test Drive - Check

DTC TROUBLESHOOTING INDEX

REWRITE

AWD CONTROL UNIT UPDATE (AWD)

Procedure

1. AWD Control Unit - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for more information about updating control units.

LEARNING RESET CLEAR

LONGITUDINAL ACCELERATION SENSOR LEARN (AWD)

Procedure

1. HDS - Connect
2. Longitudinal Acceleration Sensor - Learn

1. Select the ADJUSTMENT in the AWD WITH INTELLIGENT CONTROL with the HDS.

2. Select the LONGITUDINAL G SENSOR LEARNING in the ADJUSTMENT with the HDS.

NOTE: See the HDS Help menu for specific instructions.

COMPONENT LOCATION INDEX

REAR DIFFERENTIAL COMPONENT LOCATION INDEX (AWD)

SYMPTOM TROUBLESHOOTING

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - AWD SYSTEM INDICATOR DOES NOT COME ON (AWD)

AWD system indicator does not come on

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   Does the AWD system indicator come on?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   The failure is duplicated. Go to step 2.

2. Gauge control module operation check

   -1. Do the gauge control module self-diagnostic function .

   Does the AWD system indicator blinkΩ

   YES

   Go to step 3.

NO

Replace the gauge control module .

3. AWD control unit check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the following fuse.

Fuse	No. A20 (20 A)
Location	Under-dash fuse/relay box

   -3. Turn the vehicle to the ON mode.

   Does the AWD system indicator come on?

   YES

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good AWD control unit .

   NO

   Replace the gauge control module .

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - AWD SYSTEM INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED (AWD)

AWD system indicator does not go off, and no DTCs are stored

NOTE: Do not jump the SCS line.

1. Problem verification

   -1. Test the 12 volt battery . Charge or replace the 12 volt battery if necessary.

   -2. Turn the vehicle to the ON mode.

   Does the AWD system indicator come on?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. HDS communication check

   -1. Check that the HDS communicates with the vehicle.

   Does the HDS communicate with the vehicle?

   YES

   The HDS communication is OK. Go to step 3.

   NO

Go to the DLC circuit troubleshooting .

3. Real time AWD system communication check

   -1. Check the Main Menu of the REAL TIME AWD with the HDS.

   Does the HDS show the Main Menu of the REAL TIME AWD?

   YES

   The real time AWD system communication is OK. Go to step 4.

   NO

   Go to the real time AWD system symptom troubleshooting for HDS does not communicate.

4. AWD control unit status check 1

   -1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Longitudinal G sensor learning	Complete	B	B	B
Air purge for rear differential	Complete	B	B	B
AWD operation check	Complete	B	B	B

   Do the current condition (s) match the threshold?

   YES

   Go to step 5.

   NO

   Go to step 7.

5. Gauge control module operation check

   -1. **Do the gauge control module self-diagnostic function** .

   Does the AWD system indicator blinkΩ

   YES

   The gauge control module is OK. Go to step 6.

   NO

   Replace the gauge control module .

6. Gauge control module DTC check

   -1. Check for DTCs in the METER system with the HDS.

DTC Description	DTC
B	B

   Is DTC indicated?

   YES

Go to the indicated DTC's troubleshooting in the gauge control module.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

7. AWD control unit status check 2

-1. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Longitudinal G sensor learning	Incomplete	B	B	B
Air purge for rear differential	Incomplete	B	B	B
AWD operation check	Incomplete	B	B	B

Do the current condition (s) match the threshold?

Longitudinal G sensor learning is incomplete

Do the G SENSOR LEARNING in the ADJUSTMENT with the HDS.

Air purge for rear differential is incomplete

Do the ECU REPLACEMENT in the ADJUSTMENT with the HDS.

AWD operation check is incomplete

Do the ECU REPLACEMENT in the ADJUSTMENT with the HDS.

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - ABNORMAL NOISE (AWD)

Abnormal noise

NOTE: If necessary, compare the noise with a known-good vehicle of the same type, if the noise is remarkably abnormal, do the following troubleshooting.

1. Problem verification (abnormal noise check) 1

-1. Test-drive the vehicle and check for the abnormal noise.

Did abnormal noise reappear?

YES

The failure is duplicated. Go to step 2.

NO

Check the following items.

- **Check the rear differential fluid level and the fluid condition**.
- Check for rear differential fluid leaks.
- Check for interference with items such as the harness.
- Rotate either rear wheel by hand, and check that the other wheel rotates.
- **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS**.

- **Do the rear differential fluid pressure sensor test**.

2. Rear differential visual check:

   Check the following items.

   - **Check the rear differential fluid level and the fluid condition**.
   - Check for rear differential fluid leaks.
   - Check for interference with items such as the harness.

   Are the check results OK?

   YES

   The rear differential visual is OK. Go to step 3.

   NO

   Replace the rear differential fluid or add recommended fluid.

3. Problem verification (rear differential companion flange rotate check)

   -1. Release the parking brake.

   -2. Shift the transmission to N position/mode.

   -3. **Raise the vehicle on a lift** .

   -4. **Disconnect the No. 2 propeller shaft from the rear differential companion flange** .

   -5. Rotate the companion flange by hand.

   Can the rear differential companion flange be rotated smoothly by hand?

   YES

   Go to step 4.

   NO

   The failure is duplicated. **Replace the torque control differential (TCD) assembly or the differential carrier assembly** .

4. Rear differential operation check

   -1. Rotate either rear wheel by hand, and check that the other wheel rotates.

   Does the other wheel rotate?

   YES

   The rear differential operation is OK. Go to step 5.

   NO

   Replace the differential carrier assembly .

5. Torque control differential (TCD) assembly check

   -1. **Connect the No. 2 propeller shaft** .

-2. Remove the following fuse.

Fuse	No. A20 (20 A)

Location	Under-hood fuse/relay box

-3. Test-drive the vehicle on the lift.

Is the abnormal noise still present?

YES

Replace the torque control differential (TCD) assembly .

NO

The torque control differential (TCD) assembly is OK. Reinstall the fuse, then go to step 6.

6. Rear differential solenoid valve check

-1. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

-2. Select the SOLENOID TEST in the FUNCTIONAL TEST with the HDS.

-3. Do LEVEL 7 of the SOLENOID TEST with the HDS.

Solenoid Test

Do LEVEL 1 of the SOLENOID TEST with the HDS.

Solenoid Test

Did the abnormal noise happen when changing from LEVEL 7 to LEVEL 1?

YES

Replace the rear differential solenoid valve .

NO

The rear differential solenoid valve is OK. Go to step 7.

7. Rear differential pump motor check

-1. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

-2. **Do the AIR BLEEDING in the ADJUSTMENT with the HDS**.

Air Bleeding

Listen for any abnormal noise coming from the rear differential pump motor.

Did abnormal noise happen while doing air bleeding?

YES

Replace the rear differential pump motor .

NO

The rear differential pump motor is OK. Go to step 8.

8. Problem verification (abnormal noise check) 2

   -1. Replace the rear differential fluid.

   -2. Select the ADJUSTMENT in the REAL TIME AWD with the HDS.

   -3. Do the AIR BLEEDING in the ADJUSTMENT with the HDS.

   Air Bleeding

   Test-drive the vehicle on the lift.

   Did abnormal noise reappear?

   YES

   The failure is duplicated. Replace the torque control differential (TCD) assembly or the differential carrier assembly .

   NO

   Intermittent failure, the system is OK at this time.

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - HDS DOES NOT COMMUNICATE (AWD (WITH CAN GATEWAY)) (2017 2018 2019)

HDS does not communicate

1. HDS communication check

   -1. Turn the vehicle to the ON mode.

   -2. Check that the HDS communicates with the vehicle.

   Does the HDS communicate with the vehicle?

   YES

   The HDS communication is OK. Go to step 2.

   NO

   Go to the DLC circuit troubleshooting .

2. AWD system communication check

   -1. Check the Main Menu of the REAL TIME AWD with the HDS.

   Does the HDS show the Main Menu of the REAL TIME AWD?

   YES

   The real time AWD system communication is OK. Intermittent failure, the system is OK at this time.

   NO

   Go to step 3.

3. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A20 (20 A)
Location	Under-hood fuse/relay box

Fuse	No. D7 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The fuses is OK. Reinstall the fuses, then go to step 4.

NO

Replace the fuse (s). If the fuse (s) blows again, repair a short to ground in the No. A20 (20 A) fuse circuit and/or the No. D7 (10 A) fuse circuit, and recheck.

4. Rear differential pump motor operation check

-1. Turn the vehicle to the ON mode.

-2. Check the operation sound of the rear differential pump motor on the rear differential with a stethoscope or a flat-tipped screwdriver (at the rear differential pump motor) when the engine started.

NOTE: The rear differential pump motor operates within several seconds after the engine is started.

Rear differential pump motor operation sound heard?

YES

Go to step 9.

NO

Go to step 5.

5. Rear differential fluid pressure sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear differential fluid pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the Main Menu of the REAL TIME AWD with the HDS.

Does the HDS show the Main Menu of the REAL TIME AWD?

YES

Replace the rear differential fluid pressure sensor .

NO

The rear differential fluid pressure sensor is OK. Go to step 6.

6. Open wire check (IG1 METER line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Start the engine.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode (idling)
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 12**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 METER wire is OK. Go to step 7.

NO

Repair an open in the IG1 METER wire between the AWD control unit and the No, D7 (10 A) fuse in the under-dash fuse/relay box.

7. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 8**
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 8.

NO

Repair an open in the GND wire between the AWD control unit and ground (G503).

8. Shorted wire check (SVCC line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected

B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 20**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the SVCC wire between the AWD control unit and the rear differential fluid pressure sensor.

NO

The SVCC wire is OK. Go to step 9.

9. Open wire check (F-CAN B H, F-CAN B L lines)

-1. Disconnect the following connector.

CAN gateway 12P connector

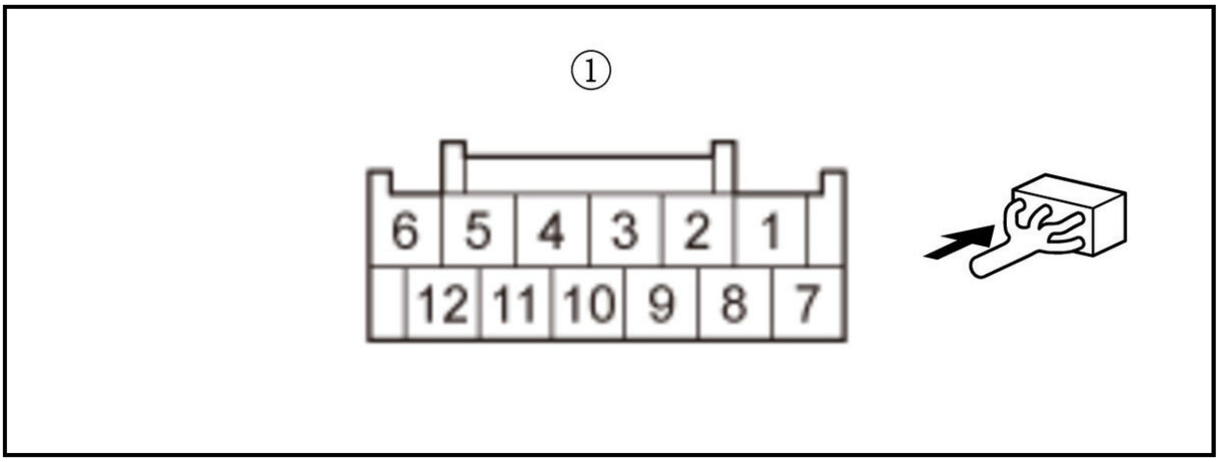
-2. Check for continuity between test points 1 and 2 individually.

F-CAN B H wire

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
B	CAN gateway 12P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 14**
Test point 2	CAN gateway 12P connector (female terminals) No. 12: ①

F-CAN B L wire

Test condition	Vehicle OFF (LOCK) mode Rear differential fluid pressure sensor 3P connector: disconnected AWD control unit 24P connector: disconnected CAN gateway 12P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 24**
Test point 2	CAN gateway 12P connector (female terminals) No. 5: ①



Is there continuity?

YES

The F-CAN B H and F-CAN B L wires is OK. Go to step 10.

NO

Repair an open in the F-CAN B H and/or F-CAN B L wires between the AWD control unit and the CAN gateway.

10. Open wire check (F-CAN A H, F-CAN A L lines)

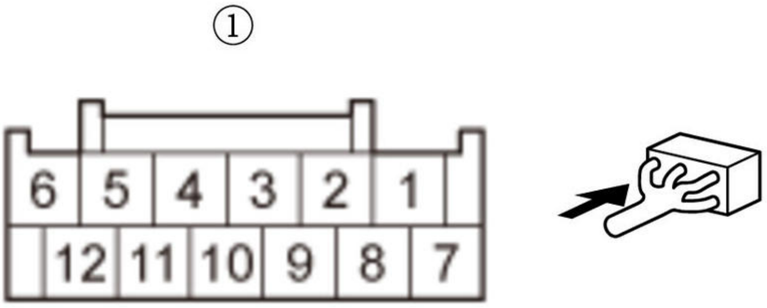
-1. Check for continuity between test points 1 and 2 individually.

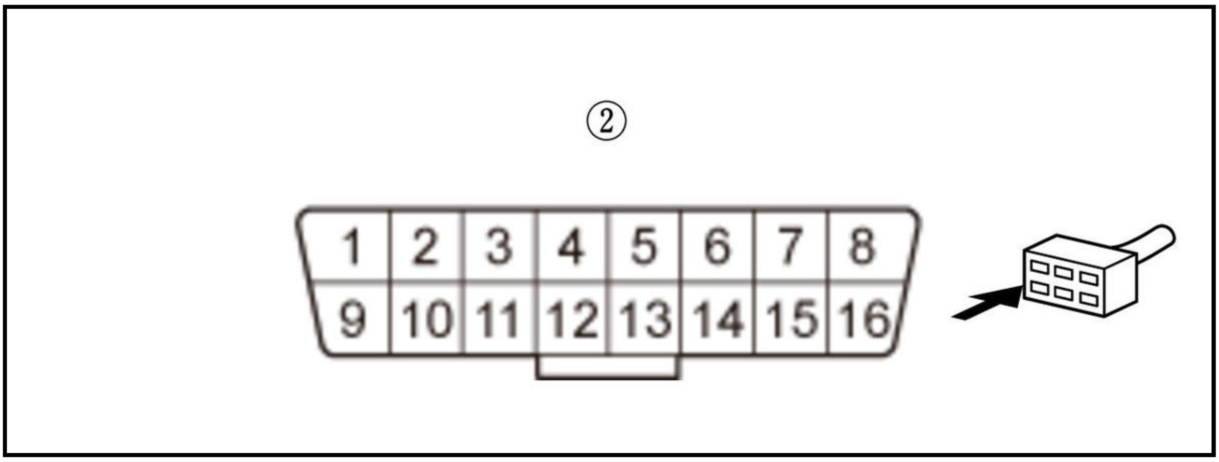
F-CAN A H wire

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
B	CAN gateway 12P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminals) No. 3: ①
Test point 2	Data link connector (16P) (female terminals) No. 6: ②

F-CAN A L wire

Test condition	Vehicle OFF (LOCK) mode
	Rear differential fluid pressure sensor 3P connector: disconnected
	AWD control unit 24P connector: disconnected
	CAN gateway 12P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminals) No. 9: ①
Test point 2	Data link connector (16P) (female terminals) No. 14: ②





Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the F-CAN A H and/or F-CAN A L wires between the CAN gateway and the data link connector.

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - HDS DOES NOT COMMUNICATE (AWD (WITH CAN GATEWAY)) (2020 2021)

HDS does not communicate

NOTE: Information marked with an asterisk (*1) applies to the model not equipped with auto idle stop system, and an asterisk (*2) applies to the model equipped with auto idle stop system.

1. HDS communication check

-1. Turn the vehicle to the ON mode.

-2. Check that the HDS communicates with the vehicle.

Does the HDS communicate with the vehicle?

YES

The HDS communication is OK. Go to step 2.

NO

Go to the DLC circuit troubleshooting .

2. AWD system communication check

-1. Check the Main Menu of the REAL TIME AWD with the HDS.

Does the HDS show the Main Menu of the REAL TIME AWD?

YES

The real time AWD system communication is OK. Intermittent failure, the system is OK at this time.

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A20**

Fuse	**No. D7**

Fuse	**No. F6*2**

Is the fuse OK?

YES

The fuses is OK. Reinstall the fuses, then go to step 4.

NO

Replace the fuse (s). If the fuse (s) blows again, repair a short to ground in the fuse (s) circuit, and recheck.

4. Rear differential pump motor operation check

-1. Turn the vehicle to the ON mode.

-2. Check the operation sound of the rear differential pump motor on the rear differential with a stethoscope or a flat-tipped screwdriver (at the rear differential pump motor) when the engine started.

NOTE: The rear differential pump motor operates within several seconds after the engine is started.

Rear differential pump motor operation sound heard?

YES

Go to step 9.

NO

Go to step 5.

5. Rear differential fluid pressure sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear differential fluid pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the Main Menu of the REAL TIME AWD with the HDS.

Does the HDS show the Main Menu of the REAL TIME AWD?

YES

Replace the rear differential fluid pressure sensor .

NO

The rear differential fluid pressure sensor is OK. Go to step 6.

6. Open wire check (IG1 METER line *1/IG1 VST line *2):

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Start the engine.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode (idling)
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 12**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 METER wire *1/IG1 VST wire *2 is OK. Go to step 7.

NO

Repair an open in the IG1 METER wire *1/IG1 VST wire *2 between the real time AWD control unit and the under-dash fuse/relay box *1/auxiliary under-dash fuse/relay box *2.

7. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 8**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 8.

NO

Repair an open in the GND wire between the AWD control unit and ground (G503).

8. Shorted wire check (SVCC line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 20**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The SVCC wire is OK. Go to step 9.

NO

Repair a short to ground in the SVCC wire between the AWD control unit and the rear differential fluid pressure sensor.

9. Open wire check (F-CAN B H, F-CAN B L lines)

-1. Disconnect the following connector.

CAN gateway 16P connector

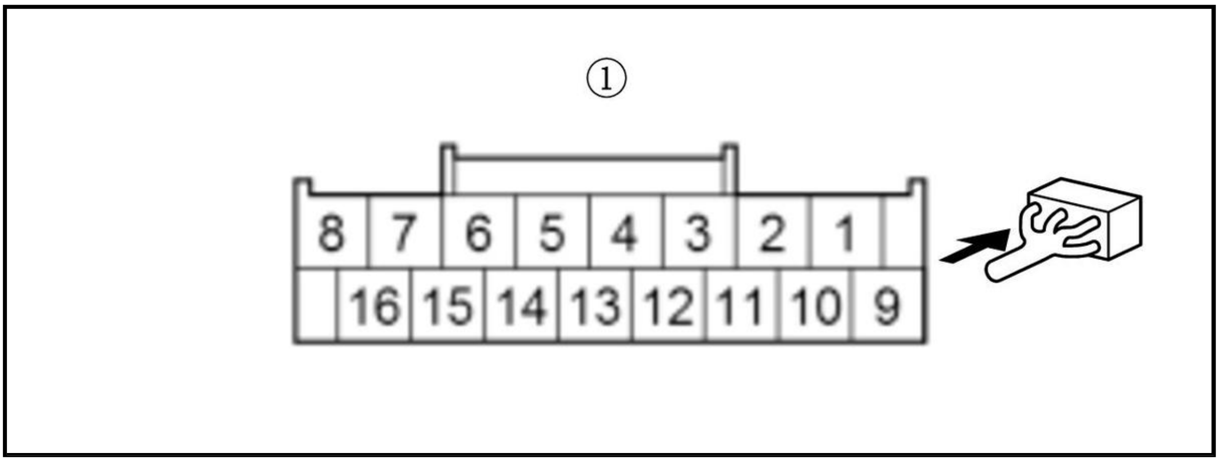
-2. Measure the resistance between test points 1 and 2 individually.

F-CAN B H wire

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 14**
Test point 2	CAN gateway 16P connector (female terminals) No. 6: ①

F-CAN B L wire

Test condition	Vehicle OFF (LOCK) mode
	Rear differential fluid pressure sensor 3P connector: disconnected
	AWD control unit 24P connector: disconnected
	CAN gateway 16P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 24**
Test point 2	CAN gateway 16P connector (female terminals) No. 14: ①



Is there 1.0 Ω or less?

YES

The F-CAN B H and F-CAN B L wires is OK. Go to step 10.

NO

Repair an open in the F-CAN B H and/or F-CAN B L wires between the AWD control unit and the CAN gateway.

10. Open wire check (DIAG-CAN H, DIAG-CAN L lines)

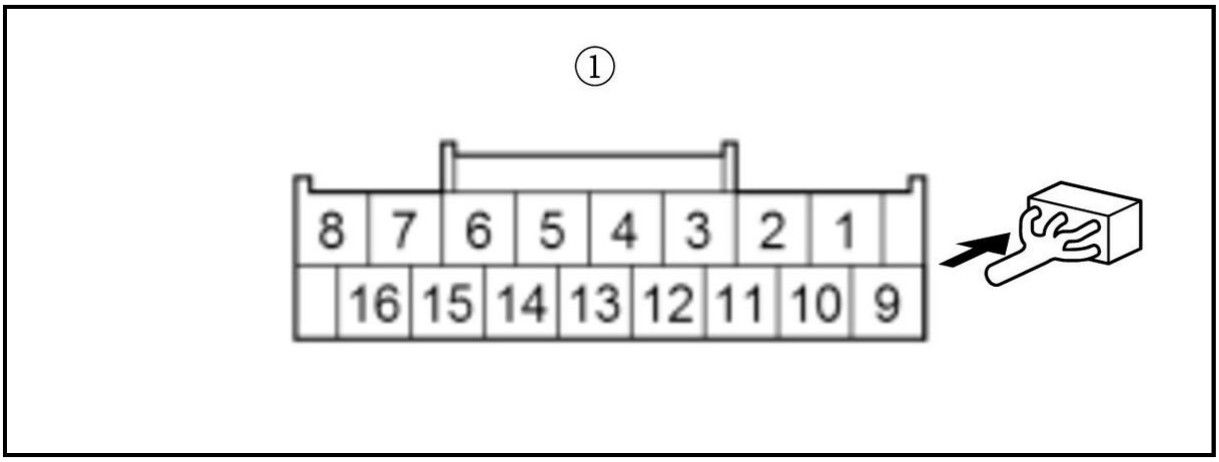
-1. Measure the resistance between test points 1 and 2 individually.

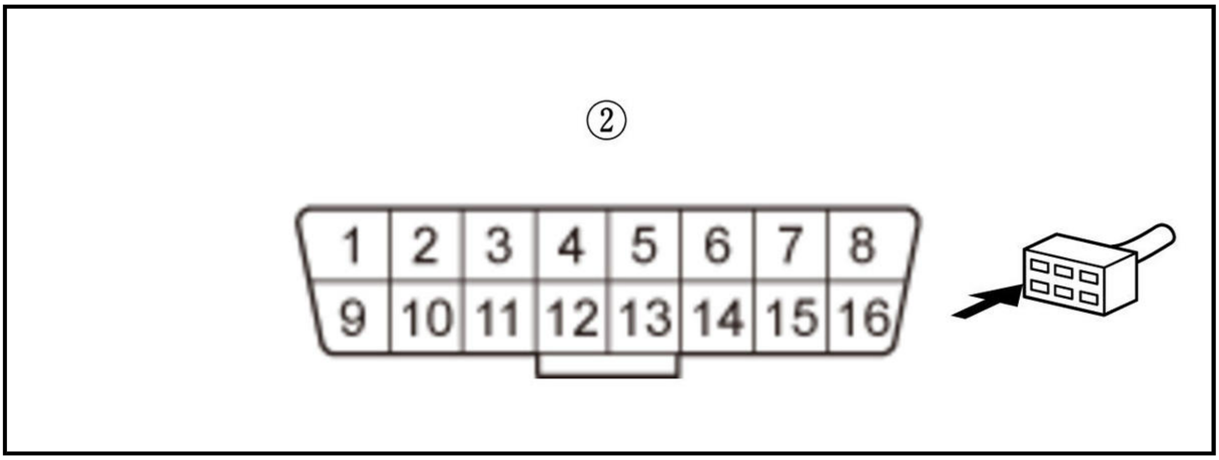
DIAG-CAN H wire

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 2: ①
Test point 2	Data link connector (16P) (female terminals) No. 6: ②

DIAG-CAN L wire

Test condition	Vehicle OFF (LOCK) mode
	Rear differential fluid pressure sensor 3P connector: disconnected
	AWD control unit 24P connector: disconnected
	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 10: ①
Test point 2	Data link connector (16P) (female terminals) No. 14: ②





Is there 1.0 Ω or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the F-CAN A H and/or F-CAN A L wires between the CAN gateway and the data link connector.

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - HDS DOES NOT COMMUNICATE (AWD (WITHOUT CAN GATEWAY))

HDS does not communicate

1. HDS communication check

-1. Turn the vehicle to the ON mode.

-2. Check that the HDS communicates with the vehicle.

Does the HDS communicate with the vehicle?

YES

The HDS communication is OK. Go to step 2.

NO

Go to the DLC circuit troubleshooting .

2. AWD system communication check

   -1. Check the Main Menu of the REAL TIME AWD with the HDS.

   Does the HDS show the Main Menu of the REAL TIME AWD?

   YES

   The real time AWD system communication is OK. Intermittent failure, the system is OK at this time.

   NO

   Go to step 3.

3. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. A20 (20 A)
Location	Under-hood fuse/relay box

Fuse	No. D7 (10 A)
Location	Under-dash fuse/relay box

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 4.

   NO

   Replace the fuse. If the fuse blows again, repair a short to ground in the No. A20 (20 A) fuse circuit, and recheck.

4. Rear differential pump motor operation check

   -1. Turn the vehicle to the ON mode.

   -2. Check the operation sound of the rear differential pump motor on the rear differential with a stethoscope or a flat-tipped screwdriver (at the rear differential pump motor) when the engine started.

   NOTE: The rear differential pump motor operates within several seconds after the engine is started.

   Rear differential pump motor operation sound heard?

   YES

   Go to step 9.

   NO

   Go to step 5.

5. Rear differential fluid pressure sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear differential fluid pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the Main Menu of the REAL TIME AWD with the HDS.

Does the HDS show the Main Menu of the REAL TIME AWD?

YES

Replace the rear differential fluid pressure sensor .

NO

The rear differential fluid pressure sensor is OK. Go to step 6.

6. Open wire check (IG1 METER line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

AWD control unit 24P connector

-3. Start the engine.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode (idling)
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 12**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 METER wire is OK. Go to step 7.

NO

Repair an open in the IG1 METER wire between the AWD control unit and the No, D7 (10 A) fuse in the under-dash fuse/relay box.

7. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 8**

Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 8.

NO

Repair an open in the GND wire between the AWD control unit and ground (G503).

8. Shorted wire check (SVCC line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 20**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the SVCC wire between the AWD control unit and the rear differential fluid pressure sensor.

NO

The SVCC wire is OK. Go to step 9.

9. Open wire check (F-CAN H, F-CAN L lines)

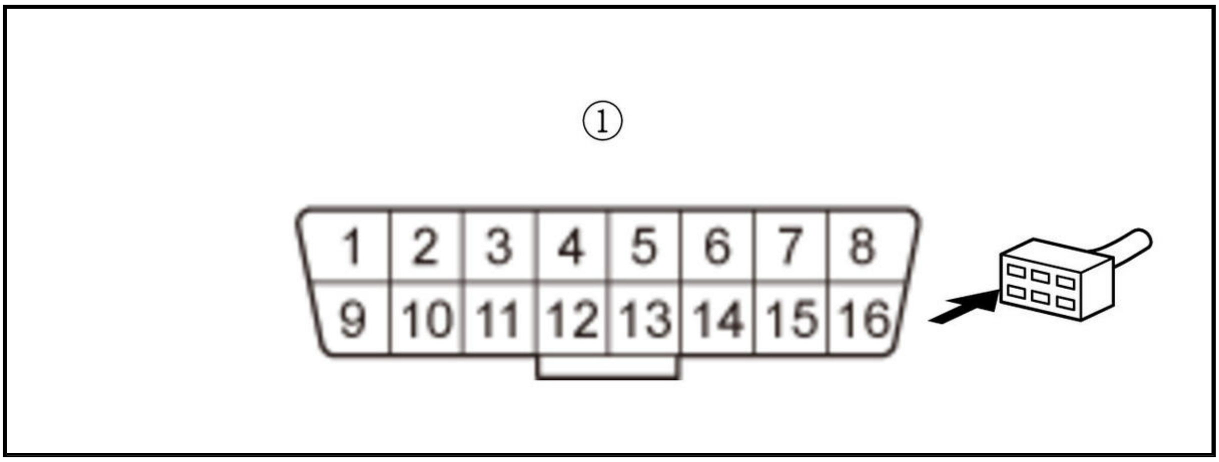
-1. Check for continuity between test points 1 and 2 individually.

F-CAN H wire

Test condition	Vehicle OFF (LOCK) mode
B	Rear differential fluid pressure sensor 3P connector: disconnected
B	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 14**
Test point 2	Data link connector (16P) (female terminals) No. 6: ①

F-CAN L wire

Test condition	Vehicle OFF (LOCK) mode
	Rear differential fluid pressure sensor 3P connector: disconnected
	AWD control unit 24P connector: disconnected
Test point 1	**AWD control unit 24P connector No. 24**
Test point 2	Data link connector (16P) (female terminals) No. 14: ①



Is there continuity?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good AWD control unit** , and recheck. If the symptom/indication goes away with a known-good AWD control unit, **replace the original AWD control unit** .

NO

Repair an open in the F-CAN H and/or F-CAN L wires between the AWD control unit and the data link connector.

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - REAL TIME AWD SYSTEM IS STUCK IN 4WD MODE (AWD)

Real time AWD system is stuck in 4WD mode

1. Problem verification (rear differential clutch test)

   -1. **Do the rear differential clutch test**.

   Is the test result OK?

   YES

   Go to step 2.

   NO

   The failure is duplicated. **Do the repair depending on the test result**.

2. Oil pressure control check

   -1. Turn the vehicle to the ON mode.

   -2. Select the FUNCTIONAL TEST in the REAL TIME AWD with the HDS.

   -3. **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS**.

   Oil Pressure Control Test

   Is the test result OK?

   1. **YES**

      Check the following items.

- **Check the rear differential fluid level and the fluid condition**.
- Check for rear differential fluid leaks.
- **Do the rear differential fluid pressure sensor test**.

NO

Follow the instructions indicated on the HDS according to the test result.

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING - WILL NOT GO INTO 4WD MODE, POOR TRACTION, POOR ACCELERATION (AT START), POOR CLIMBING ABILITY (AWD)

Will not go into 4WD mode, Poor traction, Poor acceleration (at start), Poor climbing ability

1. Rear differential clutch check

-1. **Do the rear differential clutch test**.

Is the test result OK?

1. **YES**

Check the following items.

- **Check the rear differential fluid level and the fluid condition**.
- Check for rear differential fluid leaks.
- **Do the OIL PRESSURE CONTROL TEST in the FUNCTIONAL TEST with the HDS**.
- **Do the rear differential fluid pressure sensor test**.

NO

Do the repair depending on the test result.

SYMPTOM TROUBLESHOOTING INDEX

REAL TIME AWD SYSTEM SYMPTOM TROUBLESHOOTING INDEX (AWD)

Symptom	Probable Cause	Remedy
Rear differential overheats	Fluid level too low Incorrect fluid type	**Add recommended fluid** **Drain and fill the differential with the recommended fluid**
Rear differential leaks fluid	Fluid level too high Clogged breather hose Worn or damaged oil seal Damaged sealing washer Loose mounting bolts or inadequate sealing	**Lower to proper level** **Clean or replace** **Replace the oil seal** **Replace the sealing washer** **Recheck torque or apply sealant**
HDS does not communicate with vehicle	B	**Troubleshoot the DLC circuit**
HDS does not communicate with AWD	B	**Do the symptom troubleshooting for HDS does not communicate**

Symptom	Probable Cause	Remedy
control unit		
AWD system indicator does not come on	B	**Do the symptom troubleshooting for AWD system indicator does not come on**
AWD system indicator does not go off, and no DTCs are stored	B	**Do the symptom troubleshooting for AWD system indicator does not go off, and no DTCs are stored**
Will not go into 4WD mode, Poor traction, Poor acceleration (at start), Poor climbing ability	B	**Do the symptom troubleshooting for will not go into 4WD mode, Poor traction, Poor acceleration (at start), Poor climbing ability**
Real time AWD system is stuck in 4WD mode	B	**Do the symptom troubleshooting for real time AWD system is stuck in 4WD mode**
Abnormal noise (at normal condition)	• Gear noise • • - Poor gear mesh between ring gear and drive pinion • - Hypoid gear (wear or damage) • - Poor pre-road (drive pinion) • - Debris in hypoid gear area • - Fluid level too low • - Distortion of the differential carrier case • Bearing noise • • - Bearing (wear or damage) • - Drive pinion taper bearing (wear) • -	**Do the symptom troubleshooting for abnormal noise**

Symptom	Probable Cause	Remedy
	Debris in bearing • Pump noise (at lubrication) • • - Debris in pump • - Rotor (wear or damage) • Loose or missed torqued parts	

Symptom	Probable Cause	Remedy
Abnormal noise (at start)	• Gear noise • • - Poor gear mesh between ring gear and drive pinion • - Hypoid gear (wear or damage) • - Poor pre-road (drive pinion) • - Debris in hypoid gear area • - Fluid level too low • - Distortion of the differential carrier case • - Excessive backlash (hypoid gear) • - Excessive backlash (differential gear) • - Differential side gear spline (wear)	B

Symptom	Probable Cause	Remedy
	• Bearing noise • • - Bearing (wear or damage) • - Drive pinion taper bearing (wear) • - Debris in bearing • Pump noise (at lubrication) • • - Debris in pump • - Rotor (wear or damage) • Rear differential pump motor noise • • - Bearing (wear or damage) • - Debris in rear differential pump motor • Pump noise (at control) • • - Debris in pump • - Rotor (wear or damage) • Rear differential solenoid valve noise • • - Debris in rear differential solenoid valve • - Plunger area or shaft area (wear)	

Symptom	Probable Cause	Remedy
	• - Rear differential solenoid valve (wear or damage) • Clutch chatter • • - Fluid deterioration • - Clutch facing (burnt or deterioration) • - Clutch plate (deterioration) • Loose or missed torqued parts	

Symptom	Probable Cause	Remedy
Abnormal noise (at accelerate)	• Gear noise • • - Poor gear mesh between ring gear and drive pinion • - Hypoid gear (wear or damage) • - Poor pre-road (drive pinion) • - Debris in hypoid gear area • - Fluid level too low • - Distortion of the differential carrier case • - Excessive backlash (hypoid gear) • -	B

Symptom	Probable Cause	Remedy
	Excessive backlash (differential gear) • - Differential side gear spline (wear) • Bearing noise • • - Bearing (wear or damage) • - Drive pinion taper bearing (wear) • - Debris in bearing • Pump noise (at lubrication) • • - Debris in pump • - Rotor (wear or damage) • Rear differential pump motor noise • • - Bearing (wear or damage) • - Debris in rear differential pump motor • Pump noise (at control) • • - Debris in pump • - Rotor (wear or damage) • Rear differential solenoid valve noise • • -	

Symptom	Probable Cause	Remedy
	Debris in rear differential solenoid valve • - Plunger area or shaft area (wear) • - Rear differential solenoid valve (wear or damage) • Clutch chatter • • - Fluid deterioration • - Clutch facing (burnt or deterioration) • - Clutch plate (deterioration) • Loose or missed torqued parts	

Symptom	Probable Cause	Remedy
Abnormal noise (at turning)	• Gear noise • • - Poor gear mesh between ring gear and drive pinion • - Hypoid gear (wear or damage) • - Poor pre-road (drive pinion) • - Debris in hypoid gear area • - Fluid level too low • - Distortion of the differential carrier case	B

Symptom	Probable Cause	Remedy
	• Bearing noise • • - Bearing (wear or damage) • - Drive pinion taper bearing (wear) • - Debris in bearing • Differential gear noise • • - Side gear and pinion gear (wear or damage) • - Pinion shaft (damage) • - Debris in differential gear area • Clutch chatter • • - Fluid deterioration • - Clutch facing (burnt or deterioration) • - Clutch plate (deterioration) • Loose or missed torqued parts	
Abnormal noise (at turning and accelerate)	• Gear noise • • - Poor gear mesh between ring gear and drive pinion • - Hypoid gear (wear or damage)	B

Symptom	Probable Cause	Remedy
	• - Poor pre-road (drive pinion) • - Debris in hypoid gear area • - Fluid level too low • - Distortion of the differential carrier case • - Excessive backlash (hypoid gear) • - Excessive backlash (differential gear) • - Differential side gear spline (wear) • Bearing noise • • - Bearing (wear or damage) • - Drive pinion taper bearing (wear) • - Debris in bearing • Differential gear noise • • - Side gear and pinion gear (wear or damage) • - Pinion shaft (damage) • - Debris in differential gear area

INITIALIZATION

AWD CONTROL UNIT INITIALIZATION (AWD)

Procedure

NOTE:

- Whenever the AWD control unit is replaced, it must be initialized.
- Park the vehicle on a flat and level surface.

1. HDS - Connect
2. AWD Control Unit - Initialization

> 1. Select the E-DPS CONTROL MODULE REPLACEMENT with the HDS.**NOTE:** See the HDS Help menu for specific instructions.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

AWD SYSTEM INDICATOR DOES NOT COME ON (AWD)

Remedy

Do the symptom troubleshooting for AWD system indicator does not come on

AWD SYSTEM INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED (AWD)

Remedy

Do the symptom troubleshooting for AWD system indicator does not go off, and no DTCs are stored

ABNORMAL NOISE (AT ACCELERATE) (AWD)

Probable Cause

- Gear noise
-
    - -

      Poor gear mesh between ring gear and drive pinion
    - -

      Hypoid gear (wear or damage)
    - -

      Poor pre-road (drive pinion)

    - -

      Debris in hypoid gear area

    - -

      Fluid level too low

    - -

      Distortion of the differential carrier case

    - -

      Excessive backlash (hypoid gear)

    - -

      Excessive backlash (differential gear)

    - -

      Differential side gear spline (wear)

- Bearing noise
-
    - -

      Bearing (wear or damage)

    - -

      Drive pinion taper bearing (wear)

    - -

      Debris in bearing

- Pump noise (at lubrication)
-
    - -

      Debris in pump

    - -

      Rotor (wear or damage)

- Rear differential pump motor noise
-
    - -

      Bearing (wear or damage)

    - -

      Debris in rear differential pump motor

- Pump noise (at control)

-
    - -

      Debris in pump

    - -

      Rotor (wear or damage)
- Rear differential solenoid valve noise
-
    - -

      Debris in rear differential solenoid valve

    - -

      Plunger area or shaft area (wear)

    - -

      Rear differential solenoid valve (wear or damage)
- Clutch chatter
-
    - -

      Fluid deterioration

    - -

      Clutch facing (burnt or deterioration)

    - -

      Clutch plate (deterioration)
- Loose or missed torqued parts

ABNORMAL NOISE (AT NORMAL CONDITION) (AWD)

Probable Cause

- Gear noise
-
    - -

      Poor gear mesh between ring gear and drive pinion

    - -

      Hypoid gear (wear or damage)

    - -

      Poor pre-road (drive pinion)

    - -

Debris in hypoid gear area

  - -

    Fluid level too low

  - -

    Distortion of the differential carrier case

- Bearing noise
-
  - -

    Bearing (wear or damage)

  - -

    Drive pinion taper bearing (wear)

  - -

    Debris in bearing

- Pump noise (at lubrication)
-
  - -

    Debris in pump

  - -

    Rotor (wear or damage)

- Loose or missed torqued parts

Remedy

Do the symptom troubleshooting for abnormal noise

ABNORMAL NOISE (AT START) (AWD)

Probable Cause

- Gear noise
-
  - -

    Poor gear mesh between ring gear and drive pinion

  - -

    Hypoid gear (wear or damage)

  - -

    Poor pre-road (drive pinion)

  - -

Debris in hypoid gear area

- -

Fluid level too low

- -

Distortion of the differential carrier case

- -

Excessive backlash (hypoid gear)

- -

Excessive backlash (differential gear)

- -

Differential side gear spline (wear)

- Bearing noise
-
  - -

  Bearing (wear or damage)

  - -

  Drive pinion taper bearing (wear)

  - -

  Debris in bearing

- Pump noise (at lubrication)
-
  - -

  Debris in pump

  - -

  Rotor (wear or damage)

- Rear differential pump motor noise
-
  - -

  Bearing (wear or damage)

  - -

  Debris in rear differential pump motor

- Pump noise (at control)
-
  - -

Debris in pump

  - -

    Rotor (wear or damage)

- Rear differential solenoid valve noise

HDS DOES NOT COMMUNICATE WITH AWD CONTROL UNIT (AWD)

Remedy

Do the symptom troubleshooting for HDS does not communicate

HDS DOES NOT COMMUNICATE WITH VEHICLE (AWD)

Remedy

Troubleshoot the DLC circuit

REAL TIME AWD SYSTEM IS STUCK IN 4WD MODE (AWD)

Remedy

Do the symptom troubleshooting for real time AWD system is stuck in 4WD mode

REAR DIFFERENTIAL LEAKS FLUID (AWD)

Probable Cause

- Fluid level too high
- Clogged breather hose
- Worn or damaged oil seal
- Damaged sealing washer
- Loose mounting bolts or inadequate sealing

Remedy

- **Lower to proper level**
- **Clean or replace**
- **Replace the oil seal**
- **Replace the sealing washer**
- **Recheck torque or apply sealant**

REAR DIFFERENTIAL OVERHEATS (AWD)

Probable Cause

- Fluid level too low
- Incorrect fluid type

Remedy

- **Add recommended fluid**
- **Drain and fill the differential with the recommended fluid**

WILL NOT GO INTO 4WD MODE, POOR TRACTION, POOR ACCELERATION (AT START), POOR CLIMBING ABILITY (AWD)

Remedy

Do the symptom troubleshooting for will not go into 4WD mode, Poor traction, Poor acceleration (at start), Poor climbing ability

REMOVAL, INSTALLATION AND INSPECTION

PROPELLER SHAFT REMOVAL, INSTALLATION, AND INSPECTION

Removal and Installation

NOTE: Where icon is shown, for further information see below.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

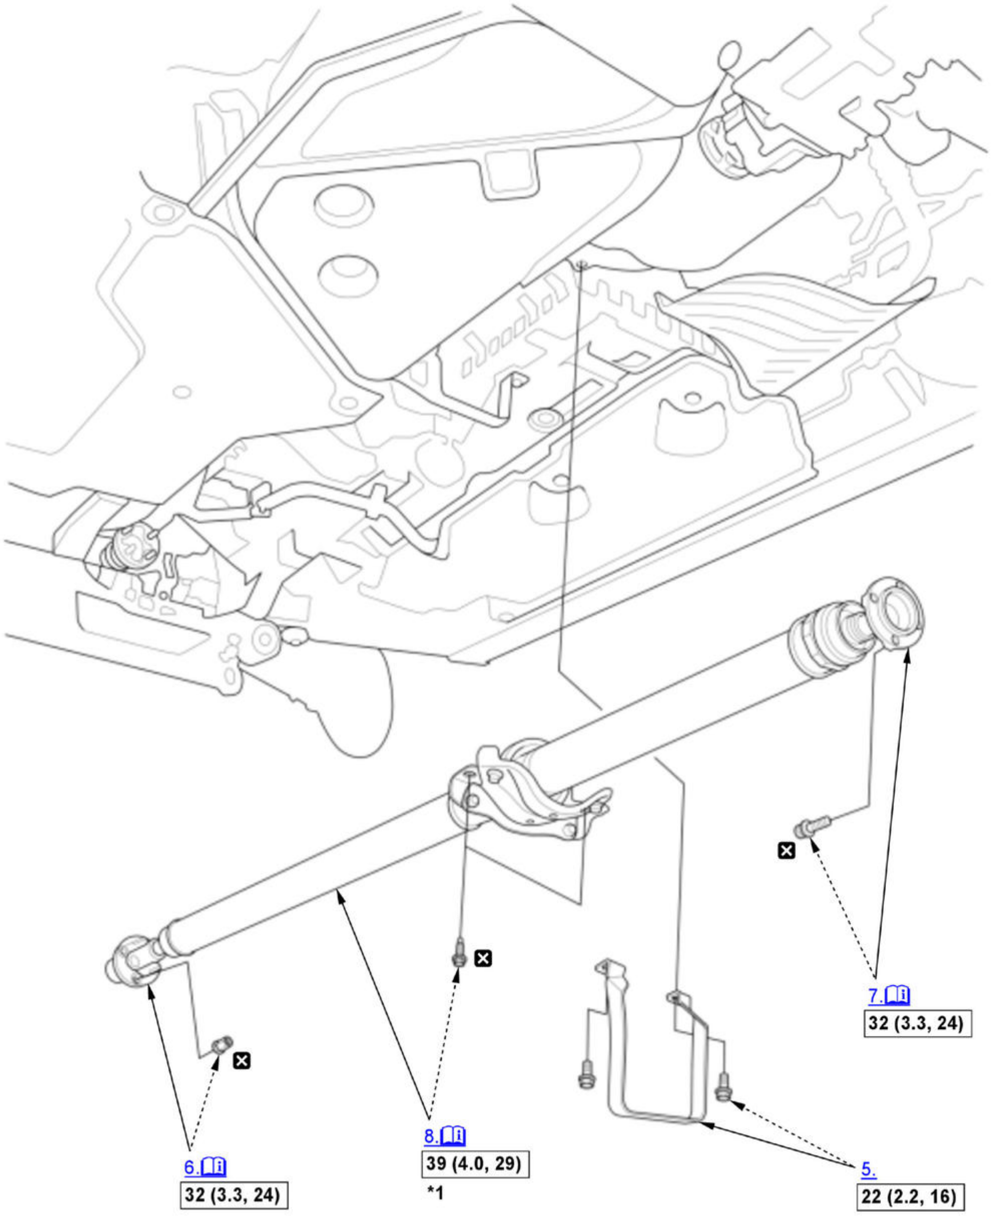

Fig. 1: Exploded View Of Propeller Shaft Replacement Components With Torque Specifications

Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	These parts have inspection items.

1. **Vehicle - Lift**
2. **Neutral Position Holding Mode - Enter**
3. **12 Volt Battery Terminal - Disconnect**
4. **Front Floor Front Brace - Remove**
5. Propeller Shaft Protector - Remove
6. No. 1 Propeller Shaft - Disconnect

	1. Make a reference marks (A) across the No. 1 propeller shaft (B) and the transfer companion flange (C).

7. No. 2 Propeller Shaft - Disconnect

	1. Make a reference marks (A) across the No. 2 propeller shaft (B) and the rear differential companion flange (C).

8. Propeller Shaft Assembly - Remove

	**NOTE:** Support the propeller shaft assembly with a transmission jack. 1. Remove the propeller shaft assembly to rear side of the vehicle while lowering the No. 2 propeller shaft. **Note for installation** Make sure that there are no clearance (A) between the propeller shaft assembly and the companion flanges as shown.

9. **Front Floor Rear Brace - Remove** (If Necessary)
10. All Removed Parts - Install

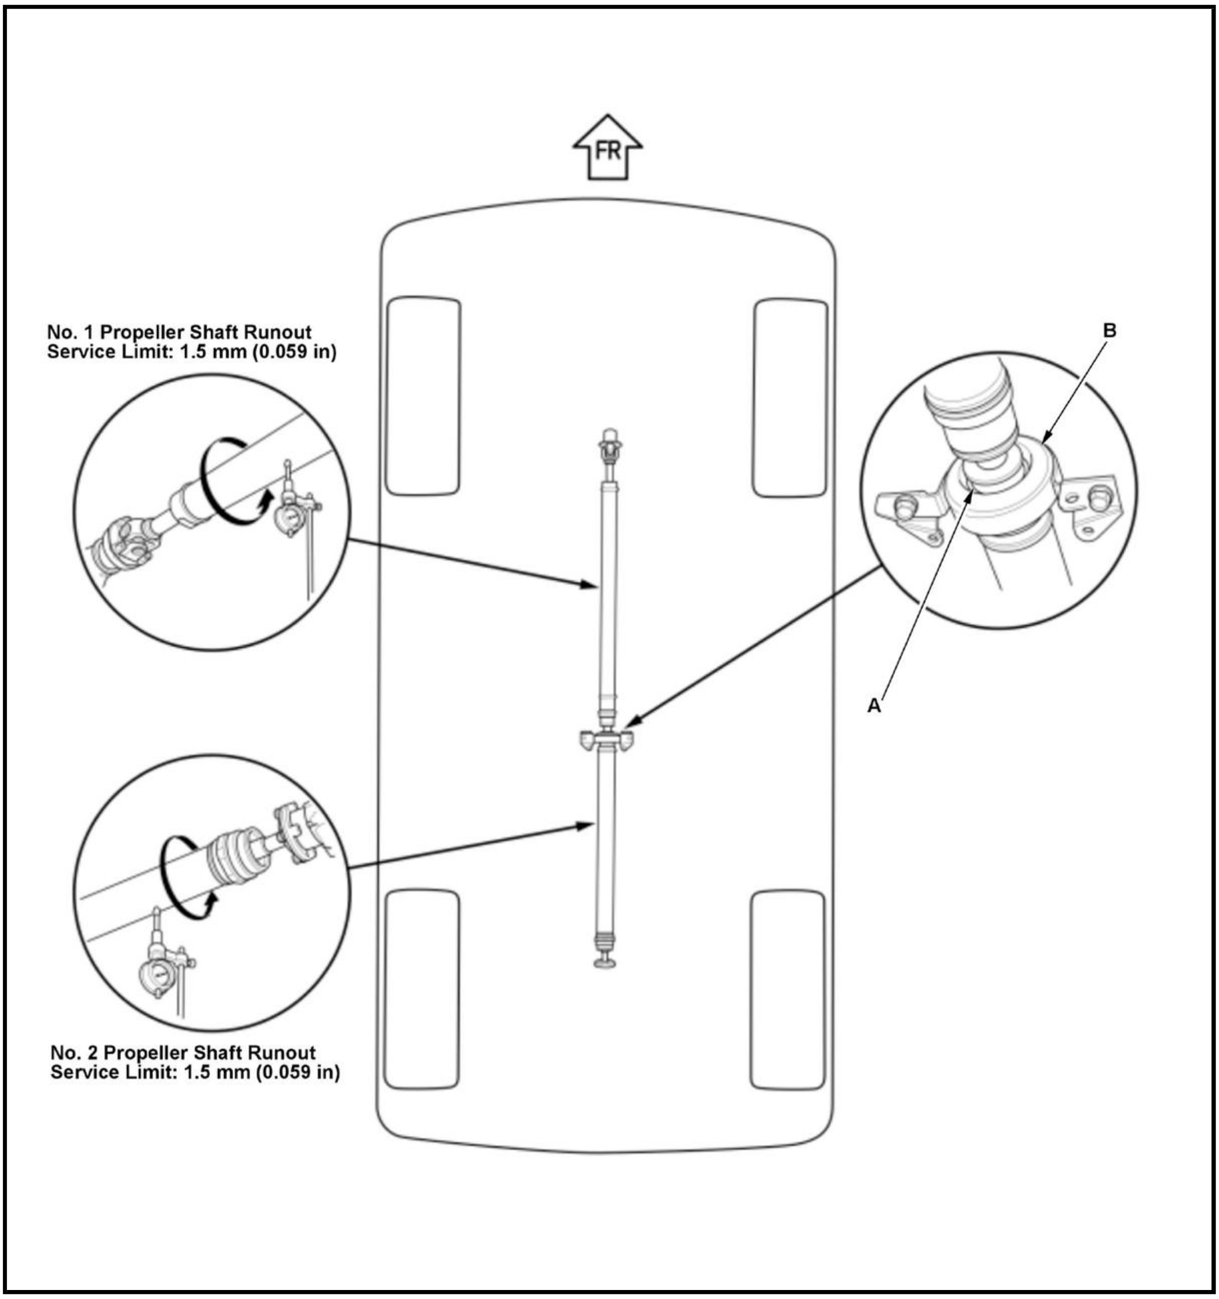
1. Install the parts in the reverse order of removal.

11. Test Drive - Check

1. Test drive and check that there are no abnormal noise and vibration.

Inspection

1. **Vehicle - Lift**
2. **Neutral Position Holding Mode - Enter**
3. **12 Volt Battery Terminal - Disconnect**
4. Propeller Shaft - Inspect



FR
No. 1 Propeller Shaft Runout
Service Limit: 1.5 mm (0.059 in)
B
A
No. 2 Propeller Shaft Runout
Service Limit: 1.5 mm (0.059 in)

Universal Joint and Boot

1. Check the center support bearing (A) for excessive play or noise. If the center support has excessive play or noise, replace the propeller shaft assembly.

2. Check the rubber portion (B) of the center support bearing for damage and deterioration. If the rubber portion is damaged or deteriorated, replace the propeller shaft assembly.

3. Check the universal joints for excessive play or noise. If the universal joints have excessive play or noise, replace the propeller shaft assembly.

Propeller Shaft Runout

4. Install a dial indicator with its needle on the center of the No. 1 and No. 2 propeller shafts.

5. Turn the other propeller shaft slowly and check the runout. Repeat this procedure for the other propeller shaft.

6. If the runout on either propeller shaft exceeds the service limit, replace the propeller shaft assembly.

INSPECTION

DRIVESHAFT INSPECTION

Inspection

1. Driveshaft - Inspect

	1. Check the inboard boot (A) and the outboard boot (B) on the driveshaft (C) for cracks, damage, leaking grease and loose boot bands (D). If any damage is found, replace the boot and the boot bands. 2. Check the driveshaft for cracks and damage. If any damage is found, replace the driveshaft. 3. Check the inboard joint (E) and the outboard joint (F) for cracks and damage. If any damage is found, replace the inboard joint or the outboard joint as an assembly. 4. Hold the inboard joint and turn the front wheel by hand, then make sure the joint is not excessively loose. If necessary, replace the inboard joint or the outboard joint as an assembly.

DISASSEMBLY AND REASSEMBLY

FRONT DRIVESHAFT DISASSEMBLY AND REASSEMBLY

Special Tools Required

Image	Description/Tool Number
	Threaded Adapter, 26 x 1.5 mm 07XAC-001030A

Disassembly

NOTE:

- ℹ Where icon is shown, for further information see below.
- Be careful not to damage the boot.
- Make marks on the disassembled parts to be able to reassemble them in their original positions.
- Use the bands included in the boot set.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

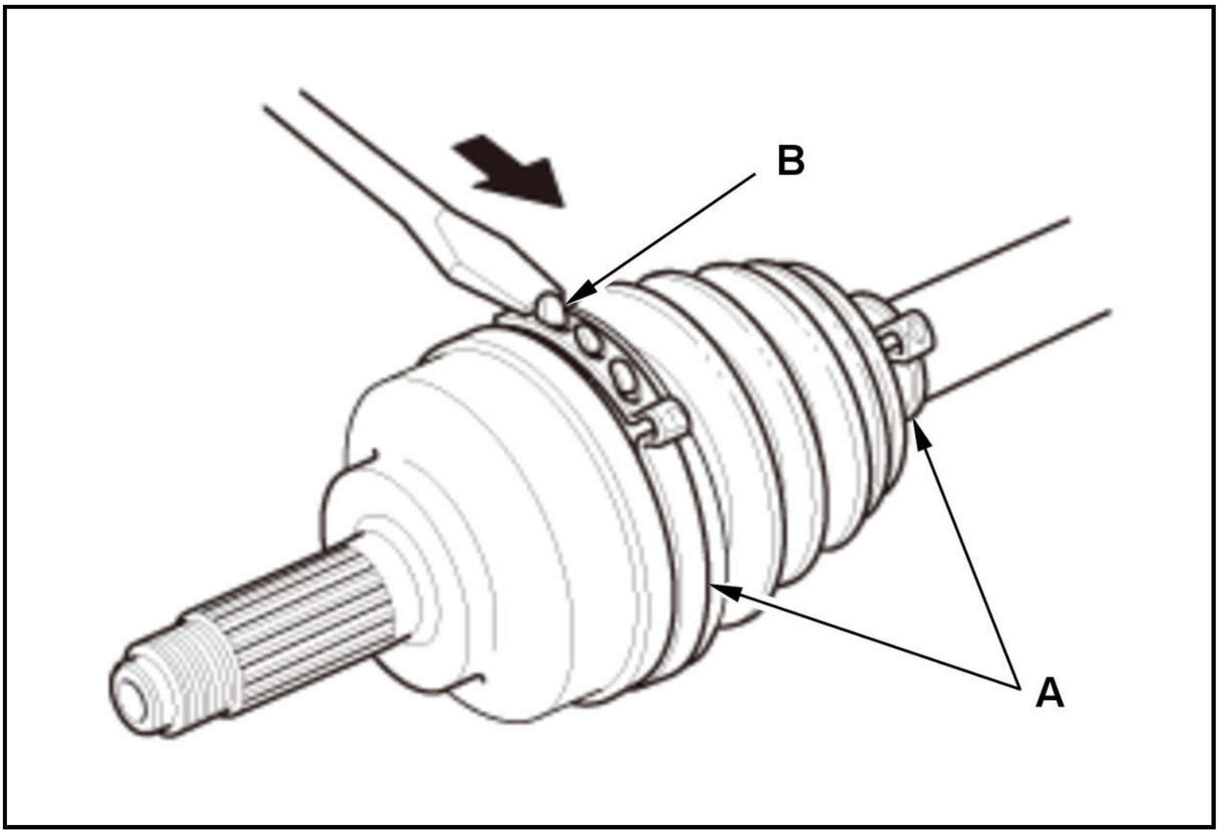
Fig. 1: Exploded View Of Front Driveshaft Components For Disassembly
Courtesy of HONDA, U.S.A., INC.

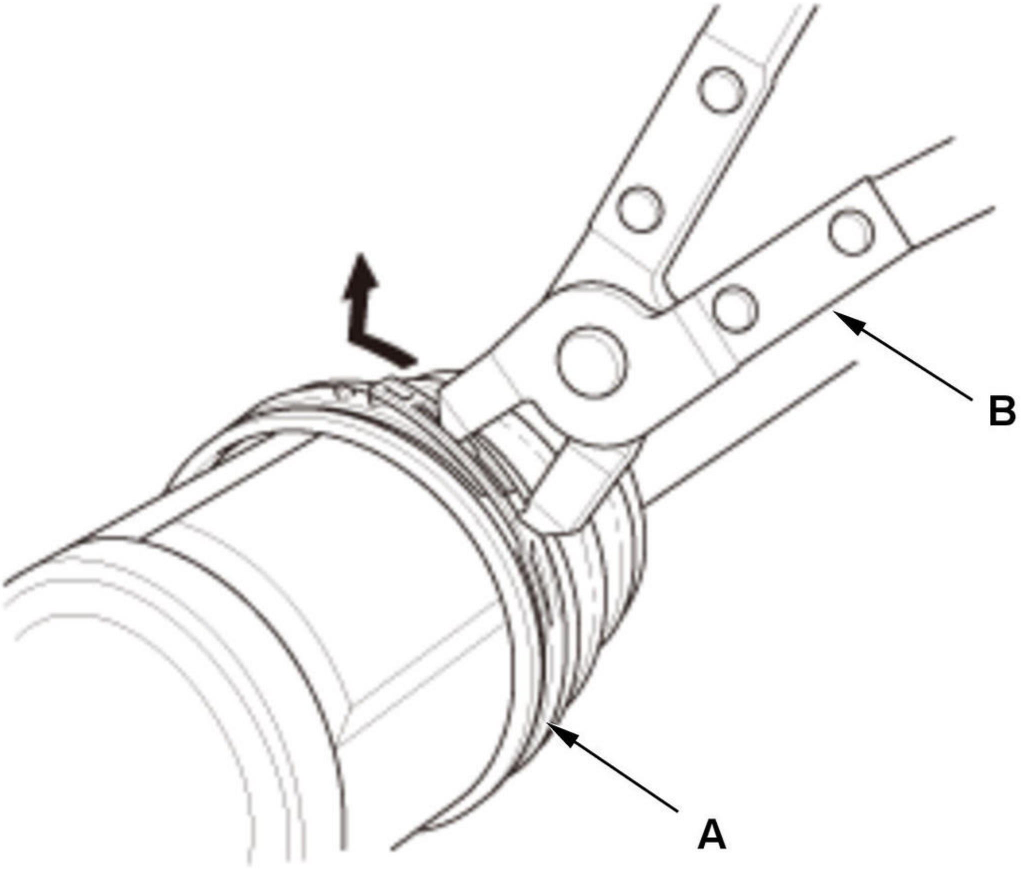
ℹ	Detailed information, notes, and precautions
☒	Replace
*1	Right driveshaft

1. Boot Bands - Remove



Ear clamp type

1. If the boot band is an ear clamp type (A), lift up the tabs (B) using a flat-tipped screwdriver.

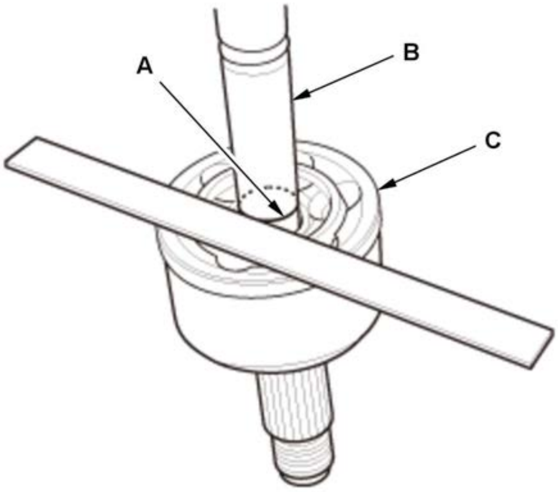


Low profile type

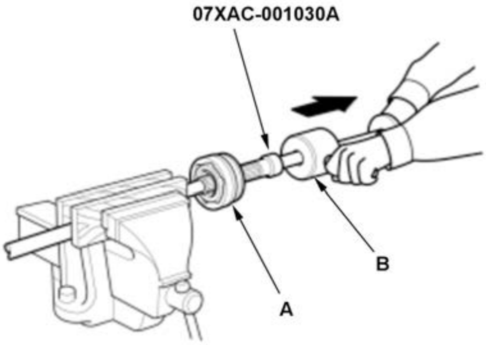
1. If the boot band is a low profile type (A), pinch the boot band using a commercially available CV boot clamp pincer pliers (B).

2. Outboard Joint - Remove

	1. Slide the outboard boot (A) partially toward the inboard joint side. 2. Wipe off the grease to expose the driveshaft and the outboard joint inner race.



3. Make a mark (A) on the driveshaft (B) at the same level as the outboard joint end (C).



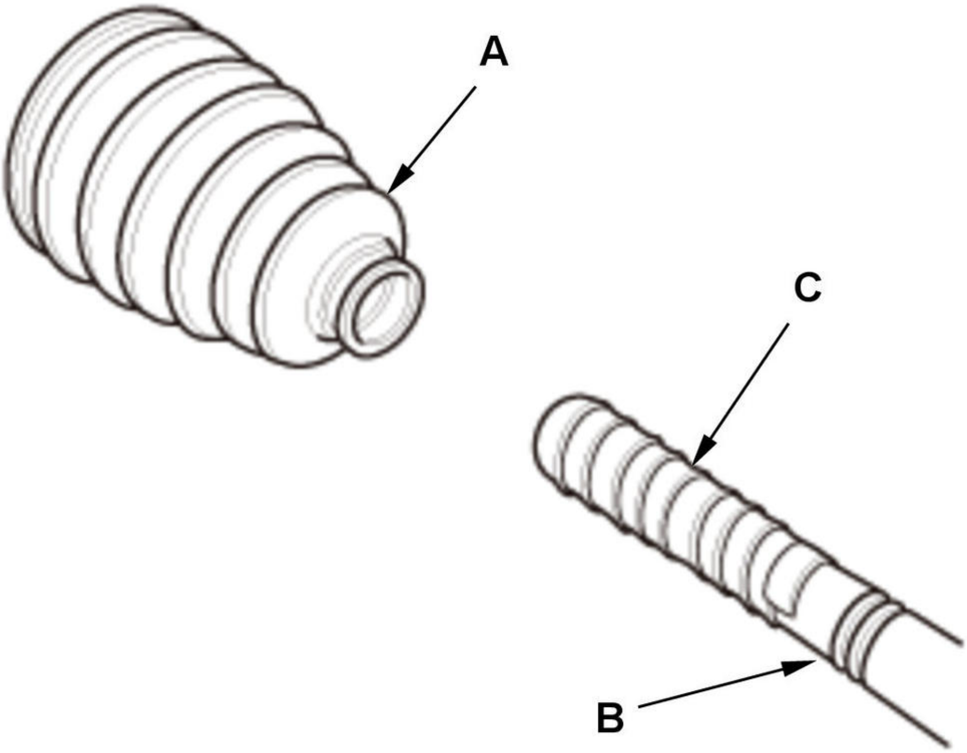
4. Securely clamp the driveshaft in a bench vise with the wood blocks.

5. Remove the outboard joint (A) using the 26 x 1.5 mm threaded adapter and a commercially available 5/8"-18 UNF slide hammer (B).

NOTE: Check inside of the outboard joint and on the serrations for wear and tear.

6. Remove the driveshaft from the bench vise.

3. Stop Ring - Remove
4. Outboard Boot - Remove



NOTE:

- Check the outboard boot (A) for cracks and damage. If any damage is found, replace the outboard boot.
- Wrap the splines on the driveshaft (B) with vinyl tape (C) to prevent damaging the outboard boot.

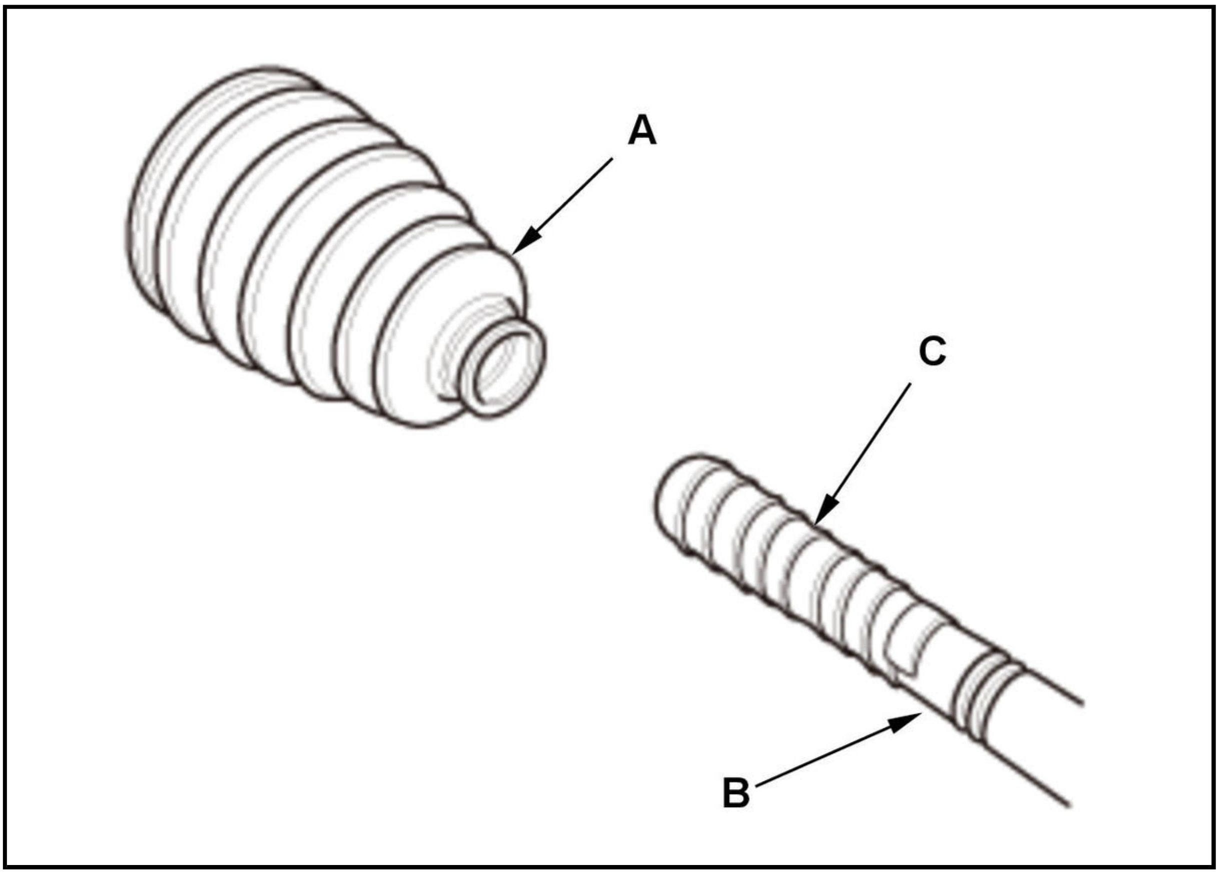
5. Inboard Joint - Remove

	1. Make marks (A) on each roller (B) and the inboard joint (C) to identify the locations of the rollers to the grooves in the inboard joint. **NOTE:** Do not engrave or scribe any marks on the rolling surface. 2. Remove the inboard joint and place it on a clean shop towel (D). Be careful not to drop the rollers when separating them from the inboard joint. **NOTE:** Check inside of the inboard joint and on the serrations for wear and tear.

6. Circlip - Remove
7. Roller and Spider - Remove

	1. Make marks (A) on the spider (B) that match the marks on the rollers. **NOTE:** Do not engrave or scribe any marks on the rolling surfaces. 2. Remove the rollers. 3. Make marks (C) on the spider and the driveshaft (D) to identify the position of the spider on the shaft. 4. Remove the spider. **NOTE:** If necessary, use a commercially available bearing puller while being careful not to damage the spider.

8. Inboard Boot - Remove



NOTE:

- Check the inboard boot (A) for cracks and damage. If any damage is found, replace the boot.
- Wrap the splines on the driveshaft (B) with vinyl tape (C) to prevent damaging the inboard boot.

Reassembly

NOTE:

- 🛈 Where icon is shown, for further information see below.
- Make marks on the disassembled parts to be able to reassemble them in their original positions.
- Be careful not to damage the boot.
- Use the bands included in the boot set.
- Be careful not to get grease on the boots attachment grooves.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

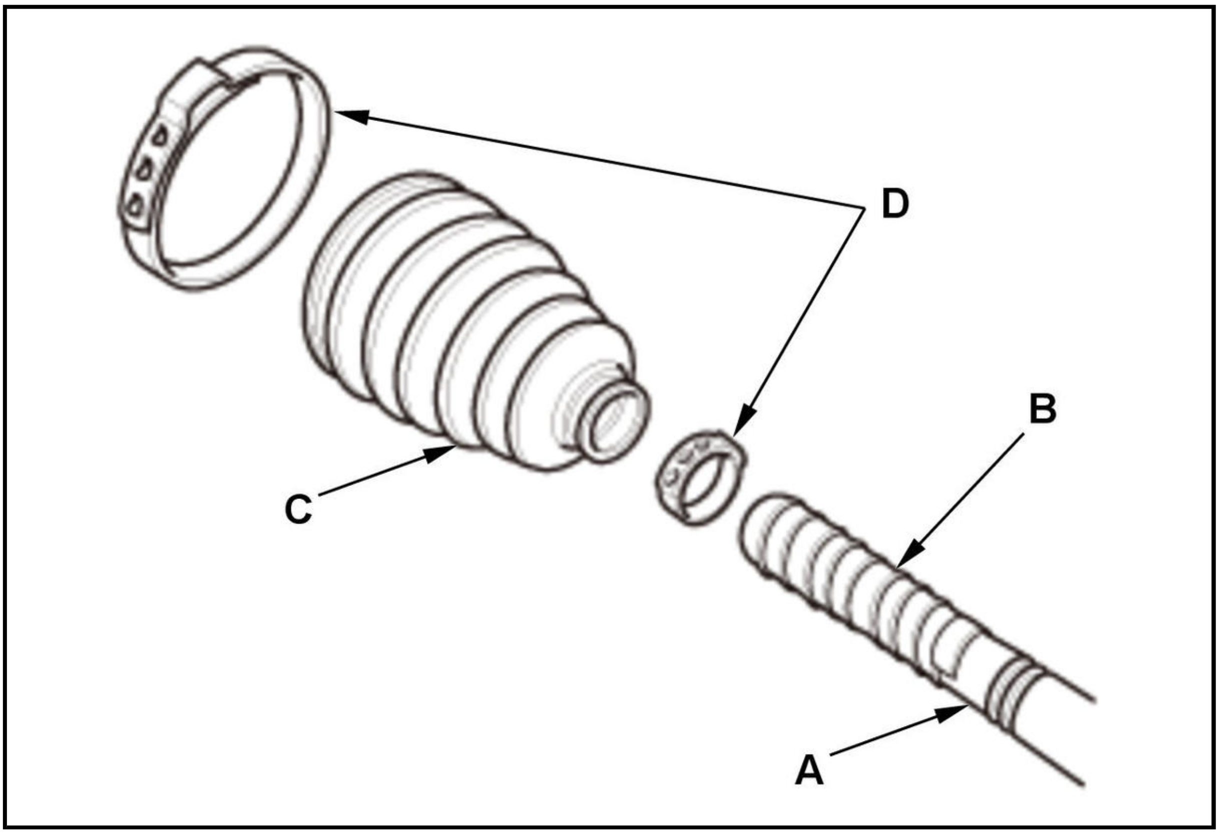
ℹ	Detailed information, notes, and precautions
☒	Replace
*1	Right driveshaft

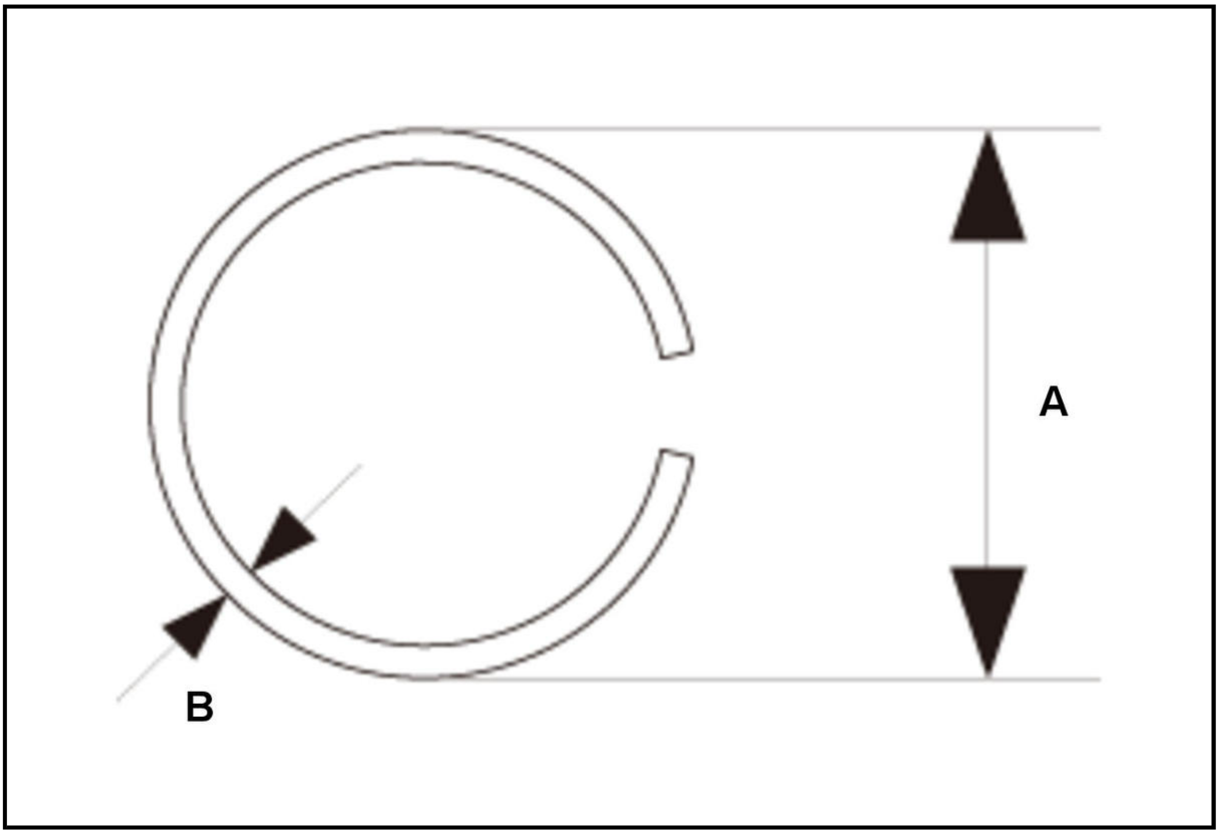
1. Outboard Boot - Install



NOTE:

- Wrap the splines on the driveshaft (A) with vinyl tape (B) to prevent damaging the outboard boot (C).
- Install new ear clamp bands (D) with the boot to prevent damaging the bands.

2. Stop Ring - Install



NOTICE:

To avoid driveshaft and vehicle damage, make sure you install the stop ring.

Stop ring specifications		
B	**Overall diameter (A):**	**31.2 mm (1.228 in)**
B	**Wire diameter (B):**	**2.0 mm (0.079 in)**

3. Outboard Joint - Install

 Use the grease included in the outboad boot set.	**NOTE:** Be careful not to damage the outboard boot. 1. Fill grease through the driveshaft hole in the outboard joint before installing the driveshaft. Inject enough grease so that it seeps out from the gap around the bearing when the driveshaft is inserted. **NOTE:** If you are installing a new outboard joint, the grease is already installed.
	2. Insert the driveshaft (A) into the outboard joint (B) until the stop ring (C) is close to the joint.
	3. To completely seat the outboard joint, pick up the driveshaft and the joint and tap or hit the assembly onto a hard surface from a height of about 10 cm (3.9 in). **NOTE:** Do not use a hammer, as excessive force may damage the driveshaft. Be careful not to damage the threaded section (A) of the outboard joint.

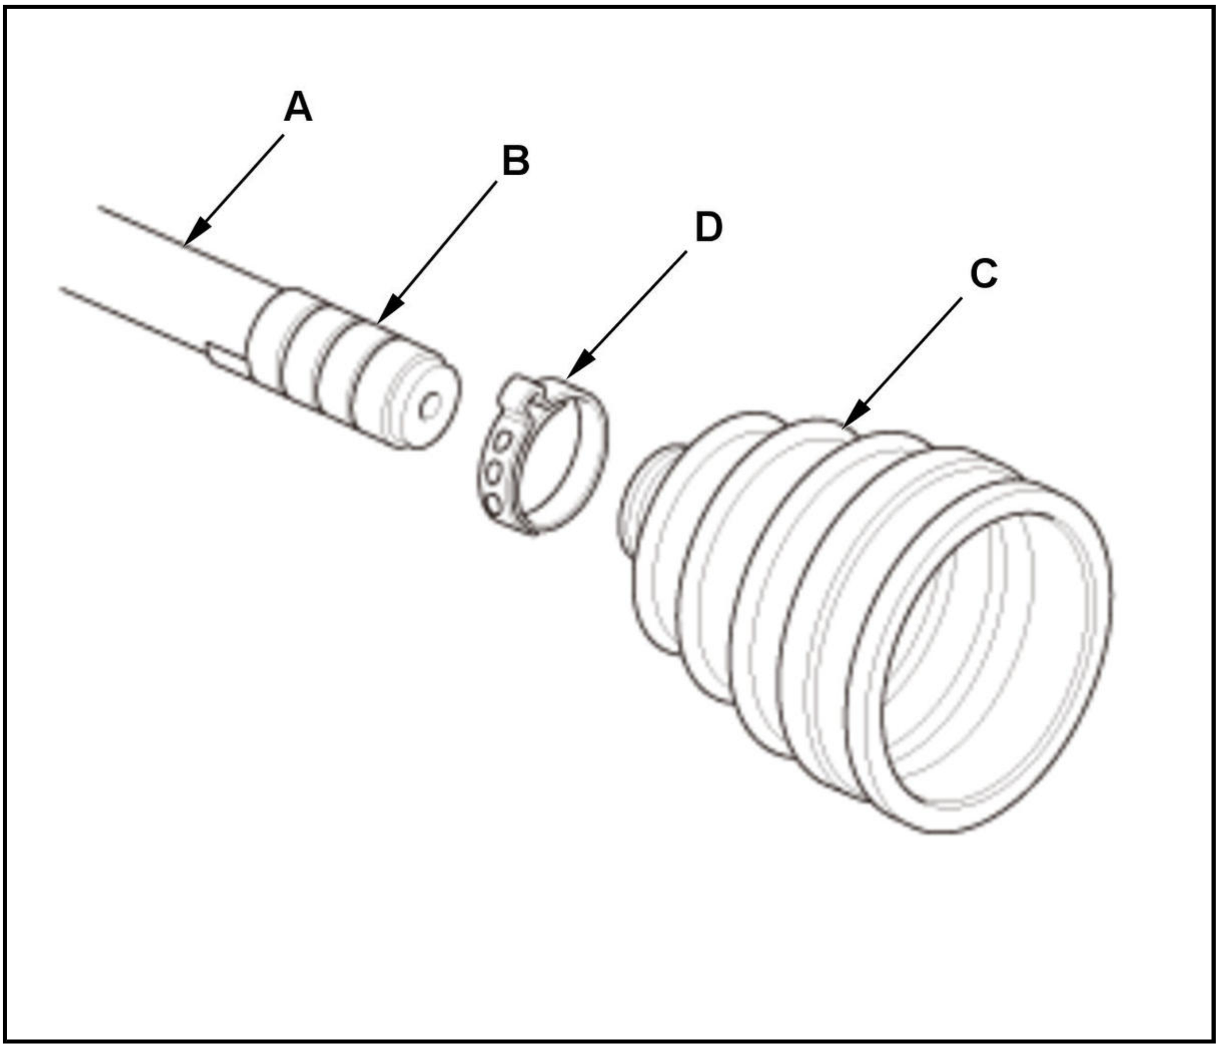
	4. Check the alignment of the paint mark (A) you made with the outboard joint end (B). **NOTICE:** To avoid driveshaft and vehicle damage, the shaft must be all the way into the outboard joint to ensure the stop ring is properly seated.

 Use the grease included in the outboard boot set.	5. Pack the outboard joint (A) with the remaining joint grease included in the outboard boot set.

Total grease quantity	
B	**Outboard joint:**
B	**150-170 g (5.29-6.00 oz)**

	6. Fit the boot ends (A) onto the driveshaft (B) and the outboard joint (C). 7. Bleed any excess air from the boot by inserting a flat-tipped screwdriver between the boot and the joint.

4. Inboard Boot - Install



NOTE:

- Wrap the splines on the driveshaft (A) with vinyl tape (B) to prevent damaging the inboard boot (C).
- Install a new ear clamp band (D) with the boot to prevent damaging the band.

5. Spider - Install

<table>
<tr><td></td><td>1. Install the spider (A) onto the driveshaft by aligning the marks (B) you made on the spider and the end of the driveshaft.</td></tr>
</table>

6. Roller - Install

	1. Fit the rollers (A) onto the spider (B) as shown and note these items: • Reinstall the rollers in their original positions on the spider by aligning the marks (C) you made. • Hold the driveshaft pointed up to prevent the rollers from falling off.

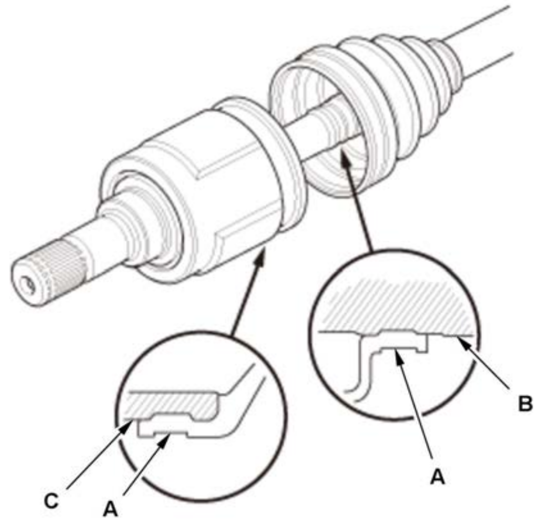
7. Circlip - Install

8. Inboard Joint - Install

	1. Pack the inboard joint with the joint grease included in the new inboard boot set.

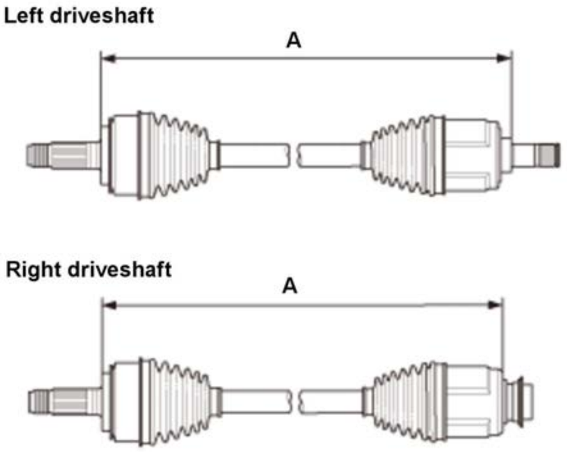
Grease quantity	
B	**Inboard joint:**
B	**195-215 g (6.88-7.58 oz)**

	2. Fit the inboard joint onto the driveshaft and note these items: • Reinstall the inboard joint onto the driveshaft by aligning the marks (A) you made on the inboard joint and the rollers. • Hold the driveshaft so the inboard joint is pointing up to prevent it from falling off.



3. Fit the boot ends (A) onto the driveshaft (B) and the inboard joint (C).

4. Bleed any excess air from the boot by inserting a flat-tipped screwdriver between the boot and the joint.



5. Adjust the length (A) of the driveshafts in the figure as shown.

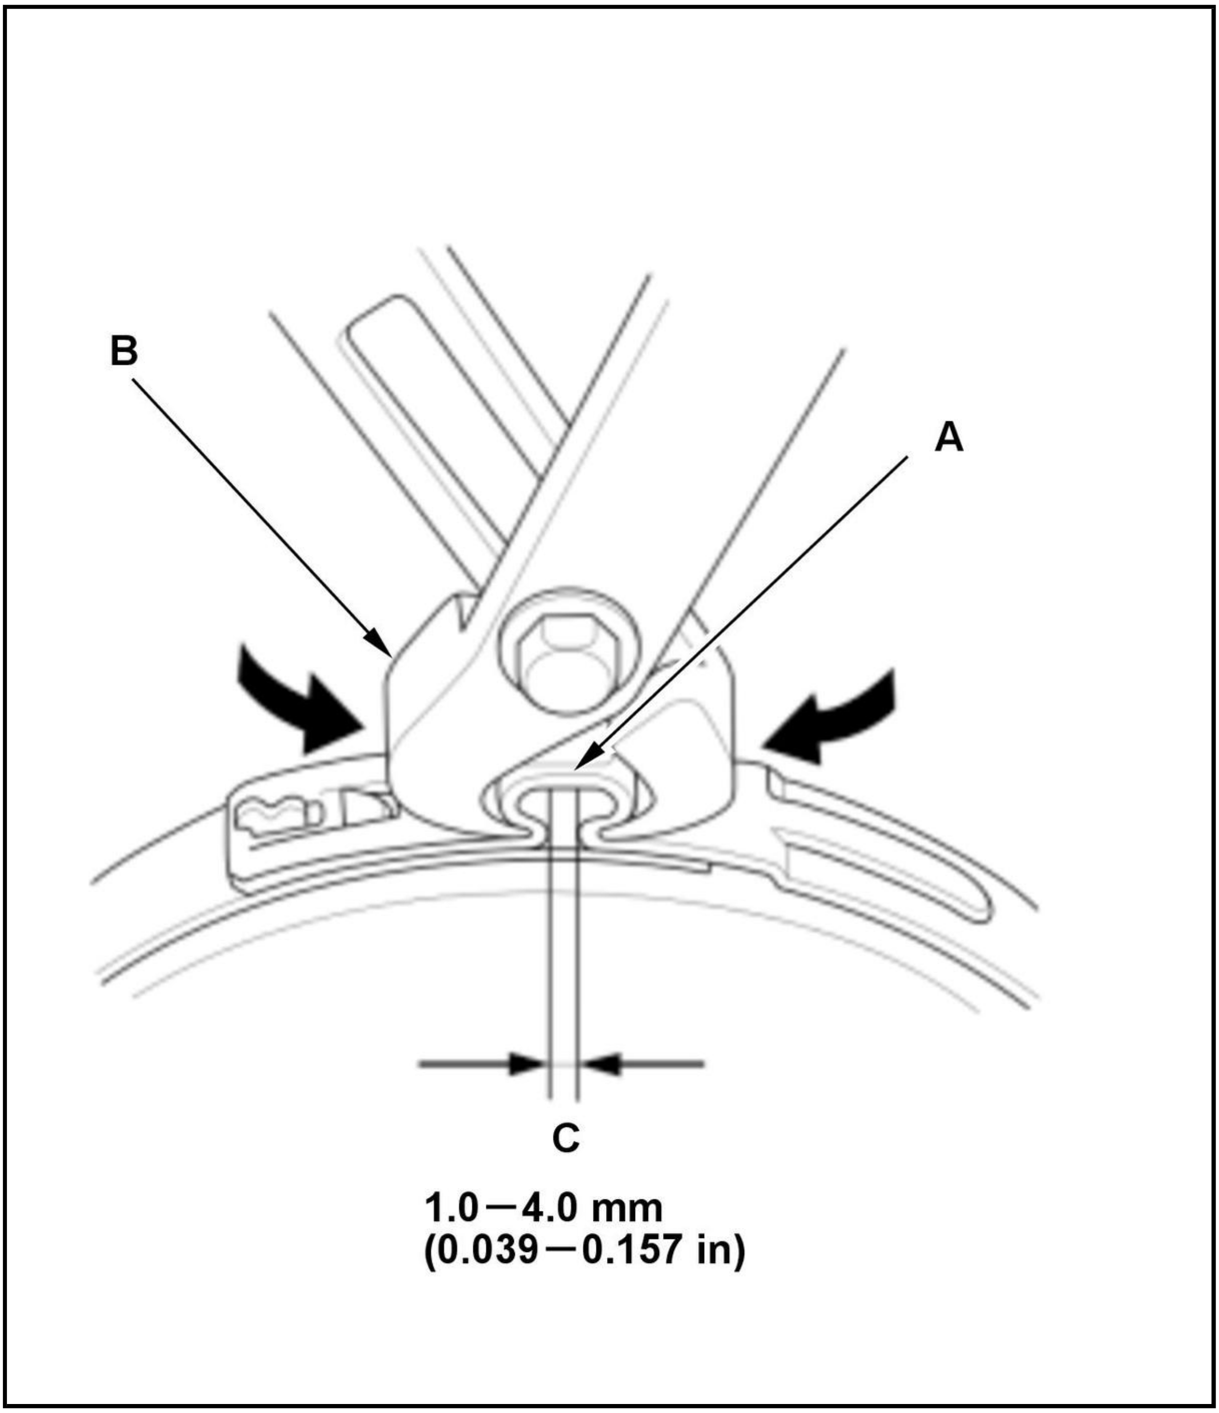
6. Adjust the boots to halfway between full compression and full extension.

7. Bleed excess air from the boots by inserting a flat-tipped screwdriver between the boot and the joint.

NOTE: Install the joints at exactly the same length.

Left/Right driveshaft	Specified length (A)
Left	**528-533 mm (20.787-20.984 in)**
Right	**526-531 mm (20.709-20.905 in)**

9. Boot Bands - Install

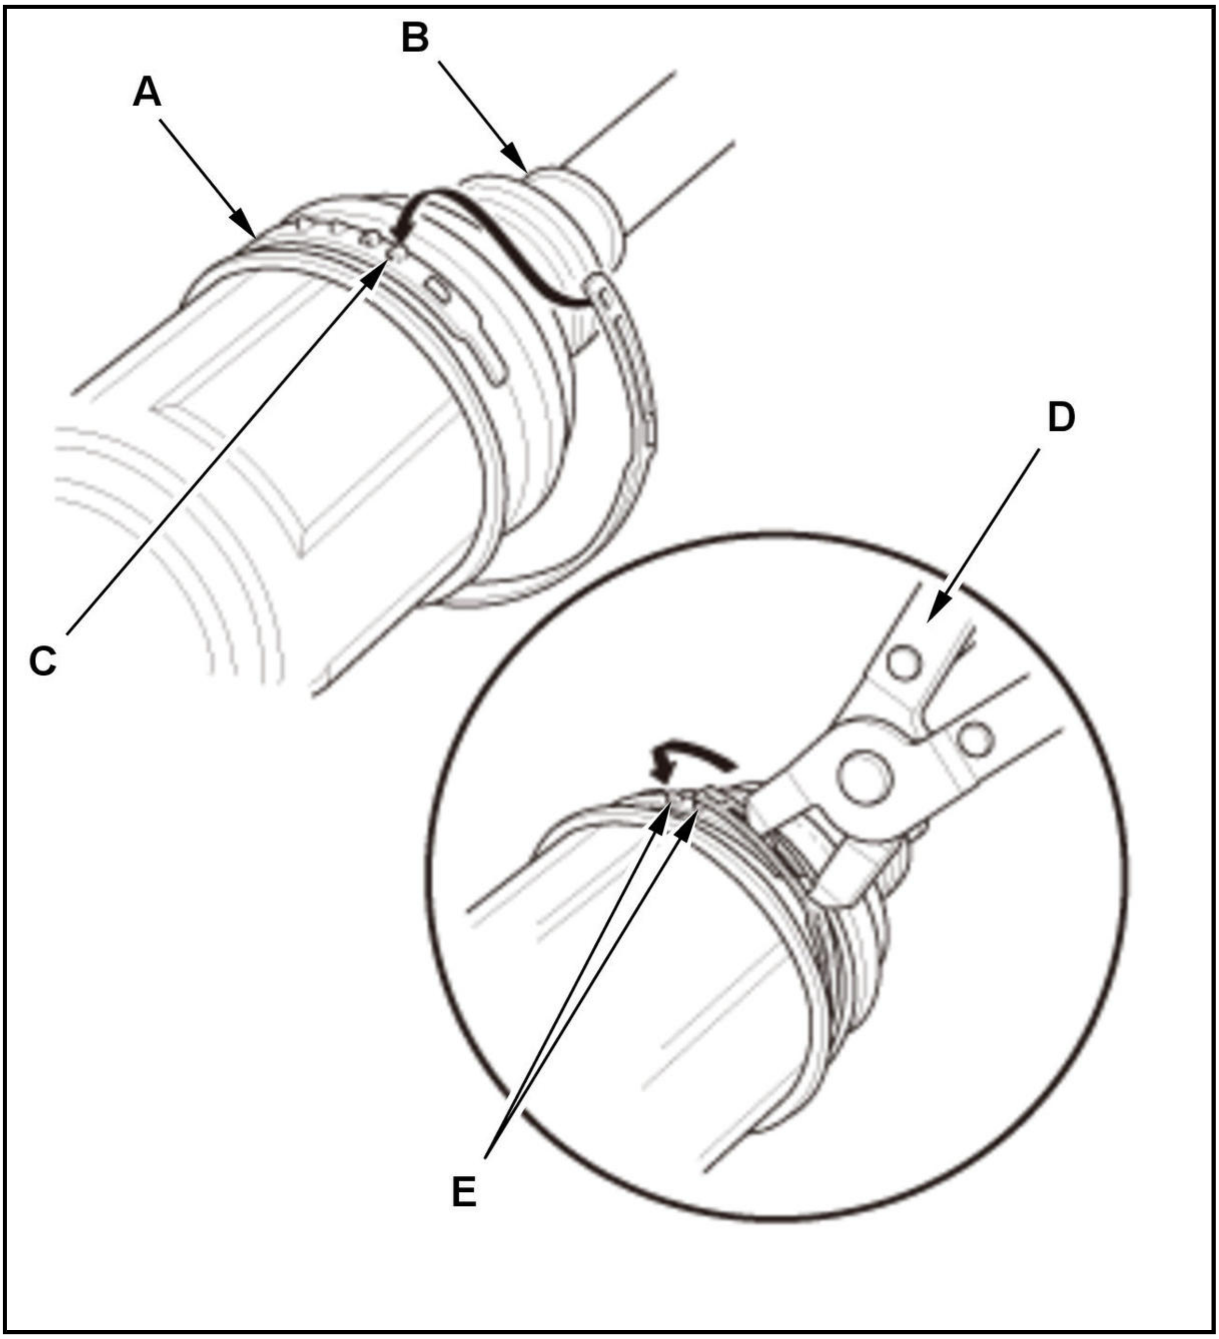


Ear clamp type

1. Close the ear portion (A) of the band using a commercially available boot band clamp tool (B).

2. Check the clearance of the closed ear portion of the band. If the clearance is not within specification, close the ear portion of the band tighter.

NOTE: Replace the ear clamp band with the one when the ear portion exceeds the specifications.



Low profile type

1. Fit the boot ends onto the driveshaft and the inboard joint, then install a new low profile band (A) onto the boot (B).

2. Hook the tab (C) of the band.

3. Close the hook portion of the band using a commercially available CV boot clamp pincer pliers (D), then hook the tabs (E) of the band.

INTERMEDIATE SHAFT DISASSEMBLY AND REASSEMBLY

Special Tools Required

Image	Description/Tool Number
	Bearing Driver Attachment, 52 x 55 mm 07746-0010400
	Driver Handle, 40 mm I.D. 07746-0030100
	Driver Handle, 15 x 135L 07749-0010000
	Oil Seal Driver, 44.5 mm 07947-SB0A100

📖	Detailed information, notes, and precautions
☒	Replace

1. Boot Bands - Remove

	1. Lift up the tabs (A) using a flat-tipped screwdriver.

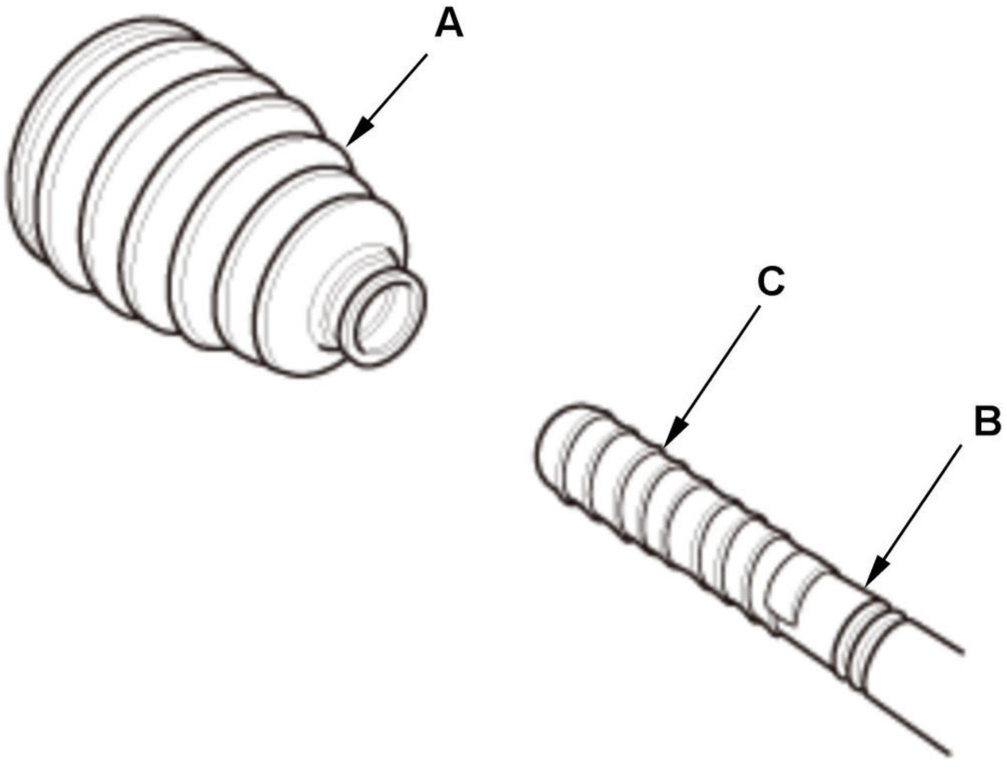
2. Outboard Joint - Remove

	1. Slide the outboard boot (A) partially toward the inboard joint side. 2. Wipe off the grease to expose the driveshaft and the outboard joint inner race.

	3. Make a mark (A) on the driveshaft (B) at the same level as the outboard joint end (C).

	4. Securely clamp the driveshaft in a bench vise with the wood blocks. 5. Remove the outboard joint (A) using the 22 x 1.5 mm threaded adapter and a commercially available 5/8"-18 UNF slide hammer (B). **NOTE:** Check inside of the outboard joint and on the serrations for wear and tear. 6. Remove the driveshaft from the bench vise.

3. Stop Ring - Remove
4. Outboard Boot - Remove



NOTE:

- Check the outboard boot (A) for cracks and damage. If any damage is found, replace the outboard boot.
- Wrap the splines on the driveshaft (B) with vinyl tape (C) to prevent damaging the outboard boot.

5. Inboard Joint - Remove

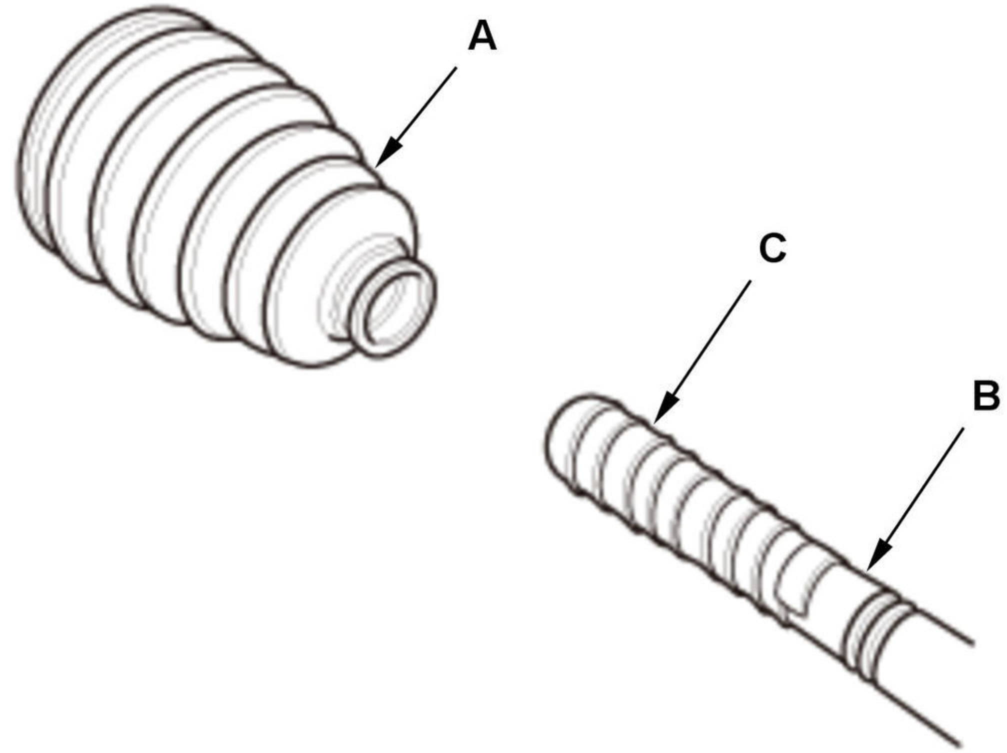
 	1. Remove the snap ring (A). 2. Make marks (B) on the bearing retainer (C) and the inboard joint (D) to identify the locations of the bearing retainer to the grooves in the inboard joint. 3. Remove the inboard joint and place it on a clean shop towel (E). Be careful not to drop the steel balls when separating them from the inboard joint.

6. Circlip - Remove

7. Bearing Retainer and Bearing Race - Remove

 	1. Make marks (A) on the bearing retainer (B), the bearing race (C) and the driveshaft (D) to identify the position of the bearing retainer and the bearing race on the shaft. 2. Remove the bearing race and the steel balls (E). **NOTE:** If necessary, use a commercially available bearing puller.

8. Inboard Boot - Remove



NOTE:

- Check the inboard boot (A) for cracks and damage. If any damage is found, replace the inboard boot.
- Wrap the splines on the driveshaft (B) with vinyl tape (C) to prevent damaging the inboard boot.

Reassembly

NOTE:

- 📖 Where icon is shown, for further information see below.
- Make marks on the disassembled parts to be able to reassemble them in their original positions.
- Be careful not to damage the boot.
- Be careful not to get grease on the boots attachment grooves.
- Use the bands included in the boot set.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

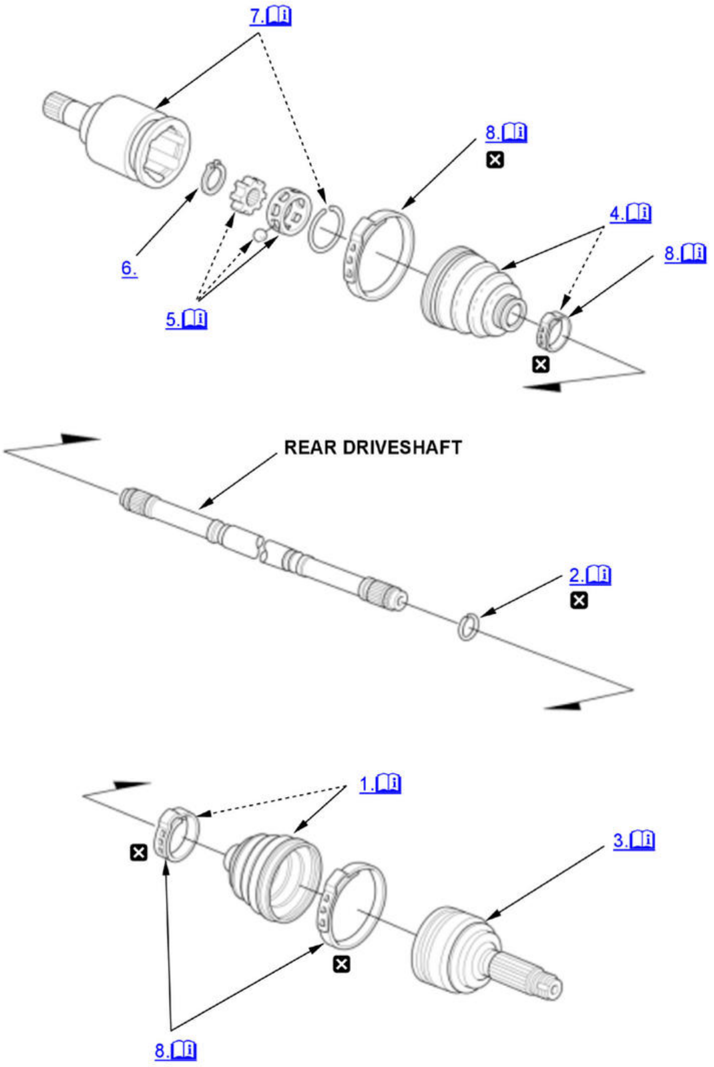


Fig. 6: Exploded View Of Rear Driveshaft Components For Reassembly
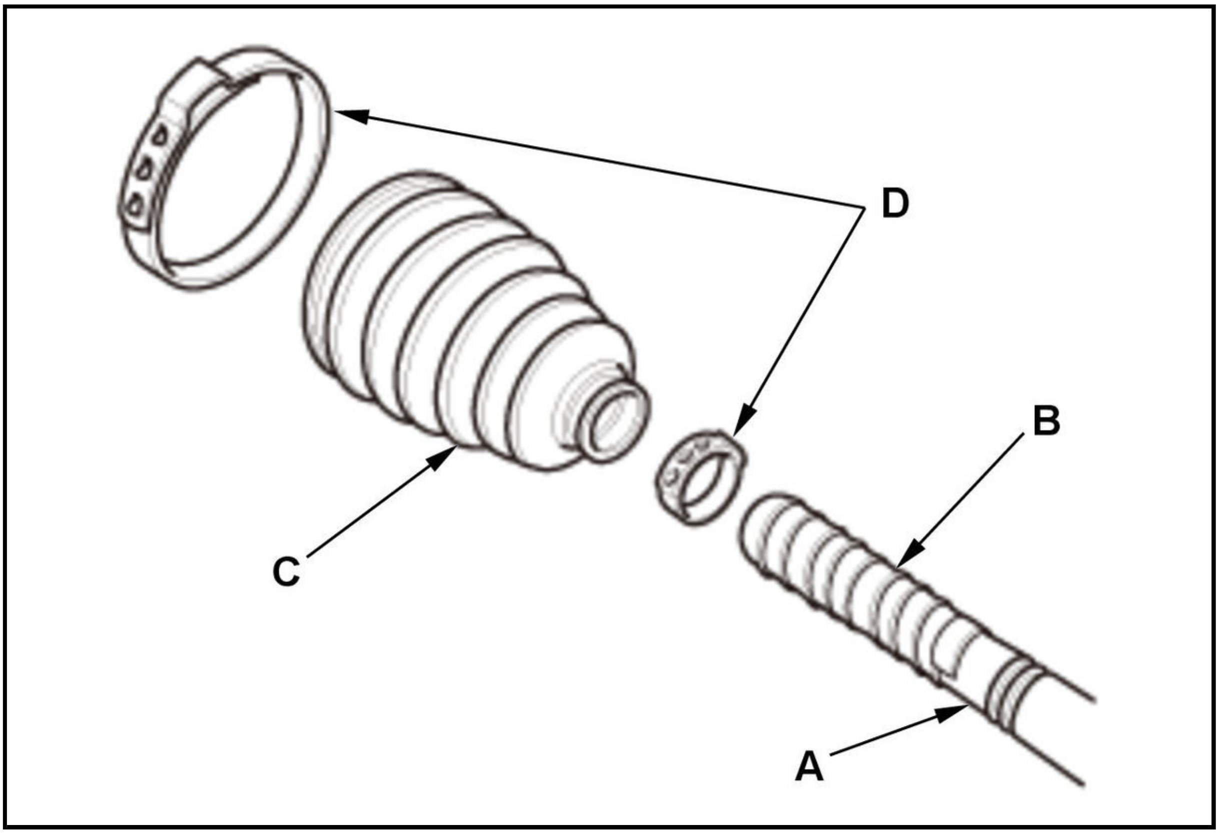
Courtesy of HONDA, U.S.A., INC.

📖	Detailed information, notes, and precautions

☒	Replace

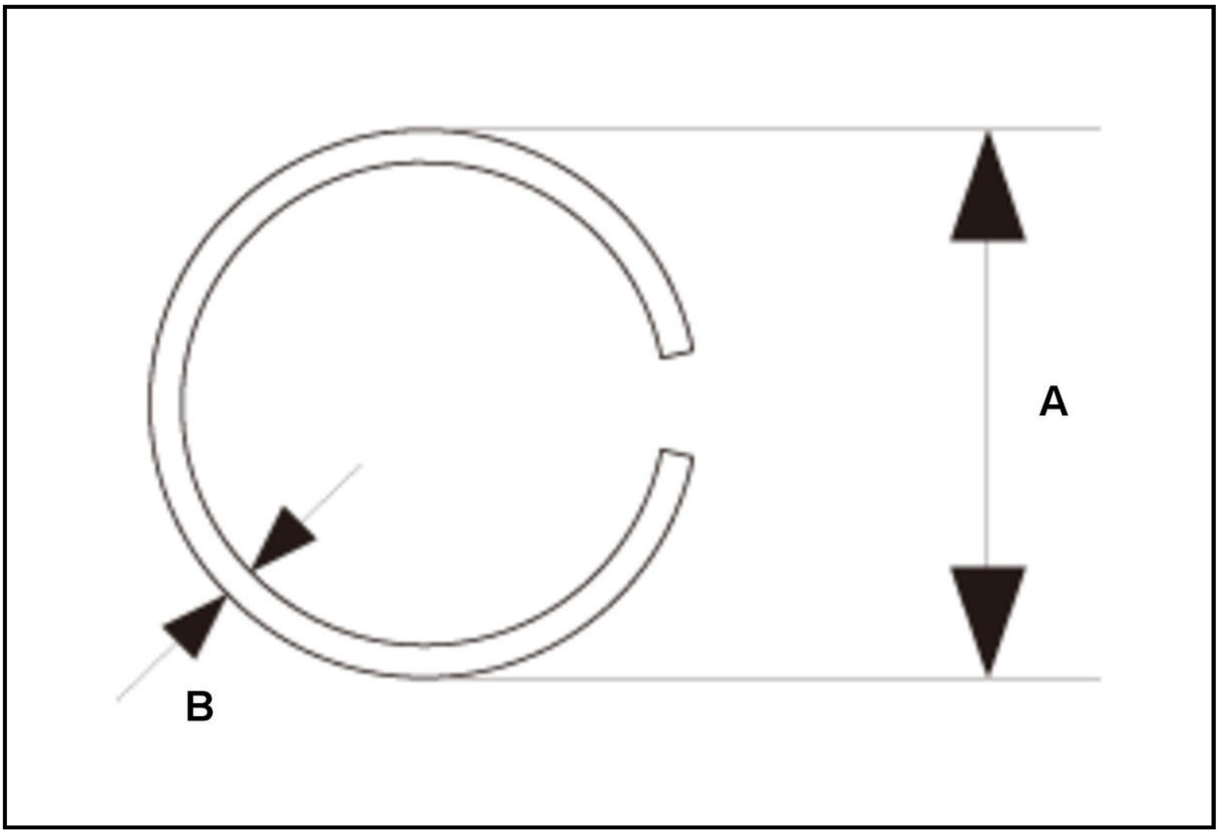
1. Outboard Boot - Install



NOTE:

- Wrap the splines on the driveshaft (A) with vinyl tape (B) to prevent damaging the outboard boot (C).
- Install new ear clamp bands (D) with the boot to prevent damaging the band.

2. Stop Ring - Install



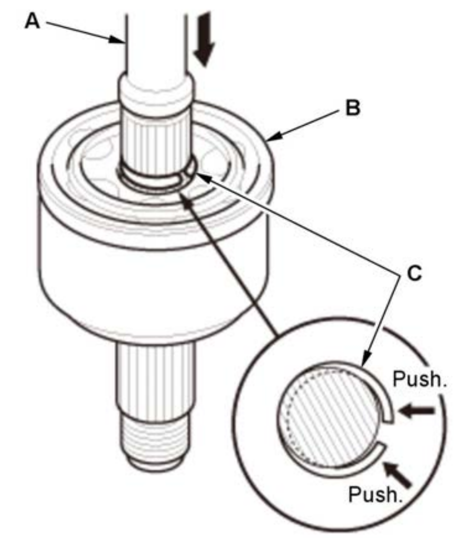
NOTICE:

To avoid driveshaft and vehicle damage, make sure you install the stop ring.

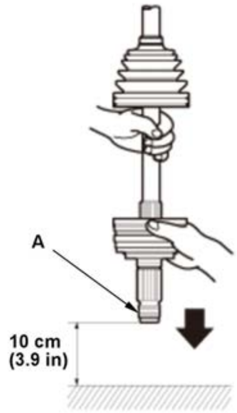
Stop ring specifications		
B	**Overall diameter (A):**	**21.97 mm (0.865 in)**
B	**Wire diameter (B):**	**1.44 mm (0.0567 in)**

3. Outboard Joint - Install

 GREASE Use the grease included in the outboad boot set.	1. Fill grease through the driveshaft hole in the outboard joint before installing the driveshaft. Inject enough grease so that it seeps out from the gap around the bearing when the driveshaft is inserted. **NOTE:** If you are installing a new outboard joint, the grease is already installed.

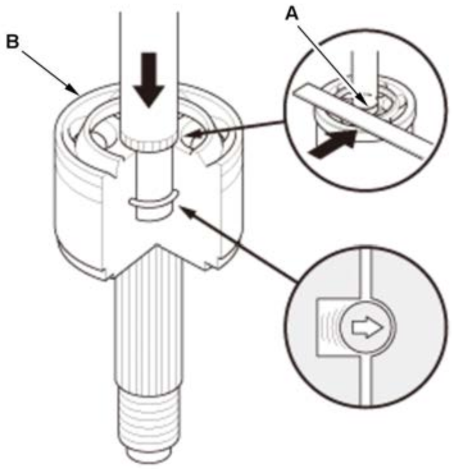


2. Insert the driveshaft (A) into the outboard joint (B) until the stop ring (C) is close to the outboard joint.



3. To completely seat the outboard joint, pick up the driveshaft and the joint and tap or hit the assembly onto a hard surface from a height of about 10 cm (3.9 in).

NOTE: Do not use a hammer, as excessive force may damage the driveshaft. Be careful not to damage the threaded section (A) of the outboard joint.



4. Check the alignment of the paint mark (A) you made with the outboard joint end (B).

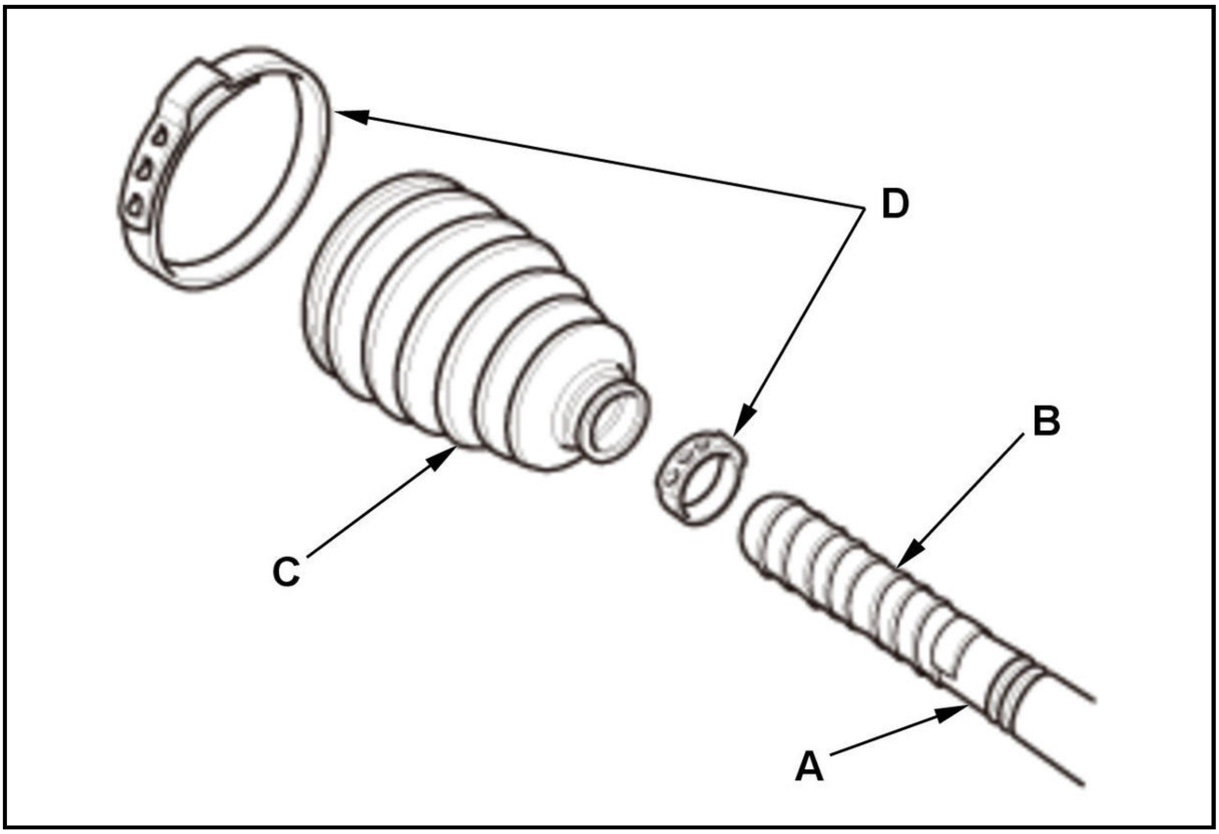
NOTICE: To avoid driveshaft and vehicle damage, the shaft must be all the way into the outboard joint to ensure the stop ring is properly seated.

 GREASE Use the grease included in the outboard boot set. A	5. Pack the outboard joint (A) with the remaining joint grease included in the outboard boot set.

Total grease quantity	
B	**Outboard joint:**
B	**82-102 g (2.89-3.60 oz)**

	6. Fit the boot ends (A) onto the driveshaft (B) and the outboard joint (C). 7. Bleed any excess air from the outboard boot by inserting a flat-tipped screwdriver between the outboard boot and the outboard joint.

4. Inboard Boot - Install



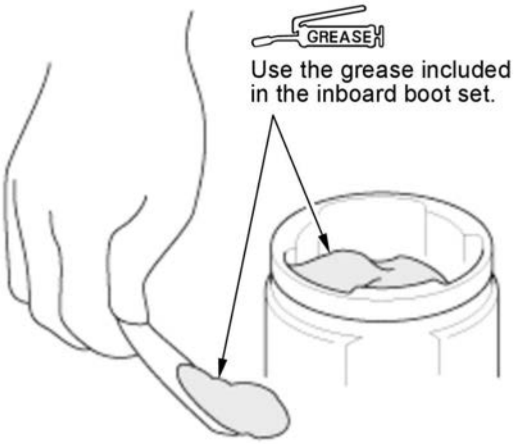
NOTE:

- Wrap the splines on the driveshaft (A) with vinyl tape (B) to prevent damaging the inboard boot (C).
- Install new ear clamp bands (D) with the boot to prevent damaging the band.

5. Bearing Retainer and Bearing Race - Install

	1. Assemble the steel balls (A), the bearing retainer (B) and the bearing race (C) by aligning the marks (D) you made on the bearing retainer and the bearing race. 2. Install the bearing onto the driveshaft (E) by aligning the marks you made on the bearing and the driveshaft. Be careful not to drop the steel balls when installing the bearing onto the driveshaft.

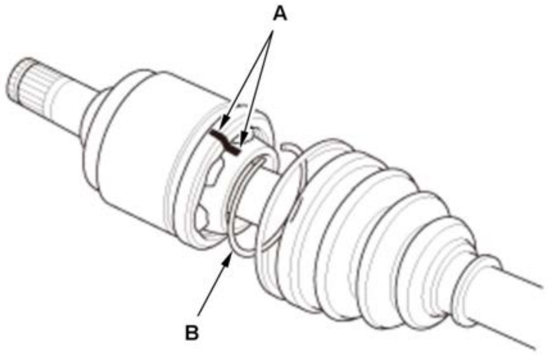
6. Circlip - Install
7. Inboard Joint - Install



GREASE
Use the grease included in the inboard boot set.

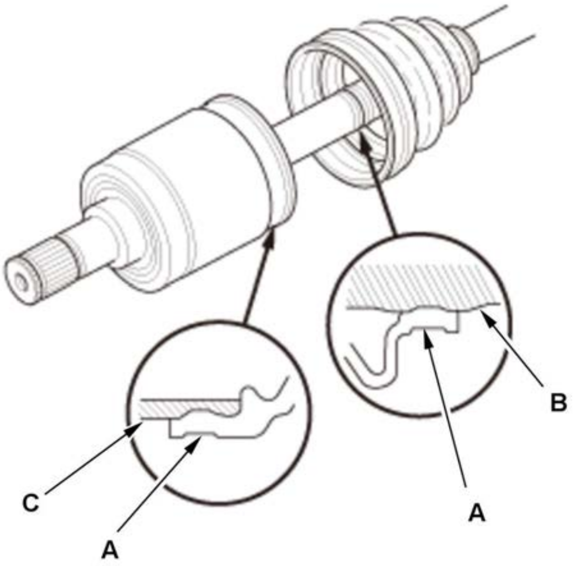
1. Pack the inboard joint with the joint grease included in the new inboard boot set.

Grease quantity	
B	**Inboard joint:**
B	**87-103 g (3.07-3.63 oz)**



2. Install the inboard joint onto the driveshaft by aligning the marks (A) you made on the inboard joint and the bearing retainer.

3. Install the snap ring (B) into the inboard joint groove.



4. Fit the boot ends (A) onto the driveshaft (B) and the inboard joint (C).

 	5. Adjust the length (A) of the driveshafts in the figure as shown, then adjust the boots to halfway between full compression and full extension. **Driveshaft length:** 6. Bleed excess air from the boots by inserting a flat-tipped screwdriver between the boot and the joint. **NOTE:** Install the joints at exactly the same length.

Left/Right driveshaft	Specified length (A)
Left	**677.2-682.2 mm (26.661-26.855 in)**
Right	**722.2-727.2 mm (28.433-28.630 in)**

8. Boot Bands - Install

 B A 7.5 mm (0.295 in) max. 1.0−3.6 mm (0.039−0.142 in)	1. Close the ear portion (A) of the band using a commercially available boot band clamp tool (Kent-Moore J-35910 or equivalent) (B). 2. Check the clearance of the closed ear portion of the band. If the clearance is not within the standard, close the ear portion of the band tighter. **NOTE:** Replace the ear clamp band with the one when the ear portion exceeds the prescribed length.

REMOVAL AND INSTALLATION

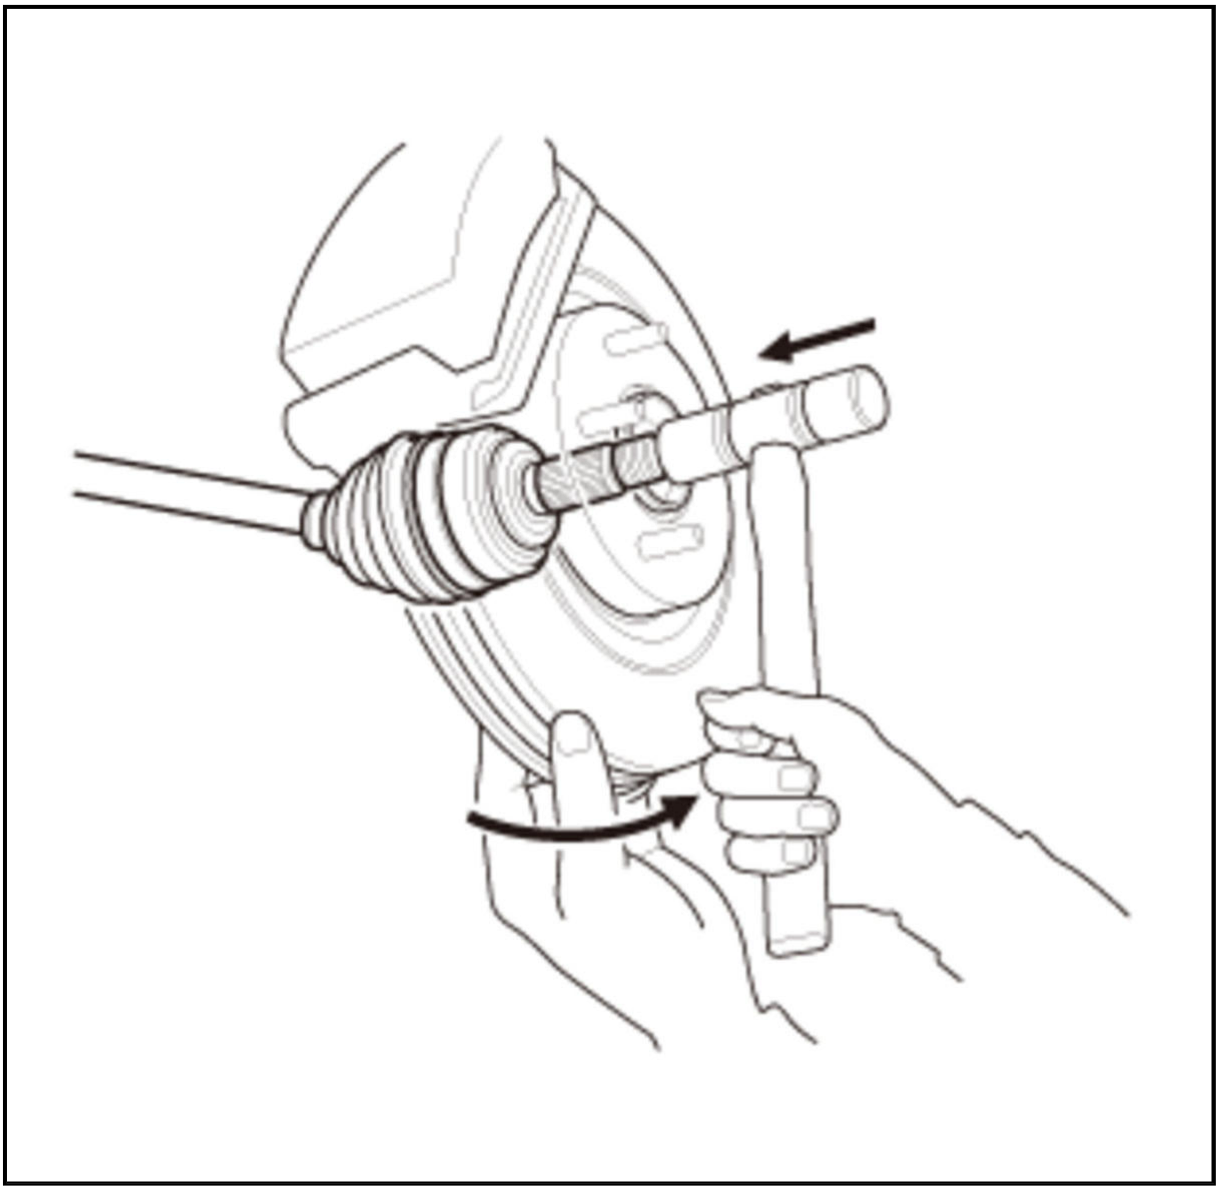
2. Spindle Nut - Remove

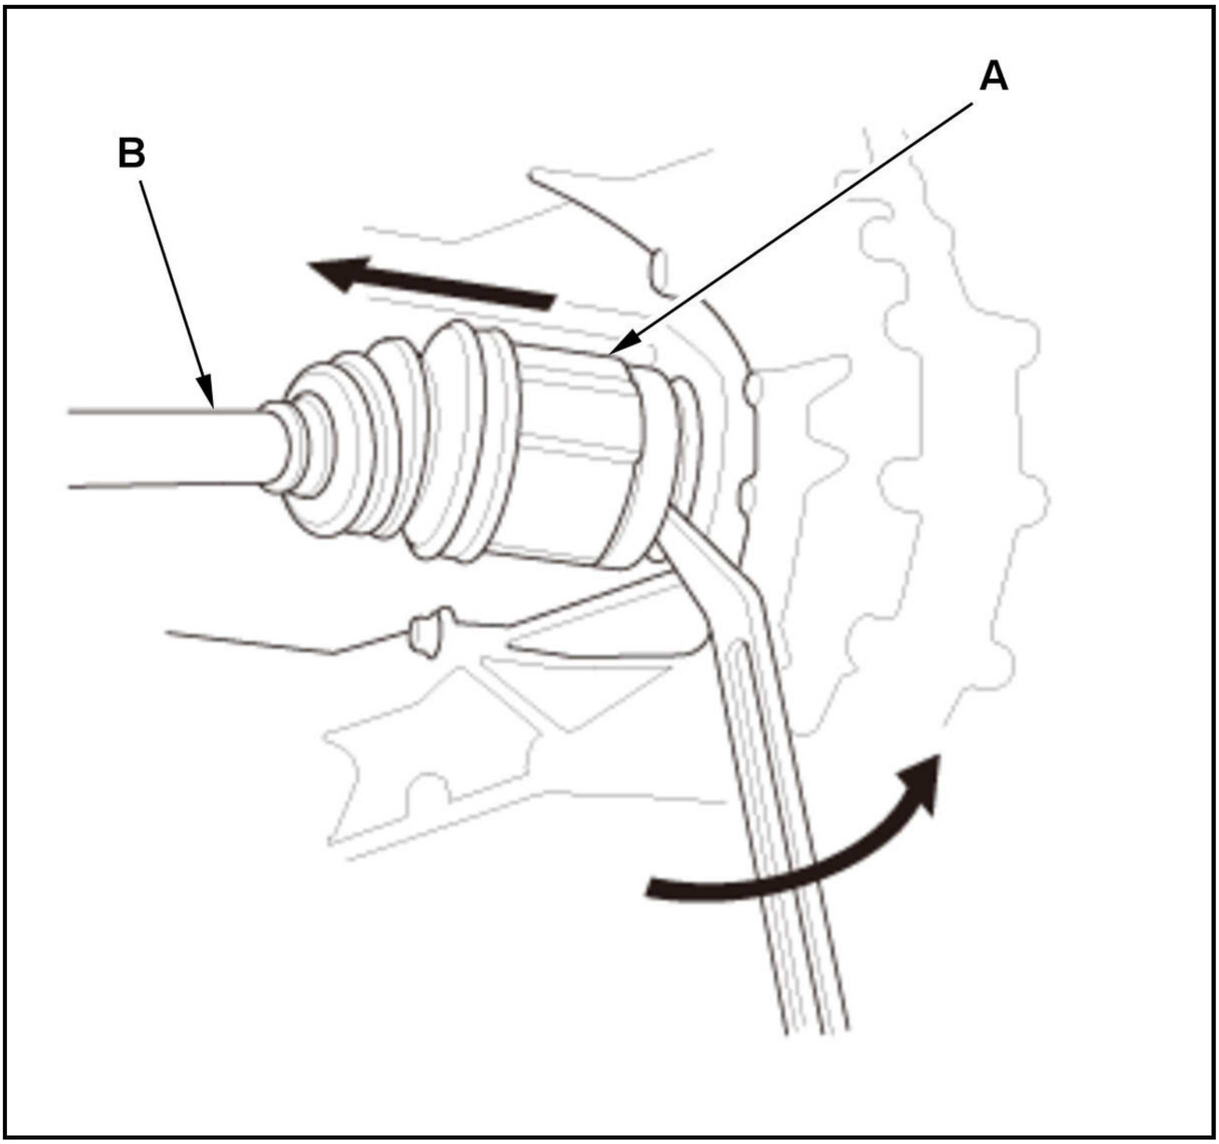
	1. Pry up the stake (A) on the spindle nut (B). 2. Remove the spindle nut.

3. **Engine Undercover - Remove**
4. **Transmission Fluid - Drain**
5. **Lower Arm Ball Joint - Disconnect**
6. Outboard Joint - Disconnect



NOTE: Be careful not to damage the outboard joint threads and the wheel speed sensor.

7. Inboard Joint - Disconnect (Both Sides)



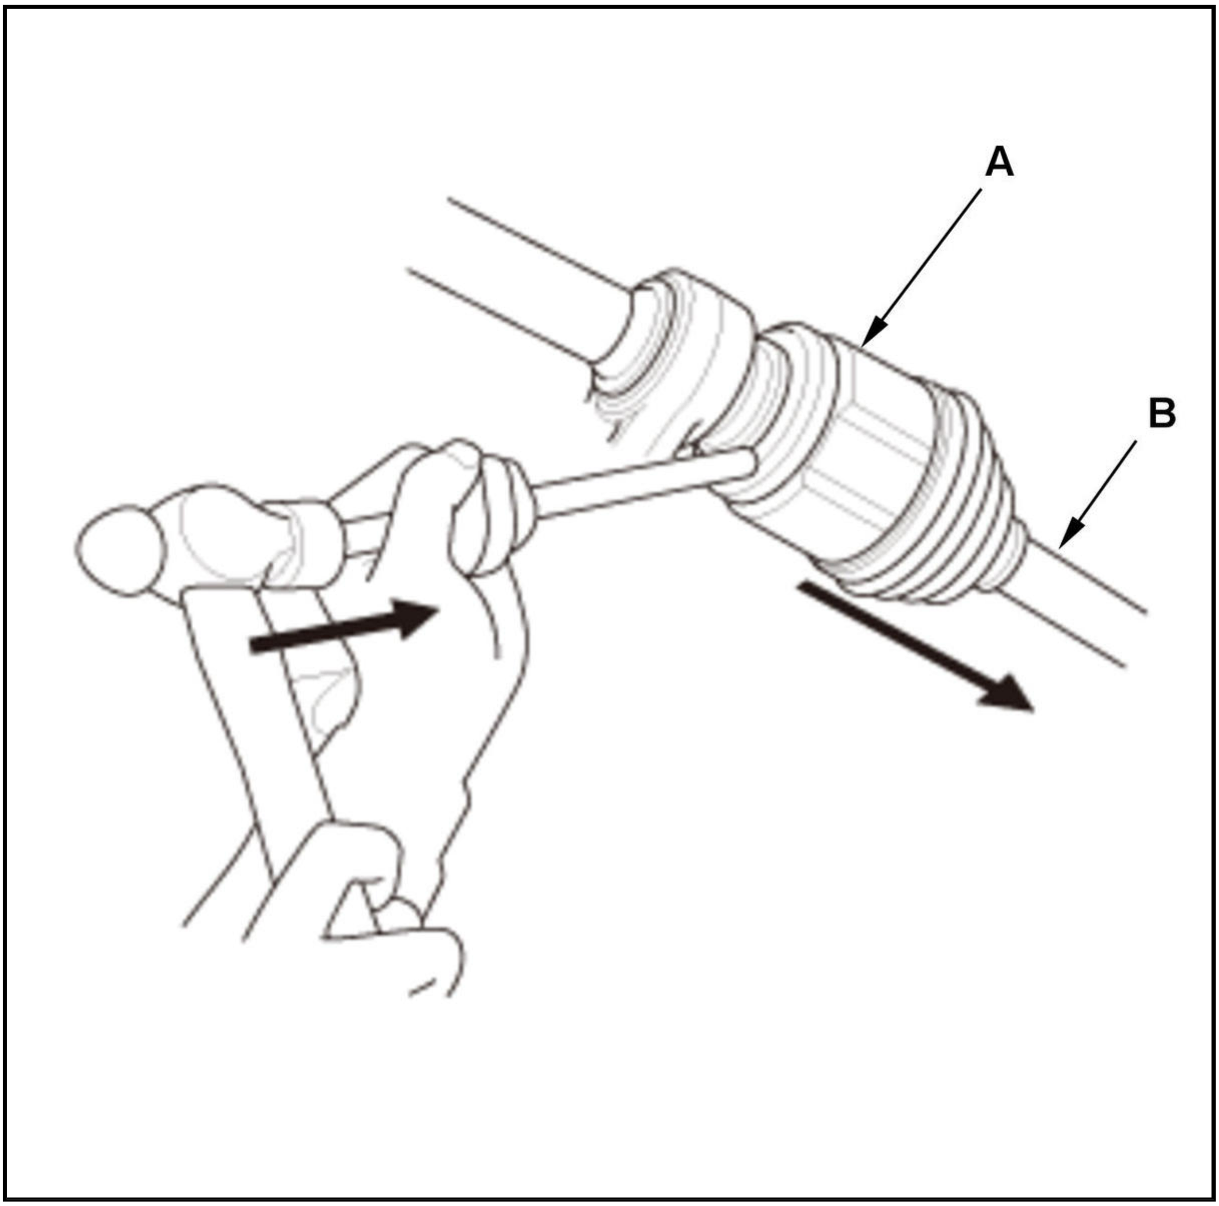
Left driveshaft

1. Pry the inboard joint (A) using a pry bar.

NOTE: Be careful not to damage the oil seal or the end of the inboard joint with the pry bar.

2. Remove the driveshaft as an assembly.

NOTE: Do not pull on the driveshaft (B), or the inboard joint may come apart. Pull the inboard joint straight out to avoid damaging the oil seal.



Right driveshaft

1. Drive the inboard joint (A) off of the intermediate shaft using a drift punch and a hammer.

2. Remove the driveshaft as an assembly.

NOTE: Do not pull on the driveshaft (B), or the inboard joint may come apart. Pull the inboard joint straight out.

8. Set Ring - Remove

Installation

NOTE: 📖 Where icon is shown, for further information see below.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

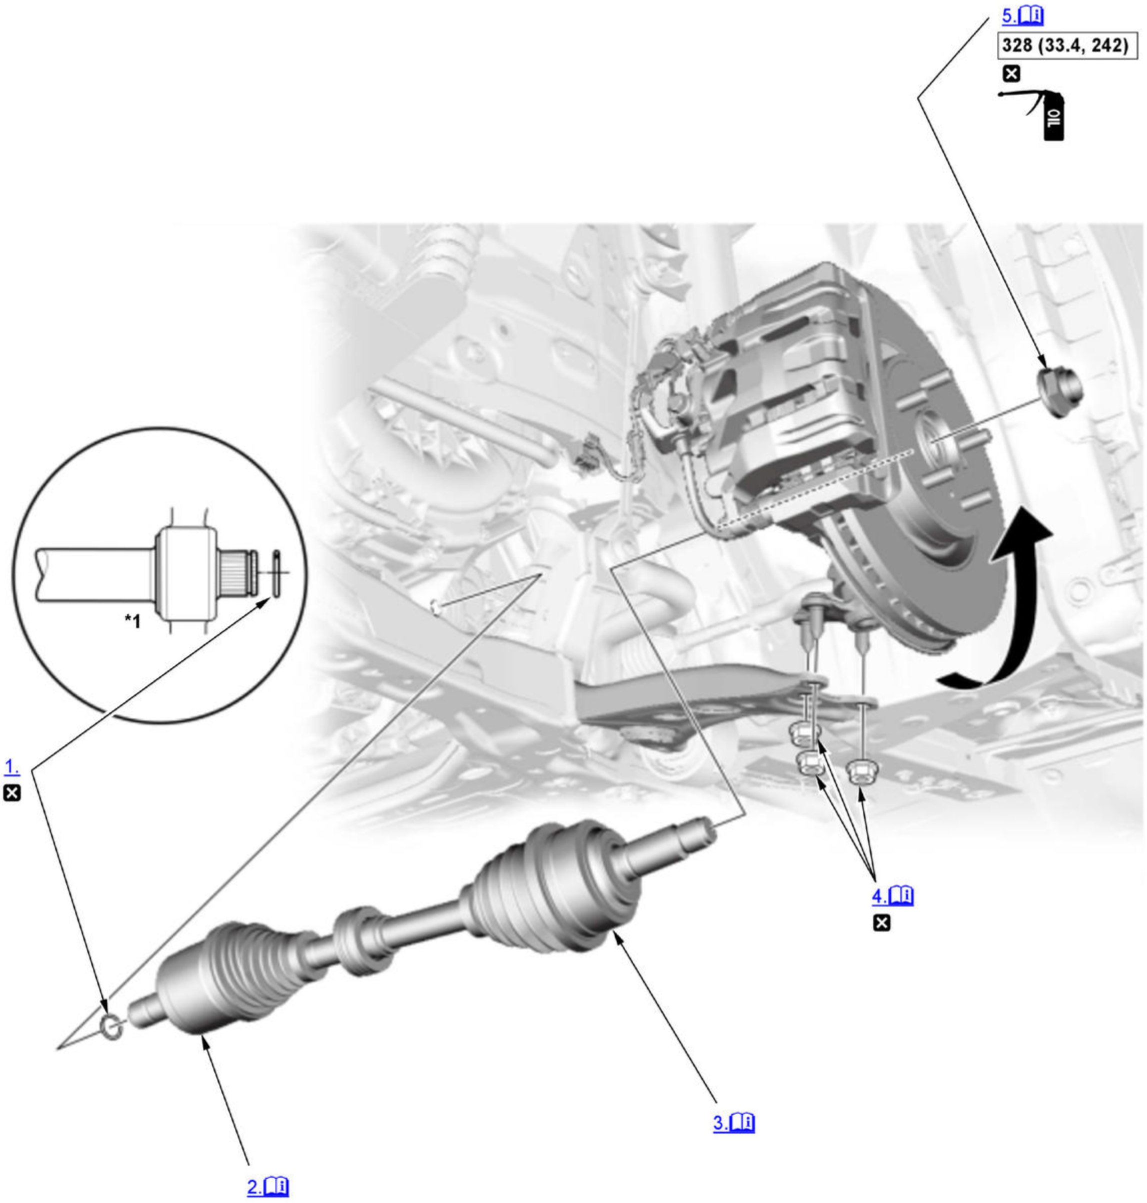


Fig. 8: Exploded View Of Front Driveshaft Components With Torque Specifications For Installation

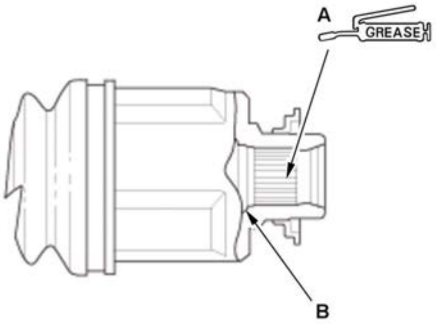
ⓘ	Detailed information, notes, and precautions
☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
OIL	Apply a small amount of engine oil to the seating surface of a new spindle nut.
*1	Intermediate shaft

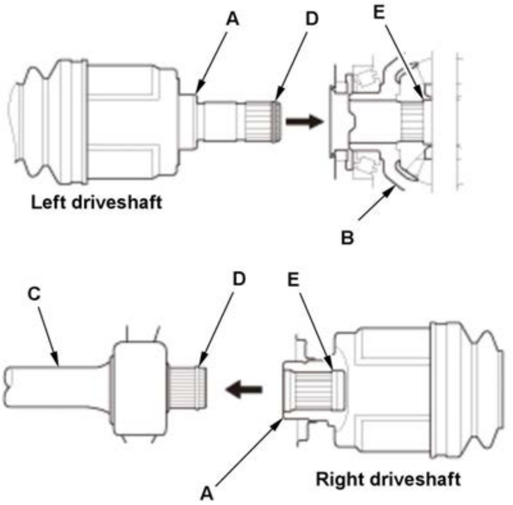
1. Set Ring - Install
2. Inboard Joint - Connect

Right driveshaft



1. Apply 2.0-3.0 g (0.071-0.106 oz) of UM246 (P/N 41211-PY5-305) to the whole splined surface (A) of the right driveshaft.

2. After applying grease, remove the grease from the splined grooves at intervals of 2-3 splines and from the set ring groove (B) so that air can bleed from the intermediate shaft.



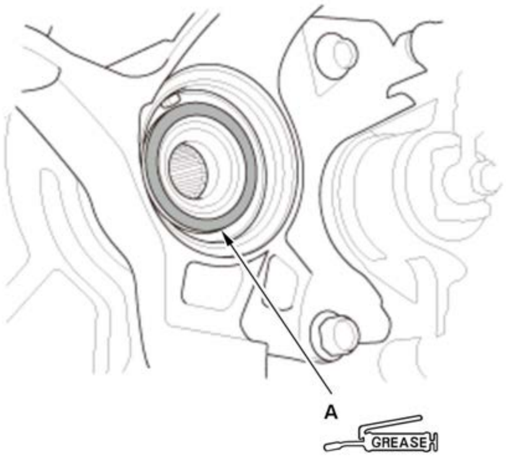
3. Left driveshaft: Clean the areas where the driveshaft contacts the differential thoroughly with solvent, then dry them with compressed air.

NOTE: Do not wash the rubber parts with solvent.

4. Insert the inboard end (A) of the driveshaft into the differential (B) or the intermediate shaft (C) until the set ring (D) locks in the groove (E).

NOTE: Insert the driveshaft horizontally to prevent damaging the oil seal.

3. Outboard Joint - Connect

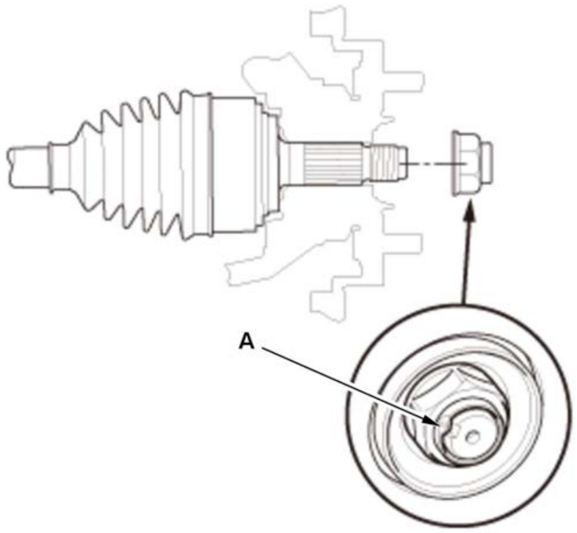


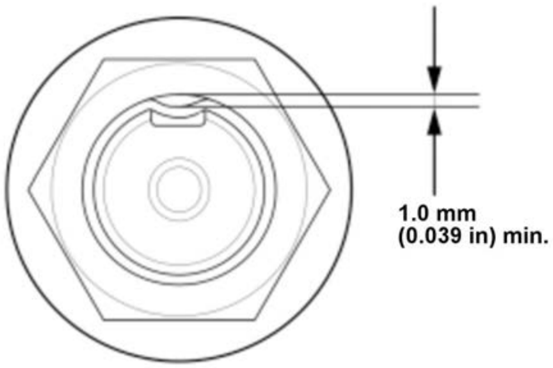
1. Apply about 3 g (0.11 oz) of Molykote M-77 grease or equivalent to the contact area (A) of the outboard joint and the front wheel bearing.
NOTE: The paste helps prevent noise and vibration.

4. Lower Arm Ball Joint - Connect

NOTE: During reassembly, loosely install new flange nuts, then tighten them to the specified torque.

5. Spindle Nut - Install





NOTE: Do not use a stake, punch or screwdriver in the brake rotor to keep it from moving. Have an assistant press on the brakes instead while you are tightening.

1. Use a drift to stake the spindle nut shoulder (A) against the driveshaft.

NOTE:

- Check spindle nut shoulder as shown.
- Be careful not to make a crack on the spindle nut when staking.

6. **Front Wheel - Install**
7. Front Driveshaft - After Install Check

1. Turn the wheel by hand and make sure there is no interference between the driveshaft and surrounding parts.

8. **Transmission Fluid - Refill**
9. **Engine Undercover - Install**
10. **Wheel Alignment - Check**
11. Test Drive - Check

INTERMEDIATE SHAFT REMOVAL AND INSTALLATION

Removal and Installation

Where icon is shown, for further information see below.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

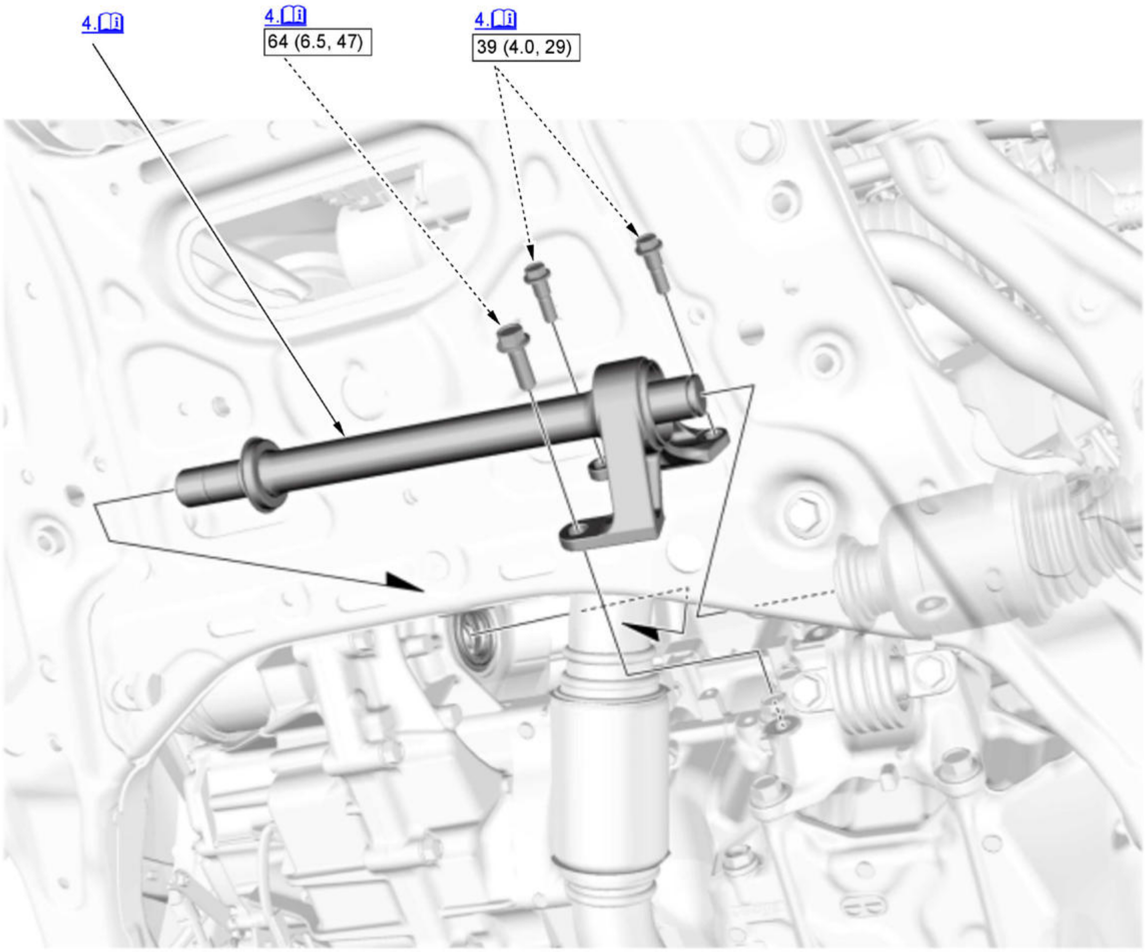


Fig. 9: Exploded View Of Intermediate Shaft Components With Torque Specifications

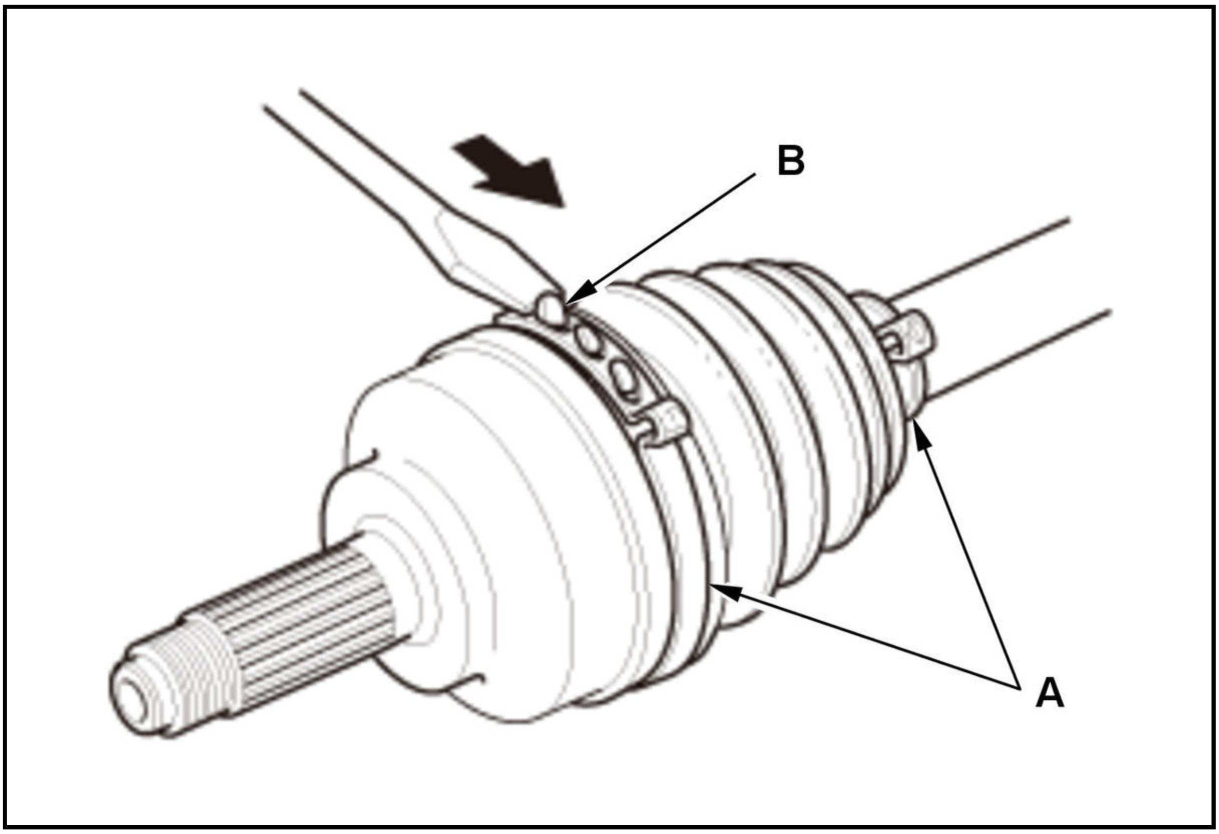
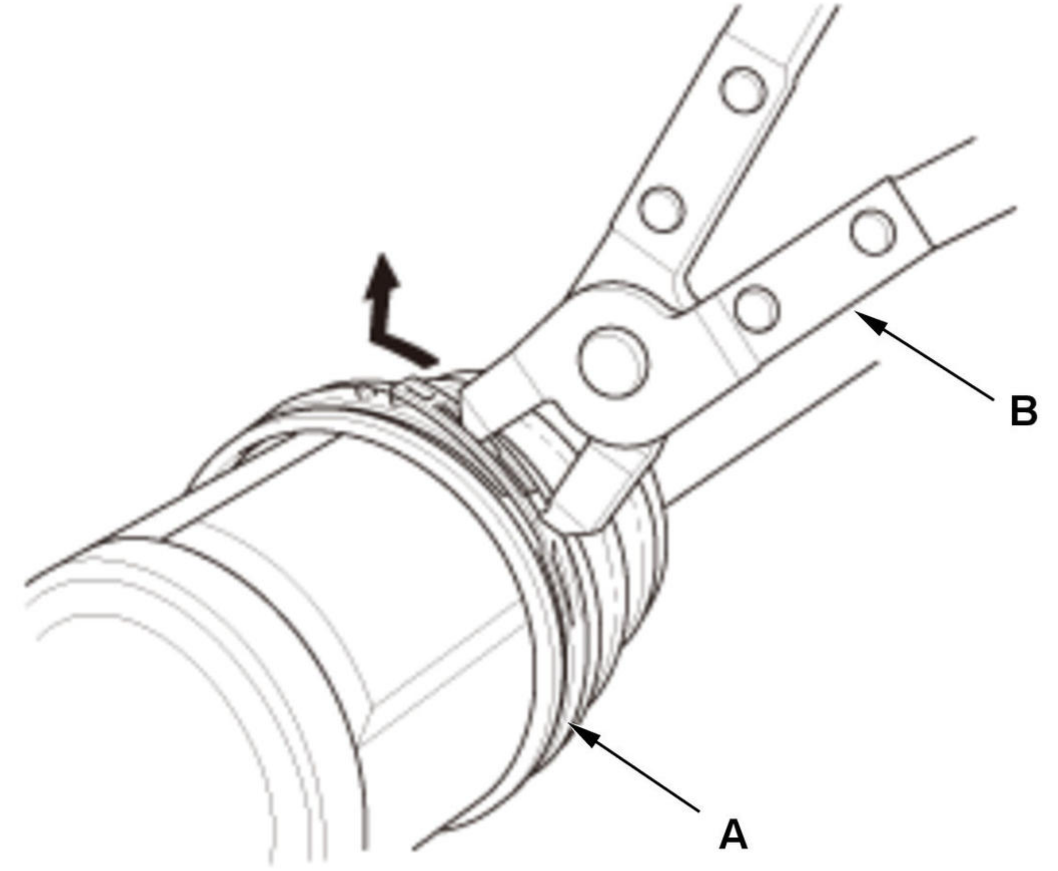
ⓘ	Detailed information, notes, and precautions
☒	Replace
*1	Right driveshaft

1. Boot Bands - Remove



Ear clamp type

1. If the boot band is an ear clamp type (A), lift up the tabs (B) using a flat-tipped screwdriver.



Low profile type

1. If the boot band is a low profile type (A), pinch the boot band using commercially available pincer CV Boot Clamp Pliers (30500) (B).

2. Outboard Joint - Remove

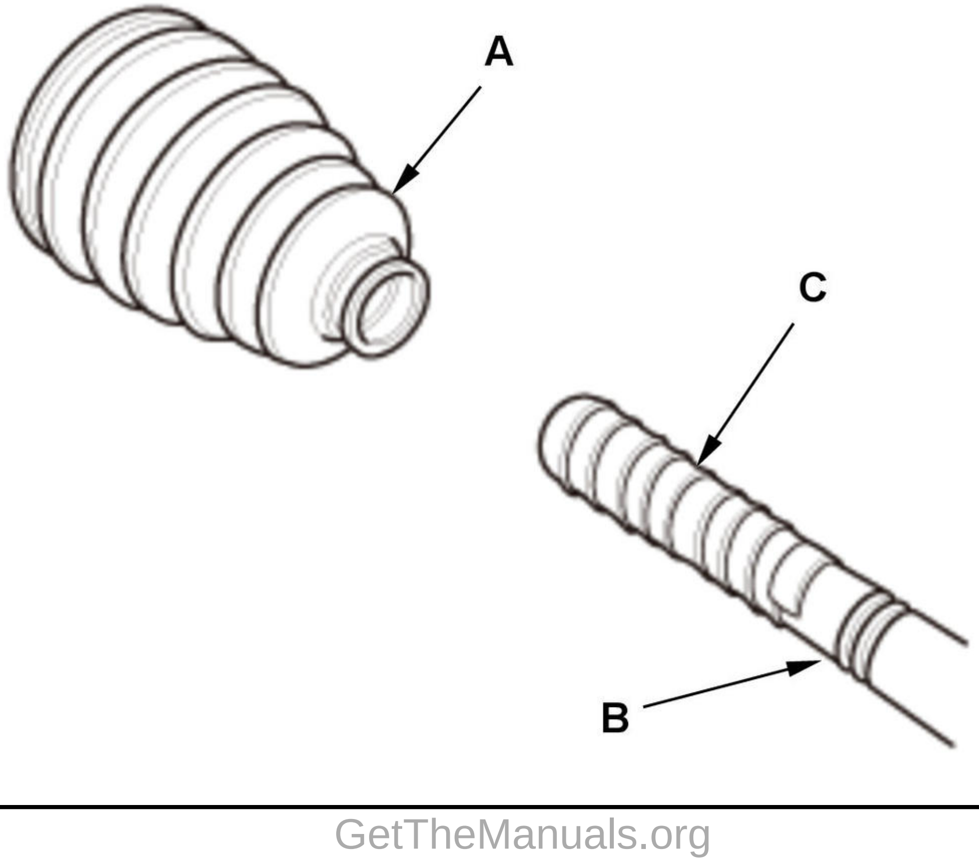
	1. Slide the outboard boot (A) partially toward the inboard joint side. 2. Wipe off the grease to expose the driveshaft and the outboard joint inner race.

	3. Make a mark (A) on the driveshaft (B) at the same level as the outboard joint end (C).

	4. Securely clamp the driveshaft in a bench vise with the wood blocks. 5. Remove the outboard joint (A) using the 26 x 1.5 mm threaded adapter and a commercially available 5/8"-18 UNF slide hammer (B). **NOTE:** Check inside of the outboard joint and on the serrations for wear and tear. 6. Remove the driveshaft from the bench vise.

3. Stop Ring - Remove

4. Outboard Boot - Remove



NOTE:

- Check the outboard boot (A) for cracks and damage. If any damage is found, replace the outboard boot.
- Wrap the splines on the driveshaft (B) with vinyl tape (C) to prevent damaging the outboard boot.

5. Inboard Joint - Remove

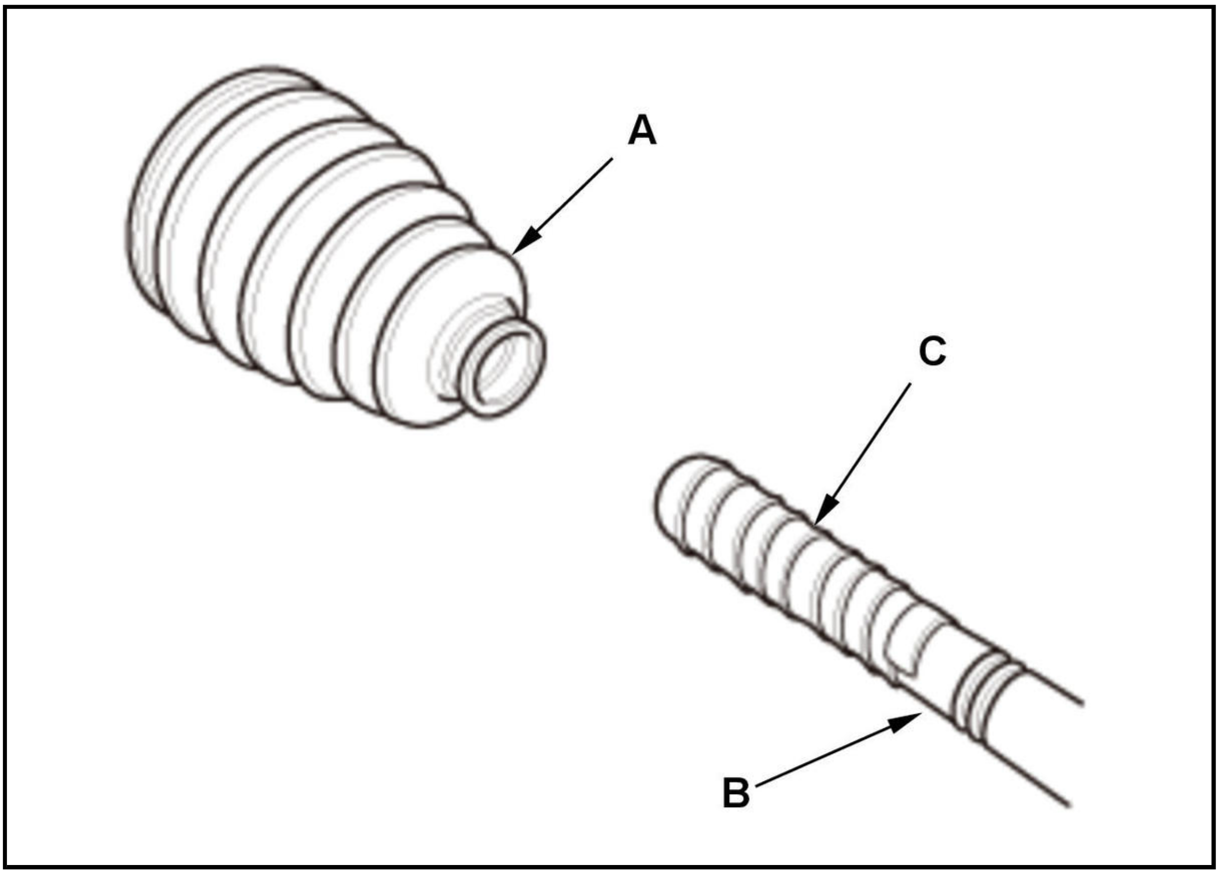
	1. Make marks (A) on each roller (B) and the inboard joint (C) to identify the locations of the rollers to the grooves in the inboard joint. **NOTE:** Do not engrave or scribe any marks on the rolling surface. 2. Remove the inboard joint and place it on a clean shop towel (D). Be careful not to drop the rollers when separating them from the inboard joint. **NOTE:** Check inside of the inboard joint and on the serrations for wear and tear.

6. Circlip - Remove

7. Roller and Spider - Remove

	1. Make marks (A) on the spider (B) that match the marks on the rollers. **NOTE:** Do not engrave or scribe any marks on the rolling surfaces. 2. Remove the rollers. 3. Make marks (C) on the spider and the driveshaft (D) to identify the position of the spider on the shaft. 4. Remove the spider. **NOTE:** If necessary, use a commercially available bearing puller while being careful not to damage the spider.

8. Inboard Boot - Remove



NOTE:

- Check the inboard boot (A) for cracks and damage. If any damage is found, replace the boot.
- Wrap the splines on the driveshaft (B) with vinyl tape (C) to prevent damaging the inboard boot.

Reassembly

NOTE:

- 📖 Where icon is shown, for further information continue to the information below.
- Make marks on the disassembled parts to be able to reassemble them in their original positions.
- Be careful not to damage the boot.
- Use the bands included in the boot set.
- Be careful not to get grease on the boots attachment grooves.

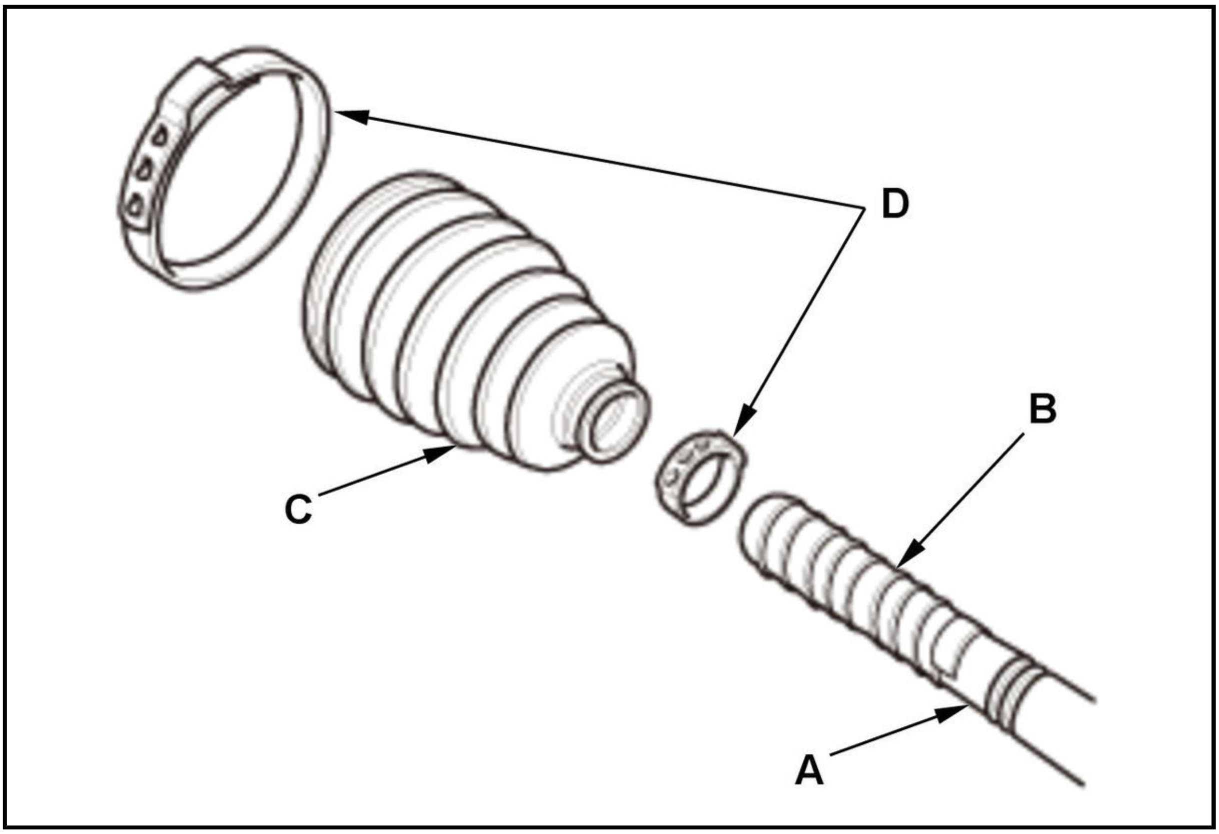
*1	Right driveshaft

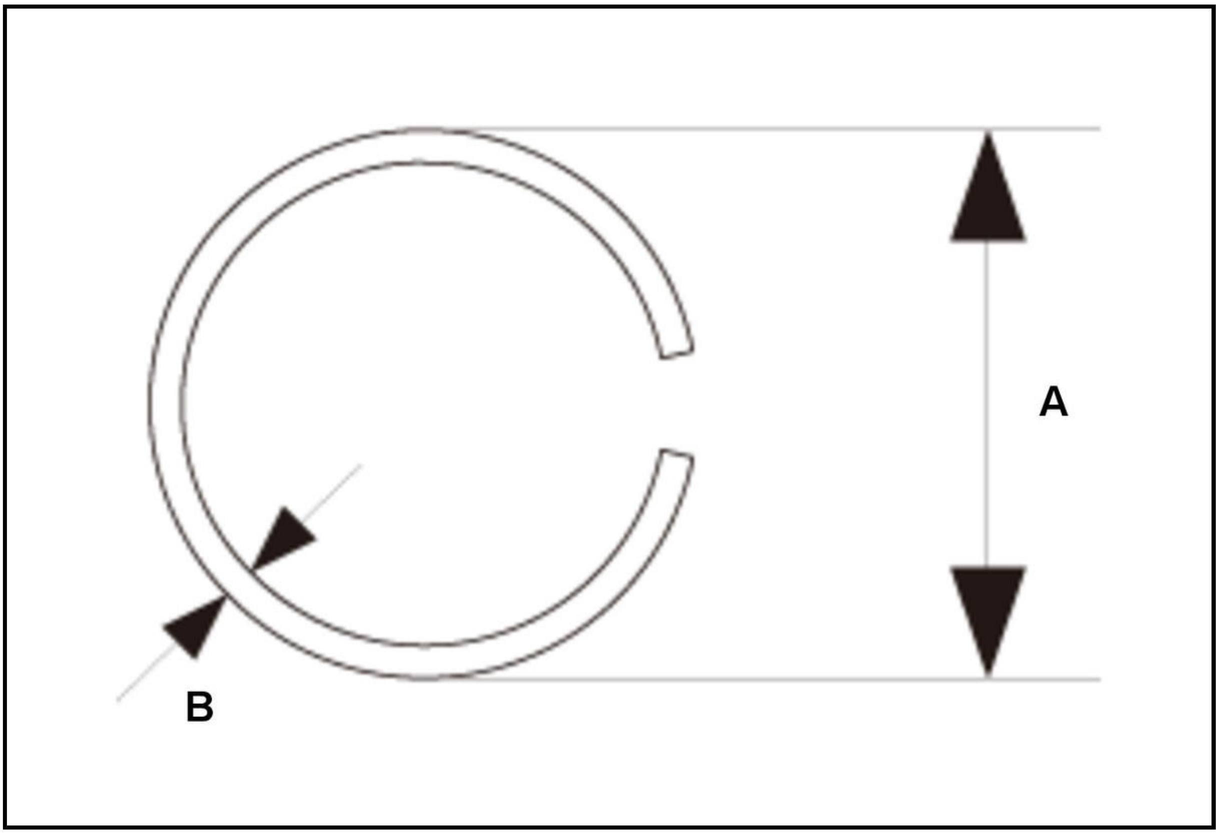
1. Outboard Boot - Install



NOTE:

- Wrap the splines on the driveshaft (A) with vinyl tape (B) to prevent damaging the outboard boot (C).
- Install new ear clamp bands (D) with the boot to prevent damaging the bands.

2. Stop Ring - Install



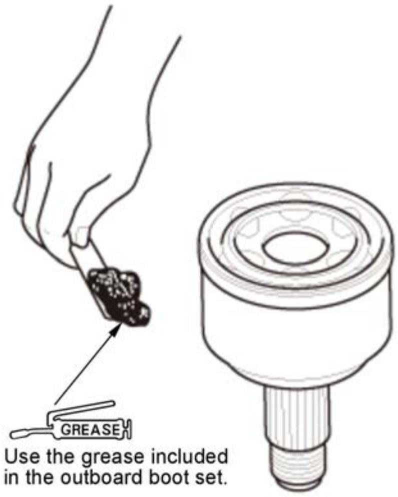
NOTICE:

To avoid driveshaft and vehicle damage, make sure you install the stop ring.

Stop ring specifications		
B	**Overall diameter (A):**	**28.5 mm (1.122 in)**
B	**Wire diameter (B):**	**1.8 mm (0.071 in)**

3. Outboard Joint - Install

<table>
<tr><td>



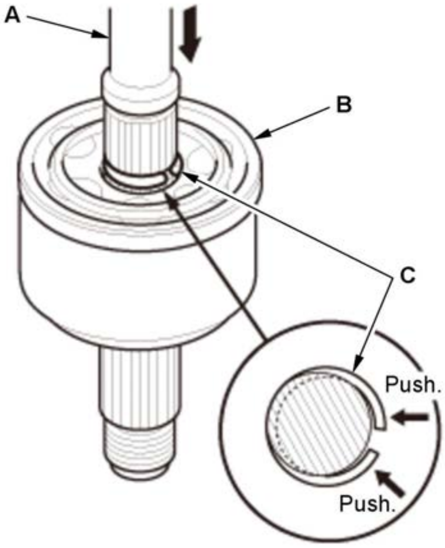
</td><td>

NOTE: Be careful not to damage the outboard boot.

1. Pack about 35 g (1.23 oz) of grease included in the new outboard boot set into the driveshaft hole in the outboard joint.

NOTE: If you are installing a new outboard joint, the grease is already installed.

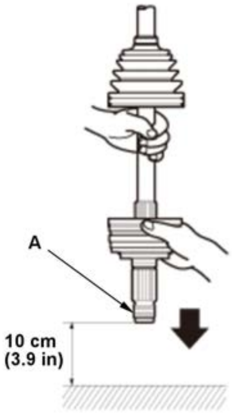
</td></tr>
<tr><td>



</td><td>

2. Insert the driveshaft (A) into the outboard joint (B) until the stop ring (C) is close to the joint.

</td></tr>
<tr><td>



</td><td>

3. To completely seat the outboard joint, pick up the driveshaft and the joint and tap or hit the assembly onto a hard surface from a height of about 10 cm (3.9 in).
NOTE: Do not use a hammer, as excessive force may damage the driveshaft. Be careful not to damage the threaded section (A) of the outboard joint.

</td></tr>
</table>

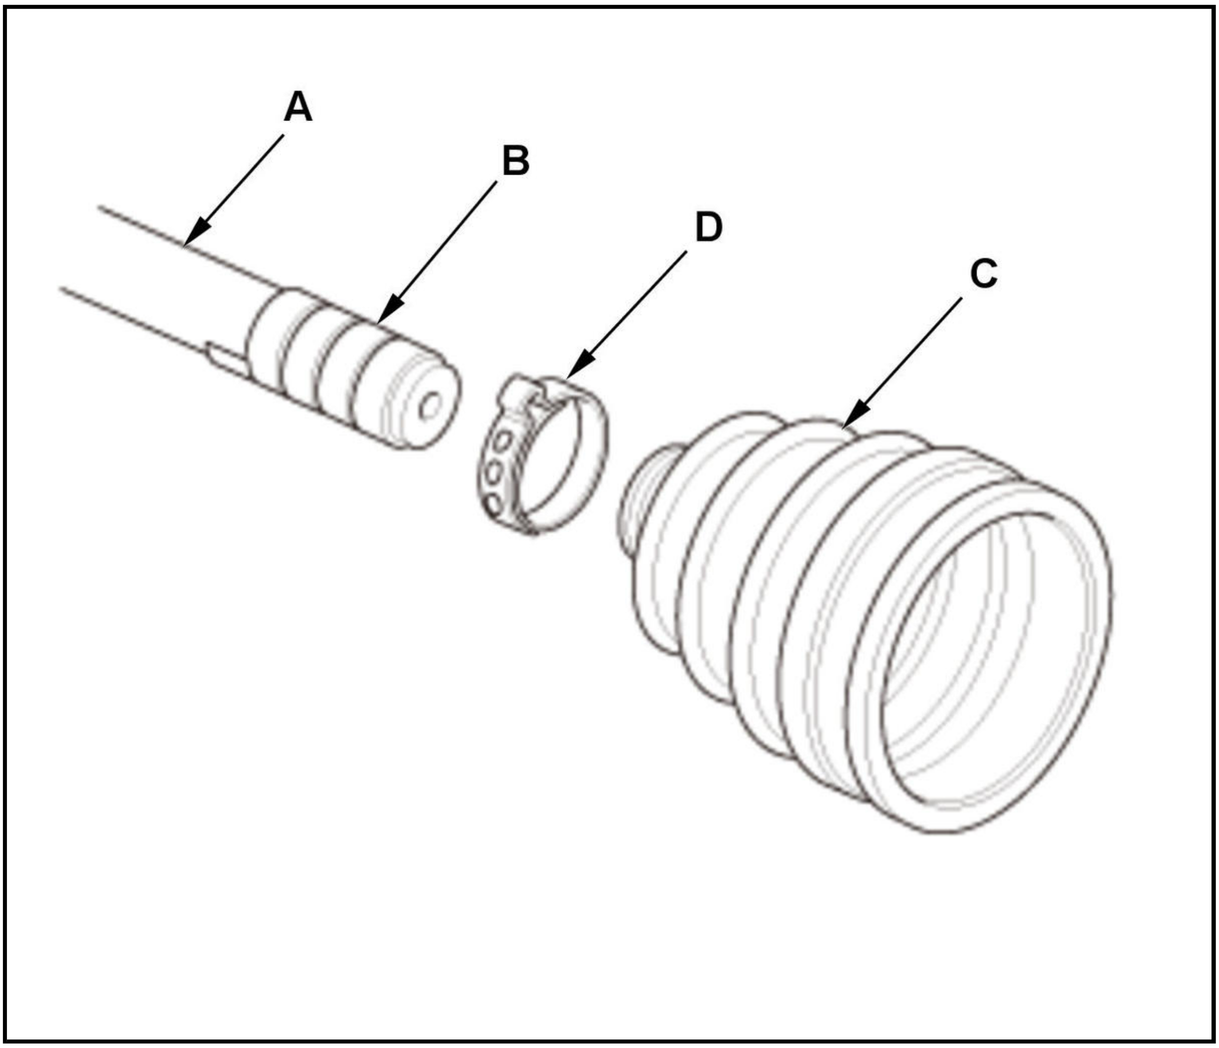
 	4. Check the alignment of the paint mark (A) you made with the outboard joint end (B). **NOTICE:** To avoid driveshaft and vehicle damage, the shaft must be all the way into the outboard joint to ensure the stop ring is properly seated.

 Use the grease included in the outboard boot set.	5. Pack the outboard joint (A) with the remaining joint grease included in the outboard boot set. **Total grease quantity Outboard joint:**

B	**110-130 g (3.88-4.59 oz)**

 	6. Fit the boot ends (A) onto the driveshaft (B) and the outboard joint (C). 7. Bleed any excess air from the boot by inserting a flat-tipped screwdriver between the boot and the joint.

4. Inboard Boot - Install



NOTE:

- Wrap the splines on the driveshaft (A) with vinyl tape (B) to prevent damaging the inboard boot (C).
- Install a new ear clamp band (D) with the boot to prevent damaging the band.

5. Spider - Install

	1. Install the spider (A) onto the driveshaft by aligning the marks (B) you made on the spider and the end of the driveshaft.

6. Roller - Install

	1. Fit the rollers (A) onto the spider (B) as shown and note these items: • Reinstall the rollers in their original positions on the spider by aligning the marks (C) you made. • Hold the driveshaft pointed up to prevent the rollers from falling off.

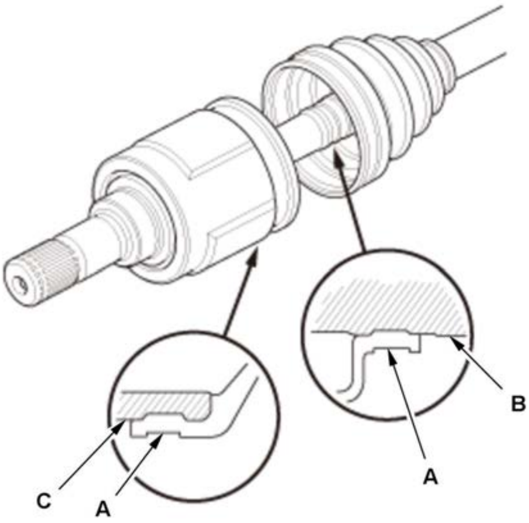
7. Circlip - Install

8. Inboard Joint - Install

	1. Pack the inboard joint with the joint grease included in the new inboard boot set. **Grease quantity Inboard joint:**

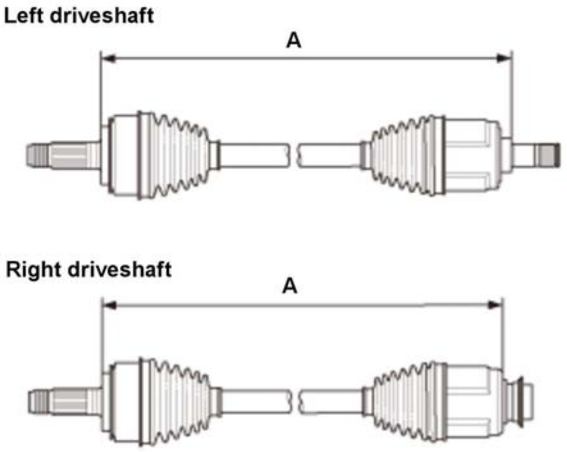
Left	**200-220 g (7.05-7.76 oz)**
Right	**205-225 g (7.23-7.94 oz)**

	2. Fit the inboard joint onto the driveshaft and note these items: • Reinstall the inboard joint onto the driveshaft by aligning the marks (A) you made on the inboard joint and the rollers. • Hold the driveshaft so the inboard joint is pointing up to prevent it from falling off.



3. Fit the boot ends (A) onto the driveshaft (B) and the inboard joint (C).

4. Bleed any excess air from the boot by inserting a flat-tipped screwdriver between the boot and the joint.



5. Adjust the length (A) of the driveshafts in the figure as shown.

Driveshaft length (1.5 L engine):

Driveshaft length (2.4 L engine):

6. Adjust the boots to halfway between full compression and full extension.

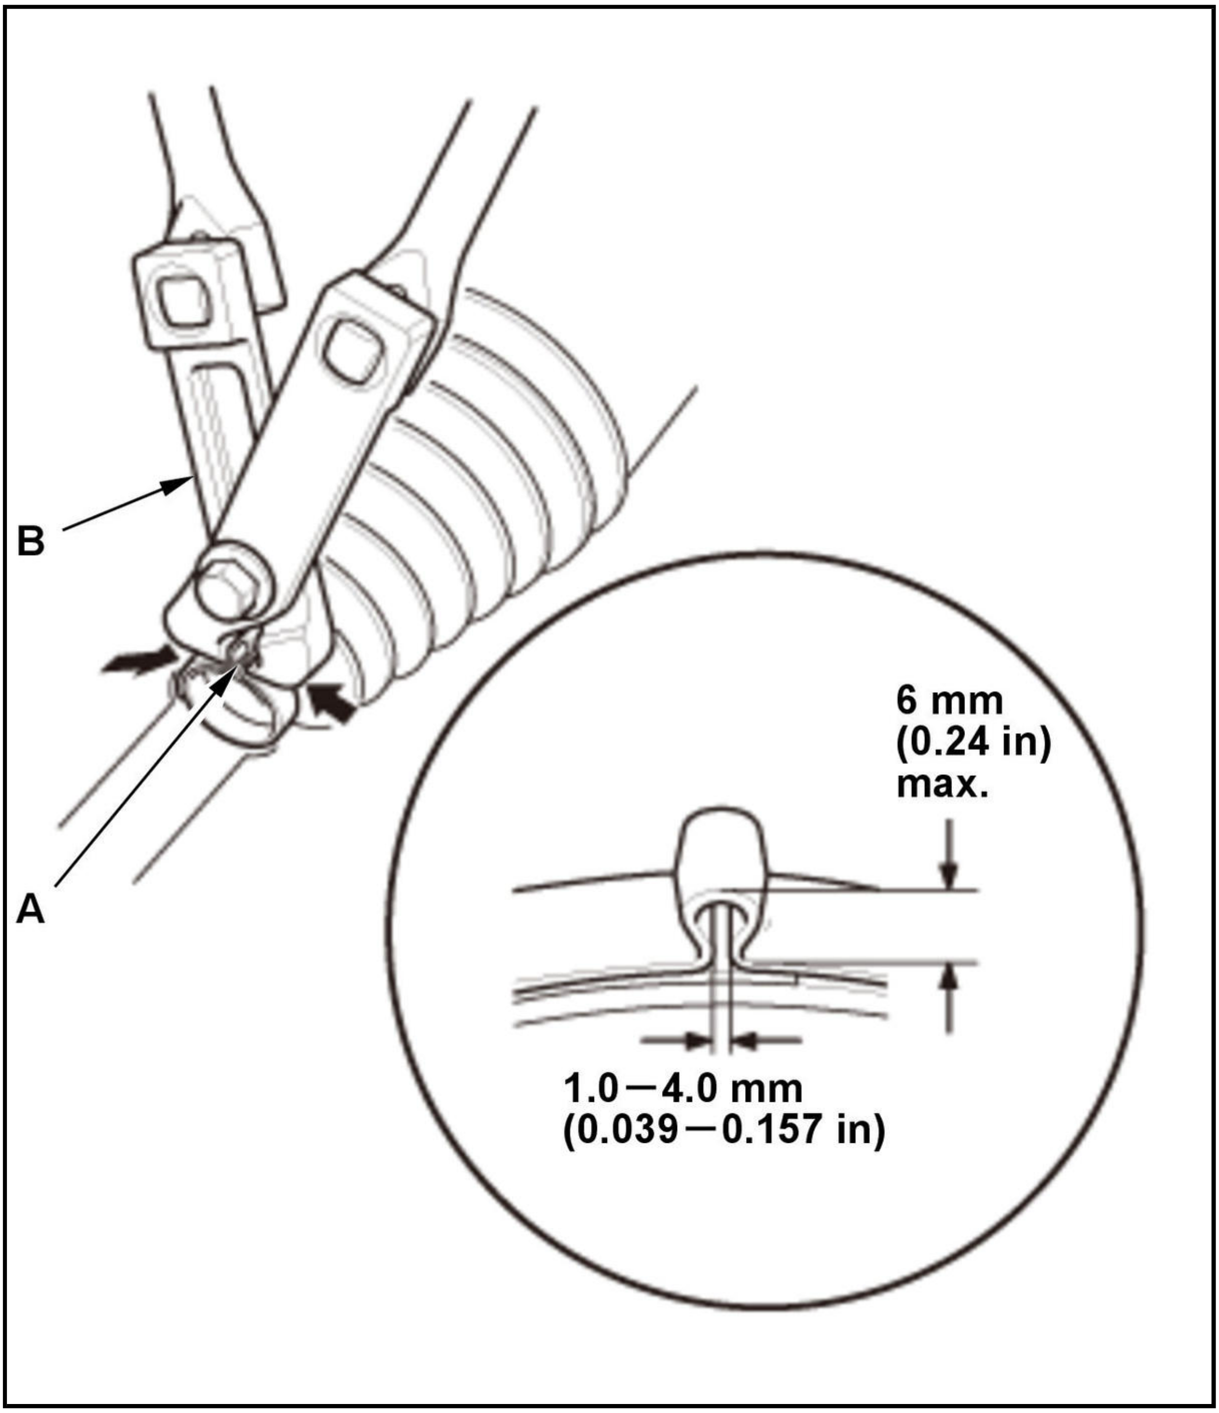
7. Bleed excess air from the boots by inserting a flat-tipped screwdriver between the boot and the joint.

NOTE: Install the joints at exactly the same length.

Left/Right driveshaft	**Specified length (A)**
Left	**550.7-555.7 mm (21.681-21.878 in)**
Right	**477.5-482.5 mm (18.799-18.996 in)**

Left/Right driveshaft	**Specified length (A)**
Left	**550.7-555.7 mm (21.681-21.878 in)**
Right	**567.1-572.1 mm (22.327-22.524 in)**

9. Boot Bands - Install

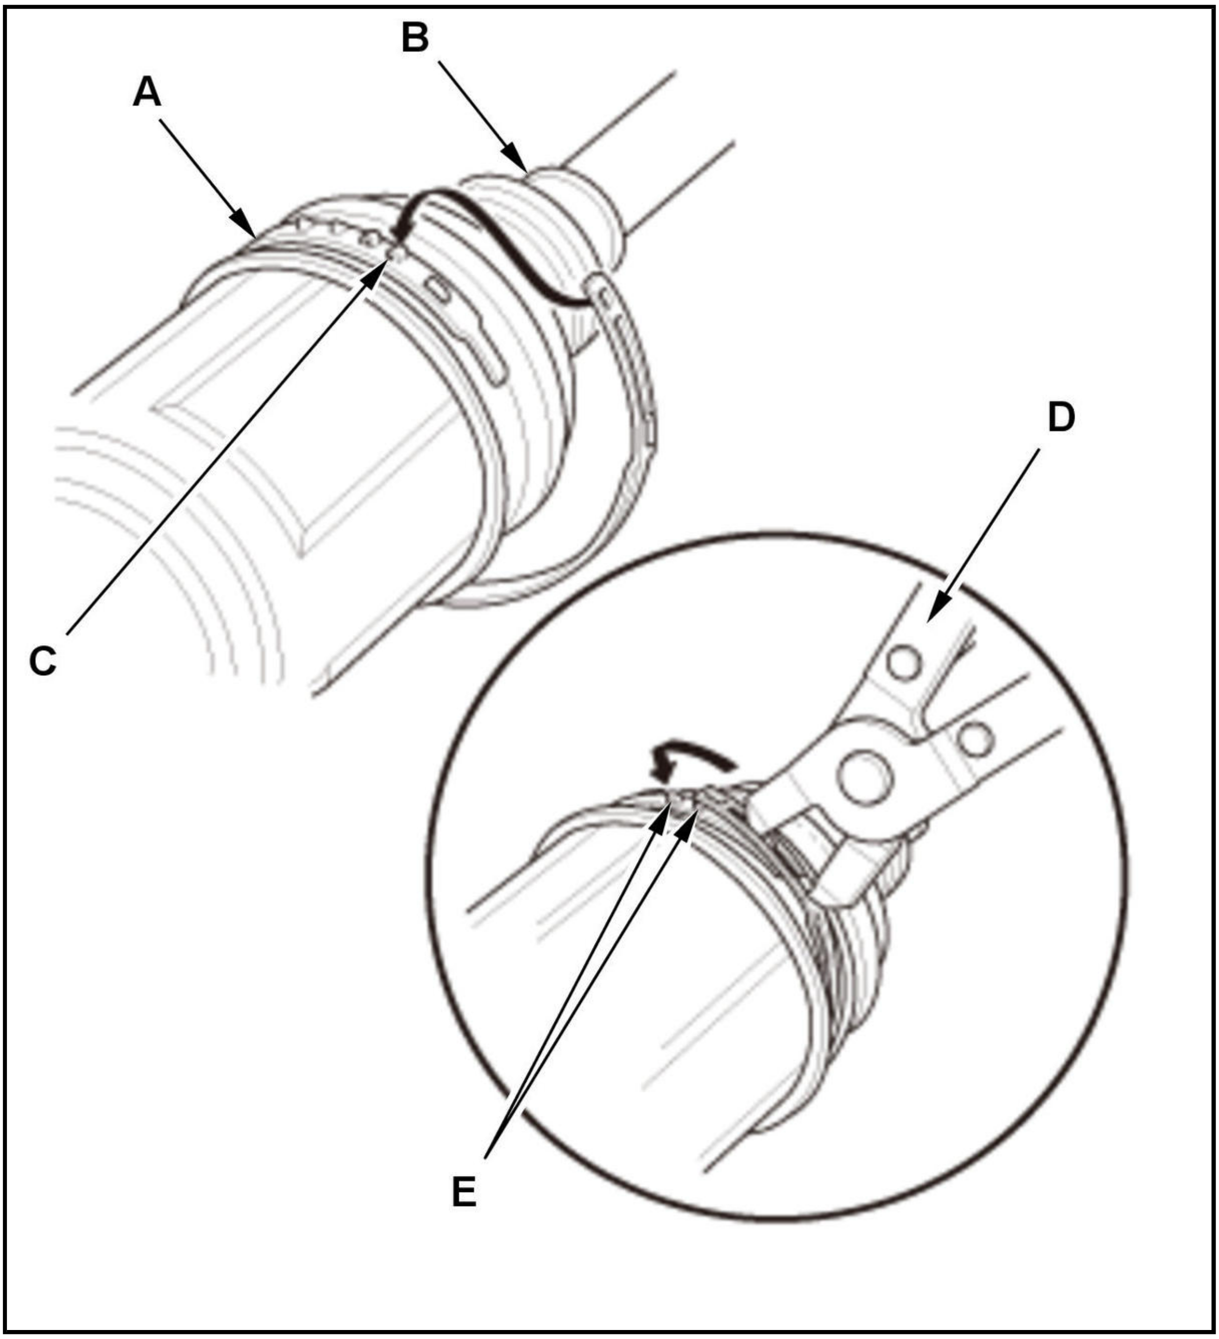


Ear clamp type

1. Close the ear portion (A) of the band using a commercially available boot band clamp tool (Kent-Moore J-35910 or equivalent) (B).

2. Check the clearance of the closed ear portion of the band. If the clearance is not within specification, close the ear portion of the band tighter.

NOTE: Replace the ear clamp band with the one when the ear portion exceeds the prescribed length.



Low profile type

1. Fit the boot ends onto the driveshaft and the inboard joint, then install a new low profile band (A) onto the boot (B).

2. Hook the tab (C) of the band.

3. Close the hook portion of the band using commercially available CV Boot Clamp Pliers (30500) (D), then hook the tabs (E) of the band.
